

LAMMPS Documentation

Release 27Jun2024-330-g7396426963

The LAMMPS Developers

Jul 26, 2024

LAMMPS DOCUMENTATION

I	User Guide	3
1	Introduction	5
1.1	Overview of LAMMPS	5
1.2	What does a LAMMPS version mean	6
1.2.1	Identifying the Version	6
1.2.2	LAMMPS releases, branches, and tags	6
1.3	LAMMPS features	7
1.3.1	General features	8
1.3.2	Particle and model types	8
1.3.3	Interatomic potentials (force fields)	9
1.3.4	Atom creation	10
1.3.5	Ensembles, constraints, and boundary conditions	10
1.3.6	Integrators	11
1.3.7	Diagnostics	11
1.3.8	Output	11
1.3.9	Multi-replica models	12
1.3.10	Pre- and post-processing	12
1.3.11	Specialized features	12
1.4	LAMMPS non-features	13
1.5	LAMMPS portability and compatibility	14
1.5.1	Programming language standards	14
1.5.2	Build systems	14
1.5.3	Operating systems	14
1.5.4	Compilers	14
1.5.5	CPU architectures	15
1.5.6	Portability compliance	15
1.6	LAMMPS open-source license	15
1.6.1	GPL version of LAMMPS	15
1.6.2	LGPL version of LAMMPS	16
1.7	Authors of LAMMPS	16
1.8	Citing LAMMPS	17
1.8.1	Core Algorithms	17
1.8.2	DOI for the LAMMPS source code	17
1.8.3	Home page	18
1.8.4	Citing contributions	18
1.9	Additional website links	18
2	Install LAMMPS	19
2.1	Download an executable for Linux	19
2.1.1	Pre-built static Linux x86_64 executables	20

2.1.2	Pre-built Ubuntu and Debian Linux executables	20
2.1.3	Pre-built Fedora Linux executables	21
2.1.4	Pre-built EPEL Linux executable	21
2.1.5	Pre-built OpenSuse Linux executable	22
2.1.6	Gentoo Linux executable	22
2.1.7	Archlinux build-script	22
2.2	Download an executable for macOS	23
2.3	Download an executable for Windows	23
2.4	Download an executable for Linux or macOS via Conda	24
2.5	Download source and documentation as a tarball	25
2.6	Download the LAMMPS source with git	25
3	Build LAMMPS	29
3.1	Build LAMMPS with CMake	29
3.1.1	Advantages of using CMake	30
3.1.2	Getting started	30
3.1.3	Configuration and build options	31
3.1.4	Multi-configuration build systems	31
3.1.5	Installing CMake	32
3.2	Build LAMMPS with make	32
3.2.1	Requirements	32
3.2.2	Getting started	33
3.2.3	Customized builds and alternate makefiles	33
3.3	Link LAMMPS as a library to another code	34
3.3.1	Link with LAMMPS as a static library	34
3.3.2	Link with LAMMPS as a shared library	36
3.4	Basic build options	38
3.4.1	Serial vs parallel build	38
3.4.2	Choice of compiler and compile/link options	40
3.4.3	Build the LAMMPS executable and library	42
3.4.4	Including or removing debug support	44
3.4.5	Build LAMMPS tools	44
3.4.6	Install LAMMPS after a build	45
3.5	Optional build settings	45
3.5.1	C++11 standard compliance	46
3.5.2	FFT library	46
3.5.3	Size of LAMMPS integer types and size limits	49
3.5.4	Output of JPG, PNG, and movie files	50
3.5.5	Read or write compressed files	51
3.5.6	Memory allocation alignment	52
3.5.7	Workaround for long long integers	52
3.5.8	Exception handling when using LAMMPS as a library	53
3.5.9	Trigger selected floating-point exceptions	53
3.6	Include packages in build	53
3.6.1	Information for both build systems	55
3.6.2	CMake presets for installing many packages	55
3.6.3	Make shortcuts for installing many packages	57
3.7	Packages with extra build options	57
3.7.1	COMPRESS package	58
3.7.2	GPU package	59
3.7.3	KIM package	62
3.7.4	KOKKOS package	64
3.7.5	LEPTON package	68
3.7.6	MACHDYN package	69

3.7.7	ML-IAP package	69
3.7.8	OPT package	70
3.7.9	POEMS package	70
3.7.10	PYTHON package	71
3.7.11	VORONOI package	71
3.7.12	ADIOS package	72
3.7.13	ATC package	73
3.7.14	AWPMD package	73
3.7.15	COLVARS package	74
3.7.16	ELECTRODE package	75
3.7.17	ML-PACE package	76
3.7.18	ML-POD package	77
3.7.19	ML-QUIP package	77
3.7.20	PLUMED package	78
3.7.21	H5MD package	80
3.7.22	ML-HDNNP package	80
3.7.23	INTEL package	81
3.7.24	MDI package	82
3.7.25	MOLFILE package	83
3.7.26	NETCDF package	83
3.7.27	OPENMP package	84
3.7.28	QMMM package	84
3.7.29	RHEO package	85
3.7.30	SCAFACOS package	86
3.7.31	VTK package	87
3.8	Build the LAMMPS documentation	87
3.8.1	Build using GNU make	88
3.8.2	Build using CMake	88
3.8.3	Prerequisites for HTML	89
3.8.4	Prerequisites for PDF	89
3.8.5	Prerequisites for ePUB and MOBI	89
3.8.6	Instructions for Developers	90
3.9	Notes for building LAMMPS on Windows	91
3.9.1	General remarks	91
3.9.2	Running Linux on Windows	91
3.9.3	Using a GNU GCC ported to Windows	91
3.9.4	Using Microsoft Visual Studio	92
3.9.5	Using Intel oneAPI Compilers and Libraries	92
3.9.6	Using a cross-compiler	93
3.10	Notes for saving disk space when building LAMMPS from source	93
3.11	Development build options	94
3.11.1	Monitor compilation flags (CMake only)	94
3.11.2	Enable static code analysis with clang-tidy (CMake only)	95
3.11.3	Report missing and unneeded ‘#include’ statements (CMake only)	95
3.11.4	Address, Leak, Undefined Behavior, and Thread Sanitizer Support (CMake only)	95
3.11.5	Code Coverage and Unit Testing (CMake only)	96
3.11.6	Coding style utilities	102
3.11.7	Clang-format support	102
3.11.8	GitHub command line interface	103
4	Run LAMMPS	105
4.1	Basics of running LAMMPS	105
4.2	Command-line options	106
4.3	Screen and logfile output	114

4.4	Running LAMMPS on Windows	116
5	Commands	119
5.1	LAMMPS input scripts	119
5.2	Parsing rules for input scripts	120
5.3	Input script structure	122
5.3.1	Initialization	123
5.3.2	System definition	123
5.3.3	Simulation settings	123
5.3.4	Run a simulation	123
5.4	Commands by category	123
5.4.1	Initialization:	124
5.4.2	Setup simulation box:	124
5.4.3	Setup atoms:	124
5.4.4	Force fields:	124
5.4.5	Settings:	124
5.4.6	Operations within timestepping (fixes) and diagnostics (computes):	124
5.4.7	Output:	125
5.4.8	Actions:	125
5.4.9	Input script control:	125
5.5	General commands	125
5.6	Fix commands	126
5.7	Compute commands	128
5.8	Pair_style potentials	129
5.9	Bond_style potentials	130
5.10	Angle_style potentials	131
5.11	Dihedral_style potentials	131
5.12	Improper_style potentials	131
5.13	KSpace solvers	132
5.14	Dump commands	132
5.15	Removed commands and packages	132
5.15.1	restart2data tool	132
5.15.2	Fix ave/spatial and fix ave/spatial/sphere	133
5.15.3	Box command	133
5.15.4	Reset_ids, reset_atom_ids, reset_mol_ids commands	133
5.15.5	LATTE package	133
5.15.6	MEAM package	133
5.15.7	Minimize style fire/old	133
5.15.8	Pair style mesont/tpm, compute style mesont, atom style mesont	134
5.15.9	MPIIO package	134
5.15.10	MSCG package	134
5.15.11	REAX package	134
5.15.12	USER-REAXC package	134
5.15.13	USER-CUDA package	134
5.15.14	i-PI tool	135
5.15.15	LAMMPS shell	135
6	Optional packages	137
6.1	Available Packages	137
6.2	Package details	139
6.2.1	ADIOS package	140
6.2.2	AMOEBA package	141
6.2.3	ASPHERE package	141
6.2.4	ATC package	142

6.2.5	AWPMD package	142
6.2.6	BOCS package	143
6.2.7	BODY package	143
6.2.8	BPM package	143
6.2.9	BROWNIAN package	144
6.2.10	CG-DNA package	144
6.2.11	CG-SPICA package	145
6.2.12	CLASS2 package	145
6.2.13	COLLOID package	146
6.2.14	COLVARS package	146
6.2.15	COMPRESS package	147
6.2.16	CORESHELL package	147
6.2.17	DIELECTRIC package	148
6.2.18	DIFFRACTION package	148
6.2.19	DIPOLE package	149
6.2.20	DPD-BASIC package	149
6.2.21	DPD-MESO package	150
6.2.22	DPD-REACT package	150
6.2.23	DPD-SMOOTH package	151
6.2.24	DRUDE package	151
6.2.25	EFF package	152
6.2.26	ELECTRODE package	153
6.2.27	EXTRA-COMMAND package	153
6.2.28	EXTRA-COMPUTE package	153
6.2.29	EXTRA-DUMP package	154
6.2.30	EXTRA-FIX package	154
6.2.31	EXTRA-MOLECULE package	154
6.2.32	EXTRA-PAIR package	154
6.2.33	FEP package	155
6.2.34	GPU package	155
6.2.35	GRANULAR package	156
6.2.36	H5MD package	156
6.2.37	INTEL package	157
6.2.38	INTERLAYER package	158
6.2.39	KIM package	158
6.2.40	KOKKOS package	159
6.2.41	KSPACE package	160
6.2.42	LATBOLTZ package	160
6.2.43	LEPTON package	161
6.2.44	MACHDYN package	161
6.2.45	MANIFOLD package	162
6.2.46	MANYBODY package	162
6.2.47	MC package	163
6.2.48	MDI package	163
6.2.49	MEAM package	164
6.2.50	MESONT package	164
6.2.51	MGPT package	165
6.2.52	MISC package	165
6.2.53	ML-HDNNP package	166
6.2.54	ML-IAP package	166
6.2.55	ML-PACE package	167
6.2.56	ML-POD package	167
6.2.57	ML-QUIP package	168
6.2.58	ML-RANN package	168

6.2.59	ML-SNAP package	169
6.2.60	ML-UF3 package	169
6.2.61	MOFFF package	169
6.2.62	MOLECULE package	170
6.2.63	MOLFILE package	171
6.2.64	NETCDF package	171
6.2.65	OPENMP package	172
6.2.66	OPT package	173
6.2.67	ORIENT package	173
6.2.68	PERI package	173
6.2.69	PHONON package	174
6.2.70	PLUGIN package	174
6.2.71	PLUMED package	175
6.2.72	POEMS package	175
6.2.73	PTM package	176
6.2.74	PYTHON package	176
6.2.75	QEQ package	177
6.2.76	QMMM package	177
6.2.77	QTB package	178
6.2.78	REACTION package	178
6.2.79	REAXFF package	179
6.2.80	REPLICA package	179
6.2.81	RHEO package	180
6.2.82	RIGID package	180
6.2.83	SCAFACOS package	181
6.2.84	SHOCK package	181
6.2.85	SMTBQ package	182
6.2.86	SPH package	182
6.2.87	SPIN package	183
6.2.88	SRD package	183
6.2.89	TALLY package	184
6.2.90	UEF package	184
6.2.91	VORONOI package	185
6.2.92	VTK package	185
6.2.93	YAFF package	186
7	Accelerate performance	187
7.1	Benchmarks	187
7.2	Measuring performance	188
7.3	General tips	189
7.4	Accelerator packages	190
7.4.1	GPU package	191
7.4.2	INTEL package	194
7.4.3	KOKKOS package	202
7.4.4	OPENMP package	209
7.4.5	OPT package	211
7.5	Comparison of various accelerator packages	214
8	Howto discussions	217
8.1	General howto	217
8.1.1	Restart a simulation	217
8.1.2	Visualize LAMMPS snapshots	218
8.1.3	Run multiple simulations from one input script	219
8.1.4	Multi-replica simulations	220

8.1.5	Library interface to LAMMPS	221
8.1.6	Coupling LAMMPS to other codes	221
8.1.7	Using LAMMPS with the MDI library for code coupling	222
8.1.8	Broken Bonds	224
8.2	Settings howto	225
8.2.1	2d simulations	225
8.2.2	Type labels	226
8.2.3	Triclinic (non-orthogonal) simulation boxes	228
8.2.4	Thermostats	233
8.2.5	Barostats	234
8.2.6	Walls	235
8.2.7	NEMD simulations	236
8.2.8	Long-range dispersion settings	237
8.3	Analysis howto	238
8.3.1	Output from LAMMPS (thermo, dumps, computes, fixes, variables)	238
8.3.2	Use chunks to calculate system properties	244
8.3.3	Using distributed grids	247
8.3.4	Calculate temperature	249
8.3.5	Calculate elastic constants	249
8.3.6	Calculate thermal conductivity	250
8.3.7	Calculate viscosity	251
8.3.8	Calculate diffusion coefficients	253
8.3.9	Output structured data from LAMMPS	254
8.4	Force fields howto	260
8.4.1	CHARMM, AMBER, COMPASS, and DREIDING force fields	260
8.4.2	AMOEBA and HIPPO force fields	265
8.4.3	TIP3P water model	270
8.4.4	TIP4P water model	273
8.4.5	TIP5P water model	276
8.4.6	SPC water model	278
8.5	Packages howto	281
8.5.1	Finite-size spherical and aspherical particles	281
8.5.2	Granular models	284
8.5.3	Body particles	286
8.5.4	Bonded particle models	292
8.5.5	Polarizable models	294
8.5.6	Adiabatic core/shell model	295
8.5.7	Drude induced dipoles	298
8.5.8	Tutorial for Thermalized Drude oscillators in LAMMPS	299
8.5.9	Peridynamics with LAMMPS	306
8.5.10	Manifolds (surfaces)	322
8.5.11	Reproducing hydrodynamics and elastic objects (RHEO)	323
8.5.12	Magnetic spins	324
8.6	Tutorials howto	325
8.6.1	Using CMake with LAMMPS	325
8.6.2	LAMMPS GitHub tutorial	332
8.6.3	Using the LAMMPS-GUI	345
8.6.4	Moltemplate Tutorial	357
8.6.5	PyLammps Tutorial	363
8.6.6	Using LAMMPS on Windows 10 with WSL	377
9	Example scripts	387
9.1	Lowercase directories	387
9.2	Uppercase directories	389

10	Auxiliary tools	391
10.1	Pre-processing tools	391
10.2	Post-processing tools	392
10.3	Miscellaneous tools	392
10.4	Tool descriptions	392
10.4.1	amber2lmp tool	392
10.4.2	binary2txt tool	392
10.4.3	ch2lmp tool	393
10.4.4	chain tool	393
10.4.5	LAMMPS coding standard	393
10.4.6	colvars tools	394
10.4.7	createatoms tool	394
10.4.8	drude tool	394
10.4.9	eam database tool	394
10.4.10	eam generate tool	395
10.4.11	eff tool	395
10.4.12	emacs tool	395
10.4.13	fep tool	395
10.4.14	i-PI tool	396
10.4.15	ipp tool	396
10.4.16	kate tool	396
10.4.17	LAMMPS-GUI	396
10.4.18	lmp2arc tool	400
10.4.19	lmp2cfg tool	400
10.4.20	Magic patterns for the “file” command	400
10.4.21	matlab tool	401
10.4.22	micelle2d tool	401
10.4.23	moltemplate tool	401
10.4.24	msi2lmp tool	401
10.4.25	Scripts for building LAMMPS when offline	402
10.4.26	phonon tool	403
10.4.27	polybond tool	403
10.4.28	pymol_asphere tool	403
10.4.29	python tool	404
10.4.30	replica tool	404
10.4.31	smd tool	404
10.4.32	spin tool	404
10.4.33	singularity/apptainer tool	405
10.4.34	stl_bin2txt tool	405
10.4.35	SWIG interface	405
10.4.36	tabulate tool	407
10.4.37	vim tool	407
10.4.38	xmgrace tool	407
11	Errors	409
11.1	Common problems	409
11.2	Error and warning details	410
11.2.1	Unknown identifier in data file	411
11.2.2	Incorrect format in ... section of data file	411
11.3	Reporting bugs	411
11.4	Debugging crashes	412
11.4.1	Using the GDB debugger to get a stack trace	413
11.4.2	Using valgrind to get a stack trace	415
11.5	Error messages	416

11.6	Warning messages	540
II	Programmer Guide	553
1	LAMMPS Library Interfaces	555
1.1	LAMMPS C Library API	555
1.1.1	Creating or deleting a LAMMPS object	556
1.1.2	Executing commands	561
1.1.3	System properties	563
1.1.4	Per-atom properties	576
1.1.5	Compute, fixes, variables	577
1.1.6	Scatter/gather operations	585
1.1.7	Neighbor list access	599
1.1.8	Configuration information	601
1.1.9	Utility functions	608
1.1.10	Extending the C API	616
1.2	LAMMPS Python APIs	617
1.3	LAMMPS Fortran API	617
1.3.1	The LIBLAMMPS Fortran Module	617
1.3.2	Creating or deleting a LAMMPS object	618
1.3.3	Executing LAMMPS commands	619
1.3.4	Accessing system properties	620
1.3.5	The LIBLAMMPS module API	621
1.4	LAMMPS C++ API	665
1.4.1	Using the C++ API directly	666
1.4.2	Creating or deleting a LAMMPS object	666
1.4.3	Executing LAMMPS commands	667
2	Use Python with LAMMPS	669
2.1	Overview	669
2.2	Installation	671
2.2.1	Installing the LAMMPS Python Module and Shared Library	671
2.2.2	Extending Python to run in parallel	675
2.3	Run LAMMPS from Python	676
2.3.1	Running LAMMPS and Python in serial	676
2.3.2	Running LAMMPS and Python in parallel with MPI	676
2.3.3	Running Python scripts	677
2.3.4	Creating or deleting a LAMMPS object	677
2.3.5	Executing commands	680
2.3.6	System properties	682
2.3.7	Per-atom properties	684
2.3.8	Compute, fixes, variables	685
2.3.9	Scatter/gather operations	687
2.3.10	Neighbor list access	688
2.3.11	Configuration information	689
2.4	The lammps Python module	690
2.4.1	The lammps class API	691
2.4.2	The PyLammps class API	714
2.4.3	The IPyLammps class API	719
2.4.4	Additional components of the lammps module	720
2.5	Extending the Python interface	722
2.6	Calling Python from LAMMPS	723
2.7	Output Readers	723

2.8	Example Python scripts	724
2.9	Handling LAMMPS errors	725
2.10	Troubleshooting	726
2.10.1	Testing if Python can launch LAMMPS	726
3	Modifying & extending LAMMPS	727
3.1	Overview	727
3.2	Submitting new features for inclusion in LAMMPS	728
3.2.1	Communication with the LAMMPS developers	729
3.2.2	Time and effort required	729
3.2.3	Submission procedure	729
3.2.4	External contributions	729
3.2.5	Location of files: individual files and packages	730
3.2.6	Changes to core LAMMPS files	730
3.3	Requirements for contributions to LAMMPS	730
3.3.1	Motivation	730
3.3.2	Licensing requirements (strict)	731
3.3.3	Integration testing (strict)	731
3.3.4	Documentation (strict)	731
3.3.5	Build system (strict)	733
3.3.6	Command or style names, file names, and keywords (strict)	733
3.3.7	Programming style requirements (varied)	733
3.3.8	Examples (preferred)	733
3.3.9	Error or warning messages and explanations (preferred)	734
3.3.10	Citation reminder (optional)	734
3.3.11	Testing (optional)	735
3.4	LAMMPS programming style	735
3.4.1	Include files (varied)	735
3.4.2	Whitespace (preferred)	736
3.4.3	Constants (strongly preferred)	736
3.4.4	Placement of braces (strongly preferred)	736
3.4.5	Miscellaneous standards (varied)	737
3.5	Atom styles	738
3.6	Pair styles	740
3.7	Bond, angle, dihedral, improper styles	742
3.8	Compute styles	743
3.9	Fix styles	743
3.10	Input script command style	745
3.11	Dump styles	745
3.12	Kspace styles	746
3.13	Minimization styles	746
3.14	Region styles	746
3.15	Body styles	747
3.16	Granular Sub-Model styles	747
3.17	Thermodynamic output options	750
3.18	Variable options	751
4	Information for Developers	753
4.1	Source files	753
4.2	Class topology	754
4.3	Code design	757
4.3.1	Object-oriented code	757
4.3.2	I/O and output formatting	760
4.3.3	Memory management	762

4.4	Parallel algorithms	763
4.4.1	Partitioning	763
4.4.2	Communication	764
4.4.3	Neighbor lists	766
4.4.4	Long-range interactions	768
4.4.5	OpenMP Parallelism	770
4.5	Accessing per-atom data	772
4.5.1	Owned and ghost atoms	772
4.5.2	Atom indexing	772
4.5.3	Atom class versus AtomVec classes	773
4.6	Communication patterns	773
4.6.1	Owned and ghost atoms	773
4.6.2	Higher level communication	774
4.7	How a timestep works	776
4.8	Writing new styles	779
4.8.1	Writing new pair styles	779
4.8.2	Package and build system considerations	780
4.8.3	Case 1: a pairwise additive model	780
4.8.4	Case 2: a many-body potential	794
4.8.5	Case 3: a potential requiring communication	797
4.8.6	Case 4: potentials without a compute() function	799
4.8.7	Writing a new fix style	800
4.9	Notes for developers and code maintainers	804
4.9.1	Reading and parsing of text and text files	804
4.9.2	Requesting and accessing neighbor lists	805
4.9.3	Choosing between a custom atom style, fix property/atom, and fix STORE/ATOM	807
4.9.4	Fix contributions to instantaneous energy, virial, and cumulative energy	807
4.9.5	KSpace PPPM FFT grids	809
4.10	Notes for updating code written for older LAMMPS versions	810
4.10.1	Setting flags in the constructor	811
4.10.2	Rename of pack/unpack_comm() to pack/unpack_forward_comm()	811
4.10.3	Use ev_init() to initialize variables derived from eflag and vflag	812
4.10.4	Use utils::count_words() functions instead of atom->count_words()	812
4.10.5	Use utils::numeric() functions instead of force->numeric()	813
4.10.6	Use utils::open_potential() function to open potential files	813
4.10.7	Use symbolic Atom and AtomVec constants instead of numerical values	814
4.10.8	Simplify customized error messages	814
4.10.9	Use of “override” instead of “virtual”	815
4.10.10	Simplified function names for forward and reverse communication	815
4.10.11	Simplified and more compact neighbor list requests	816
4.10.12	Split of fix STORE into fix STORE/GLOBAL and fix STORE/PERATOM	816
4.10.13	Rename of fix STORE/PERATOM to fix STORE/ATOM and change of arguments	817
4.10.14	Use Output::get_dump_by_id() instead of Output::find_dump()	818
4.10.15	Refactored grid communication using Grid3d/Grid2d classes instead of GridComm	818
4.11	Writing plugins	819
4.11.1	Members of lammpsplugin_t	820
4.11.2	Pair style example	820
4.11.3	Fix style example	821
4.11.4	Command style example	821
4.11.5	Additional Details	822
4.11.6	Compiling plugins	823
4.12	Adding tests for unit testing	823
4.12.1	Tests for utility functions	824
4.12.2	Tests for individual LAMMPS commands	825

4.12.3	Tests for the C-style library interface	826
4.12.4	Tests for the Python module and package	826
4.12.5	Tests for the Fortran interface	827
4.12.6	Tests for the C++-style library interface	827
4.12.7	Tests for reading and writing file formats	827
4.12.8	Tests for styles computing or modifying forces	827
4.12.9	Tests for programs in the tools folder	830
4.12.10	Troubleshooting failed unit tests	830
4.13	C++ base classes	831
4.13.1	LAMMPS Class	832
4.13.2	LAMMPS Atom and AtomVec Base Classes	834
4.13.3	LAMMPS Input Base Class	837
4.14	Platform abstraction functions	839
4.14.1	Time functions	839
4.14.2	Platform information functions	839
4.14.3	File and path functions and global constants	840
4.14.4	Standard I/O function wrappers	843
4.14.5	Environment variable functions	844
4.14.6	Dynamically loaded object or library functions	845
4.14.7	Compressed file I/O functions	846
4.15	Utility functions	846
4.15.1	I/O with status check and similar functions	846
4.15.2	String to number conversions with validity check	848
4.15.3	String processing	851
4.15.4	Potential file functions	856
4.15.5	Argument processing	857
4.15.6	Convenience functions	859
4.15.7	Customized standard functions	861
4.16	Special Math functions	862
4.17	Tokenizer classes	864
4.18	Argument parsing classes	869
4.19	File reader classes	872
4.20	Memory pool classes	877
4.21	Eigensolver functions	880
4.22	Communication buffer coding with <i>ubuf</i>	881
4.23	Use of distributed grids within style classes	882
4.23.1	Style commands	883
4.23.2	Grid data allocation and access	883
4.23.3	Grid class constructors	884
4.23.4	Grid class set methods	885
4.23.5	Grid class setup_grid method	886
4.23.6	More grid class set methods	886
4.23.7	Grid class get methods	887
4.23.8	Grid class owned/ghost communication	887
4.23.9	Grid class remap methods for load balancing	889
4.23.10	Grid class I/O methods	890
4.23.11	Style class grid access methods	891
4.23.12	Final notes	892

III Command Reference 895

1	Commands 897
1.1	angle_coeff command 897

1.1.1	Syntax	897
1.1.2	Examples	897
1.1.3	Description	897
1.1.4	Restrictions	898
1.1.5	Related commands	898
1.1.6	Default	898
1.2	angle_style command	898
1.2.1	Syntax	898
1.2.2	Examples	899
1.2.3	Description	899
1.2.4	Restrictions	900
1.2.5	Related commands	900
1.2.6	Default	900
1.3	angle_write command	901
1.3.1	Syntax	901
1.3.2	Examples	901
1.3.3	Description	901
1.3.4	Restrictions	901
1.3.5	Related commands	902
1.3.6	Default	902
1.4	atom_modify command	902
1.4.1	Syntax	902
1.4.2	Examples	902
1.4.3	Description	903
1.4.4	Restrictions	904
1.4.5	Related commands	904
1.4.6	Default	905
1.5	atom_style command	905
1.5.1	Syntax	905
1.5.2	Examples	905
1.5.3	Description	906
1.5.4	Atom style attributes	906
1.5.5	Particle size and mass	908
1.5.6	Additional information about specific atom styles	908
1.5.7	Restrictions	910
1.5.8	Related commands	911
1.5.9	Default	911
1.6	balance command	911
1.6.1	Syntax	911
1.6.2	Examples	912
1.6.3	Description	912
1.6.4	Restrictions	918
1.6.5	Related commands	918
1.6.6	Default	918
1.7	bond_coeff command	919
1.7.1	Syntax	919
1.7.2	Examples	919
1.7.3	Description	919
1.7.4	Restrictions	920
1.7.5	Related commands	920
1.7.6	Default	920
1.8	bond_style command	920
1.8.1	Syntax	920
1.8.2	Examples	920

	1.8.3	Description	920
	1.8.4	Restrictions	922
	1.8.5	Related commands	922
	1.8.6	Default	922
1.9		bond_write command	922
	1.9.1	Syntax	922
	1.9.2	Examples	923
	1.9.3	Description	923
	1.9.4	Restrictions	923
	1.9.5	Related commands	923
	1.9.6	Default	923
1.10		boundary command	923
	1.10.1	Syntax	923
	1.10.2	Examples	924
	1.10.3	Description	924
	1.10.4	Restrictions	925
	1.10.5	Related commands	925
	1.10.6	Default	925
1.11		change_box command	925
	1.11.1	Syntax	925
	1.11.2	Examples	926
	1.11.3	Description	926
	1.11.4	Restrictions	930
	1.11.5	Related commands	930
	1.11.6	Default	930
1.12		clear command	930
	1.12.1	Syntax	930
	1.12.2	Examples	930
	1.12.3	Description	931
	1.12.4	Restrictions	931
	1.12.5	Related commands	931
	1.12.6	Default	931
1.13		comm_modify command	931
	1.13.1	Syntax	931
	1.13.2	Examples	932
	1.13.3	Description	932
	1.13.4	Restrictions	934
	1.13.5	Related commands	934
	1.13.6	Default	934
1.14		comm_style command	934
	1.14.1	Syntax	934
	1.14.2	Examples	934
	1.14.3	Description	934
	1.14.4	Restrictions	935
	1.14.5	Related commands	935
	1.14.6	Default	935
1.15		compute command	935
	1.15.1	Syntax	935
	1.15.2	Examples	935
	1.15.3	Description	935
	1.15.4	Restrictions	942
	1.15.5	Related commands	942
	1.15.6	Default	942
1.16		compute_modify command	942

1.16.1	Syntax	942
1.16.2	Examples	943
1.16.3	Description	943
1.16.4	Restrictions	943
1.16.5	Related commands	943
1.16.6	Default	943
1.17	create_atoms command	944
1.17.1	Syntax	944
1.17.2	Examples	945
1.17.3	Description	945
1.17.4	Restrictions	952
1.17.5	Related commands	952
1.17.6	Default	952
1.18	create_bonds command	952
1.18.1	Syntax	952
1.18.2	Examples	953
1.18.3	Description	953
1.18.4	Restrictions	955
1.18.5	Related commands	955
1.18.6	Default	955
1.19	create_box command	955
1.19.1	Syntax	955
1.19.2	Examples	956
1.19.3	Description	956
1.19.4	Restrictions	958
1.19.5	Related commands	958
1.19.6	Default	958
1.20	delete_atoms command	959
1.20.1	Syntax	959
1.20.2	Examples	959
1.20.3	Description	960
1.20.4	Restrictions	961
1.20.5	Related commands	961
1.20.6	Default	961
1.21	delete_bonds command	961
1.21.1	Syntax	961
1.21.2	Examples	962
1.21.3	Description	962
1.21.4	Restrictions	963
1.21.5	Related commands	964
1.21.6	Default	964
1.22	dielectric command	964
1.22.1	Syntax	964
1.22.2	Examples	964
1.22.3	Description	964
1.22.4	Restrictions	964
1.22.5	Related commands	964
1.22.6	Default	964
1.23	dihedral_coeff command	965
1.23.1	Syntax	965
1.23.2	Examples	965
1.23.3	Description	965
1.23.4	Restrictions	966
1.23.5	Related commands	966

	1.23.6	Default	966
1.24		dihedral_style command	966
	1.24.1	Syntax	966
	1.24.2	Examples	967
	1.24.3	Description	967
	1.24.4	Restrictions	968
	1.24.5	Related commands	969
	1.24.6	Default	969
1.25		dihedral_write command	969
	1.25.1	Syntax	969
	1.25.2	Examples	969
	1.25.3	Description	969
	1.25.4	Restrictions	970
	1.25.5	Related commands	970
	1.25.6	Default	970
1.26		dimension command	970
	1.26.1	Syntax	970
	1.26.2	Examples	970
	1.26.3	Description	970
	1.26.4	Restrictions	971
	1.26.5	Related commands	971
	1.26.6	Default	971
1.27		displace_atoms command	971
	1.27.1	Syntax	971
	1.27.2	Examples	972
	1.27.3	Description	972
	1.27.4	Restrictions	973
	1.27.5	Related commands	973
	1.27.6	Default	973
1.28		dump command	974
1.29		dump vtk command	974
1.30		dump h5md command	974
1.31		dump molfile command	974
1.32		dump netcdf command	974
1.33		dump image command	974
1.34		dump movie command	974
1.35		dump atom/adios command	974
1.36		dump custom/adios command	974
1.37		dump cfg/uef command	974
	1.37.1	Syntax	974
	1.37.2	Examples	976
	1.37.3	Description	977
	1.37.4	Restrictions	986
	1.37.5	Related commands	987
	1.37.6	Default	987
1.38		dump atom/adios command	987
1.39		dump custom/adios command	987
	1.39.1	Syntax	987
	1.39.2	Examples	987
	1.39.3	Description	987
	1.39.4	Restrictions	988
	1.39.5	Related commands	988
1.40		dump cfg/uef command	988
	1.40.1	Syntax	988

1.40.2	Examples	988
1.40.3	Description	989
1.40.4	Restrictions	989
1.40.5	Related commands	989
1.40.6	Default	989
1.41	dump h5md command	989
1.41.1	Syntax	989
1.41.2	Examples	990
1.41.3	Description	990
1.41.4	Restrictions	991
1.41.5	Related commands	991
1.42	dump image command	991
1.43	dump movie command	991
1.43.1	Syntax	991
1.44	dump_modify options for dump image/movie	993
1.44.1	Syntax	993
1.44.2	Examples	994
1.44.3	Description	994
1.44.4	Image Quality Settings	1000
1.44.5	Dump_modify keywords for dump image and dump movie	1001
1.44.6	Restrictions	1005
1.44.7	Related commands	1005
1.44.8	Default	1005
1.45	dump_modify command	1008
1.46	dump_modify command for image/movie options	1008
1.46.1	Syntax	1008
1.46.2	Examples	1010
1.46.3	Description	1010
1.46.4	Restrictions	1020
1.46.5	Related commands	1020
1.46.6	Default	1020
1.47	dump molfile command	1021
1.47.1	Syntax	1021
1.47.2	Examples	1021
1.47.3	Description	1021
1.47.4	Restrictions	1022
1.47.5	Related commands	1023
1.47.6	Default	1023
1.48	dump netcdf command	1023
1.49	dump netcdf/mpiio command	1023
1.49.1	Syntax	1023
1.49.2	Examples	1023
1.49.3	Description	1023
1.49.4	Restrictions	1024
1.49.5	Related commands	1024
1.50	dump vtk command	1024
1.50.1	Syntax	1024
1.50.2	Examples	1024
1.50.3	Description	1024
1.50.4	Restrictions	1026
1.50.5	Related commands	1026
1.50.6	Default	1026
1.51	dynamical_matrix command	1027
1.51.1	Syntax	1027

	1.51.2	Examples	1027
	1.51.3	Description	1027
	1.51.4	Restrictions	1028
	1.51.5	Related commands	1028
	1.51.6	Default	1028
1.52		echo command	1028
	1.52.1	Syntax	1028
	1.52.2	Examples	1028
	1.52.3	Description	1028
	1.52.4	Restrictions	1029
	1.52.5	Related commands	1029
	1.52.6	Default	1029
1.53		fix command	1029
	1.53.1	Syntax	1029
	1.53.2	Examples	1029
	1.53.3	Description	1029
	1.53.4	Restrictions	1039
	1.53.5	Related commands	1039
	1.53.6	Default	1039
1.54		fix_modify command	1039
	1.54.1	Syntax	1039
	1.54.2	Examples	1040
	1.54.3	Description	1040
	1.54.4	Restrictions	1042
	1.54.5	Related commands	1042
	1.54.6	Default	1042
1.55		fitpod command	1042
	1.55.1	Syntax	1042
	1.55.2	Examples	1042
	1.55.3	Description	1042
	1.55.4	POD Potential	1045
	1.55.5	Training	1045
	1.55.6	Validation	1046
	1.55.7	Restrictions	1046
	1.55.8	Related commands	1046
	1.55.9	Default	1046
1.56		group command	1046
	1.56.1	Syntax	1046
	1.56.2	Examples	1047
	1.56.3	Description	1048
	1.56.4	Restrictions	1051
	1.56.5	Related commands	1051
	1.56.6	Default	1051
1.57		group2ndx command	1051
1.58		ndx2group command	1051
	1.58.1	Syntax	1051
	1.58.2	Examples	1051
	1.58.3	Description	1051
	1.58.4	File Format	1052
	1.58.5	Restrictions	1052
	1.58.6	Related commands	1052
	1.58.7	Default	1052
1.59		hyper command	1053
	1.59.1	Syntax	1053

	1.59.2	Examples	1053
	1.59.3	Description	1053
	1.59.4	Restrictions	1055
	1.59.5	Related commands	1055
	1.59.6	Default	1055
1.60		if command	1055
	1.60.1	Syntax	1055
	1.60.2	Examples	1056
	1.60.3	Description	1056
	1.60.4	Restrictions	1058
	1.60.5	Related commands	1058
	1.60.6	Default	1058
1.61		improper_coeff command	1058
	1.61.1	Syntax	1058
	1.61.2	Examples	1059
	1.61.3	Description	1059
	1.61.4	Restrictions	1060
	1.61.5	Related commands	1060
	1.61.6	Default	1060
1.62		improper_style command	1060
	1.62.1	Syntax	1060
	1.62.2	Examples	1060
	1.62.3	Description	1060
	1.62.4	Restrictions	1061
	1.62.5	Related commands	1062
	1.62.6	Default	1062
1.63		include command	1062
	1.63.1	Syntax	1062
	1.63.2	Examples	1062
	1.63.3	Description	1062
	1.63.4	Restrictions	1062
	1.63.5	Related commands	1062
	1.63.6	Default	1063
1.64		info command	1063
	1.64.1	Syntax	1063
	1.64.2	Examples	1063
	1.64.3	Description	1063
	1.64.4	Restrictions	1065
	1.64.5	Related commands	1065
	1.64.6	Default	1065
1.65		jump command	1065
	1.65.1	Syntax	1065
	1.65.2	Examples	1065
	1.65.3	Description	1065
	1.65.4	Restrictions	1067
	1.65.5	Related commands	1067
	1.65.6	Default	1067
1.66		kim command	1067
	1.66.1	Syntax	1067
	1.66.2	Examples	1067
	1.66.3	Description	1068
	1.66.4	Using OpenKIM IMs with LAMMPS (<i>kim init, kim interactions</i>)	1069
	1.66.5	Using OpenKIM Web Queries in LAMMPS (<i>kim query</i>)	1073
	1.66.6	Accessing KIM Model Parameters from LAMMPS (<i>kim param</i>)	1076

1.66.7	Writing material properties in standard KIM Property Instance format (<i>kim property</i>) . .	1080
1.66.8	Citation of OpenKIM IMs	1086
1.66.9	Restrictions	1086
1.66.10	Related commands	1086
1.67	kspace_modify command	1087
1.67.1	Syntax	1087
1.67.2	Examples	1088
1.67.3	Description	1088
1.67.4	Restrictions	1092
1.67.5	Related commands	1092
1.67.6	Default	1093
1.68	kspace_style command	1094
1.68.1	Syntax	1094
1.68.2	Examples	1095
1.68.3	Description	1096
1.68.4	Restrictions	1100
1.68.5	Related commands	1100
1.68.6	Default	1100
1.69	label command	1101
1.69.1	Syntax	1101
1.69.2	Examples	1101
1.69.3	Description	1101
1.69.4	Restrictions	1102
1.69.5	Related commands	1102
1.69.6	Default	1102
1.70	labelmap command	1102
1.70.1	Syntax	1102
1.70.2	Examples	1102
1.70.3	Description	1102
1.70.4	Restrictions	1103
1.70.5	Related commands	1103
1.70.6	Default	1103
1.71	lattice command	1103
1.71.1	Syntax	1103
1.71.2	Examples	1104
1.71.3	Description	1104
1.71.4	Restrictions	1108
1.71.5	Related commands	1108
1.71.6	Default	1108
1.72	log command	1108
1.72.1	Syntax	1108
1.72.2	Examples	1108
1.72.3	Description	1109
1.72.4	Restrictions	1109
1.72.5	Related commands	1109
1.72.6	Default	1109
1.73	mass command	1109
1.73.1	Syntax	1109
1.73.2	Examples	1109
1.73.3	Description	1110
1.73.4	Restrictions	1110
1.73.5	Related commands	1110
1.73.6	Default	1110
1.74	mdi command	1111

	1.74.1	Syntax	1111
	1.74.2	Examples	1111
	1.74.3	Description	1111
	1.74.4	Restrictions	1116
	1.74.5	Related commands	1116
	1.74.6	Default	1116
1.75		min_modify command	1116
	1.75.1	Syntax	1116
	1.75.2	Examples	1117
	1.75.3	Description	1117
	1.75.4	Restrictions	1118
	1.75.5	Related commands	1118
	1.75.6	Default	1118
1.76		min_style spin command	1119
1.77		min_style spin/cg command	1119
1.78		min_style spin/lbfgs command	1119
	1.78.1	Syntax	1119
	1.78.2	Examples	1119
	1.78.3	Description	1119
	1.78.4	Restrictions	1120
	1.78.5	Related commands	1120
	1.78.6	Default	1120
1.79		min_style cg command	1121
1.80		min_style hftn command	1121
1.81		min_style sd command	1121
1.82		min_style quickmin command	1121
1.83		min_style fire command	1121
1.84		min_style spin command	1121
1.85		min_style spin/cg command	1121
1.86		min_style spin/lbfgs command	1121
	1.86.1	Syntax	1121
	1.86.2	Examples	1121
	1.86.3	Description	1121
	1.86.4	Restrictions	1123
	1.86.5	Related commands	1123
	1.86.6	Default	1123
1.87		minimize command	1123
	1.87.1	Syntax	1123
	1.87.2	Examples	1123
	1.87.3	Description	1124
	1.87.4	Restrictions	1128
	1.87.5	Related commands	1128
	1.87.6	Default	1128
1.88		molecule command	1128
	1.88.1	Syntax	1128
	1.88.2	Examples	1129
	1.88.3	Description	1129
	1.88.4	Format of a molecule file	1130
	1.88.5	Restrictions	1138
	1.88.6	Related commands	1138
	1.88.7	Default	1138
1.89		neb command	1138
	1.89.1	Syntax	1138
	1.89.2	Examples	1139

	1.89.3	Description	1139
	1.89.4	Restrictions	1143
	1.89.5	Related commands	1143
	1.89.6	Default	1144
1.90		neb/spin command	1144
	1.90.1	Syntax	1144
	1.90.2	Examples	1144
	1.90.3	Description	1145
	1.90.4	Restrictions	1148
	1.90.5	Related commands	1149
	1.90.6	Default	1149
1.91		neigh_modify command	1149
	1.91.1	Syntax	1149
	1.91.2	Examples	1150
	1.91.3	Description	1150
	1.91.4	Restrictions	1152
	1.91.5	Related commands	1153
	1.91.6	Default	1153
1.92		neighbor command	1153
	1.92.1	Syntax	1153
	1.92.2	Examples	1153
	1.92.3	Description	1153
	1.92.4	Restrictions	1154
	1.92.5	Related commands	1154
	1.92.6	Default	1154
1.93		newton command	1155
	1.93.1	Syntax	1155
	1.93.2	Examples	1155
	1.93.3	Description	1155
	1.93.4	Restrictions	1155
	1.93.5	Related commands	1155
	1.93.6	Default	1156
1.94		next command	1156
	1.94.1	Syntax	1156
	1.94.2	Examples	1156
	1.94.3	Description	1156
	1.94.4	Restrictions	1158
	1.94.5	Related commands	1158
	1.94.6	Default	1158
1.95		package command	1158
	1.95.1	Syntax	1158
	1.95.2	Examples	1160
	1.95.3	Description	1161
	1.95.4	Restrictions	1167
	1.95.5	Related commands	1167
	1.95.6	Defaults	1167
1.96		pair_coeff command	1168
	1.96.1	Syntax	1168
	1.96.2	Examples	1168
	1.96.3	Description	1169
	1.96.4	Restrictions	1170
	1.96.5	Related commands	1170
	1.96.6	Default	1170
1.97		pair_modify command	1170

	1.97.1	Syntax	1170
	1.97.2	Examples	1171
	1.97.3	Description	1171
	1.97.4	Restrictions	1175
	1.97.5	Related commands	1175
	1.97.6	Default	1175
1.98		pair_style command	1175
	1.98.1	Syntax	1175
	1.98.2	Examples	1175
	1.98.3	Description	1175
	1.98.4	Restrictions	1184
	1.98.5	Related commands	1185
	1.98.6	Default	1185
1.99		pair_write command	1185
	1.99.1	Syntax	1185
	1.99.2	Examples	1185
	1.99.3	Description	1185
	1.99.4	Restrictions	1186
	1.99.5	Related commands	1186
	1.99.6	Default	1186
1.100		partition command	1186
	1.100.1	Syntax	1186
	1.100.2	Examples	1186
	1.100.3	Description	1187
	1.100.4	Restrictions	1187
	1.100.5	Related commands	1187
	1.100.6	Default	1187
1.101		plugin command	1187
	1.101.1	Syntax	1187
	1.101.2	Examples	1188
	1.101.3	Description	1188
	1.101.4	Restrictions	1188
	1.101.5	Related commands	1189
	1.101.6	Default	1189
1.102		prd command	1189
	1.102.1	Syntax	1189
	1.102.2	Examples	1190
	1.102.3	Description	1190
	1.102.4	Restrictions	1193
	1.102.5	Related commands	1193
	1.102.6	Default	1193
1.103		print command	1193
	1.103.1	Syntax	1193
	1.103.2	Examples	1193
	1.103.3	Description	1194
	1.103.4	Restrictions	1195
	1.103.5	Related commands	1195
	1.103.6	Default	1195
1.104		processors command	1195
	1.104.1	Syntax	1195
	1.104.2	Examples	1196
	1.104.3	Description	1196
	1.104.4	Restrictions	1199
	1.104.5	Related commands	1200

	1.104.6	Default	1200
1.105		python command	1200
	1.105.1	Syntax	1200
	1.105.2	Examples	1201
	1.105.3	Description	1201
	1.105.4	Restrictions	1207
	1.105.5	Related commands	1207
	1.105.6	Default	1207
1.106		quit command	1208
	1.106.1	Syntax	1208
	1.106.2	Examples	1208
	1.106.3	Description	1208
	1.106.4	Restrictions	1208
	1.106.5	Related commands	1208
	1.106.6	Default	1208
1.107		read_data command	1208
	1.107.1	Syntax	1208
	1.107.2	Examples	1209
	1.107.3	Description	1210
	1.107.4	Reading multiple data files	1210
	1.107.5	Format of a data file	1212
	1.107.6	Format of the header of a data file	1213
	1.107.7	Header specification of the simulation box size and shape	1214
	1.107.8	Meaning of other header keywords	1217
	1.107.9	Format of the body of a data file	1217
	1.107.10	Restrictions	1232
	1.107.11	Related commands	1232
	1.107.12	Default	1232
1.108		read_dump command	1232
	1.108.1	Syntax	1232
	1.108.2	Examples	1233
	1.108.3	Description	1234
	1.108.4	Restrictions	1237
	1.108.5	Related commands	1237
	1.108.6	Default	1238
1.109		read_restart command	1238
	1.109.1	Syntax	1238
	1.109.2	Examples	1238
	1.109.3	Description	1238
	1.109.4	Restrictions	1241
	1.109.5	Related commands	1241
	1.109.6	Default	1241
1.110		region command	1241
	1.110.1	Syntax	1241
	1.110.2	Examples	1242
	1.110.3	Description	1243
	1.110.4	Restrictions	1247
	1.110.5	Related commands	1247
	1.110.6	Default	1247
1.111		replicate command	1247
	1.111.1	Syntax	1247
	1.111.2	Examples	1247
	1.111.3	Description	1248
	1.111.4	Restrictions	1249

	1.111.5	Related commands	1249
	1.111.6	Default	1249
1.112		rerun command	1249
	1.112.1	Syntax	1249
	1.112.2	Examples	1250
	1.112.3	Description	1250
	1.112.4	Restrictions	1252
	1.112.5	Related commands	1252
	1.112.6	Default	1252
1.113		reset_atoms command	1252
	1.113.1	Syntax	1252
	1.113.2	Examples	1253
	1.113.3	Description	1253
	1.113.4	Restrictions	1255
	1.113.5	Related commands	1256
	1.113.6	Defaults	1256
1.114		reset_timestep command	1256
	1.114.1	Syntax	1256
	1.114.2	Examples	1256
	1.114.3	Description	1256
	1.114.4	Restrictions	1257
	1.114.5	Related commands	1257
	1.114.6	Default	1257
1.115		restart command	1257
	1.115.1	Syntax	1257
	1.115.2	Examples	1258
	1.115.3	Description	1258
	1.115.4	Restrictions	1259
	1.115.5	Related commands	1259
	1.115.6	Default	1259
1.116		run command	1259
	1.116.1	Syntax	1259
	1.116.2	Examples	1260
	1.116.3	Description	1260
	1.116.4	Restrictions	1262
	1.116.5	Related commands	1262
	1.116.6	Default	1262
1.117		run_style command	1262
	1.117.1	Syntax	1262
	1.117.2	Examples	1263
	1.117.3	Description	1263
	1.117.4	Restrictions	1266
	1.117.5	Related commands	1267
	1.117.6	Default	1267
1.118		set command	1267
	1.118.1	Syntax	1267
	1.118.2	Examples	1270
	1.118.3	Description	1270
	1.118.4	Restrictions	1275
	1.118.5	Related commands	1275
	1.118.6	Default	1275
1.119		shell command	1275
	1.119.1	Syntax	1275
	1.119.2	Examples	1276

1.119.3	Description	1276
1.119.4	Restrictions	1277
1.119.5	Related commands	1277
1.119.6	Default	1277
1.120	special_bonds command	1277
1.120.1	Syntax	1277
1.120.2	Examples	1278
1.120.3	Description	1278
1.120.4	Restrictions	1281
1.120.5	Related commands	1281
1.120.6	Default	1281
1.121	suffix command	1281
1.121.1	Syntax	1281
1.121.2	Examples	1281
1.121.3	Description	1282
1.121.4	Restrictions	1283
1.121.5	Related commands	1283
1.121.6	Default	1283
1.122	tad command	1283
1.122.1	Syntax	1283
1.122.2	Examples	1284
1.122.3	Description	1284
1.122.4	Restrictions	1286
1.122.5	Related commands	1287
1.122.6	Default	1287
1.123	temper command	1287
1.123.1	Syntax	1287
1.123.2	Examples	1287
1.123.3	Description	1287
1.123.4	Restrictions	1289
1.123.5	Related commands	1289
1.123.6	Default	1289
1.124	temper/grem command	1289
1.124.1	Syntax	1289
1.124.2	Examples	1290
1.124.3	Description	1290
1.124.4	Restrictions	1291
1.124.5	Related commands	1291
1.124.6	Default	1291
1.125	temper/npt command	1291
1.125.1	Syntax	1291
1.125.2	Examples	1291
1.125.3	Description	1292
1.125.4	Restrictions	1292
1.125.5	Related commands	1292
1.125.6	Default	1292
1.126	thermo command	1292
1.126.1	Syntax	1292
1.126.2	Examples	1293
1.126.3	Description	1293
1.126.4	Restrictions	1293
1.126.5	Related commands	1293
1.126.6	Default	1293
1.127	thermo_modify command	1293

1.127.1	Syntax	1293
1.127.2	Examples	1294
1.127.3	Description	1294
1.127.4	Restrictions	1297
1.127.5	Related commands	1297
1.127.6	Default	1297
1.128	thermo_style command	1297
1.128.1	Syntax	1297
1.128.2	Examples	1299
1.128.3	Description	1299
1.128.4	Restrictions	1304
1.128.5	Related commands	1304
1.128.6	Default	1304
1.129	third_order command	1304
1.129.1	Syntax	1304
1.129.2	Examples	1304
1.129.3	Description	1305
1.129.4	Restrictions	1305
1.129.5	Related commands	1305
1.129.6	Default	1305
1.130	timer command	1306
1.130.1	Syntax	1306
1.130.2	Examples	1306
1.130.3	Description	1306
1.130.4	Restrictions	1307
1.130.5	Related commands	1307
1.130.6	Default	1307
1.131	timestep command	1307
1.131.1	Syntax	1307
1.131.2	Examples	1308
1.131.3	Description	1308
1.131.4	Restrictions	1308
1.131.5	Related commands	1308
1.131.6	Default	1308
1.132	uncompute command	1308
1.132.1	Syntax	1308
1.132.2	Examples	1309
1.132.3	Description	1309
1.132.4	Restrictions	1309
1.132.5	Related commands	1309
1.132.6	Default	1309
1.133	undump command	1309
1.133.1	Syntax	1309
1.133.2	Examples	1309
1.133.3	Description	1309
1.133.4	Restrictions	1310
1.133.5	Related commands	1310
1.133.6	Default	1310
1.134	unfix command	1310
1.134.1	Syntax	1310
1.134.2	Examples	1310
1.134.3	Description	1310
1.134.4	Restrictions	1310
1.134.5	Related commands	1310

1.134.6	Default	1311
1.135	units command	1311
1.135.1	Syntax	1311
1.135.2	Examples	1311
1.135.3	Description	1311
1.135.4	Restrictions	1315
1.135.5	Related commands	1315
1.135.6	Default	1315
1.136	variable command	1316
1.136.1	Syntax	1316
1.136.2	Examples	1317
1.136.3	Description	1318
1.136.4	Immediate Evaluation of Variables	1335
1.136.5	Variable Accuracy	1336
1.136.6	Restrictions	1337
1.136.7	Related commands	1337
1.136.8	Default	1337
1.137	velocity command	1337
1.137.1	Syntax	1337
1.137.2	Examples	1338
1.137.3	Description	1338
1.137.4	Restrictions	1340
1.137.5	Related commands	1340
1.137.6	Default	1340
1.138	write_coeff command	1340
1.138.1	Syntax	1340
1.138.2	Examples	1341
1.138.3	Description	1341
1.138.4	Restrictions	1341
1.138.5	Related commands	1341
1.139	write_data command	1341
1.139.1	Syntax	1341
1.139.2	Examples	1342
1.139.3	Description	1342
1.139.4	Restrictions	1343
1.139.5	Related commands	1344
1.139.6	Default	1344
1.140	write_dump command	1344
1.140.1	Syntax	1344
1.140.2	Examples	1344
1.140.3	Description	1345
1.140.4	Restrictions	1345
1.140.5	Related commands	1345
1.140.6	Default	1345
1.141	write_restart command	1345
1.141.1	Syntax	1345
1.141.2	Examples	1346
1.141.3	Description	1346
1.141.4	Restrictions	1347
1.141.5	Related commands	1347
1.141.6	Default	1347
2	Fixes	1349
2.1	fix accelerate/cos command	1349

2.1.1	Syntax	1349
2.1.2	Examples	1349
2.1.3	Description	1349
2.1.4	Restart, fix_modify, output, run start/stop, minimize info	1350
2.1.5	Restrictions	1350
2.1.6	Related commands	1350
2.1.7	Default	1350
2.2	fix acks2/reaxff command	1350
2.2.1	Syntax	1350
2.2.2	Examples	1351
2.2.3	Description	1351
2.2.4	Restart, fix_modify, output, run start/stop, minimize info	1352
2.2.5	Restrictions	1352
2.2.6	Related commands	1352
2.2.7	Default	1352
2.3	fix adapt command	1353
2.3.1	Syntax	1353
2.3.2	Examples	1354
2.3.3	Description	1354
2.3.4	Restart, fix_modify, output, run start/stop, minimize info	1358
2.3.5	Restrictions	1358
2.3.6	Related commands	1359
2.3.7	Default	1359
2.4	fix adapt/fep command	1359
2.4.1	Syntax	1359
2.4.2	Examples	1360
2.4.3	Description	1360
2.4.4	Restart, fix_modify, output, run start/stop, minimize info	1363
2.4.5	Restrictions	1363
2.4.6	Related commands	1363
2.4.7	Default	1363
2.5	fix add/heat command	1363
2.5.1	Syntax	1363
2.5.2	Examples	1364
2.5.3	Description	1364
2.5.4	Restart, fix_modify, output, run start/stop, minimize info	1364
2.5.5	Restrictions	1364
2.5.6	Related commands	1364
2.5.7	Default	1365
2.6	fix addforce command	1365
2.6.1	Syntax	1365
2.6.2	Examples	1365
2.6.3	Description	1365
2.6.4	Restart, fix_modify, output, run start/stop, minimize info	1366
2.6.5	Restrictions	1367
2.6.6	Related commands	1367
2.6.7	Default	1367
2.7	fix addtorque command	1367
2.7.1	Syntax	1367
2.7.2	Examples	1368
2.7.3	Description	1368
2.7.4	Restart, fix_modify, output, run start/stop, minimize info	1368
2.7.5	Restrictions	1369
2.7.6	Related commands	1369

	2.7.7	Default	1369
2.8		fix alchemy command	1369
	2.8.1	Syntax	1369
	2.8.2	Examples	1369
	2.8.3	Description	1369
	2.8.4	Restart, fix_modify, output, run start/stop, minimize info	1371
	2.8.5	Restrictions	1371
	2.8.6	Related commands	1371
	2.8.7	Default	1371
2.9		fix amoeba/bitorsion command	1371
	2.9.1	Syntax	1371
	2.9.2	Examples	1371
	2.9.3	Description	1372
	2.9.4	Restart, fix_modify, output, run start/stop, minimize info	1373
	2.9.5	Restrictions	1373
	2.9.6	Related commands	1373
	2.9.7	Default	1373
2.10		fix amoeba/pitorsion command	1374
	2.10.1	Syntax	1374
	2.10.2	Examples	1374
	2.10.3	Description	1374
	2.10.4	Restart, fix_modify, output, run start/stop, minimize info	1375
	2.10.5	Restrictions	1376
	2.10.6	Related commands	1376
	2.10.7	Default	1376
2.11		fix append/atoms command	1376
	2.11.1	Syntax	1376
	2.11.2	Examples	1377
	2.11.3	Description	1377
	2.11.4	Restart, fix_modify, output, run start/stop, minimize info	1377
	2.11.5	Restrictions	1377
	2.11.6	Related commands	1378
	2.11.7	Default	1378
2.12		fix atc command	1378
	2.12.1	Syntax	1378
	2.12.2	Examples	1378
	2.12.3	Description	1378
	2.12.4	Restart, fix_modify, output, run start/stop, minimize info	1380
	2.12.5	Restrictions	1381
	2.12.6	Related commands	1381
	2.12.7	Default	1383
2.13		fix atom/swap command	1384
	2.13.1	Syntax	1384
	2.13.2	Examples	1384
	2.13.3	Description	1384
	2.13.4	Restart, fix_modify, output, run start/stop, minimize info	1386
	2.13.5	Restrictions	1386
	2.13.6	Related commands	1386
	2.13.7	Default	1386
2.14		fix ave/atom command	1387
	2.14.1	Syntax	1387
	2.14.2	Examples	1387
	2.14.3	Description	1387
	2.14.4	Restart, fix_modify, output, run start/stop, minimize info	1389

	2.14.5	Restrictions	1389
	2.14.6	Related commands	1389
	2.14.7	Default	1389
2.15		fix ave/chunk command	1389
	2.15.1	Syntax	1389
	2.15.2	Examples	1391
	2.15.3	Description	1391
	2.15.4	Restart, fix_modify, output, run start/stop, minimize info	1396
	2.15.5	Restrictions	1396
	2.15.6	Related commands	1396
	2.15.7	Default	1396
2.16		fix ave/correlate command	1396
	2.16.1	Syntax	1396
	2.16.2	Examples	1397
	2.16.3	Description	1398
	2.16.4	Restart, fix_modify, output, run start/stop, minimize info	1401
	2.16.5	Restrictions	1401
	2.16.6	Related commands	1401
	2.16.7	Default	1401
2.17		fix ave/correlate/long command	1402
	2.17.1	Syntax	1402
	2.17.2	Examples	1403
	2.17.3	Description	1403
	2.17.4	Restart, fix_modify, output, run start/stop, minimize info	1403
	2.17.5	Restrictions	1404
	2.17.6	Related commands	1404
	2.17.7	Default	1404
2.18		fix ave/grid command	1404
	2.18.1	Syntax	1404
	2.18.2	Examples	1405
	2.18.3	Description	1405
	2.18.4	Restart, fix_modify, output, run start/stop, minimize info	1410
	2.18.5	Restrictions	1410
	2.18.6	Related commands	1410
	2.18.7	Default	1410
2.19		fix ave/histo command	1410
2.20		fix ave/histo/weight command	1410
	2.20.1	Syntax	1410
	2.20.2	Examples	1412
	2.20.3	Description	1412
	2.20.4	Restart, fix_modify, output, run start/stop, minimize info	1415
	2.20.5	Restrictions	1416
	2.20.6	Related commands	1416
	2.20.7	Default	1416
2.21		Fix ave/spatial command	1416
2.22		Fix ave/spatial command	1416
2.23		fix ave/time command	1416
	2.23.1	Syntax	1416
	2.23.2	Examples	1417
	2.23.3	Description	1418
	2.23.4	Restart, fix_modify, output, run start/stop, minimize info	1421
	2.23.5	Restrictions	1421
	2.23.6	Related commands	1421
	2.23.7	Default	1421

2.24	fix aveforce command	1421
2.24.1	Syntax	1421
2.24.2	Examples	1422
2.24.3	Description	1422
2.24.4	Restart, fix_modify, output, run start/stop, minimize info	1423
2.24.5	Restrictions	1423
2.24.6	Related commands	1423
2.24.7	Default	1423
2.25	fix balance command	1423
2.25.1	Syntax	1423
2.25.2	Examples	1424
2.25.3	Description	1424
2.25.4	Restart, fix_modify, output, run start/stop, minimize info	1429
2.25.5	Restrictions	1429
2.25.6	Related commands	1429
2.25.7	Default	1429
2.26	fix bocs command	1429
2.26.1	Syntax	1429
2.26.2	Examples	1430
2.26.3	Description	1430
2.26.4	Restart, fix_modify, output, run start/stop, minimize info	1431
2.26.5	Restrictions	1431
2.26.6	Further information	1431
2.27	fix bond/break command	1432
2.27.1	Syntax	1432
2.27.2	Examples	1432
2.27.3	Description	1432
2.27.4	Restart, fix_modify, output, run start/stop, minimize info	1433
2.27.5	Restrictions	1434
2.27.6	Related commands	1434
2.27.7	Default	1434
2.28	fix bond/create command	1434
2.29	fix bond/create/angle command	1434
2.29.1	Syntax	1434
2.29.2	Examples	1435
2.29.3	Description	1435
2.29.4	Restart, fix_modify, output, run start/stop, minimize info	1437
2.29.5	Restrictions	1438
2.29.6	Related commands	1438
2.29.7	Default	1438
2.30	fix bond/react command	1438
2.30.1	Syntax	1438
2.30.2	Examples	1439
2.30.3	Description	1440
2.30.4	Restart, fix_modify, output, run start/stop, minimize info	1447
2.30.5	Restrictions	1448
2.30.6	Related commands	1448
2.30.7	Default	1448
2.31	fix bond/swap command	1448
2.31.1	Syntax	1448
2.31.2	Examples	1449
2.31.3	Description	1449
2.31.4	Restart, fix_modify, output, run start/stop, minimize info	1451
2.31.5	Restrictions	1451

	2.31.6	Related commands	1452
	2.31.7	Default	1452
2.32		fix box/relax command	1452
	2.32.1	Syntax	1452
	2.32.2	Examples	1452
	2.32.3	Description	1453
	2.32.4	Restart, fix_modify, output, run start/stop, minimize info	1456
	2.32.5	Restrictions	1457
	2.32.6	Related commands	1457
	2.32.7	Default	1457
2.33		fix brownian command	1457
2.34		fix brownian/sphere command	1457
2.35		fix brownian/asphere command	1457
	2.35.1	Syntax	1457
	2.35.2	Examples	1458
	2.35.3	Description	1458
	2.35.4	Restart, fix_modify, output, run start/stop, minimize info	1460
	2.35.5	Restrictions	1460
	2.35.6	Related commands	1460
	2.35.7	Default	1460
2.36		fix charge/regulation command	1461
	2.36.1	Syntax	1461
	2.36.2	Examples	1462
	2.36.3	Description	1462
	2.36.4	Output	1464
	2.36.5	Restrictions	1464
	2.36.6	Related commands	1464
	2.36.7	Default	1465
2.37		fix cmap command	1465
	2.37.1	Syntax	1465
	2.37.2	Examples	1465
	2.37.3	Description	1465
	2.37.4	Restart, fix_modify, output, run start/stop, minimize info	1466
	2.37.5	Restrictions	1467
	2.37.6	Related commands	1467
	2.37.7	Default	1467
2.38		fix colvars command	1467
	2.38.1	Syntax	1467
	2.38.2	Examples	1468
	2.38.3	Description	1468
	2.38.4	Restart, fix_modify, output, run start/stop, minimize info	1469
	2.38.5	Restrictions	1469
	2.38.6	Related commands	1469
	2.38.7	Default	1469
2.39		fix controller command	1469
	2.39.1	Syntax	1469
	2.39.2	Examples	1470
	2.39.3	Description	1470
	2.39.4	Restart, fix_modify, output, run start/stop, minimize info	1472
	2.39.5	Restrictions	1472
	2.39.6	Related commands	1472
	2.39.7	Default	1472
2.40		fix damping/cundall command	1473
	2.40.1	Syntax	1473

2.40.2	Examples	1473
2.40.3	Description	1473
2.40.4	Restart, fix_modify, output, run start/stop, minimize info	1474
2.40.5	Restrictions	1474
2.40.6	Related commands	1474
2.40.7	Default	1475
2.40.8	References	1475
2.41	fix deform command	1475
2.41.1	Syntax	1475
2.41.2	Examples	1476
2.41.3	Description	1476
2.41.4	Restart, fix_modify, output, run start/stop, minimize info	1482
2.41.5	Restrictions	1483
2.41.6	Related commands	1483
2.41.7	Default	1483
2.42	fix deform/pressure command	1483
2.42.1	Syntax	1483
2.42.2	Examples	1485
2.42.3	Description	1485
2.42.4	Restart, fix_modify, output, run start/stop, minimize info	1488
2.42.5	Restrictions	1488
2.42.6	Related commands	1488
2.42.7	Default	1488
2.43	fix deposit command	1488
2.43.1	Syntax	1488
2.43.2	Examples	1490
2.43.3	Description	1490
2.43.4	Restart, fix_modify, output, run start/stop, minimize info	1493
2.43.5	Restrictions	1493
2.43.6	Related commands	1493
2.43.7	Default	1493
2.44	fix dpd/energy command	1493
2.44.1	Syntax	1493
2.44.2	Examples	1494
2.44.3	Description	1494
2.44.4	Restrictions	1494
2.44.5	Related commands	1495
2.44.6	Default	1495
2.45	fix edpd/source command	1495
2.46	fix tdpd/source command	1495
2.46.1	Syntax	1495
2.46.2	Examples	1496
2.46.3	Description	1496
2.46.4	Restart, fix_modify, output, run start/stop, minimize info	1496
2.46.5	Restrictions	1496
2.46.6	Related commands	1497
2.46.7	Default	1497
2.47	fix drag command	1497
2.47.1	Syntax	1497
2.47.2	Examples	1497
2.47.3	Description	1497
2.47.4	Restart, fix_modify, output, run start/stop, minimize info	1498
2.47.5	Restrictions	1498
2.47.6	Related commands	1498

	2.47.7	Default	1498
2.48		fix drude command	1498
	2.48.1	Syntax	1498
	2.48.2	Examples	1498
	2.48.3	Description	1499
	2.48.4	Restrictions	1499
	2.48.5	Related commands	1499
	2.48.6	Default	1499
2.49		fix drude/transform/direct command	1499
2.50		fix drude/transform/inverse command	1499
	2.50.1	Syntax	1499
	2.50.2	Examples	1499
	2.50.3	Description	1500
	2.50.4	Restart, fix_modify, output, run start/stop, minimize info	1502
	2.50.5	Restrictions	1502
	2.50.6	Related commands	1502
	2.50.7	Default	1502
2.51		fix dt/reset command	1502
	2.51.1	Syntax	1502
	2.51.2	Examples	1503
	2.51.3	Description	1503
	2.51.4	Restart, fix_modify, output, run start/stop, minimize info	1504
	2.51.5	Restrictions	1504
	2.51.6	Related commands	1504
	2.51.7	Default	1504
2.52		fix efield command	1504
2.53		fix efield/tip4p command	1504
	2.53.1	Syntax	1504
	2.53.2	Examples	1505
	2.53.3	Description	1505
	2.53.4	Restart, fix_modify, output, run start/stop, minimize info	1506
	2.53.5	Restrictions	1507
	2.53.6	Related commands	1507
	2.53.7	Default	1507
2.54		fix ehex command	1507
	2.54.1	Syntax	1507
	2.54.2	Examples	1508
	2.54.3	Description	1508
	2.54.4	Restart, fix_modify, output, run start/stop, minimize info	1510
	2.54.5	Restrictions	1510
	2.54.6	Related commands	1510
	2.54.7	Default	1510
2.55		fix electrode/conp command	1510
2.56		fix electrode/conq command	1510
2.57		fix electrode/thermo command	1510
	2.57.1	Syntax	1511
	2.57.2	Examples	1512
	2.57.3	Description	1512
	2.57.4	Restart, fix_modify, output, run start/stop, minimize info	1514
	2.57.5	Restrictions	1515
	2.57.6	Default	1516
2.58		fix electron/stopping command	1516
2.59		fix electron/stopping/fit command	1516
	2.59.1	Syntax	1516

	2.59.2	Examples	1517
	2.59.3	Description	1517
	2.59.4	Restart, fix_modify, output, run start/stop, minimize info	1518
	2.59.5	Restrictions	1519
	2.59.6	Default	1519
2.60		fix enforce2d command	1519
	2.60.1	Syntax	1519
	2.60.2	Examples	1519
	2.60.3	Description	1520
	2.60.4	Restart, fix_modify, output, run start/stop, minimize info	1520
	2.60.5	Restrictions	1520
	2.60.6	Related commands	1520
	2.60.7	Default	1520
2.61		fix eos/cv command	1520
	2.61.1	Syntax	1520
	2.61.2	Examples	1521
	2.61.3	Description	1521
	2.61.4	Restrictions	1521
	2.61.5	Related commands	1521
	2.61.6	Default	1521
2.62		fix eos/table command	1521
	2.62.1	Syntax	1521
	2.62.2	Examples	1522
	2.62.3	Description	1522
	2.62.4	Restrictions	1523
	2.62.5	Related commands	1523
	2.62.6	Default	1523
2.63		fix eos/table/rx command	1523
	2.63.1	Syntax	1523
	2.63.2	Examples	1524
	2.63.3	Description	1524
	2.63.4	Restrictions	1526
	2.63.5	Related commands	1526
	2.63.6	Default	1526
2.64		fix evaporate command	1526
	2.64.1	Syntax	1526
	2.64.2	Examples	1527
	2.64.3	Description	1527
	2.64.4	Restart, fix_modify, output, run start/stop, minimize info	1527
	2.64.5	Restrictions	1528
	2.64.6	Related commands	1528
	2.64.7	Default	1528
2.65		fix external command	1528
	2.65.1	Syntax	1528
	2.65.2	Examples	1528
	2.65.3	Description	1528
	2.65.4	Restart, fix_modify, output, run start/stop, minimize info	1530
	2.65.5	Restrictions	1530
	2.65.6	Related commands	1530
	2.65.7	Default	1530
2.66		fix ffl command	1531
	2.66.1	Syntax	1531
	2.66.2	Examples	1531
	2.66.3	Description	1531

2.66.4	Restart, fix_modify, output, run start/stop, minimize info	1532
2.66.5	Restrictions	1532
2.66.6	Related commands	1532
2.67	fix filter/corotate command	1532
2.67.1	Syntax	1532
2.67.2	Examples	1533
2.67.3	Description	1533
2.67.4	Restart, fix_modify, output, run start/stop, minimize info	1533
2.67.5	Restrictions	1533
2.67.6	Related commands	1533
2.67.7	Default	1533
2.68	fix flow/gauss command	1534
2.68.1	Syntax	1534
2.68.2	Examples	1534
2.68.3	Description	1534
2.68.4	Restart, fix_modify, output, run start/stop, minimize info	1535
2.68.5	Restrictions	1536
2.68.6	Related commands	1536
2.68.7	Default	1536
2.69	fix freeze command	1536
2.69.1	Syntax	1536
2.69.2	Examples	1536
2.69.3	Description	1536
2.69.4	Restart, fix_modify, output, run start/stop, minimize info	1537
2.69.5	Restrictions	1537
2.69.6	Related commands	1537
2.69.7	Default	1537
2.70	fix gcmc command	1537
2.70.1	Syntax	1537
2.70.2	Examples	1538
2.70.3	Description	1539
2.70.4	Restart, fix_modify, output, run start/stop, minimize info	1542
2.70.5	Restrictions	1543
2.70.6	Related commands	1544
2.70.7	Default	1544
2.71	fix gld command	1544
2.71.1	Syntax	1544
2.71.2	Examples	1545
2.71.3	Description	1545
2.71.4	Restart, fix_modify, output, run start/stop, minimize info	1546
2.71.5	Restrictions	1546
2.71.6	Related commands	1546
2.71.7	Default	1546
2.72	fix gle command	1546
2.72.1	Syntax	1546
2.72.2	Examples	1547
2.72.3	Description	1547
2.72.4	Restart, fix_modify, output, run start/stop, minimize info	1548
2.72.5	Restrictions	1548
2.72.6	Related commands	1548
2.73	fix gravity command	1549
2.73.1	Syntax	1549
2.73.2	Examples	1549
2.73.3	Description	1549

2.73.4	Restart, fix_modify, output, run start/stop, minimize info	1550
2.73.5	Restrictions	1550
2.73.6	Related commands	1551
2.73.7	Default	1551
2.74	fix grem command	1551
2.74.1	Syntax	1551
2.74.2	Examples	1551
2.74.3	Description	1551
2.74.4	Restart, fix_modify, output, run start/stop, minimize info	1552
2.74.5	Restrictions	1552
2.74.6	Related commands	1552
2.74.7	Default	1552
2.75	fix halt command	1553
2.75.1	Syntax	1553
2.75.2	Examples	1553
2.75.3	Description	1553
2.75.4	Restart, fix_modify, output, run start/stop, minimize info	1555
2.75.5	Restrictions	1555
2.75.6	Related commands	1555
2.75.7	Default	1555
2.76	fix heat command	1555
2.76.1	Syntax	1555
2.76.2	Examples	1555
2.76.3	Description	1556
2.76.4	Restart, fix_modify, output, run start/stop, minimize info	1557
2.76.5	Restrictions	1557
2.76.6	Related commands	1557
2.76.7	Default	1557
2.77	fix heat/flow command	1557
2.77.1	Syntax	1557
2.77.2	Examples	1558
2.77.3	Description	1558
2.77.4	Restart, fix_modify, output, run start/stop, minimize info	1558
2.77.5	Restrictions	1558
2.77.6	Related commands	1558
2.77.7	Default	1558
2.78	fix hyper/global command	1558
2.78.1	Syntax	1558
2.78.2	Examples	1559
2.78.3	Description	1559
2.78.4	Restart, fix_modify, output, run start/stop, minimize info	1561
2.78.5	Restrictions	1562
2.78.6	Related commands	1562
2.78.7	Default	1562
2.79	fix hyper/local command	1562
2.79.1	Syntax	1562
2.79.2	Examples	1563
2.79.3	Description	1563
2.79.4	Restart, fix_modify, output, run start/stop, minimize info	1567
2.79.5	Restrictions	1569
2.79.6	Related commands	1569
2.79.7	Default	1569
2.80	fix imd command	1569
2.80.1	Syntax	1569

	2.80.2	Examples	1570
	2.80.3	Description	1570
	2.80.4	Restart, fix_modify, output, run start/stop, minimize info	1571
	2.80.5	Restrictions	1571
	2.80.6	Related commands	1571
	2.80.7	Default	1571
2.81		fix indent command	1571
	2.81.1	Syntax	1571
	2.81.2	Examples	1572
	2.81.3	Description	1572
	2.81.4	Restart, fix_modify, output, run start/stop, minimize info	1574
	2.81.5	Restrictions	1574
	2.81.6	Related commands	1575
	2.81.7	Default	1575
2.82		fix ipi command	1575
	2.82.1	Syntax	1575
	2.82.2	Examples	1575
	2.82.3	Description	1575
	2.82.4	Obtaining i-PI	1576
	2.82.5	Restart, fix_modify, output, run start/stop, minimize info	1576
	2.82.6	Restrictions	1576
	2.82.7	Related commands	1576
2.83		fix langevin command	1577
	2.83.1	Syntax	1577
	2.83.2	Examples	1577
	2.83.3	Description	1578
	2.83.4	Restart, fix_modify, output, run start/stop, minimize info	1580
	2.83.5	Restrictions	1581
	2.83.6	Related commands	1581
	2.83.7	Default	1581
2.84		fix langevin/drude command	1581
	2.84.1	Syntax	1581
	2.84.2	Examples	1582
	2.84.3	Description	1582
	2.84.4	Restart, fix_modify, output, run start/stop, minimize info	1585
	2.84.5	Restrictions	1585
	2.84.6	Related commands	1585
	2.84.7	Default	1585
2.85		fix langevin/eff command	1585
	2.85.1	Syntax	1585
	2.85.2	Examples	1586
	2.85.3	Description	1586
	2.85.4	Restart, fix_modify, output, run start/stop, minimize info	1586
	2.85.5	Restrictions	1587
	2.85.6	Related commands	1587
	2.85.7	Default	1587
2.86		fix langevin/spin command	1587
	2.86.1	Syntax	1587
	2.86.2	Examples	1587
	2.86.3	Description	1587
	2.86.4	Restart, fix_modify, output, run start/stop, minimize info	1588
	2.86.5	Restrictions	1588
	2.86.6	Related commands	1588
	2.86.7	Default	1588

2.87	fix lb/fluid command	1589
2.87.1	Syntax	1589
2.87.2	Examples	1590
2.87.3	Description	1590
2.87.4	Restart, fix_modify, output, run start/stop, minimize info	1593
2.87.5	Restrictions	1594
2.87.6	Related commands	1594
2.87.7	Default	1594
2.88	fix lb/momentum command	1594
2.88.1	Syntax	1594
2.88.2	Examples	1595
2.88.3	Description	1595
2.88.4	Restart, fix_modify, output, run start/stop, minimize info	1595
2.88.5	Restrictions	1595
2.88.6	Related commands	1595
2.88.7	Default	1596
2.89	fix lb/viscous command	1596
2.89.1	Syntax	1596
2.89.2	Examples	1596
2.89.3	Description	1596
2.89.4	Restart, fix_modify, output, run start/stop, minimize info	1596
2.89.5	Restrictions	1597
2.89.6	Related commands	1597
2.89.7	Default	1597
2.90	fix lineforce command	1597
2.90.1	Syntax	1597
2.90.2	Examples	1597
2.90.3	Description	1597
2.90.4	Restart, fix_modify, output, run start/stop, minimize info	1598
2.90.5	Restrictions	1598
2.90.6	Related commands	1598
2.90.7	Default	1598
2.91	fix manifoldforce command	1598
2.91.1	Syntax	1598
2.91.2	Examples	1598
2.91.3	Description	1598
2.91.4	Restart, fix_modify, output, run start/stop, minimize info	1599
2.91.5	Restrictions	1599
2.91.6	Related commands	1599
2.92	fix mdi/qm command	1599
2.92.1	Syntax	1599
2.92.2	Examples	1600
2.92.3	Description	1600
2.92.4	Restart, fix_modify, output, run start/stop, minimize info	1602
2.92.5	Restrictions	1603
2.92.6	Related commands	1603
2.92.7	Default	1603
2.93	fix mdi/qmmm command	1603
2.93.1	Syntax	1603
2.93.2	Examples	1604
2.93.3	Description	1604
2.93.4	Restart, fix_modify, output, run start/stop, minimize info	1606
2.93.5	Restrictions	1606
2.93.6	Related commands	1607

	2.93.7	Default	1607
2.94		fix meso/move command	1607
	2.94.1	Syntax	1607
	2.94.2	Examples	1607
	2.94.3	Description	1608
	2.94.4	Restart, fix_modify, output, run start/stop, minimize info	1610
	2.94.5	Restrictions	1610
	2.94.6	Related commands	1610
	2.94.7	Default	1610
2.95		fix_modify AtC commands	1610
	2.95.1	fix_modify AtC add_molecule command	1610
	2.95.2	fix_modify AtC add_species command	1611
	2.95.3	fix_modify AtC atom_element_map command	1612
	2.95.4	fix_modify AtC atom_weight command	1613
	2.95.5	fix_modify AtC atomic_charge command	1614
	2.95.6	fix_modify AtC boundary_dynamics command	1615
	2.95.7	fix_modify AtC boundary_faceset command	1616
	2.95.8	fix_modify AtC boundary type command	1617
	2.95.9	fix_modify AtC consistent_fe_initialization command	1617
	2.95.10	fix_modify AtC control localized_lambda command	1618
	2.95.11	fix_modify AtC control momentum command	1619
	2.95.12	fix_modify AtC control thermal command	1620
	2.95.13	fix_modify AtC decomposition command	1622
	2.95.14	fix_modify AtC extrinsic electron_integration command	1623
	2.95.15	fix_modify AtC equilibrium_start command	1624
	2.95.16	fix_modify AtC extrinsic exchange command	1624
	2.95.17	fix_modify AtC fe_md_boundary command	1625
	2.95.18	fix_modify AtC filter scale command	1626
	2.95.19	fix_modify AtC filter type command	1627
	2.95.20	fix_modify AtC fix command	1628
	2.95.21	fix_modify AtC fix_flux command	1629
	2.95.22	fix_modify AtC computes command	1629
	2.95.23	fix_modify AtC fields command	1630
	2.95.24	fix_modify AtC gradients command	1632
	2.95.25	fix_modify AtC kernel command	1634
	2.95.26	fix_modify AtC on_the_fly command	1635
	2.95.27	fix_modify AtC rates command	1636
	2.95.28	fix_modify AtC initial command	1637
	2.95.29	fix_modify AtC internal_element_set command	1638
	2.95.30	fix_modify AtC internal_quadrature command	1639
	2.95.31	fix_modify AtC kernel_bandwidth command	1640
	2.95.32	fix_modify AtC control lumped_lambda_solve command	1641
	2.95.33	fix_modify AtC control mask_direction command	1641
	2.95.34	fix_modify AtC mass_matrix command	1642
	2.95.35	fix_modify AtC material command	1643
	2.95.36	fix_modify AtC mesh add_to_nodeset command	1644
	2.95.37	fix_modify AtC mesh create command	1644
	2.95.38	fix_modify AtC mesh create_elementset command	1645
	2.95.39	fix_modify AtC mesh create_faceset box command	1646
	2.95.40	fix_modify AtC mesh create_faceset plane command	1647
	2.95.41	fix_modify AtC mesh create_nodeset command	1648
	2.95.42	fix_modify AtC mesh delete_elements command	1649
	2.95.43	fix_modify AtC mesh nodeset_to_elementset command	1650
	2.95.44	fix_modify AtC mesh output command	1651

2.95.45	fix_modify AtC mesh quadrature command	1651
2.95.46	fix_modify AtC mesh read command	1652
2.95.47	fix_modify AtC mesh write command	1653
2.95.48	fix_modify AtC output command	1654
2.95.49	fix_modify AtC output boundary_integral command	1655
2.95.50	fix_modify AtC output contour_integral command	1656
2.95.51	fix_modify AtC output nodeset command	1657
2.95.52	fix_modify AtC output volume_integral command	1658
2.95.53	fix_modify AtC pair_interactions command	1658
2.95.54	fix_modify AtC bond_interactions command	1658
2.95.55	fix_modify AtC poisson_solver command	1659
2.95.56	fix_modify AtC read_restart command	1660
2.95.57	fix_modify AtC remove_molecule command	1661
2.95.58	fix_modify AtC remove_source command	1662
2.95.59	fix_modify AtC remove_species command	1662
2.95.60	fix_modify AtC reset_atomic_reference_positions command	1663
2.95.61	fix_modify AtC reset_time command	1664
2.95.62	fix_modify AtC sample_frequency command	1665
2.95.63	fix_modify AtC set reference_potential_energy command	1666
2.95.64	fix_modify AtC source command	1666
2.95.65	fix_modify AtC source_integration command	1667
2.95.66	fix_modify AtC temperature_definition command	1668
2.95.67	fix_modify AtC filter command	1669
2.95.68	fix_modify AtC time_integration command	1670
2.95.69	fix_modify AtC track_displacement command	1671
2.95.70	fix_modify AtC unfix command	1672
2.95.71	fix_modify AtC unfix_flux command	1672
2.95.72	fix_modify AtC write_atom_weights command	1673
2.95.73	fix_modify AtC write_restart command	1674
2.96	fix mol/swap command	1675
2.96.1	Syntax	1675
2.96.2	Examples	1675
2.96.3	Description	1676
2.96.4	Restart, fix_modify, output, run start/stop, minimize info	1677
2.96.5	Restrictions	1677
2.96.6	Related commands	1677
2.96.7	Default	1677
2.97	fix momentum command	1677
2.98	fix momentum/chunk command	1678
2.98.1	Syntax	1678
2.98.2	Examples	1678
2.98.3	Description	1678
2.98.4	Restart, fix_modify, output, run start/stop, minimize info	1679
2.98.5	Restrictions	1679
2.98.6	Related commands	1679
2.98.7	Default	1679
2.99	fix move command	1679
2.99.1	Syntax	1679
2.99.2	Examples	1680
2.99.3	Description	1680
2.99.4	Restart, fix_modify, output, run start/stop, minimize info	1682
2.99.5	Restrictions	1683
2.99.6	Related commands	1683
2.99.7	Default	1683

2.100	fix msst command	1683
2.100.1	Syntax	1683
2.100.2	Examples	1684
2.100.3	Description	1684
2.100.4	Restart, fix_modify, output, run start/stop, minimize info	1685
2.100.5	Restrictions	1686
2.100.6	Related commands	1686
2.100.7	Default	1686
2.101	fix mvv/dpd command	1686
2.102	fix mvv/edpd command	1686
2.103	fix mvv/tdpd command	1686
2.103.1	Syntax	1686
2.103.2	Examples	1687
2.103.3	Description	1687
2.103.4	Restart, fix_modify, output, run start/stop, minimize info	1687
2.103.5	Restrictions	1688
2.103.6	Related commands	1688
2.103.7	Default	1688
2.104	fix neb command	1688
2.104.1	Syntax	1688
2.104.2	Examples	1689
2.104.3	Description	1689
2.104.4	Restart, fix_modify, output, run start/stop, minimize info	1691
2.104.5	Restrictions	1691
2.104.6	Related commands	1691
2.104.7	Default	1691
2.105	fix neb/spin command	1692
2.105.1	Syntax	1692
2.105.2	Examples	1692
2.105.3	Description	1692
2.105.4	Restart, fix_modify, output, run start/stop, minimize info	1692
2.105.5	Restrictions	1692
2.105.6	Related commands	1693
2.105.7	Default	1693
2.106	fix nvt command	1693
2.107	fix npt command	1693
2.108	fix nph command	1693
2.108.1	Syntax	1693
2.108.2	Examples	1694
2.108.3	Description	1694
2.108.4	Restart, fix_modify, output, run start/stop, minimize info	1700
2.108.5	Restrictions	1701
2.108.6	Related commands	1702
2.108.7	Default	1702
2.109	fix nvt/eff command	1702
2.110	fix npt/eff command	1702
2.111	fix nph/eff command	1702
2.111.1	Syntax	1702
2.111.2	Examples	1703
2.111.3	Description	1703
2.111.4	Restart, fix_modify, output, run start/stop, minimize info	1704
2.111.5	Restrictions	1704
2.111.6	Related commands	1704
2.111.7	Default	1704

2.112	fix nvt/uef command	1704
2.113	fix npt/uef command	1704
2.113.1	Syntax	1704
2.113.2	Examples	1705
2.113.3	Description	1705
2.113.4	Restart, fix_modify, output, run start/stop, minimize info	1707
2.113.5	Restrictions	1707
2.113.6	Related commands	1708
2.113.7	Default	1708
2.114	fix nonaffine/displacement command	1708
2.114.1	Syntax	1708
2.114.2	Examples	1709
2.114.3	Description	1709
2.114.4	Restart, fix_modify, output, run start/stop, minimize info	1709
2.114.5	Restrictions	1710
2.114.6	Related commands	1710
2.114.7	Default	1710
2.115	fix nph/asphere command	1710
2.115.1	Syntax	1710
2.115.2	Examples	1710
2.115.3	Description	1710
2.115.4	Restart, fix_modify, output, run start/stop, minimize info	1711
2.115.5	Restrictions	1712
2.115.6	Related commands	1712
2.115.7	Default	1712
2.116	fix nph/body command	1712
2.116.1	Syntax	1712
2.116.2	Examples	1712
2.116.3	Description	1712
2.116.4	Restart, fix_modify, output, run start/stop, minimize info	1713
2.116.5	Restrictions	1714
2.116.6	Related commands	1714
2.116.7	Default	1714
2.117	fix nph/sphere command	1714
2.117.1	Syntax	1714
2.117.2	Examples	1714
2.117.3	Description	1715
2.117.4	Restart, fix_modify, output, run start/stop, minimize info	1716
2.117.5	Restrictions	1716
2.117.6	Related commands	1716
2.117.7	Default	1716
2.118	fix nphug command	1716
2.118.1	Syntax	1716
2.118.2	Examples	1717
2.118.3	Description	1717
2.118.4	Restart, fix_modify, output, run start/stop, minimize info	1719
2.118.5	Restrictions	1719
2.118.6	Related commands	1719
2.118.7	Default	1720
2.119	fix npt/asphere command	1720
2.119.1	Syntax	1720
2.119.2	Examples	1720
2.119.3	Description	1720
2.119.4	Restart, fix_modify, output, run start/stop, minimize info	1721

2.119.5	Restrictions	1722
2.119.6	Related commands	1722
2.119.7	Default	1722
2.120	fix npt/body command	1722
2.120.1	Syntax	1722
2.120.2	Examples	1722
2.120.3	Description	1723
2.120.4	Restart, fix_modify, output, run start/stop, minimize info	1724
2.120.5	Restrictions	1724
2.120.6	Related commands	1724
2.120.7	Default	1724
2.121	fix npt/cauchy command	1724
2.121.1	Syntax	1724
2.121.2	Examples	1725
2.121.3	Description	1725
2.121.4	Restart, fix_modify, output, run start/stop, minimize info	1730
2.121.5	Restrictions	1731
2.121.6	Related commands	1732
2.121.7	Default	1732
2.122	fix npt/sphere command	1732
2.122.1	Syntax	1733
2.122.2	Examples	1733
2.122.3	Description	1733
2.122.4	Restart, fix_modify, output, run start/stop, minimize info	1734
2.122.5	Restrictions	1735
2.122.6	Related commands	1735
2.122.7	Default	1735
2.123	fix numdiff command	1735
2.123.1	Syntax	1735
2.123.2	Examples	1735
2.123.3	Description	1735
2.123.4	Restart, fix_modify, output, run start/stop, minimize info	1736
2.123.5	Restrictions	1736
2.123.6	Related commands	1737
2.123.7	Default	1737
2.124	fix numdiff/virial command	1737
2.124.1	Syntax	1737
2.124.2	Examples	1737
2.124.3	Description	1737
2.124.4	Restart, fix_modify, output, run start/stop, minimize info	1738
2.124.5	Restrictions	1738
2.124.6	Related commands	1738
2.124.7	Default	1738
2.125	fix nve command	1738
2.125.1	Syntax	1739
2.125.2	Examples	1739
2.125.3	Description	1739
2.125.4	Restart, fix_modify, output, run start/stop, minimize info	1739
2.125.5	Restrictions	1739
2.125.6	Related commands	1740
2.125.7	Default	1740
2.126	fix nve/asphere command	1740
2.126.1	Syntax	1740
2.126.2	Examples	1740

2.126.3	Description	1740
2.126.4	Restart, fix_modify, output, run start/stop, minimize info	1740
2.126.5	Restrictions	1741
2.126.6	Related commands	1741
2.126.7	Default	1741
2.127	fix nve/asphere/noforce command	1741
2.127.1	Syntax	1741
2.127.2	Examples	1741
2.127.3	Description	1741
2.127.4	Restart, fix_modify, output, run start/stop, minimize info	1742
2.127.5	Restrictions	1742
2.127.6	Related commands	1742
2.127.7	Default	1742
2.128	fix nve/awpmd command	1742
2.128.1	Syntax	1742
2.128.2	Examples	1742
2.128.3	Description	1743
2.128.4	Restart, fix_modify, output, run start/stop, minimize info	1743
2.128.5	Restrictions	1743
2.128.6	Related commands	1743
2.128.7	Default	1743
2.129	fix nve/body command	1743
2.129.1	Syntax	1743
2.129.2	Examples	1744
2.129.3	Description	1744
2.129.4	Restart, fix_modify, output, run start/stop, minimize info	1744
2.129.5	Restrictions	1744
2.129.6	Related commands	1744
2.129.7	Default	1744
2.130	fix nve/bpm/sphere command	1744
2.130.1	Syntax	1744
2.130.2	Examples	1745
2.130.3	Description	1745
2.130.4	Restart, fix_modify, output, run start/stop, minimize info	1745
2.130.5	Restrictions	1745
2.130.6	Related commands	1745
2.130.7	Default	1746
2.131	fix nve/dot command	1746
2.131.1	Syntax	1746
2.131.2	Examples	1746
2.131.3	Description	1746
2.131.4	Restrictions	1746
2.131.5	Related commands	1746
2.131.6	Default	1747
2.132	fix nve/dotc/langevin command	1747
2.132.1	Syntax	1747
2.132.2	Examples	1747
2.132.3	Description	1747
2.132.4	Restrictions	1749
2.132.5	Related commands	1749
2.132.6	Default	1749
2.133	fix nve/eff command	1749
2.133.1	Syntax	1749
2.133.2	Examples	1749

2.133.3	Description	1749
2.133.4	Restart, fix_modify, output, run start/stop, minimize info	1750
2.133.5	Restrictions	1750
2.133.6	Related commands	1750
2.133.7	Default	1750
2.134	fix nve/limit command	1750
2.134.1	Syntax	1750
2.134.2	Examples	1750
2.134.3	Description	1750
2.134.4	Restart, fix_modify, output, run start/stop, minimize info	1751
2.134.5	Restrictions	1751
2.134.6	Related commands	1751
2.134.7	Default	1751
2.135	fix nve/line command	1751
2.135.1	Syntax	1751
2.135.2	Examples	1752
2.135.3	Description	1752
2.135.4	Restart, fix_modify, output, run start/stop, minimize info	1752
2.135.5	Restrictions	1752
2.135.6	Related commands	1752
2.135.7	Default	1752
2.136	fix nve/manifold/rattle command	1752
2.136.1	Syntax	1752
2.136.2	Examples	1753
2.136.3	Description	1753
2.136.4	Restart, fix_modify, output, run start/stop, minimize info	1753
2.136.5	Restrictions	1753
2.136.6	Related commands	1754
2.136.7	Default	1754
2.137	fix nve/noforce command	1754
2.137.1	Syntax	1754
2.137.2	Examples	1754
2.137.3	Description	1754
2.137.4	Restart, fix_modify, output, run start/stop, minimize info	1754
2.137.5	Restrictions	1755
2.137.6	Related commands	1755
2.137.7	Default	1755
2.138	fix nve/sphere command	1755
2.138.1	Syntax	1755
2.138.2	Examples	1755
2.138.3	Description	1756
2.138.4	Restart, fix_modify, output, run start/stop, minimize info	1756
2.138.5	Restrictions	1756
2.138.6	Related commands	1757
2.138.7	Default	1757
2.139	fix nve/spin command	1757
2.139.1	Syntax	1757
2.139.2	Examples	1757
2.139.3	Description	1757
2.139.4	Restrictions	1758
2.139.5	Related commands	1758
2.139.6	Default	1758
2.140	fix nve/tri command	1759
2.140.1	Syntax	1759

2.140.2	Examples	1759
2.140.3	Description	1759
2.140.4	Restart, fix_modify, output, run start/stop, minimize info	1759
2.140.5	Restrictions	1759
2.140.6	Related commands	1759
2.140.7	Default	1760
2.141	fix nvk command	1760
2.141.1	Syntax	1760
2.141.2	Examples	1760
2.141.3	Description	1760
2.141.4	Restart, fix_modify, output, run start/stop, minimize info	1760
2.141.5	Restrictions	1760
2.141.6	Related commands	1761
2.141.7	Default	1761
2.142	fix nvt/asphere command	1761
2.142.1	Syntax	1761
2.142.2	Examples	1761
2.142.3	Description	1761
2.142.4	Restart, fix_modify, output, run start/stop, minimize info	1762
2.142.5	Restrictions	1763
2.142.6	Related commands	1763
2.142.7	Default	1763
2.143	fix nvt/body command	1763
2.143.1	Syntax	1763
2.143.2	Examples	1763
2.143.3	Description	1763
2.143.4	Restart, fix_modify, output, run start/stop, minimize info	1764
2.143.5	Restrictions	1765
2.143.6	Related commands	1765
2.143.7	Default	1765
2.144	fix nvt/manifold/rattle command	1765
2.144.1	Syntax	1765
2.144.2	Examples	1766
2.144.3	Description	1766
2.144.4	Restart, fix_modify, output, run start/stop, minimize info	1766
2.144.5	Restrictions	1766
2.144.6	Related commands	1766
2.145	fix nvt/sllod command	1766
2.145.1	Syntax	1767
2.145.2	Examples	1767
2.145.3	Description	1767
2.145.4	Restart, fix_modify, output, run start/stop, minimize info	1768
2.145.5	Restrictions	1769
2.145.6	Related commands	1769
2.145.7	Default	1769
2.146	fix nvt/sllod/eff command	1769
2.146.1	Syntax	1769
2.146.2	Examples	1770
2.146.3	Description	1770
2.146.4	Restart, fix_modify, output, run start/stop, minimize info	1770
2.146.5	Restrictions	1770
2.146.6	Related commands	1770
2.146.7	Default	1771
2.147	fix nvt/sphere command	1771

2.147.1	Syntax	1771
2.147.2	Examples	1771
2.147.3	Description	1771
2.147.4	Restart, fix_modify, output, run start/stop, minimize info	1772
2.147.5	Restrictions	1773
2.147.6	Related commands	1773
2.147.7	Default	1773
2.148	fix oneway command	1773
2.148.1	Syntax	1773
2.148.2	Examples	1773
2.148.3	Description	1773
2.148.4	Restart, fix_modify, output, run start/stop, minimize info	1774
2.148.5	Restrictions	1774
2.148.6	Related commands	1774
2.148.7	Default	1774
2.149	fix orient/fcc command	1774
2.150	fix orient/bcc command	1774
2.150.1	Syntax	1774
2.150.2	Examples	1775
2.150.3	Description	1775
2.150.4	Restart, fix_modify, output, run start/stop, minimize info	1776
2.150.5	Restrictions	1777
2.150.6	Related commands	1777
2.150.7	Default	1777
2.151	fix orient/eco command	1777
2.151.1	Examples	1778
2.151.2	Description	1778
2.151.3	Restart, fix_modify, output, run start/stop, minimize info	1779
2.151.4	Restrictions	1779
2.151.5	Related commands	1779
2.151.6	Default	1779
2.152	fix pafi command	1780
2.152.1	Syntax	1780
2.152.2	Examples	1780
2.152.3	Description	1780
2.152.4	Restart, fix_modify, output, run start/stop, minimize info	1781
2.152.5	Restrictions	1781
2.152.6	Default	1781
2.153	fix pair command	1781
2.153.1	Syntax	1781
2.153.2	Examples	1782
2.153.3	Description	1782
2.153.4	Restart, fix_modify, output, run start/stop, minimize info	1783
2.153.5	Restrictions	1783
2.153.6	Related commands	1783
2.153.7	Default	1783
2.154	fix phonon command	1783
2.154.1	Syntax	1783
2.154.2	Examples	1784
2.154.3	Description	1784
2.154.4	Restart, fix_modify, output, run start/stop, minimize info	1785
2.154.5	Restrictions	1785
2.154.6	Related commands	1786
2.154.7	Default	1786

2.155	fix pimd/langevin command	1786
2.156	fix pimd/nvt command	1786
2.156.1	Syntax	1786
2.156.2	Examples	1787
2.156.3	Description	1787
2.156.4	Restart, fix_modify, output, run start/stop, minimize info	1791
2.156.5	Restrictions	1793
2.156.6	Default	1793
2.157	fix planeforce command	1794
2.157.1	Syntax	1794
2.157.2	Examples	1794
2.157.3	Description	1794
2.157.4	Restart, fix_modify, output, run start/stop, minimize info	1794
2.157.5	Restrictions	1795
2.157.6	Related commands	1795
2.157.7	Default	1795
2.158	fix plumed command	1795
2.158.1	Syntax	1795
2.158.2	Examples	1795
2.158.3	Description	1795
2.158.4	Restart, fix_modify, output, run start/stop, minimize info	1796
2.158.5	Restrictions	1796
2.158.6	Related commands	1796
2.158.7	Default	1797
2.159	fix poems command	1797
2.159.1	Syntax	1797
2.159.2	Examples	1797
2.159.3	Description	1797
2.159.4	Restart, fix_modify, output, run start/stop, minimize info	1798
2.159.5	Restrictions	1798
2.159.6	Related commands	1799
2.159.7	Default	1799
2.160	fix polarize/bem/gmres command	1799
2.161	fix polarize/bem/icc command	1799
2.162	fix polarize/functional command	1799
2.162.1	Syntax	1799
2.162.2	Examples	1799
2.162.3	Description	1800
2.162.4	Restart, fix_modify, output, run start/stop, minimize info	1801
2.162.5	Restrictions	1802
2.162.6	Related commands	1802
2.162.7	Default	1802
2.163	fix pour command	1802
2.163.1	Syntax	1802
2.163.2	Examples	1803
2.163.3	Description	1804
2.163.4	Restart, fix_modify, output, run start/stop, minimize info	1805
2.163.5	Restrictions	1806
2.163.6	Related commands	1806
2.163.7	Default	1806
2.164	fix precession/spin command	1806
2.164.1	Syntax	1806
2.164.2	Examples	1807
2.164.3	Description	1807

2.164.4	Restart, fix_modify, output, run start/stop, minimize info	1809
2.164.5	Restrictions	1809
2.164.6	Related commands	1809
2.164.7	Default	1809
2.165	fix press/berendsen command	1809
2.165.1	Syntax	1809
2.165.2	Examples	1810
2.165.3	Description	1810
2.165.4	Restart, fix_modify, output, run start/stop, minimize info	1812
2.165.5	Restrictions	1812
2.165.6	Related commands	1812
2.165.7	Default	1812
2.166	fix press/langevin command	1813
2.166.1	Syntax	1813
2.166.2	Examples	1813
2.166.3	Description	1813
2.166.4	Restart, fix_modify, output, run start/stop, minimize info	1816
2.166.5	Restrictions	1817
2.166.6	Related commands	1817
2.166.7	Default	1817
2.167	fix print command	1817
2.167.1	Syntax	1817
2.167.2	Examples	1817
2.167.3	Description	1818
2.167.4	Restart, fix_modify, output, run start/stop, minimize info	1819
2.167.5	Restrictions	1819
2.167.6	Related commands	1819
2.167.7	Default	1819
2.168	fix propel/self command	1819
2.168.1	Syntax	1819
2.168.2	Examples	1819
2.168.3	Description	1820
2.168.4	Restart, fix_modify, output, run start/stop, minimize info	1821
2.168.5	Restrictions	1821
2.168.6	Related commands	1821
2.168.7	Default	1821
2.169	fix property/atom command	1821
2.169.1	Syntax	1821
2.169.2	Examples	1822
2.169.3	Description	1822
2.169.4	Restart, fix_modify, output, run start/stop, minimize info	1825
2.169.5	Restrictions	1826
2.169.6	Related commands	1826
2.169.7	Default	1826
2.170	fix python/invoke command	1826
2.170.1	Syntax	1826
2.170.2	Examples	1826
2.170.3	Description	1827
2.170.4	Restrictions	1827
2.170.5	Related commands	1827
2.171	fix python/move command	1827
2.171.1	Syntax	1827
2.171.2	Examples	1827
2.171.3	Description	1828

2.171.4	Restart, fix_modify, output, run start/stop, minimize info	1829
2.171.5	Restrictions	1829
2.171.6	Related commands	1829
2.171.7	Default	1829
2.172	fix qbmsst command	1829
2.172.1	Syntax	1829
2.172.2	Examples	1830
2.172.3	Description	1831
2.172.4	Restart, fix_modify, output, run start/stop, minimize info	1831
2.172.5	Restrictions	1832
2.172.6	Related commands	1833
2.172.7	Default	1833
2.173	fix qeq/point command	1833
2.174	fix qeq/shielded command	1833
2.175	fix qeq/slatter command	1833
2.176	fix qeq/dynamic command	1833
2.177	fix qeq/fire command	1833
2.177.1	Syntax	1833
2.177.2	Examples	1834
2.177.3	Description	1834
2.177.4	Restart, fix_modify, output, run start/stop, minimize info	1836
2.177.5	Restrictions	1836
2.177.6	Related commands	1836
2.177.7	Default	1836
2.178	fix qeq/comb command	1837
2.178.1	Syntax	1837
2.178.2	Examples	1837
2.178.3	Description	1837
2.178.4	Restart, fix_modify, output, run start/stop, minimize info	1838
2.178.5	Restrictions	1838
2.178.6	Related commands	1838
2.178.7	Default	1838
2.179	fix qeq/reaxff command	1839
2.179.1	Syntax	1839
2.179.2	Examples	1839
2.179.3	Description	1839
2.179.4	Restart, fix_modify, output, run start/stop, minimize info	1840
2.179.5	Restrictions	1840
2.179.6	Related commands	1841
2.179.7	Default	1841
2.180	fix qmmm command	1841
2.180.1	Syntax	1841
2.180.2	Examples	1841
2.180.3	Description	1841
2.180.4	Restart, fix_modify, output, run start/stop, minimize info	1842
2.180.5	Restrictions	1842
2.180.6	Related commands	1842
2.180.7	Default	1842
2.181	fix qtb command	1842
2.181.1	Syntax	1842
2.181.2	Examples	1843
2.181.3	Description	1843
2.181.4	Restart, fix_modify, output, run start/stop, minimize info	1844
2.181.5	Restrictions	1844

2.181.6	Related commands	1844
2.181.7	Default	1844
2.182	fix reaxff/bonds command	1845
2.182.1	Syntax	1845
2.182.2	Examples	1845
2.182.3	Description	1845
2.182.4	Restart, fix_modify, output, run start/stop, minimize info	1846
2.182.5	Restrictions	1846
2.182.6	Related commands	1846
2.182.7	Default	1846
2.183	fix reaxff/species command	1846
2.183.1	Syntax	1846
2.183.2	Examples	1847
2.183.3	Description	1847
2.183.4	Restart, fix_modify, output, run start/stop, minimize info	1849
2.183.5	Restrictions	1849
2.183.6	Related commands	1849
2.183.7	Default	1850
2.184	fix recenter command	1850
2.184.1	Syntax	1850
2.184.2	Examples	1850
2.184.3	Description	1850
2.184.4	Restart, fix_modify, output, run start/stop, minimize info	1851
2.184.5	Restrictions	1851
2.184.6	Related commands	1852
2.184.7	Default	1852
2.185	fix restrain command	1852
2.185.1	Syntax	1852
2.185.2	Examples	1853
2.185.3	Description	1853
2.185.4	Restart, fix_modify, output, run start/stop, minimize info	1855
2.185.5	Restrictions	1856
2.185.6	Related commands	1856
2.185.7	Default	1856
2.186	fix rheo command	1856
2.186.1	Syntax	1856
2.186.2	Examples	1857
2.186.3	Description	1857
2.186.4	Restart, fix_modify, output, run start/stop, minimize info	1858
2.186.5	Restrictions	1858
2.186.6	Related commands	1858
2.186.7	Default	1858
2.187	fix rheo/oxidation command	1858
2.187.1	Syntax	1858
2.187.2	Examples	1859
2.187.3	Description	1859
2.187.4	Restart, fix_modify, output, run start/stop, minimize info	1859
2.187.5	Restrictions	1859
2.187.6	Related commands	1859
2.187.7	Default	1859
2.188	fix rheo/pressure command	1860
2.188.1	Syntax	1860
2.188.2	Examples	1860
2.188.3	Description	1860

2.188.4	Restart, fix_modify, output, run start/stop, minimize info	1861
2.188.5	Restrictions	1861
2.188.6	Related commands	1861
2.188.7	Default	1861
2.189	fix rheo/thermal command	1861
2.189.1	Syntax	1861
2.189.2	Examples	1862
2.189.3	Description	1862
2.189.4	Restart, fix_modify, output, run start/stop, minimize info	1863
2.189.5	Restrictions	1863
2.189.6	Related commands	1863
2.189.7	Default	1863
2.190	fix rheo/viscosity command	1863
2.190.1	Syntax	1863
2.190.2	Examples	1864
2.190.3	Description	1864
2.190.4	Restart, fix_modify, output, run start/stop, minimize info	1864
2.190.5	Restrictions	1864
2.190.6	Related commands	1865
2.190.7	Default	1865
2.191	fix rhok command	1865
2.191.1	Syntax	1865
2.191.2	Examples	1865
2.191.3	Description	1865
2.191.4	Restart, fix_modify, output, run start/stop, minimize info	1866
2.191.5	Restrictions	1866
2.191.6	Related commands	1866
2.191.7	Default	1866
2.192	fix rigid command	1866
2.193	fix rigid/nve command	1866
2.194	fix rigid/nvt command	1866
2.195	fix rigid/npt command	1867
2.196	fix rigid/nph command	1867
2.197	fix rigid/small command	1867
2.198	fix rigid/nve/small command	1867
2.199	fix rigid/nvt/small command	1867
2.200	fix rigid/npt/small command	1867
2.201	fix rigid/nph/small command	1867
2.201.1	Syntax	1867
2.201.2	Examples	1868
2.201.3	Description	1869
2.201.4	Restart, fix_modify, output, run start/stop, minimize info	1877
2.201.5	Restrictions	1878
2.201.6	Related commands	1878
2.201.7	Default	1878
2.202	fix rigid/meso command	1878
2.202.1	Syntax	1878
2.202.2	Examples	1879
2.202.3	Description	1879
2.202.4	Restart, fix_modify, output, run start/stop, minimize info	1882
2.202.5	Restrictions	1883
2.202.6	Related commands	1883
2.202.7	Default	1883
2.203	fix rx command	1883

2.203.1	Syntax	1883
2.203.2	Examples	1884
2.203.3	Description	1884
2.203.4	Restrictions	1886
2.203.5	Related commands	1886
2.203.6	Default	1886
2.204	fix saed/vtk command	1887
2.204.1	Syntax	1887
2.204.2	Examples	1887
2.204.3	Description	1887
2.204.4	Restart, fix_modify, output, run start/stop, minimize info	1889
2.204.5	Restrictions	1889
2.204.6	Related commands	1889
2.204.7	Default	1889
2.205	fix setforce command	1889
2.206	fix setforce/spin command	1889
2.206.1	Syntax	1889
2.206.2	Examples	1890
2.206.3	Description	1890
2.206.4	Restart, fix_modify, output, run start/stop, minimize info	1891
2.206.5	Restrictions	1891
2.206.6	Related commands	1891
2.206.7	Default	1891
2.207	fix sgcmc command	1891
2.207.1	Syntax	1891
2.207.2	Examples	1892
2.207.3	Description	1892
2.207.4	Restart, fix_modify, output, run start/stop, minimize info	1893
2.207.5	Restrictions	1894
2.207.6	Default	1894
2.208	fix shake command	1894
2.209	fix rattle command	1894
2.209.1	Syntax	1894
2.209.2	Examples	1895
2.209.3	Description	1895
2.209.4	Restart, fix_modify, output, run start/stop, minimize info	1897
2.209.5	Restrictions	1898
2.209.6	Related commands	1898
2.209.7	Default	1898
2.210	fix shardlow command	1898
2.210.1	Syntax	1898
2.210.2	Examples	1899
2.210.3	Description	1899
2.210.4	Restrictions	1899
2.210.5	Related commands	1900
2.210.6	Default	1900
2.211	fix smd command	1900
2.211.1	Syntax	1900
2.211.2	Examples	1901
2.211.3	Description	1901
2.211.4	Restart, fix_modify, output, run start/stop, minimize info	1901
2.211.5	Restrictions	1902
2.211.6	Related commands	1902
2.211.7	Default	1902

2.212	fix smd/adjust_dt command	1902
2.212.1	Syntax	1902
2.212.2	Examples	1903
2.212.3	Description	1903
2.212.4	Restart, fix_modify, output, run start/stop, minimize info	1903
2.212.5	Restrictions	1903
2.212.6	Related commands	1903
2.212.7	Default	1903
2.213	fix smd/integrate_tlsph command	1903
2.213.1	Syntax	1903
2.213.2	Examples	1904
2.213.3	Description	1904
2.213.4	Restart, fix_modify, output, run start/stop, minimize info	1904
2.213.5	Restrictions	1904
2.213.6	Related commands	1904
2.213.7	Default	1904
2.214	fix smd/integrate_ulsph command	1904
2.214.1	Syntax	1904
2.214.2	Examples	1905
2.214.3	Description	1905
2.214.4	Restart, fix_modify, output, run start/stop, minimize info	1905
2.214.5	Restrictions	1905
2.214.6	Related commands	1905
2.214.7	Default	1905
2.215	fix smd/move_tri_surf command	1906
2.215.1	Syntax	1906
2.215.2	Examples	1906
2.215.3	Description	1906
2.215.4	Restart, fix_modify, output, run start/stop, minimize info	1907
2.215.5	Restrictions	1907
2.215.6	Related commands	1907
2.215.7	Default	1907
2.216	fix smd/setvel command	1907
2.216.1	Syntax	1907
2.216.2	Examples	1907
2.216.3	Description	1908
2.216.4	Restart, fix_modify, output, run start/stop, minimize info	1908
2.216.5	Restrictions	1908
2.216.6	Related commands	1908
2.216.7	Default	1908
2.217	fix smd/wall_surface command	1909
2.217.1	Syntax	1909
2.217.2	Examples	1909
2.217.3	Description	1909
2.217.4	Restart, fix_modify, output, run start/stop, minimize info	1909
2.217.5	Restrictions	1909
2.217.6	Related commands	1910
2.217.7	Default	1910
2.218	fix sph command	1910
2.218.1	Syntax	1910
2.218.2	Examples	1910
2.218.3	Description	1910
2.218.4	Restart, fix_modify, output, run start/stop, minimize info	1910
2.218.5	Restrictions	1910

2.218.6	Related commands	1911
2.218.7	Default	1911
2.219	fix sph/stationary command	1911
2.219.1	Syntax	1911
2.219.2	Examples	1911
2.219.3	Description	1911
2.219.4	Restart, fix_modify, output, run start/stop, minimize info	1911
2.219.5	Restrictions	1911
2.219.6	Related commands	1912
2.219.7	Default	1912
2.220	fix spring command	1912
2.220.1	Syntax	1912
2.220.2	Examples	1912
2.220.3	Description	1912
2.220.4	Restart, fix_modify, output, run start/stop, minimize info	1913
2.220.5	Restrictions	1914
2.220.6	Related commands	1914
2.220.7	Default	1914
2.221	fix spring/chunk command	1914
2.221.1	Syntax	1914
2.221.2	Examples	1914
2.221.3	Description	1914
2.221.4	Restart, fix_modify, output, run start/stop, minimize info	1915
2.221.5	Restrictions	1915
2.221.6	Related commands	1915
2.221.7	Default	1915
2.222	fix spring/rg command	1916
2.222.1	Syntax	1916
2.222.2	Examples	1916
2.222.3	Description	1916
2.222.4	Restart, fix_modify, output, run start/stop, minimize info	1917
2.222.5	Restrictions	1917
2.222.6	Related commands	1917
2.222.7	Default	1917
2.223	fix spring/self command	1917
2.223.1	Syntax	1917
2.223.2	Examples	1918
2.223.3	Description	1918
2.223.4	Restart, fix_modify, output, run start/stop, minimize info	1918
2.223.5	Restrictions	1919
2.223.6	Related commands	1919
2.223.7	Default	1919
2.224	fix srd command	1919
2.224.1	Syntax	1919
2.224.2	Examples	1920
2.224.3	Description	1920
2.224.4	Restart, fix_modify, output, run start/stop, minimize info	1923
2.224.5	Restrictions	1924
2.224.6	Related commands	1924
2.224.7	Default	1924
2.225	fix store/force command	1924
2.225.1	Syntax	1924
2.225.2	Examples	1924
2.225.3	Description	1925

2.225.4	Restart, fix_modify, output, run start/stop, minimize info	1925
2.225.5	Restrictions	1925
2.225.6	Related commands	1925
2.225.7	Default	1925
2.226	fix store/state command	1926
2.226.1	Syntax	1926
2.226.2	Examples	1927
2.226.3	Description	1927
2.226.4	Restart, fix_modify, output, run start/stop, minimize info	1927
2.226.5	Restrictions	1928
2.226.6	Related commands	1928
2.226.7	Default	1928
2.227	fix temp/berendsen command	1928
2.227.1	Syntax	1928
2.227.2	Examples	1928
2.227.3	Description	1928
2.227.4	Restart, fix_modify, output, run start/stop, minimize info	1930
2.227.5	Restrictions	1930
2.227.6	Related commands	1930
2.227.7	Default	1930
2.228	fix temp/csvr command	1931
2.229	fix temp/csld command	1931
2.229.1	Syntax	1931
2.229.2	Examples	1931
2.229.3	Description	1931
2.229.4	Restart, fix_modify, output, run start/stop, minimize info	1932
2.229.5	Restrictions	1933
2.229.6	Related commands	1933
2.229.7	Default	1933
2.230	fix temp/rescale command	1933
2.230.1	Syntax	1933
2.230.2	Examples	1934
2.230.3	Description	1934
2.230.4	Restart, fix_modify, output, run start/stop, minimize info	1935
2.230.5	Restrictions	1936
2.230.6	Related commands	1936
2.230.7	Default	1936
2.231	fix temp/rescale/eff command	1936
2.231.1	Syntax	1936
2.231.2	Examples	1936
2.231.3	Description	1936
2.231.4	Restart, fix_modify, output, run start/stop, minimize info	1937
2.231.5	Restrictions	1937
2.231.6	Related commands	1937
2.231.7	Default	1937
2.232	fix tfmc command	1937
2.232.1	Syntax	1937
2.232.2	Examples	1938
2.232.3	Description	1938
2.232.4	Restart, fix_modify, output, run start/stop, minimize info	1939
2.232.5	Restrictions	1939
2.232.6	Related commands	1939
2.232.7	Default	1939
2.233	fix tgnvt/drude command	1939

2.234	fix tgnpt/drude command	1939
2.234.1	Syntax	1939
2.234.2	Examples	1940
2.234.3	Description	1941
2.234.4	Restart, fix_modify, output, run start/stop, minimize info	1943
2.234.5	Restrictions	1943
2.234.6	Related commands	1944
2.234.7	Default	1944
2.235	fix thermal/conductivity command	1944
2.235.1	Syntax	1944
2.235.2	Examples	1944
2.235.3	Description	1944
2.235.4	Restart, fix_modify, output, run start/stop, minimize info	1945
2.235.5	Restrictions	1946
2.235.6	Related commands	1946
2.235.7	Default	1946
2.236	fix ti/spring command	1946
2.236.1	Syntax	1946
2.236.2	Example	1947
2.236.3	Description	1947
2.236.4	Restart, fix_modify, output, run start/stop, minimize info	1948
2.236.5	Related commands	1948
2.236.6	Restrictions	1948
2.236.7	Default	1948
2.237	fix tmd command	1949
2.237.1	Syntax	1949
2.237.2	Examples	1949
2.237.3	Description	1949
2.237.4	Restart, fix_modify, output, run start/stop, minimize info	1950
2.237.5	Restrictions	1950
2.237.6	Related commands	1950
2.237.7	Default	1950
2.238	fix ttm command	1951
2.239	fix ttm/grid command	1951
2.240	fix ttm/mod command	1951
2.240.1	Syntax	1951
2.240.2	Examples	1952
2.240.3	Description	1952
2.240.4	Restart, fix_modify, output, run start/stop, minimize info	1955
2.240.5	Restrictions	1956
2.240.6	Related commands	1956
2.240.7	Default	1956
2.241	fix tune/kspc command	1956
2.241.1	Syntax	1956
2.241.2	Examples	1957
2.241.3	Description	1957
2.241.4	Restrictions	1957
2.241.5	Related commands	1958
2.241.6	Default	1958
2.242	fix vector command	1958
2.242.1	Syntax	1958
2.242.2	Examples	1958
2.242.3	Description	1958
2.242.4	Restart, fix_modify, output, run start/stop, minimize info	1960

2.242.5	Restrictions	1960
2.242.6	Related commands	1960
2.242.7	Defaults	1960
2.243	fix viscosity command	1960
2.243.1	Syntax	1960
2.243.2	Examples	1961
2.243.3	Description	1961
2.243.4	Restart, fix_modify, output, run start/stop, minimize info	1962
2.243.5	Restrictions	1962
2.243.6	Related commands	1963
2.243.7	Default	1963
2.244	fix viscous command	1963
2.244.1	Syntax	1963
2.244.2	Examples	1963
2.244.3	Description	1963
2.244.4	Restart, fix_modify, output, run start/stop, minimize info	1964
2.244.5	Restrictions	1965
2.244.6	Related commands	1965
2.244.7	Default	1965
2.245	fix viscous/sphere command	1965
2.245.1	Syntax	1965
2.245.2	Examples	1965
2.245.3	Description	1965
2.245.4	Restart, fix_modify, output, run start/stop, minimize info	1966
2.245.5	Restrictions	1966
2.245.6	Related commands	1966
2.245.7	Default	1966
2.246	fix wall/lj93 command	1967
2.247	fix wall/lj126 command	1967
2.248	fix wall/lj1043 command	1967
2.249	fix wall/colloid command	1967
2.250	fix wall/harmonic command	1967
2.251	fix wall/lepton command	1967
2.252	fix wall/morse command	1967
2.253	fix wall/table command	1967
2.253.1	Syntax	1967
2.253.2	Examples	1969
2.253.3	Description	1969
2.253.4	Lepton expression syntax and features	1972
2.253.5	Table file format	1973
2.253.6	Restart, fix_modify, output, run start/stop, minimize info	1974
2.253.7	Restrictions	1975
2.253.8	Related commands	1975
2.253.9	Default	1975
2.254	fix wall/body/polygon command	1975
2.254.1	Syntax	1975
2.254.2	Examples	1976
2.254.3	Description	1976
2.254.4	Restart, fix_modify, output, run start/stop, minimize info	1976
2.254.5	Restrictions	1976
2.254.6	Related commands	1977
2.254.7	Default	1977
2.255	fix wall/body/polyhedron command	1977
2.255.1	Syntax	1977

2.255.2	Examples	1977
2.255.3	Description	1978
2.255.4	Restart, fix_modify, output, run start/stop, minimize info	1978
2.255.5	Restrictions	1978
2.255.6	Related commands	1978
2.255.7	Default	1979
2.256	fix wall/ees command	1979
2.257	fix wall/region/ees command	1979
2.257.1	Syntax	1979
2.257.2	Examples	1979
2.257.3	Description	1980
2.257.4	Restart, fix_modify, output, run start/stop, minimize info	1981
2.257.5	Restrictions	1981
2.257.6	Related commands	1981
2.257.7	Default	1981
2.258	fix wall/flow command	1982
2.258.1	Syntax	1982
2.258.2	Examples	1982
2.258.3	Description	1982
2.258.4	Restart, fix_modify, output, run start/stop, minimize info	1983
2.258.5	Restrictions	1983
2.258.6	Related commands	1984
2.258.7	Default	1984
2.259	fix wall/gran command	1984
2.259.1	Syntax	1984
2.259.2	Examples	1985
2.259.3	Description	1985
2.259.4	Restart, fix_modify, output, run start/stop, minimize info	1987
2.259.5	Restrictions	1988
2.259.6	Related commands	1988
2.259.7	Default	1988
2.260	fix wall/gran/region command	1988
2.260.1	Syntax	1988
2.260.2	Examples	1989
2.260.3	Description	1989
2.260.4	Restart, fix_modify, output, run start/stop, minimize info	1991
2.260.5	Restrictions	1992
2.260.6	Related commands	1992
2.260.7	Default	1992
2.261	fix wall/piston command	1992
2.261.1	Syntax	1992
2.261.2	Examples	1993
2.261.3	Description	1993
2.261.4	Restart, fix_modify, output, run start/stop, minimize info	1994
2.261.5	Restrictions	1994
2.261.6	Related commands	1994
2.261.7	Default	1994
2.262	fix wall/reflect command	1994
2.262.1	Syntax	1994
2.262.2	Examples	1995
2.262.3	Description	1995
2.262.4	Restart, fix_modify, output, run start/stop, minimize info	1996
2.262.5	Restrictions	1996
2.262.6	Related commands	1996

2.262.7	Default	1997
2.263	fix wall/reflect/stochastic command	1997
2.263.1	Syntax	1997
2.263.2	Examples	1997
2.263.3	Description	1998
2.263.4	Restrictions	1998
2.263.5	Related commands	1998
2.263.6	Default	1999
2.264	fix wall/region command	1999
2.264.1	Syntax	1999
2.264.2	Examples	1999
2.264.3	Description	2000
2.264.4	Restart, fix_modify, output, run start/stop, minimize info	2001
2.264.5	Restrictions	2002
2.264.6	Related commands	2002
2.264.7	Default	2002
2.265	fix wall/srd command	2002
2.265.1	Syntax	2002
2.265.2	Examples	2003
2.265.3	Description	2003
2.265.4	Restart, fix_modify, output, run start/stop, minimize info	2005
2.265.5	Restrictions	2005
2.265.6	Related commands	2005
2.265.7	Default	2005
2.266	fix widom command	2005
2.266.1	Syntax	2005
2.266.2	Examples	2006
2.266.3	Description	2006
2.266.4	Restart, fix_modify, output, run start/stop, minimize info	2007
2.266.5	Restrictions	2008
2.266.6	Related commands	2008
2.266.7	Default	2008
3	Computes	2009
3.1	compute ackland/atom command	2009
3.1.1	Syntax	2009
3.1.2	Examples	2009
3.1.3	Description	2009
3.1.4	Output info	2010
3.1.5	Restrictions	2010
3.1.6	Related commands	2010
3.1.7	Default	2010
3.2	compute adf command	2010
3.2.1	Syntax	2010
3.2.2	Examples	2011
3.2.3	Description	2011
3.2.4	Output info	2013
3.2.5	Restrictions	2013
3.2.6	Related commands	2013
3.2.7	Default	2013
3.3	compute angle command	2014
3.3.1	Syntax	2014
3.3.2	Examples	2014
3.3.3	Description	2014

3.3.4	Output info	2014
3.3.5	Restrictions	2014
3.3.6	Related commands	2014
3.3.7	Default	2015
3.4	compute angle/local command	2015
3.4.1	Syntax	2015
3.4.2	Examples	2015
3.4.3	Description	2015
3.4.4	Output info	2016
3.4.5	Restrictions	2017
3.4.6	Related commands	2017
3.4.7	Default	2017
3.5	compute angmom/chunk command	2017
3.5.1	Syntax	2017
3.5.2	Examples	2017
3.5.3	Description	2017
3.5.4	Output info	2018
3.5.5	Restrictions	2018
3.5.6	Related commands	2018
3.5.7	Default	2018
3.6	compute ave/sphere/atom command	2018
3.6.1	Syntax	2019
3.6.2	Examples	2019
3.6.3	Description	2019
3.6.4	Output info	2020
3.6.5	Restrictions	2020
3.6.6	Related commands	2020
3.6.7	Default	2020
3.7	compute basal/atom command	2020
3.7.1	Syntax	2020
3.7.2	Examples	2021
3.7.3	Description	2021
3.7.4	Output info	2021
3.7.5	Restrictions	2021
3.7.6	Related commands	2021
3.7.7	Default	2021
3.8	compute body/local command	2022
3.8.1	Syntax	2022
3.8.2	Examples	2022
3.8.3	Description	2022
3.8.4	Output info	2023
3.8.5	Restrictions	2023
3.8.6	Related commands	2023
3.8.7	Default	2023
3.9	compute bond command	2023
3.9.1	Syntax	2023
3.9.2	Examples	2023
3.9.3	Description	2023
3.9.4	Output info	2024
3.9.5	Restrictions	2024
3.9.6	Related commands	2024
3.9.7	Default	2024
3.10	compute bond/local command	2024
3.10.1	Syntax	2024

	3.10.2	Examples	2025
	3.10.3	Description	2025
	3.10.4	Output info	2027
	3.10.5	Restrictions	2027
	3.10.6	Related commands	2027
	3.10.7	Default	2027
3.11		compute born/matrix command	2027
	3.11.1	Syntax	2027
	3.11.2	Examples	2028
	3.11.3	Description	2028
	3.11.4	Restrictions	2030
	3.11.5	Default	2030
3.12		compute centro/atom command	2030
	3.12.1	Syntax	2030
	3.12.2	Examples	2031
	3.12.3	Description	2031
	3.12.4	Output info	2032
	3.12.5	Restrictions	2032
	3.12.6	Related commands	2032
	3.12.7	Default	2032
3.13		compute chunk/atom command	2033
	3.13.1	Syntax	2033
	3.13.2	Examples	2034
	3.13.3	Description	2034
	3.13.4	Output info	2040
	3.13.5	Restrictions	2040
	3.13.6	Related commands	2041
	3.13.7	Default	2041
3.14		compute chunk/spread/atom command	2041
	3.14.1	Syntax	2041
	3.14.2	Examples	2042
	3.14.3	Description	2042
	3.14.4	Output info	2044
	3.14.5	Restrictions	2044
	3.14.6	Related commands	2044
	3.14.7	Default	2044
3.15		compute cluster/atom command	2044
3.16		compute fragment/atom command	2044
3.17		compute aggregate/atom command	2044
	3.17.1	Syntax	2044
	3.17.2	Examples	2045
	3.17.3	Description	2045
	3.17.4	Output info	2046
	3.17.5	Restrictions	2046
	3.17.6	Related commands	2046
	3.17.7	Default	2046
3.18		compute cna/atom command	2046
	3.18.1	Syntax	2046
	3.18.2	Examples	2047
	3.18.3	Description	2047
	3.18.4	Output info	2048
	3.18.5	Restrictions	2048
	3.18.6	Related commands	2048
	3.18.7	Default	2048

3.19	compute cnp/atom command	2048
3.19.1	Syntax	2048
3.19.2	Examples	2048
3.19.3	Description	2049
3.19.4	Output info	2049
3.19.5	Restrictions	2050
3.19.6	Related commands	2050
3.19.7	Default	2050
3.20	compute com command	2050
3.20.1	Syntax	2050
3.20.2	Examples	2050
3.20.3	Description	2050
3.20.4	Output info	2051
3.20.5	Restrictions	2051
3.20.6	Related commands	2051
3.20.7	Default	2051
3.21	compute com/chunk command	2051
3.21.1	Syntax	2051
3.21.2	Examples	2052
3.21.3	Description	2052
3.21.4	Output info	2052
3.21.5	Restrictions	2053
3.21.6	Related commands	2053
3.21.7	Default	2053
3.22	compute composition/atom command	2053
3.22.1	Syntax	2053
3.22.2	Examples	2053
3.22.3	Description	2053
3.22.4	Output info	2054
3.22.5	Restrictions	2054
3.22.6	Related commands	2055
3.22.7	Default	2055
3.23	compute contact/atom command	2055
3.23.1	Syntax	2055
3.23.2	Examples	2055
3.23.3	Description	2055
3.23.4	Output info	2055
3.23.5	Restrictions	2056
3.23.6	Related commands	2056
3.23.7	Default	2056
3.24	compute coord/atom command	2056
3.24.1	Syntax	2056
3.24.2	Examples	2056
3.24.3	Description	2057
3.24.4	Output info	2058
3.24.5	Restrictions	2058
3.24.6	Related commands	2058
3.24.7	Default	2058
3.25	compute count/type command	2058
3.25.1	Syntax	2058
3.25.2	Examples	2059
3.25.3	Description	2059
3.25.4	Output info	2060
3.25.5	Restrictions	2060

	3.25.6	Related commands	2060
	3.25.7	Default	2060
3.26		compute damage/atom command	2060
	3.26.1	Syntax	2060
	3.26.2	Examples	2061
	3.26.3	Description	2061
	3.26.4	Output info	2061
	3.26.5	Restrictions	2061
	3.26.6	Related commands	2061
	3.26.7	Default	2061
3.27		compute dihedral command	2061
	3.27.1	Syntax	2061
	3.27.2	Examples	2062
	3.27.3	Description	2062
	3.27.4	Output info	2062
	3.27.5	Restrictions	2062
	3.27.6	Related commands	2062
	3.27.7	Default	2062
3.28		compute dihedral/local command	2062
	3.28.1	Syntax	2062
	3.28.2	Examples	2063
	3.28.3	Description	2063
	3.28.4	Output info	2064
	3.28.5	Restrictions	2064
	3.28.6	Related commands	2064
	3.28.7	Default	2064
3.29		compute dilatation/atom command	2064
	3.29.1	Syntax	2064
	3.29.2	Examples	2065
	3.29.3	Description	2065
	3.29.4	Output info	2065
	3.29.5	Restrictions	2065
	3.29.6	Related commands	2065
	3.29.7	Default	2065
3.30		compute dipole command	2065
3.31		compute dipole/tip4p command	2065
	3.31.1	Syntax	2065
	3.31.2	Examples	2066
	3.31.3	Description	2066
	3.31.4	Output info	2066
	3.31.5	Restrictions	2066
	3.31.6	Related commands	2067
	3.31.7	Default	2067
3.32		compute dipole/chunk command	2067
3.33		compute dipole/tip4p/chunk command	2067
	3.33.1	Syntax	2067
	3.33.2	Examples	2067
	3.33.3	Description	2067
	3.33.4	Output info	2068
	3.33.5	Restrictions	2068
	3.33.6	Related commands	2068
	3.33.7	Default	2068
3.34		compute displace/atom command	2069
	3.34.1	Syntax	2069

	3.34.2	Examples	2069
	3.34.3	Description	2069
	3.34.4	Output info	2070
	3.34.5	Restrictions	2071
	3.34.6	Related commands	2071
	3.34.7	Default	2071
3.35		compute dpd command	2071
	3.35.1	Syntax	2071
	3.35.2	Examples	2071
	3.35.3	Description	2071
	3.35.4	Output info	2072
	3.35.5	Restrictions	2072
	3.35.6	Related commands	2072
	3.35.7	Default	2072
3.36		compute dpd/atom command	2072
	3.36.1	Syntax	2072
	3.36.2	Examples	2073
	3.36.3	Description	2073
	3.36.4	Output info	2073
	3.36.5	Restrictions	2073
	3.36.6	Related commands	2073
	3.36.7	Default	2073
3.37		compute edpd/temp/atom command	2073
	3.37.1	Syntax	2073
	3.37.2	Examples	2074
	3.37.3	Description	2074
	3.37.4	Output info	2074
	3.37.5	Restrictions	2074
	3.37.6	Related commands	2074
	3.37.7	Default	2074
3.38		compute efield/atom command	2074
	3.38.1	Syntax	2074
	3.38.2	Examples	2075
	3.38.3	Description	2075
	3.38.4	Output info	2075
	3.38.5	Restrictions	2075
	3.38.6	Related commands	2075
	3.38.7	Default	2076
3.39		compute efield/wolf/atom command	2076
	3.39.1	Syntax	2076
	3.39.2	Examples	2076
	3.39.3	Description	2076
	3.39.4	Output info	2077
	3.39.5	Restrictions	2077
	3.39.6	Related commands	2077
	3.39.7	Default	2077
3.40		compute entropy/atom command	2078
	3.40.1	Syntax	2078
	3.40.2	Examples	2078
	3.40.3	Description	2078
	3.40.4	Output info	2079
	3.40.5	Restrictions	2079
	3.40.6	Related commands	2079
	3.40.7	Default	2079

3.41	compute erotate/asphere command	2080
3.41.1	Syntax	2080
3.41.2	Examples	2080
3.41.3	Description	2080
3.41.4	Output info	2080
3.41.5	Restrictions	2080
3.41.6	Related commands	2081
3.41.7	Default	2081
3.42	compute erotate/rigid command	2081
3.42.1	Syntax	2081
3.42.2	Examples	2081
3.42.3	Description	2081
3.42.4	Output info	2081
3.42.5	Restrictions	2082
3.42.6	Related commands	2082
3.42.7	Default	2082
3.43	compute erotate/sphere command	2082
3.43.1	Syntax	2082
3.43.2	Examples	2082
3.43.3	Description	2082
3.43.4	Output info	2083
3.43.5	Restrictions	2083
3.43.6	Related commands	2083
3.43.7	Default	2083
3.44	compute erotate/sphere/atom command	2083
3.44.1	Syntax	2083
3.44.2	Examples	2084
3.44.3	Description	2084
3.44.4	Output info	2084
3.44.5	Restrictions	2084
3.44.6	Related commands	2084
3.44.7	Default	2084
3.45	compute event/displace command	2084
3.45.1	Syntax	2084
3.45.2	Examples	2085
3.45.3	Description	2085
3.45.4	Output info	2085
3.45.5	Restrictions	2085
3.45.6	Related commands	2085
3.45.7	Default	2085
3.46	compute fabric command	2086
3.46.1	Syntax	2086
3.46.2	Examples	2086
3.46.3	Description	2086
3.46.4	Output info	2087
3.46.5	Restrictions	2088
3.46.6	Related commands	2088
3.46.7	Default	2088
3.47	compute fep command	2088
3.47.1	Syntax	2088
3.47.2	Examples	2089
3.47.3	Description	2089
3.47.4	Output info	2091
3.47.5	Restrictions	2092

	3.47.6	Related commands	2092
	3.47.7	Default	2092
3.48		compute fep/ta command	2092
	3.48.1	Syntax	2092
	3.48.2	Examples	2093
	3.48.3	Description	2093
	3.48.4	Output info	2093
	3.48.5	Restrictions	2093
	3.48.6	Related commands	2093
	3.48.7	Default	2094
3.49		compute global/atom command	2094
	3.49.1	Syntax	2094
	3.49.2	Examples	2094
	3.49.3	Description	2095
	3.49.4	Output info	2097
	3.49.5	Restrictions	2097
	3.49.6	Related commands	2097
	3.49.7	Default	2097
3.50		compute group/group command	2097
	3.50.1	Syntax	2097
	3.50.2	Examples	2098
	3.50.3	Description	2098
	3.50.4	Output info	2099
	3.50.5	Restrictions	2099
	3.50.6	Related commands	2099
	3.50.7	Default	2099
3.51		compute gyration command	2100
	3.51.1	Syntax	2100
	3.51.2	Examples	2100
	3.51.3	Description	2100
	3.51.4	Output info	2100
	3.51.5	Restrictions	2101
	3.51.6	Related commands	2101
	3.51.7	Default	2101
3.52		compute gyration/chunk command	2101
	3.52.1	Syntax	2101
	3.52.2	Examples	2101
	3.52.3	Description	2101
	3.52.4	Output info	2102
	3.52.5	Restrictions	2102
	3.52.6	Related commands	2102
	3.52.7	Default	2103
3.53		compute gyration/shape command	2103
	3.53.1	Syntax	2103
	3.53.2	Examples	2103
	3.53.3	Description	2103
	3.53.4	Output info	2104
	3.53.5	Restrictions	2104
	3.53.6	Related commands	2104
	3.53.7	Default	2104
3.54		compute gyration/shape/chunk command	2104
	3.54.1	Syntax	2104
	3.54.2	Examples	2105
	3.54.3	Description	2105

	3.54.4	Output info	2105
	3.54.5	Restrictions	2106
	3.54.6	Related commands	2106
	3.54.7	Default	2106
3.55		compute heat/flux command	2106
	3.55.1	Syntax	2106
	3.55.2	Examples	2106
	3.55.3	Description	2106
	3.55.4	Output info	2108
	3.55.5	Restrictions	2108
	3.55.6	Related commands	2108
	3.55.7	Default	2108
3.56		compute hexorder/atom command	2110
	3.56.1	Syntax	2110
	3.56.2	Examples	2110
	3.56.3	Description	2110
	3.56.4	Output info	2111
	3.56.5	Restrictions	2111
	3.56.6	Related commands	2111
	3.56.7	Default	2111
3.57		compute hma command	2112
	3.57.1	Syntax	2112
	3.57.2	Examples	2112
	3.57.3	Description	2112
	3.57.4	Output info	2114
	3.57.5	Restrictions	2114
	3.57.6	Related commands	2114
	3.57.7	Default	2114
3.58		compute improper command	2114
	3.58.1	Syntax	2114
	3.58.2	Examples	2115
	3.58.3	Description	2115
	3.58.4	Output info	2115
	3.58.5	Restrictions	2115
	3.58.6	Related commands	2115
	3.58.7	Default	2115
3.59		compute improper/local command	2115
	3.59.1	Syntax	2115
	3.59.2	Examples	2116
	3.59.3	Description	2116
	3.59.4	Output info	2116
	3.59.5	Restrictions	2116
	3.59.6	Related commands	2116
	3.59.7	Default	2117
3.60		compute inertia/chunk command	2117
	3.60.1	Syntax	2117
	3.60.2	Examples	2117
	3.60.3	Description	2117
	3.60.4	Output info	2118
	3.60.5	Restrictions	2118
	3.60.6	Related commands	2118
	3.60.7	Default	2118
3.61		compute ke command	2118
	3.61.1	Syntax	2118

	3.61.2	Examples	2118
	3.61.3	Description	2118
	3.61.4	Output info	2119
	3.61.5	Restrictions	2119
	3.61.6	Related commands	2119
	3.61.7	Default	2119
3.62		compute ke/atom command	2119
	3.62.1	Syntax	2119
	3.62.2	Examples	2119
	3.62.3	Description	2119
	3.62.4	Output info	2120
	3.62.5	Restrictions	2120
	3.62.6	Related commands	2120
	3.62.7	Default	2120
3.63		compute ke/atom/eff command	2120
	3.63.1	Syntax	2120
	3.63.2	Examples	2120
	3.63.3	Description	2120
	3.63.4	Output info	2121
	3.63.5	Restrictions	2121
	3.63.6	Related commands	2121
	3.63.7	Default	2121
3.64		compute ke/eff command	2121
	3.64.1	Syntax	2121
	3.64.2	Examples	2122
	3.64.3	Description	2122
	3.64.4	Output info	2122
	3.64.5	Restrictions	2122
	3.64.6	Related commands	2123
	3.64.7	Default	2123
3.65		compute ke/rigid command	2123
	3.65.1	Syntax	2123
	3.65.2	Examples	2123
	3.65.3	Description	2123
	3.65.4	Output info	2123
	3.65.5	Restrictions	2124
	3.65.6	Related commands	2124
	3.65.7	Default	2124
3.66		compute mliap command	2124
	3.66.1	Syntax	2124
	3.66.2	Examples	2124
	3.66.3	Description	2124
	3.66.4	Output info	2126
	3.66.5	Restrictions	2126
	3.66.6	Related commands	2126
	3.66.7	Default	2126
3.67		compute momentum command	2127
	3.67.1	Syntax	2127
	3.67.2	Examples	2127
	3.67.3	Description	2127
	3.67.4	Output info	2127
	3.67.5	Restrictions	2127
	3.67.6	Related commands	2127
	3.67.7	Default	2127

3.68	compute msd command	2128
3.68.1	Syntax	2128
3.68.2	Examples	2128
3.68.3	Description	2128
3.68.4	Output info	2129
3.68.5	Restrictions	2129
3.68.6	Related commands	2129
3.68.7	Default	2129
3.69	compute msd/chunk command	2129
3.69.1	Syntax	2129
3.69.2	Examples	2130
3.69.3	Description	2130
3.69.4	Output info	2131
3.69.5	Restrictions	2131
3.69.6	Related commands	2131
3.69.7	Default	2131
3.70	compute msd/nongauss command	2131
3.70.1	Syntax	2131
3.70.2	Examples	2132
3.70.3	Description	2132
3.70.4	Output info	2132
3.70.5	Restrictions	2132
3.70.6	Related commands	2132
3.70.7	Default	2133
3.71	compute nbond/atom command	2133
3.71.1	Syntax	2133
3.71.2	Examples	2133
3.71.3	Description	2133
3.71.4	Output info	2133
3.71.5	Restrictions	2134
3.71.6	Related commands	2134
3.71.7	Default	2134
3.72	compute omega/chunk command	2134
3.72.1	Syntax	2134
3.72.2	Examples	2134
3.72.3	Description	2134
3.72.4	Output info	2135
3.72.5	Restrictions	2135
3.72.6	Related commands	2135
3.72.7	Default	2135
3.73	compute orientorder/atom command	2135
3.73.1	Syntax	2135
3.73.2	Examples	2136
3.73.3	Description	2136
3.73.4	Output info	2138
3.73.5	Restrictions	2138
3.73.6	Related commands	2138
3.73.7	Default	2138
3.74	compute pace command	2138
3.74.1	Syntax	2138
3.74.2	Examples	2139
3.74.3	Description	2139
3.74.4	Output info	2141
3.74.5	Restrictions	2141

	3.74.6	Related commands	2141
	3.74.7	Default	2142
3.75		compute pair command	2142
	3.75.1	Syntax	2142
	3.75.2	Examples	2142
	3.75.3	Description	2142
	3.75.4	Output info	2143
	3.75.5	Restrictions	2143
	3.75.6	Related commands	2143
	3.75.7	Default	2143
3.76		compute pair/local command	2143
	3.76.1	Syntax	2143
	3.76.2	Examples	2144
	3.76.3	Description	2144
	3.76.4	Output info	2145
	3.76.5	Restrictions	2146
	3.76.6	Related commands	2146
	3.76.7	Default	2146
3.77		compute pe command	2146
	3.77.1	Syntax	2146
	3.77.2	Examples	2146
	3.77.3	Description	2146
	3.77.4	Output info	2147
	3.77.5	Restrictions	2147
	3.77.6	Related commands	2147
	3.77.7	Default	2147
3.78		compute pe/atom command	2147
	3.78.1	Syntax	2147
	3.78.2	Examples	2148
	3.78.3	Description	2148
	3.78.4	Output info	2149
	3.78.5	Restrictions	2149
	3.78.6	Related commands	2149
	3.78.7	Default	2149
3.79		compute plasticity/atom command	2149
	3.79.1	Syntax	2149
	3.79.2	Examples	2149
	3.79.3	Description	2149
	3.79.4	Output info	2150
	3.79.5	Restrictions	2150
	3.79.6	Related commands	2150
	3.79.7	Default	2150
3.80		compute pod/atom command	2150
3.81		compute podd/atom command	2150
3.82		compute pod/local command	2150
3.83		compute pod/global command	2150
	3.83.1	Syntax	2150
	3.83.2	Examples	2151
	3.83.3	Description	2151
	3.83.4	Output info	2151
	3.83.5	Restrictions	2152
	3.83.6	Related commands	2152
	3.83.7	Default	2152
3.84		compute pressure command	2152

3.84.1	Syntax	2152
3.84.2	Examples	2152
3.84.3	Description	2153
3.84.4	Output info	2154
3.84.5	Restrictions	2154
3.84.6	Related commands	2154
3.84.7	Default	2154
3.85	compute pressure/alchemy command	2155
3.85.1	Syntax	2155
3.85.2	Examples	2155
3.85.3	Description	2155
3.85.4	Output info	2155
3.85.5	Restrictions	2156
3.85.6	Related commands	2156
3.85.7	Default	2156
3.86	compute pressure/uef command	2156
3.86.1	Syntax	2156
3.86.2	Examples	2156
3.86.3	Description	2156
3.86.4	Restrictions	2157
3.86.5	Related commands	2157
3.86.6	Default	2157
3.87	compute property/atom command	2157
3.87.1	Syntax	2157
3.87.2	Examples	2159
3.87.3	Description	2159
3.87.4	Output info	2160
3.87.5	Restrictions	2160
3.87.6	Related commands	2160
3.87.7	Default	2160
3.88	compute property/chunk command	2160
3.88.1	Syntax	2160
3.88.2	Examples	2161
3.88.3	Description	2161
3.88.4	Output info	2162
3.88.5	Restrictions	2162
3.88.6	Related commands	2162
3.88.7	Default	2162
3.89	compute property/grid command	2162
3.89.1	Syntax	2162
3.89.2	Examples	2163
3.89.3	Description	2163
3.89.4	Output info	2163
3.89.5	Restrictions	2164
3.89.6	Related commands	2164
3.89.7	Default	2164
3.90	compute property/local command	2164
3.90.1	Syntax	2164
3.90.2	Examples	2165
3.90.3	Description	2165
3.90.4	Output info	2166
3.90.5	Restrictions	2166
3.90.6	Related commands	2166
3.90.7	Default	2166

3.91	compute ptm/atom command	2167
3.91.1	Syntax	2167
3.91.2	Examples	2167
3.91.3	Description	2167
3.91.4	Output info	2168
3.91.5	Restrictions	2168
3.91.6	Related commands	2169
3.91.7	Default	2169
3.92	compute rattlers/atom command	2169
3.92.1	Syntax	2169
3.92.2	Examples	2169
3.92.3	Description	2169
3.92.4	Output info	2170
3.92.5	Restrictions	2170
3.92.6	Related commands	2170
3.92.7	Default	2170
3.93	compute rdf command	2170
3.93.1	Syntax	2170
3.93.2	Examples	2171
3.93.3	Description	2171
3.93.4	Output info	2172
3.93.5	Restrictions	2173
3.93.6	Related commands	2173
3.93.7	Default	2173
3.94	compute reaxff/atom command	2173
3.94.1	Syntax	2173
3.94.2	Examples	2174
3.94.3	Description	2174
3.94.4	Output info	2174
3.94.5	Restrictions	2175
3.94.6	Related commands	2175
3.94.7	Default	2175
3.95	compute reduce command	2175
3.96	compute reduce/region command	2175
3.96.1	Syntax	2175
3.96.2	Examples	2176
3.96.3	Description	2176
3.96.4	Output info	2178
3.96.5	Restrictions	2178
3.96.6	Related commands	2178
3.96.7	Default	2178
3.97	compute reduce/chunk command	2178
3.97.1	Syntax	2178
3.97.2	Examples	2179
3.97.3	Description	2179
3.97.4	Output info	2180
3.97.5	Restrictions	2181
3.97.6	Related commands	2181
3.97.7	Default	2181
3.98	compute rheo/property/atom command	2181
3.98.1	Syntax	2181
3.98.2	Examples	2182
3.98.3	Description	2182
3.98.4	Output info	2182

	3.98.5	Restrictions	2183
	3.98.6	Related commands	2183
	3.98.7	Default	2183
3.99		compute rigid/local command	2183
	3.99.1	Syntax	2183
	3.99.2	Examples	2184
	3.99.3	Description	2184
	3.99.4	Output info	2185
	3.99.5	Restrictions	2185
	3.99.6	Related commands	2186
	3.99.7	Default	2186
3.100		compute saed command	2186
	3.100.1	Syntax	2186
	3.100.2	Examples	2186
	3.100.3	Description	2187
	3.100.4	Output info	2189
	3.100.5	Restrictions	2189
	3.100.6	Related commands	2189
	3.100.7	Default	2189
3.101		compute slcsa/atom command	2189
	3.101.1	Syntax	2189
	3.101.2	Examples	2190
	3.101.3	Description	2190
	3.101.4	Output info	2191
	3.101.5	Restrictions	2191
	3.101.6	Related commands	2191
	3.101.7	Default	2191
3.102		compute slice command	2191
	3.102.1	Syntax	2191
	3.102.2	Examples	2192
	3.102.3	Description	2192
	3.102.4	Output info	2193
	3.102.5	Restrictions	2193
	3.102.6	Related commands	2193
	3.102.7	Default	2193
3.103		compute smd/contact/radius command	2193
	3.103.1	Syntax	2193
	3.103.2	Examples	2193
	3.103.3	Description	2194
	3.103.4	Output info	2194
	3.103.5	Restrictions	2194
	3.103.6	Related commands	2194
	3.103.7	Default	2194
3.104		compute smd/damage command	2194
	3.104.1	Syntax	2194
	3.104.2	Examples	2195
	3.104.3	Description	2195
	3.104.4	Restrictions	2195
	3.104.5	Related commands	2195
	3.104.6	Default	2195
3.105		compute smd/hourglass/error command	2195
	3.105.1	Syntax	2195
	3.105.2	Examples	2196
	3.105.3	Description	2196

3.105.4	Restrictions	2196
3.105.5	Related commands	2196
3.105.6	Default	2196
3.106	compute smd/internal/energy command	2196
3.106.1	Syntax	2196
3.106.2	Examples	2197
3.106.3	Description	2197
3.106.4	Output Info	2197
3.106.5	Restrictions	2197
3.106.6	Related commands	2197
3.106.7	Default	2197
3.107	compute smd/plastic/strain command	2197
3.107.1	Syntax	2197
3.107.2	Examples	2198
3.107.3	Description	2198
3.107.4	Restrictions	2198
3.107.5	Related commands	2198
3.107.6	Default	2198
3.108	compute smd/plastic/strain/rate command	2198
3.108.1	Syntax	2198
3.108.2	Examples	2199
3.108.3	Description	2199
3.108.4	Restrictions	2199
3.108.5	Related commands	2199
3.108.6	Default	2199
3.109	compute smd/rho command	2199
3.109.1	Syntax	2199
3.109.2	Examples	2200
3.109.3	Description	2200
3.109.4	Output info	2200
3.109.5	Restrictions	2200
3.109.6	Related commands	2200
3.109.7	Default	2200
3.110	compute smd/tlsph/defgrad command	2200
3.110.1	Syntax	2200
3.110.2	Examples	2201
3.110.3	Description	2201
3.110.4	Output info	2201
3.110.5	Restrictions	2201
3.110.6	Related commands	2201
3.110.7	Default	2201
3.111	compute smd/tlsph/dt command	2201
3.111.1	Syntax	2201
3.111.2	Examples	2202
3.111.3	Description	2202
3.111.4	Output info	2202
3.111.5	Restrictions	2202
3.111.6	Related commands	2202
3.111.7	Default	2202
3.112	compute smd/tlsph/num/neighs command	2202
3.112.1	Syntax	2202
3.112.2	Examples	2203
3.112.3	Description	2203
3.112.4	Output info	2203

3.112.5	Restrictions	2203
3.112.6	Related commands	2203
3.112.7	Default	2203
3.113	compute <code>smd/tlsph/shape</code> command	2203
3.113.1	Syntax	2203
3.113.2	Examples	2204
3.113.3	Description	2204
3.113.4	Output info	2204
3.113.5	Restrictions	2204
3.113.6	Related commands	2204
3.113.7	Default	2204
3.114	compute <code>smd/tlsph/strain</code> command	2204
3.114.1	Syntax	2204
3.114.2	Examples	2205
3.114.3	Description	2205
3.114.4	Output info	2205
3.114.5	Restrictions	2205
3.114.6	Related commands	2205
3.114.7	Default	2205
3.115	compute <code>smd/tlsph/strain/rate</code> command	2205
3.115.1	Syntax	2205
3.115.2	Examples	2206
3.115.3	Description	2206
3.115.4	Output info	2206
3.115.5	Restrictions	2206
3.115.6	Related commands	2206
3.115.7	Default	2206
3.116	compute <code>smd/tlsph/stress</code> command	2206
3.116.1	Syntax	2206
3.116.2	Examples	2207
3.116.3	Description	2207
3.116.4	Output info	2207
3.116.5	Restrictions	2207
3.116.6	Related commands	2207
3.116.7	Default	2207
3.117	compute <code>smd/triangle/vertices</code> command	2207
3.117.1	Syntax	2207
3.117.2	Examples	2208
3.117.3	Description	2208
3.117.4	Output info	2208
3.117.5	Restrictions	2208
3.117.6	Related commands	2208
3.117.7	Default	2208
3.118	compute <code>smd/ulsph/effm</code> command	2208
3.118.1	Syntax	2208
3.118.2	Examples	2209
3.118.3	Description	2209
3.118.4	Output info	2209
3.118.5	Restrictions	2209
3.118.6	Related commands	2209
3.118.7	Default	2209
3.119	compute <code>smd/ulsph/num/neighs</code> command	2209
3.119.1	Syntax	2209
3.119.2	Examples	2210

3.119.3	Description	2210
3.119.4	Output info	2210
3.119.5	Restrictions	2210
3.119.6	Related commands	2210
3.119.7	Default	2210
3.120	compute smd/ulsph/strain command	2210
3.120.1	Syntax	2210
3.120.2	Examples	2211
3.120.3	Description	2211
3.120.4	Output info	2211
3.120.5	Restrictions	2211
3.120.6	Related commands	2211
3.120.7	Default	2211
3.121	compute smd/ulsph/strain/rate command	2211
3.121.1	Syntax	2211
3.121.2	Examples	2212
3.121.3	Description	2212
3.121.4	Output info	2212
3.121.5	Restrictions	2212
3.121.6	Related commands	2212
3.121.7	Default	2212
3.122	compute smd/ulsph/stress command	2212
3.122.1	Syntax	2212
3.122.2	Examples	2213
3.122.3	Description	2213
3.122.4	Output info	2213
3.122.5	Restrictions	2213
3.122.6	Related commands	2213
3.122.7	Default	2213
3.123	compute smd/vol command	2213
3.123.1	Syntax	2213
3.123.2	Examples	2214
3.123.3	Description	2214
3.123.4	Output info	2214
3.123.5	Restrictions	2214
3.123.6	Related commands	2214
3.123.7	Default	2214
3.124	compute sna/atom command	2215
3.125	compute snad/atom command	2215
3.126	compute snav/atom command	2215
3.127	compute snap command	2215
3.128	compute sna/grid command	2215
3.129	compute sna/grid/local command	2215
3.129.1	Syntax	2215
3.129.2	Examples	2216
3.129.3	Description	2217
3.129.4	Output info	2221
3.129.5	Restrictions	2222
3.129.6	Related commands	2222
3.129.7	Default	2222
3.130	compute sph/e/atom command	2223
3.130.1	Syntax	2223
3.130.2	Examples	2223
3.130.3	Description	2223

3.130.4	Output info	2223
3.130.5	Restrictions	2224
3.130.6	Related commands	2224
3.130.7	Default	2224
3.131	compute sph/rho/atom command	2224
3.131.1	Syntax	2224
3.131.2	Examples	2224
3.131.3	Description	2224
3.131.4	Output info	2224
3.131.5	Restrictions	2225
3.131.6	Related commands	2225
3.131.7	Default	2225
3.132	compute sph/t/atom command	2225
3.132.1	Syntax	2225
3.132.2	Examples	2225
3.132.3	Description	2225
3.132.4	Output info	2226
3.132.5	Restrictions	2226
3.132.6	Related commands	2226
3.132.7	Default	2226
3.133	compute spin command	2226
3.133.1	Syntax	2226
3.133.2	Examples	2226
3.133.3	Description	2226
3.133.4	Output info	2227
3.133.5	Restrictions	2227
3.133.6	Default	2227
3.134	compute stress/atom command	2227
3.135	compute centroid/stress/atom command	2227
3.135.1	Syntax	2227
3.135.2	Examples	2228
3.135.3	Description	2228
3.135.4	Output info	2230
3.135.5	Restrictions	2231
3.135.6	Related commands	2231
3.135.7	Default	2231
3.136	compute stress/cartesian command	2231
3.136.1	Syntax	2231
3.136.2	Examples	2232
3.136.3	Description	2232
3.136.4	Output info	2232
3.136.5	Restrictions	2233
3.136.6	Related commands	2233
3.137	compute stress/cylinder command	2233
3.138	compute stress/spherical command	2233
3.138.1	Syntax	2233
3.138.2	Examples	2233
3.138.3	Description	2234
3.138.4	Output info	2234
3.138.5	Restrictions	2234
3.138.6	Related commands	2235
3.138.7	Default	2235
3.139	compute stress/mop command	2235
3.140	compute stress/mop/profile command	2235

3.140.1	Syntax	2235
3.140.2	Examples	2235
3.140.3	Description	2236
3.140.4	Output info	2236
3.140.5	Restrictions	2237
3.140.6	Related commands	2237
3.140.7	Default	2237
3.141	compute force/tally command	2237
3.142	compute heat/flux/tally command	2237
3.143	compute heat/flux/virial/tally command	2237
3.144	compute pe/tally command	2237
3.145	compute pe/mol/tally command	2237
3.146	compute stress/tally command	2237
3.146.1	Syntax	2237
3.146.2	Examples	2238
3.146.3	Description	2238
3.146.4	Output info	2239
3.146.5	Restrictions	2240
3.146.6	Related commands	2240
3.146.7	Default	2240
3.147	compute tdpd/cc/atom command	2240
3.147.1	Syntax	2240
3.147.2	Examples	2240
3.147.3	Description	2241
3.147.4	Output info	2241
3.147.5	Restrictions	2241
3.147.6	Related commands	2241
3.147.7	Default	2241
3.148	compute temp command	2241
3.148.1	Syntax	2241
3.148.2	Examples	2242
3.148.3	Description	2242
3.148.4	Output info	2243
3.148.5	Restrictions	2243
3.148.6	Related commands	2243
3.148.7	Default	2243
3.149	compute temp/asphere command	2243
3.149.1	Syntax	2243
3.149.2	Examples	2244
3.149.3	Description	2244
3.149.4	Output info	2245
3.149.5	Restrictions	2245
3.149.6	Related commands	2245
3.149.7	Default	2245
3.150	compute temp/body command	2245
3.150.1	Syntax	2245
3.150.2	Examples	2246
3.150.3	Description	2246
3.150.4	Output info	2247
3.150.5	Restrictions	2247
3.150.6	Related commands	2247
3.150.7	Default	2247
3.151	compute temp/chunk command	2247
3.151.1	Syntax	2247

3.151.2	Examples	2248
3.151.3	Description	2248
3.151.4	Output info	2250
3.151.5	Restrictions	2250
3.151.6	Related commands	2251
3.151.7	Default	2251
3.152	compute temp/com command	2251
3.152.1	Syntax	2251
3.152.2	Examples	2251
3.152.3	Description	2251
3.152.4	Output info	2252
3.152.5	Restrictions	2252
3.152.6	Related commands	2252
3.152.7	Default	2252
3.153	compute temp/cs command	2252
3.153.1	Syntax	2252
3.153.2	Examples	2253
3.153.3	Description	2253
3.153.4	Output info	2254
3.153.5	Restrictions	2254
3.153.6	Related commands	2254
3.153.7	Default	2254
3.154	compute temp/deform command	2254
3.154.1	Syntax	2254
3.154.2	Examples	2254
3.154.3	Description	2255
3.154.4	Output info	2256
3.154.5	Restrictions	2256
3.154.6	Related commands	2256
3.154.7	Default	2256
3.155	compute temp/deform/eff command	2256
3.155.1	Syntax	2256
3.155.2	Examples	2256
3.155.3	Description	2257
3.155.4	Output info	2257
3.155.5	Restrictions	2257
3.155.6	Related commands	2257
3.155.7	Default	2257
3.156	compute temp/drude command	2257
3.156.1	Syntax	2257
3.156.2	Examples	2258
3.156.3	Description	2258
3.156.4	Output info	2258
3.156.5	Restrictions	2258
3.156.6	Related commands	2259
3.156.7	Default	2259
3.157	compute temp/eff command	2259
3.157.1	Syntax	2259
3.157.2	Examples	2259
3.157.3	Description	2259
3.157.4	Output info	2260
3.157.5	Restrictions	2260
3.157.6	Related commands	2260
3.157.7	Default	2260

3.158	compute temp/partial command	2260
3.158.1	Syntax	2260
3.158.2	Examples	2261
3.158.3	Description	2261
3.158.4	Output info	2262
3.158.5	Restrictions	2262
3.158.6	Related commands	2262
3.158.7	Default	2262
3.159	compute temp/profile command	2262
3.159.1	Syntax	2262
3.159.2	Examples	2263
3.159.3	Description	2263
3.159.4	Output info	2264
3.159.5	Restrictions	2264
3.159.6	Related commands	2265
3.159.7	Default	2265
3.160	compute temp/ramp command	2265
3.160.1	Syntax	2265
3.160.2	Examples	2265
3.160.3	Description	2265
3.160.4	Output info	2266
3.160.5	Restrictions	2266
3.160.6	Related commands	2266
3.160.7	Default	2267
3.161	compute temp/region command	2267
3.161.1	Syntax	2267
3.161.2	Examples	2267
3.161.3	Description	2267
3.161.4	Output info	2268
3.161.5	Restrictions	2268
3.161.6	Related commands	2268
3.161.7	Default	2268
3.162	compute temp/region/eff command	2268
3.162.1	Syntax	2268
3.162.2	Examples	2269
3.162.3	Description	2269
3.162.4	Output info	2269
3.162.5	Restrictions	2269
3.162.6	Related commands	2269
3.162.7	Default	2269
3.163	compute temp/rotate command	2269
3.163.1	Syntax	2269
3.163.2	Examples	2270
3.163.3	Description	2270
3.163.4	Output info	2270
3.163.5	Restrictions	2271
3.163.6	Related commands	2271
3.163.7	Default	2271
3.164	compute temp/sphere command	2271
3.164.1	Syntax	2271
3.164.2	Examples	2271
3.164.3	Description	2271
3.164.4	Output info	2272
3.164.5	Restrictions	2273

3.164.6	Related commands	2273
3.164.7	Default	2273
3.165	compute temp/uef command	2273
3.165.1	Syntax	2273
3.165.2	Examples	2273
3.165.3	Description	2273
3.165.4	Restrictions	2273
3.165.5	Related commands	2274
3.165.6	Default	2274
3.166	compute ti command	2274
3.166.1	Syntax	2274
3.166.2	Examples	2274
3.166.3	Description	2275
3.166.4	Output info	2275
3.166.5	Restrictions	2276
3.166.6	Related commands	2276
3.166.7	Default	2276
3.167	compute torque/chunk command	2276
3.167.1	Syntax	2276
3.167.2	Examples	2276
3.167.3	Description	2276
3.167.4	Output info	2277
3.167.5	Restrictions	2277
3.167.6	Related commands	2277
3.167.7	Default	2277
3.168	compute vacf command	2277
3.168.1	Syntax	2277
3.168.2	Examples	2278
3.168.3	Description	2278
3.168.4	Output info	2278
3.168.5	Restrictions	2278
3.168.6	Related commands	2279
3.168.7	Default	2279
3.169	compute vcm/chunk command	2279
3.169.1	Syntax	2279
3.169.2	Examples	2279
3.169.3	Description	2279
3.169.4	Output info	2280
3.169.5	Restrictions	2280
3.169.6	Related commands	2280
3.169.7	Default	2280
3.170	compute viscosity/cos command	2280
3.170.1	Syntax	2280
3.170.2	Examples	2280
3.170.3	Description	2281
3.170.4	Output info	2282
3.170.5	Restrictions	2282
3.170.6	Related commands	2282
3.170.7	Default	2282
3.171	compute voronoi/atom command	2282
3.171.1	Syntax	2282
3.171.2	Examples	2283
3.171.3	Description	2283
3.171.4	Output info	2285

3.171.5	Restrictions	2285
3.171.6	Related commands	2285
3.171.7	Default	2285
3.172	compute xrd command	2285
3.172.1	Syntax	2285
3.172.2	Examples	2286
3.172.3	Description	2286
3.172.4	Output info	2288
3.172.5	Restrictions	2289
3.172.6	Related commands	2289
3.172.7	Default	2289
4	Pair Styles	2291
4.1	pair_style adp command	2291
4.1.1	Syntax	2291
4.1.2	Examples	2291
4.1.3	Description	2291
4.1.4	Mixing, shift, table, tail correction, restart, rRESPA info	2293
4.1.5	Restrictions	2293
4.1.6	Related commands	2293
4.1.7	Default	2293
4.2	pair_style agni command	2294
4.2.1	Syntax	2294
4.2.2	Examples	2294
4.2.3	Description	2294
4.2.4	Mixing, shift, table, tail correction, restart, rRESPA info	2295
4.2.5	Restrictions	2295
4.2.6	Related commands	2295
4.2.7	Default	2295
4.3	pair_style aip/water/2dm command	2296
4.3.1	Syntax	2296
4.3.2	Examples	2296
4.3.3	Description	2296
4.3.4	Mixing, shift, table, tail correction, restart, rRESPA info	2298
4.3.5	Restrictions	2298
4.3.6	Related commands	2298
4.3.7	Default	2298
4.4	pair_style airebo command	2299
4.5	pair_style airebo/morse command	2299
4.6	pair_style rebo command	2299
4.6.1	Syntax	2299
4.6.2	Examples	2299
4.6.3	Description	2299
4.6.4	Mixing, shift, table, tail correction, restart, rRESPA info	2301
4.6.5	Restrictions	2302
4.6.6	Related commands	2302
4.6.7	Default	2302
4.7	pair_style amoeba command	2302
4.8	pair_style hippo command	2302
4.8.1	Syntax	2302
4.8.2	Examples	2303
4.8.3	Additional info	2303
4.8.4	Description	2303
4.8.5	Mixing, shift, table, tail correction, restart, rRESPA info	2305

	4.8.6	Restrictions	2305
	4.8.7	Related commands	2306
	4.8.8	Default	2306
4.9	pair_style	atm command	2307
	4.9.1	Syntax	2307
	4.9.2	Examples	2307
	4.9.3	Description	2307
	4.9.4	Mixing, shift, table, tail correction, restart, rRESPA info	2309
	4.9.5	Restrictions	2309
	4.9.6	Related commands	2309
	4.9.7	Default	2309
4.10	pair_style	awpmd/cut command	2309
	4.10.1	Syntax	2309
	4.10.2	Examples	2310
	4.10.3	Description	2310
	4.10.4	Mixing, shift, table, tail correction, restart, rRESPA info	2311
	4.10.5	Restrictions	2311
	4.10.6	Related commands	2311
	4.10.7	Default	2311
4.11	pair_style	beck command	2311
	4.11.1	Syntax	2311
	4.11.2	Examples	2311
	4.11.3	Description	2312
	4.11.4	Mixing, shift, table, tail correction, restart, rRESPA info	2312
	4.11.5	Restrictions	2313
	4.11.6	Related commands	2313
	4.11.7	Default	2313
4.12	pair_style	body/nparticle command	2313
	4.12.1	Syntax	2313
	4.12.2	Examples	2313
	4.12.3	Description	2313
	4.12.4	Mixing, shift, table, tail correction, restart, rRESPA info	2314
	4.12.5	Restrictions	2315
	4.12.6	Related commands	2315
	4.12.7	Default	2315
4.13	pair_style	body/rounded/polygon command	2315
	4.13.1	Syntax	2315
	4.13.2	Examples	2315
	4.13.3	Description	2315
	4.13.4	Mixing, shift, table, tail correction, restart, rRESPA info	2318
	4.13.5	Restrictions	2318
	4.13.6	Related commands	2318
	4.13.7	Default	2318
4.14	pair_style	body/rounded/polyhedron command	2318
	4.14.1	Syntax	2318
	4.14.2	Examples	2319
	4.14.3	Description	2319
	4.14.4	Mixing, shift, table, tail correction, restart, rRESPA info	2321
	4.14.5	Restrictions	2321
	4.14.6	Related commands	2321
	4.14.7	Default	2321
4.15	pair_style	bop command	2321
	4.15.1	Syntax	2321
	4.15.2	Examples	2321

4.15.3	Description	2322
4.15.4	Mixing, shift, table, tail correction, restart, rRESPA info	2326
4.15.5	Restrictions	2326
4.15.6	Related commands	2327
4.15.7	Default	2327
4.16	pair_style born command	2327
4.17	pair_style born/coul/long command	2327
4.18	pair_style born/coul/msm command	2327
4.19	pair_style born/coul/wolf command	2327
4.20	pair_style born/coul/dsf command	2327
4.20.1	Syntax	2327
4.20.2	Examples	2328
4.20.3	Description	2329
4.20.4	Mixing, shift, table, tail correction, restart, rRESPA info	2330
4.20.5	Restrictions	2330
4.20.6	Related commands	2330
4.20.7	Default	2330
4.21	pair_style born/gauss command	2330
4.21.1	Syntax	2330
4.21.2	Examples	2331
4.21.3	Description	2331
4.21.4	Mixing, shift, table, tail correction, restart, rRESPA info	2331
4.21.5	Restrictions	2332
4.21.6	Related commands	2332
4.21.7	Default	2332
4.22	pair_style bpm/spring command	2332
4.22.1	Syntax	2332
4.22.2	Examples	2332
4.22.3	Description	2332
4.22.4	Mixing, shift, table, tail correction, restart, rRESPA info	2333
4.22.5	Restrictions	2333
4.22.6	Related commands	2333
4.22.7	Default	2334
4.23	pair_style brownian command	2334
4.24	pair_style brownian/poly command	2334
4.24.1	Syntax	2334
4.24.2	Examples	2334
4.24.3	Description	2334
4.24.4	Mixing, shift, table, tail correction, restart, rRESPA info	2335
4.24.5	Restrictions	2336
4.24.6	Related commands	2336
4.24.7	Default	2336
4.25	pair_style buck command	2336
4.26	pair_style buck/coul/cut command	2336
4.27	pair_style buck/coul/long command	2336
4.28	pair_style buck/coul/msm command	2336
4.28.1	Syntax	2336
4.28.2	Examples	2337
4.28.3	Description	2337
4.28.4	Mixing, shift, table, tail correction, restart, rRESPA info	2338
4.28.5	Restrictions	2339
4.28.6	Related commands	2339
4.28.7	Default	2339
4.29	pair_style buck6d/coul/gauss/dsf command	2339

4.30	pair_style buck6d/coul/gauss/long command	2339
4.30.1	Syntax	2339
4.30.2	Examples	2339
4.30.3	Description	2340
4.30.4	Mixing, shift, table, tail correction, restart, rRESPA info	2341
4.30.5	Restrictions	2341
4.30.6	Related commands	2341
4.30.7	Default	2341
4.31	pair_style buck/long/coul/long command	2341
4.31.1	Syntax	2341
4.31.2	Examples	2342
4.31.3	Description	2342
4.31.4	Mixing, shift, table, tail correction, restart, rRESPA info	2343
4.31.5	Restrictions	2343
4.31.6	Related commands	2343
4.31.7	Default	2343
4.32	pair_style lj/charmm/coul/charmm command	2344
4.33	pair_style lj/charmm/coul/charmm/implicit command	2344
4.34	pair_style lj/charmm/coul/long command	2344
4.35	pair_style lj/charmm/coul/msm command	2344
4.36	pair_style lj/charmmfsw/coul/charmmfsh command	2344
4.37	pair_style lj/charmmfsw/coul/long command	2344
4.37.1	Syntax	2344
4.37.2	Examples	2345
4.37.3	Description	2345
4.37.4	Mixing, shift, table, tail correction, restart, rRESPA info	2347
4.37.5	Restrictions	2347
4.37.6	Related commands	2347
4.37.7	Default	2348
4.38	pair_style lj/class2 command	2348
4.39	pair_style lj/class2/coul/cut command	2348
4.40	pair_style lj/class2/coul/long command	2348
4.40.1	Syntax	2348
4.40.2	Examples	2349
4.40.3	Description	2349
4.40.4	Mixing, shift, table, tail correction, restart, rRESPA info	2350
4.40.5	Restrictions	2350
4.40.6	Related commands	2351
4.40.7	Default	2351
4.41	pair_style colloid command	2351
4.41.1	Syntax	2351
4.41.2	Examples	2351
4.41.3	Description	2351
4.41.4	Mixing, shift, table, tail correction, restart, rRESPA info	2354
4.41.5	Restrictions	2354
4.41.6	Related commands	2354
4.41.7	Default	2354
4.42	pair_style comb command	2354
4.43	pair_style comb3 command	2355
4.43.1	Syntax	2355
4.43.2	Examples	2355
4.43.3	Description	2355
4.43.4	Mixing, shift, table, tail correction, restart, rRESPA info	2357
4.43.5	Restrictions	2357

	4.43.6	Related commands	2357
	4.43.7	Default	2357
4.44	pair_style	cosine/squared command	2357
	4.44.1	Syntax	2357
	4.44.2	Examples	2358
	4.44.3	Description	2358
	4.44.4	Mixing, shift, table, tail correction, restart, rRESPA info	2359
	4.44.5	Restrictions	2359
	4.44.6	Related commands	2359
	4.44.7	Default	2359
4.45	pair_style	coul/cut command	2360
4.46	pair_style	coul/cut/global command	2360
4.47	pair_style	coul/debye command	2360
4.48	pair_style	coul/dsf command	2360
4.49	pair_style	coul/exclude command	2360
4.50	pair_style	coul/long command	2360
4.51	pair_style	coul/msm command	2360
4.52	pair_style	coul/streitz command	2360
4.53	pair_style	coul/wolf command	2360
4.54	pair_style	tip4p/cut command	2361
4.55	pair_style	tip4p/long command	2361
	4.55.1	Syntax	2361
	4.55.2	Examples	2361
	4.55.3	Description	2362
	4.55.4	Mixing, shift, table, tail correction, restart, rRESPA info	2364
	4.55.5	Restrictions	2365
	4.55.6	Related commands	2365
	4.55.7	Default	2365
4.56	pair_style	coul/diel command	2365
	4.56.1	Syntax	2365
	4.56.2	Examples	2366
	4.56.3	Description	2366
	4.56.4	Mixing, shift, table, tail correction, restart, rRESPA info	2366
	4.56.5	Restrictions	2367
	4.56.6	Related commands	2367
	4.56.7	Default	2367
4.57	pair_style	coul/shield command	2367
	4.57.1	Syntax	2367
	4.57.2	Examples	2367
	4.57.3	Description	2367
	4.57.4	Mixing, shift, table, tail correction, restart, rRESPA info	2368
	4.57.5	Restrictions	2368
	4.57.6	Related commands	2368
	4.57.7	Default	2368
4.58	pair_style	coul/slatter command	2369
4.59	pair_style	coul/slatter/cut command	2369
4.60	pair_style	coul/slatter/long command	2369
	4.60.1	Syntax	2369
	4.60.2	Examples	2369
	4.60.3	Description	2369
	4.60.4	Mixing, shift, table, tail correction, restart, rRESPA info	2370
	4.60.5	Restrictions	2370
	4.60.6	Related commands	2370
	4.60.7	Default	2370

4.61	pair_style coul/tt command	2370
4.61.1	Syntax	2370
4.61.2	Examples	2371
4.61.3	Description	2371
4.61.4	Mixing, shift, table, tail correction, restart, rRESPA info	2372
4.61.5	Restrictions	2372
4.61.6	Related commands	2372
4.61.7	Default	2372
4.62	pair_style born/coul/dsf/cs command	2372
4.63	pair_style born/coul/long/cs command	2372
4.64	pair_style born/coul/wolf/cs command	2372
4.65	pair_style buck/coul/long/cs command	2372
4.66	pair_style coul/long/cs command	2372
4.67	pair_style coul/wolf/cs command	2373
4.68	pair_style lj/cut/coul/long/cs command	2373
4.69	pair_style lj/class2/coul/long/cs command	2373
4.69.1	Syntax	2373
4.69.2	Examples	2373
4.69.3	Description	2374
4.69.4	Mixing, shift, table, tail correction, restart, rRESPA info	2375
4.69.5	Restrictions	2375
4.69.6	Related commands	2375
4.69.7	Default	2375
4.70	pair_style coul/cut/dielectric command	2376
4.71	pair_style coul/long/dielectric command	2376
4.72	pair_style lj/cut/coul/cut/dielectric command	2376
4.73	pair_style lj/cut/coul/debye/dielectric command	2376
4.74	pair_style lj/cut/coul/long/dielectric command	2376
4.75	pair_style lj/cut/coul/msm/dielectric command	2376
4.76	pair_style lj/long/coul/long/dielectric command	2376
4.76.1	Syntax	2376
4.76.2	Examples	2376
4.76.3	Description	2377
4.76.4	Mixing, shift, table, tail correction, restart, rRESPA info	2377
4.76.5	Restrictions	2377
4.76.6	Related commands	2378
4.76.7	Default	2378
4.77	pair_style lj/cut/dipole/cut command	2378
4.78	pair_style lj/sf/dipole/sf command	2378
4.79	pair_style lj/cut/dipole/long command	2378
4.80	pair_style lj/long/dipole/long command	2378
4.80.1	Syntax	2378
4.80.2	Examples	2379
4.80.3	Description	2379
4.80.4	Mixing, shift, table, tail correction, restart, rRESPA info	2383
4.80.5	Restrictions	2384
4.80.6	Related commands	2384
4.80.7	Default	2384
4.81	pair_style dpd command	2384
4.82	pair_style dpd/tstat command	2384
4.82.1	Syntax	2384
4.82.2	Examples	2385
4.82.3	Description	2385
4.82.4	Mixing, shift, table, tail correction, restart, rRESPA info	2386

	4.82.5	Restrictions	2387
	4.82.6	Related commands	2387
	4.82.7	Default	2387
4.83	pair_style dpd/coul/slater/long command		2387
	4.83.1	Syntax	2388
	4.83.2	Examples	2388
	4.83.3	Description	2388
	4.83.4	Mixing, shift, table, tail correction, restart, rRESPA info	2389
	4.83.5	Restrictions	2390
	4.83.6	Related commands	2390
	4.83.7	Default	2390
4.84	pair_style dpd/ext command		2390
4.85	pair_style dpd/ext/tstat command		2390
	4.85.1	Syntax	2390
	4.85.2	Examples	2391
	4.85.3	Description	2391
	4.85.4	Restrictions	2393
	4.85.5	Related commands	2393
4.86	pair_style dpd/fdt command		2393
4.87	pair_style dpd/fdt/energy command		2393
	4.87.1	Syntax	2394
	4.87.2	Examples	2394
	4.87.3	Description	2394
	4.87.4	Restrictions	2396
	4.87.5	Related commands	2396
	4.87.6	Default	2396
4.88	pair_style drip command		2396
	4.88.1	Syntax	2396
	4.88.2	Examples	2396
	4.88.3	Description	2397
	4.88.4	Mixing, shift, table, tail correction, restart, rRESPA info	2398
	4.88.5	Restrictions	2398
	4.88.6	Related commands	2398
4.89	pair_style dsmc command		2398
	4.89.1	Syntax	2398
	4.89.2	Examples	2399
	4.89.3	Description	2399
	4.89.4	Mixing, shift, table, tail correction, restart, rRESPA info	2400
	4.89.5	Restrictions	2400
	4.89.6	Related commands	2400
	4.89.7	Default	2400
4.90	pair_style e3b command		2400
	4.90.1	Syntax	2400
	4.90.2	Examples	2401
	4.90.3	Description	2401
	4.90.4	Mixing, shift, table, tail correction, restart, rRESPA info	2402
	4.90.5	Restrictions	2403
	4.90.6	Related commands	2403
	4.90.7	Default	2403
4.91	pair_style eam command		2403
4.92	pair_style eam/alloy command		2403
4.93	pair_style eam/cd command		2403
4.94	pair_style eam/cd/old command		2403
4.95	pair_style eam/fs command		2403

4.96	pair_style eam/he command	2403
4.96.1	Syntax	2404
4.96.2	Examples	2404
4.96.3	Description	2404
4.96.4	Mixing, shift, table, tail correction, restart, rRESPA info	2409
4.96.5	Restrictions	2410
4.96.6	Related commands	2410
4.96.7	Default	2410
4.97	pair_style edip command	2410
4.98	pair_style edip/multi command	2410
4.98.1	Syntax	2410
4.98.2	Examples	2411
4.98.3	Description	2411
4.98.4	Mixing, shift, table, tail correction, restart, rRESPA info	2413
4.98.5	Restrictions	2413
4.98.6	Related commands	2413
4.98.7	Default	2413
4.99	pair_style eff/cut command	2413
4.99.1	Syntax	2413
4.99.2	Examples	2414
4.99.3	Description	2414
4.99.4	Mixing, shift, table, tail correction, restart, rRESPA info	2417
4.99.5	Restrictions	2417
4.99.6	Related commands	2417
4.99.7	Default	2418
4.100	pair_style eim command	2418
4.100.1	Syntax	2418
4.100.2	Examples	2418
4.100.3	Description	2418
4.100.4	Restrictions	2420
4.100.5	Related commands	2420
4.100.6	Default	2420
4.101	pair_style exp6/rx command	2421
4.101.1	Syntax	2421
4.101.2	Examples	2421
4.101.3	Description	2421
4.101.4	Mixing, shift, table, tail correction, restart, rRESPA info	2423
4.101.5	Restrictions	2423
4.101.6	Related commands	2423
4.101.7	Default	2423
4.102	pair_style extep command	2423
4.102.1	Syntax	2423
4.102.2	Examples	2424
4.102.3	Description	2424
4.102.4	Restrictions	2424
4.102.5	Related commands	2424
4.102.6	Default	2424
4.103	pair_style lj/cut/soft command	2424
4.104	pair_style lj/cut/coul/cut/soft command	2424
4.105	pair_style lj/cut/coul/long/soft command	2424
4.106	pair_style lj/cut/tip4p/long/soft command	2425
4.107	pair_style lj/charmm/coul/long/soft command	2425
4.108	pair_style lj/class2/soft command	2425
4.109	pair_style lj/class2/coul/cut/soft command	2425

4.110	pair_style lj/class2/coul/long/soft command	2425
4.111	pair_style coul/cut/soft command	2425
4.112	pair_style coul/long/soft command	2425
4.113	pair_style tip4p/long/soft command	2425
4.114	pair_style morse/soft command	2425
4.114.1	Syntax	2425
4.114.2	Examples	2427
4.114.3	Description	2428
4.114.4	Mixing, shift, table, tail correction, restart, rRESPA info	2431
4.114.5	Restrictions	2431
4.114.6	Related commands	2431
4.114.7	Default	2432
4.115	pair_style gauss command	2432
4.116	pair_style gauss/cut command	2432
4.116.1	Syntax	2432
4.116.2	Examples	2432
4.116.3	Description	2432
4.116.4	Mixing, shift, table, tail correction, restart, rRESPA info	2433
4.116.5	Restrictions	2434
4.116.6	Related commands	2434
4.116.7	Default	2435
4.117	pair_style gayberne command	2435
4.117.1	Syntax	2435
4.117.2	Examples	2435
4.117.3	Description	2435
4.117.4	Mixing, shift, table, tail correction, restart, rRESPA info	2437
4.117.5	Restrictions	2437
4.117.6	Related commands	2438
4.117.7	Default	2438
4.118	pair_style gran/hooke command	2438
4.119	pair_style gran/hooke/history command	2438
4.120	pair_style gran/hertz/history command	2438
4.120.1	Syntax	2438
4.120.2	Examples	2439
4.120.3	Description	2439
4.120.4	Mixing, shift, table, tail correction, restart, rRESPA info	2441
4.120.5	Restrictions	2442
4.120.6	Related commands	2442
4.120.7	Default	2442
4.121	pair_style granular command	2442
4.121.1	Syntax	2442
4.121.2	Examples	2442
4.121.3	Description	2443
4.121.4	Mixing, shift, table, tail correction, restart, rRESPA info	2452
4.121.5	Restrictions	2452
4.121.6	Related commands	2453
4.121.7	Default	2453
4.121.8	References	2453
4.122	pair_style lj/gromacs command	2454
4.123	pair_style lj/gromacs/coul/gromacs command	2454
4.123.1	Syntax	2454
4.123.2	Examples	2454
4.123.3	Description	2454
4.123.4	Mixing, shift, table, tail correction, restart, rRESPA info	2456

4.123.5	Restrictions	2456
4.123.6	Related commands	2456
4.123.7	Default	2456
4.124	pair_style gw command	2456
4.125	pair_style gw/zbl command	2456
4.125.1	Syntax	2456
4.125.2	Examples	2457
4.125.3	Description	2457
4.125.4	Mixing, shift, table, tail correction, restart, rRESPA info	2457
4.125.5	Restrictions	2458
4.125.6	Related commands	2458
4.125.7	Default	2458
4.126	pair_style harmonic/cut command	2458
4.126.1	Syntax	2458
4.126.2	Examples	2458
4.126.3	Description	2458
4.126.4	Mixing, shift, table, tail correction, restart, rRESPA info	2459
4.126.5	Restrictions	2459
4.126.6	Related commands	2459
4.126.7	Default	2459
4.127	pair_style hbond/dreiding/lj command	2460
4.128	pair_style hbond/dreiding/morse command	2460
4.128.1	Syntax	2460
4.128.2	Examples	2460
4.128.3	Description	2460
4.128.4	Mixing, shift, table, tail correction, restart, rRESPA info	2463
4.128.5	Restrictions	2464
4.128.6	Related commands	2464
4.128.7	Default	2464
4.129	pair_style hdnp command	2464
4.129.1	Syntax	2464
4.129.2	Examples	2465
4.129.3	Description	2465
4.129.4	Mixing, shift, table, tail correction, restart, rRESPA info	2467
4.129.5	Restrictions	2467
4.130	pair_style hybrid command	2467
4.131	pair_style hybrid/molecular command	2468
4.132	pair_style hybrid/overlay command	2468
4.133	pair_style hybrid/scaled command	2468
4.133.1	Syntax	2468
4.133.2	Examples	2468
4.133.3	Description	2469
4.133.4	Mixing, shift, table, tail correction, restart, rRESPA info	2474
4.133.5	Restrictions	2474
4.133.6	Related commands	2474
4.133.7	Default	2474
4.134	pair_style ilp/graphene/hbn command	2475
4.134.1	Syntax	2475
4.134.2	Examples	2475
4.134.3	Description	2475
4.134.4	Mixing, shift, table, tail correction, restart, rRESPA info	2477
4.134.5	Restrictions	2477
4.134.6	Related commands	2477
4.134.7	Default	2477

4.135	pair_style ilp/tmd command	2478
4.135.1	Syntax	2478
4.135.2	Examples	2478
4.135.3	Description	2478
4.135.4	Mixing, shift, table, tail correction, restart, rRESPA info	2480
4.135.5	Restrictions	2480
4.135.6	Related commands	2480
4.135.7	Default	2480
4.136	pair_style kim command	2480
4.136.1	Syntax	2480
4.136.2	Examples	2480
4.136.3	Description	2481
4.136.4	Mixing, shift, table, tail correction, restart, rRESPA info	2481
4.136.5	Restrictions	2482
4.136.6	Related commands	2482
4.136.7	Default	2482
4.137	pair_style kolmogorov/crespi/full command	2482
4.137.1	Syntax	2482
4.137.2	Examples	2482
4.137.3	Description	2482
4.137.4	Mixing, shift, table, tail correction, restart, rRESPA info	2484
4.137.5	Restrictions	2484
4.137.6	Related commands	2484
4.137.7	Default	2484
4.138	pair_style kolmogorov/crespi/z command	2484
4.138.1	Syntax	2484
4.138.2	Examples	2484
4.138.3	Description	2485
4.138.4	Restrictions	2485
4.138.5	Related commands	2485
4.138.6	Default	2485
4.139	pair_style lcbop command	2486
4.139.1	Syntax	2486
4.139.2	Examples	2486
4.139.3	Description	2486
4.139.4	Mixing, shift, table, tail correction, restart, rRESPA info	2486
4.139.5	Restrictions	2487
4.139.6	Related commands	2487
4.139.7	Default	2487
4.140	pair_style lebedeva/z command	2487
4.140.1	Syntax	2487
4.140.2	Examples	2487
4.140.3	Description	2487
4.140.4	Restrictions	2488
4.140.5	Related commands	2488
4.140.6	Default	2488
4.141	pair_style lepton command	2489
4.141.1	Syntax	2489
4.141.2	Examples	2489
4.141.3	Description	2490
4.141.4	Lepton expression syntax and features	2491
4.141.5	Mixing, shift, table, tail correction, restart, rRESPA info	2492
4.141.6	Restrictions	2492
4.141.7	Related commands	2492

	4.141.8	Default	2493
4.142	pair_style	line/lj command	2493
	4.142.1	Syntax	2493
	4.142.2	Examples	2493
	4.142.3	Description	2493
	4.142.4	Mixing, shift, table, tail correction, restart, rRESPA info	2494
	4.142.5	Restrictions	2494
	4.142.6	Related commands	2495
	4.142.7	Default	2495
4.143	pair_style	list command	2495
	4.143.1	Syntax	2495
	4.143.2	Examples	2495
	4.143.3	Description	2495
	4.143.4	Mixing, shift, table, tail correction, restart, rRESPA info	2497
	4.143.5	Restrictions	2497
	4.143.6	Related commands	2497
	4.143.7	Default	2497
4.144	pair_style	lj/cut command	2497
	4.144.1	Syntax	2498
	4.144.2	Examples	2498
	4.144.3	Description	2498
	4.144.4	Coefficients	2498
	4.144.5	Mixing, shift, table, tail correction, restart, rRESPA info	2499
	4.144.6	Related commands	2499
	4.144.7	Default	2500
4.145	pair_style	lj96/cut command	2500
	4.145.1	Syntax	2500
	4.145.2	Examples	2500
	4.145.3	Description	2500
	4.145.4	Mixing, shift, table, tail correction, restart, rRESPA info	2501
	4.145.5	Restrictions	2501
	4.145.6	Related commands	2501
	4.145.7	Default	2501
4.146	pair_style	lj/cubic command	2501
	4.146.1	Syntax	2501
	4.146.2	Examples	2502
	4.146.3	Description	2502
	4.146.4	Mixing, shift, table, tail correction, restart, rRESPA info	2503
	4.146.5	Restrictions	2503
	4.146.6	Related commands	2503
	4.146.7	Default	2503
4.147	pair_style	lj/cut/coul/cut command	2503
4.148	pair_style	lj/cut/coul/debye command	2503
4.149	pair_style	lj/cut/coul/dsf command	2504
4.150	pair_style	lj/cut/coul/long command	2504
4.151	pair_style	lj/cut/coul/msm command	2504
4.152	pair_style	lj/cut/coul/wolf command	2504
	4.152.1	Syntax	2504
	4.152.2	Examples	2505
	4.152.3	Description	2505
	4.152.4	Coefficients	2506
	4.152.5	Mixing, shift, table, tail correction, restart, rRESPA info	2507
	4.152.6	Restrictions	2507
	4.152.7	Related commands	2508

	4.152.8	Default	2508
4.153	pair_style lj/cut/sphere command		2508
	4.153.1	Syntax	2508
	4.153.2	Examples	2508
	4.153.3	Description	2508
	4.153.4	Coefficients	2510
	4.153.5	Mixing, shift, table, tail correction, restart, rRESPA info	2510
	4.153.6	Restrictions	2511
	4.153.7	Related commands	2511
	4.153.8	Default	2511
4.154	pair_style lj/cut/tip4p/cut command		2511
4.155	pair_style lj/cut/tip4p/long command		2511
	4.155.1	Syntax	2511
	4.155.2	Examples	2512
	4.155.3	Description	2512
	4.155.4	Coefficients	2513
	4.155.5	Mixing, shift, table, tail correction, restart, rRESPA info	2514
	4.155.6	Restrictions	2514
	4.155.7	Related commands	2514
	4.155.8	Default	2514
4.156	pair_style lj/expand command		2514
4.157	pair_style lj/expand/coul/long command		2515
	4.157.1	Syntax	2515
	4.157.2	Examples	2515
	4.157.3	Description	2515
	4.157.4	Mixing, shift, table, tail correction, restart, rRESPA info	2516
	4.157.5	Restrictions	2516
	4.157.6	Related commands	2516
	4.157.7	Default	2516
4.158	pair_style lj/expand/sphere command		2516
	4.158.1	Syntax	2517
	4.158.2	Examples	2517
	4.158.3	Description	2517
	4.158.4	Coefficients	2518
	4.158.5	Mixing, shift, table, tail correction, restart, rRESPA info	2519
	4.158.6	Restrictions	2519
	4.158.7	Related commands	2519
	4.158.8	Default	2519
4.159	pair_style lj/long/coul/long command		2519
4.160	pair_style lj/long/tip4p/long command		2519
	4.160.1	Syntax	2520
	4.160.2	Examples	2520
	4.160.3	Description	2521
	4.160.4	Mixing, shift, table, tail correction, restart, rRESPA info	2522
	4.160.5	Restrictions	2523
	4.160.6	Related commands	2523
	4.160.7	Default	2523
4.161	pair_style lj/relres command		2523
	4.161.1	Syntax	2523
	4.161.2	Examples	2523
	4.161.3	Description	2523
	4.161.4	Mixing, shift, table, tail correction, restart, rRESPA info	2526
	4.161.5	Restrictions	2527
	4.161.6	Related commands	2527

	4.161.7	Default	2527
4.162	pair_style	lj/smooth command	2527
	4.162.1	Syntax	2527
	4.162.2	Examples	2527
	4.162.3	Description	2527
	4.162.4	Mixing, shift, table, tail correction, restart, rRESPA info	2528
	4.162.5	Restrictions	2529
	4.162.6	Related commands	2529
	4.162.7	Default	2529
4.163	pair_style	lj/smooth/linear command	2529
	4.163.1	Syntax	2529
	4.163.2	Examples	2529
	4.163.3	Description	2529
	4.163.4	Mixing, shift, table, tail correction, restart, rRESPA info	2530
	4.163.5	Restrictions	2530
	4.163.6	Related commands	2531
	4.163.7	Default	2531
4.164	pair_style	lj/switch3/coulgauss/long command	2531
4.165	pair_style	mm3/switch3/coulgauss/long command	2531
	4.165.1	Syntax	2531
	4.165.2	Examples	2531
	4.165.3	Description	2532
	4.165.4	Mixing, shift, table, tail correction, restart, rRESPA info	2532
	4.165.5	Restrictions	2533
	4.165.6	Related commands	2533
	4.165.7	Default	2533
4.166	pair_style	local/density command	2533
	4.166.1	Syntax	2533
	4.166.2	Examples	2533
	4.166.3	Description	2533
	4.166.4	Mixing, shift, table, tail correction, restart, rRESPA info	2536
	4.166.5	Restrictions	2536
	4.166.6	Related commands	2536
	4.166.7	Default	2536
4.167	pair_style	lubricate command	2537
4.168	pair_style	lubricate/poly command	2537
	4.168.1	Syntax	2537
	4.168.2	Examples	2537
	4.168.3	Description	2537
	4.168.4	Mixing, shift, table, tail correction, restart, rRESPA info	2539
	4.168.5	Restrictions	2539
	4.168.6	Related commands	2540
	4.168.7	Default	2540
4.169	pair_style	lubricateU command	2540
4.170	pair_style	lubricateU/poly command	2540
	4.170.1	Syntax	2540
	4.170.2	Examples	2540
	4.170.3	Description	2541
	4.170.4	Mixing, shift, table, tail correction, restart, rRESPA info	2542
	4.170.5	Restrictions	2542
	4.170.6	Related commands	2543
	4.170.7	Default	2543
4.171	pair_style	lj/mdf command	2543
4.172	pair_style	buck/mdf command	2543

4.173	pair_style	lennard/mdf command	2543
4.173.1	Syntax		2543
4.173.2	Examples		2544
4.173.3	Description		2544
4.173.4	Mixing, shift, table, tail correction, restart, rRESPA info		2545
4.173.5	Restrictions		2545
4.173.6	Related commands		2546
4.173.7	Default		2546
4.174	pair_style	meam command	2546
4.175	pair_style	meam/ms command	2546
4.175.1	Syntax		2546
4.175.2	Examples		2546
4.175.3	Description		2546
4.175.4	Mixing, shift, table, tail correction, restart, rRESPA info		2552
4.175.5	Restrictions		2552
4.175.6	Related commands		2552
4.175.7	Default		2552
4.176	pair_style	meam/spline command	2553
4.176.1	Syntax		2553
4.176.2	Examples		2553
4.176.3	Description		2553
4.176.4	Mixing, shift, table, tail correction, restart, rRESPA info		2554
4.176.5	Restrictions		2555
4.176.6	Related commands		2555
4.176.7	Default		2555
4.177	pair_style	meam/sw/spline command	2555
4.177.1	Syntax		2555
4.177.2	Examples		2555
4.177.3	Description		2555
4.177.4	Mixing, shift, table, tail correction, restart, rRESPA info		2556
4.177.5	Restrictions		2557
4.177.6	Related commands		2557
4.177.7	Default		2557
4.178	pair_style	mesocnt command	2557
4.179	pair_style	mesocnt/viscous command	2557
4.179.1	Syntax		2557
4.179.2	Examples		2557
4.179.3	Description		2558
4.179.4	Mixing, shift, table, tail correction, restart, rRESPA info		2560
4.179.5	Restrictions		2560
4.179.6	Related commands		2560
4.179.7	Default		2560
4.180	pair_style	edpd command	2560
4.181	pair_style	mdpd command	2560
4.182	pair_style	mdpd/rhosum command	2561
4.183	pair_style	tdpd command	2561
4.183.1	Syntax		2561
4.183.2	Examples		2561
4.183.3	Description		2562
4.183.4	Example scripts		2564
4.183.5	Mixing, shift, table, tail correction, restart, rRESPA info		2566
4.183.6	Restrictions		2566
4.183.7	Related commands		2566
4.183.8	Default		2566

4.184	pair_style	mgpt command	2567
	4.184.1	Syntax	2567
	4.184.2	Examples	2567
	4.184.3	Description	2567
	4.184.4	Mixing, shift, table, tail correction, restart, rRESPA info	2568
	4.184.5	Restrictions	2569
	4.184.6	Related commands	2569
	4.184.7	Default	2569
4.185	pair_style	mie/cut command	2569
	4.185.1	Syntax	2570
	4.185.2	Examples	2570
	4.185.3	Description	2570
	4.185.4	Mixing, shift, table, tail correction, restart, rRESPA info	2570
	4.185.5	Restrictions	2571
	4.185.6	Related commands	2571
	4.185.7	Default	2571
4.186	pair_style	mliap command	2571
	4.186.1	Syntax	2571
	4.186.2	Examples	2572
	4.186.3	Description	2572
	4.186.4	Mixing, shift, table, tail correction, restart, rRESPA info	2575
	4.186.5	Restrictions	2575
	4.186.6	Related commands	2575
	4.186.7	Default	2575
4.187	pair_style	momb command	2576
	4.187.1	Syntax	2576
	4.187.2	Examples	2576
	4.187.3	Description	2576
	4.187.4	Restrictions	2577
	4.187.5	Related commands	2577
	4.187.6	Default	2577
4.188	pair_style	morse command	2577
4.189	pair_style	morse/smooth/linear command	2577
	4.189.1	Syntax	2577
	4.189.2	Examples	2578
	4.189.3	Description	2578
	4.189.4	Mixing, shift, table, tail correction, restart, rRESPA info	2579
	4.189.5	Restrictions	2579
	4.189.6	Related commands	2579
	4.189.7	Default	2579
4.190	pair_style	multi/lucy command	2579
	4.190.1	Syntax	2579
	4.190.2	Examples	2579
	4.190.3	Description	2580
	4.190.4	Mixing, shift, table, tail correction, restart, rRESPA info	2581
	4.190.5	Restrictions	2582
	4.190.6	Related commands	2582
	4.190.7	Default	2582
4.191	pair_style	multi/lucy/rx command	2582
	4.191.1	Syntax	2582
	4.191.2	Examples	2582
	4.191.3	Description	2583
	4.191.4	Mixing, shift, table, tail correction, restart, rRESPA info	2585
	4.191.5	Restrictions	2585

4.191.6	Related commands	2585
4.191.7	Default	2585
4.192	pair_style nb3b/harmonic command	2586
4.193	pair_style nb3b/screened command	2586
4.193.1	Syntax	2586
4.193.2	Examples	2586
4.193.3	Description	2586
4.193.4	Restrictions	2587
4.193.5	Related commands	2587
4.193.6	Default	2587
4.194	pair_style nm/cut command	2587
4.195	pair_style nm/cut/split command	2588
4.196	pair_style nm/cut/coul/cut command	2588
4.197	pair_style nm/cut/coul/long command	2588
4.197.1	Syntax	2588
4.197.2	Examples	2588
4.197.3	Description	2589
4.197.4	Mixing, shift, table, tail correction, restart, rRESPA info	2590
4.197.5	Restrictions	2590
4.197.6	Related commands	2590
4.197.7	Default	2590
4.198	pair_style none command	2591
4.198.1	Syntax	2591
4.198.2	Examples	2591
4.198.3	Description	2591
4.198.4	Restrictions	2591
4.198.5	Related commands	2591
4.198.6	Default	2591
4.199	pair_style oxdna/excv command	2592
4.200	pair_style oxdna/stk command	2592
4.201	pair_style oxdna/hbond command	2592
4.202	pair_style oxdna/xstk command	2592
4.203	pair_style oxdna/coaxstk command	2592
4.203.1	Syntax	2592
4.203.2	Examples	2592
4.203.3	Description	2594
4.203.4	Potential file reading	2595
4.203.5	Restrictions	2595
4.203.6	Related commands	2595
4.203.7	Default	2596
4.204	pair_style oxdna2/excv command	2596
4.205	pair_style oxdna2/stk command	2596
4.206	pair_style oxdna2/hbond command	2596
4.207	pair_style oxdna2/xstk command	2596
4.208	pair_style oxdna2/coaxstk command	2596
4.209	pair_style oxdna2/dh command	2596
4.209.1	Syntax	2596
4.209.2	Examples	2597
4.209.3	Description	2598
4.209.4	Potential file reading	2599
4.209.5	Restrictions	2600
4.209.6	Related commands	2600
4.209.7	Default	2600
4.210	pair_style oxrna2/excv command	2601

4.211	pair_style oxrna2/stk command	2601
4.212	pair_style oxrna2/hbond command	2601
4.213	pair_style oxrna2/xstk command	2601
4.214	pair_style oxrna2/coaxstk command	2601
4.215	pair_style oxrna2/dh command	2601
	4.215.1 Syntax	2601
	4.215.2 Examples	2602
	4.215.3 Description	2603
	4.215.4 Potential file reading	2604
	4.215.5 Restrictions	2605
	4.215.6 Related commands	2605
	4.215.7 Default	2605
4.216	pair_style pace command	2605
4.217	pair_style pace/extrapolation command	2605
	4.217.1 Syntax	2605
	4.217.2 Examples	2606
	4.217.3 Description	2606
	4.217.4 Extrapolation grade	2607
	4.217.5 Core repulsion	2607
	4.217.6 Mixing, shift, table, tail correction, restart, rRESPA info	2608
	4.217.7 Restrictions	2608
	4.217.8 Related commands	2608
	4.217.9 Default	2608
4.218	pair_style pedone command	2609
	4.218.1 Syntax	2609
	4.218.2 Examples	2609
	4.218.3 Description	2609
	4.218.4 Mixing, shift, table, tail correction, restart, rRESPA info	2610
	4.218.5 Restrictions	2610
	4.218.6 Related commands	2610
	4.218.7 Default	2610
4.219	pair_style peri/pmb command	2611
4.220	pair_style peri/lps command	2611
4.221	pair_style peri/ves command	2611
4.222	pair_style peri/eps command	2611
	4.222.1 Syntax	2611
	4.222.2 Examples	2611
	4.222.3 Description	2611
	4.222.4 Mixing, shift, table, tail correction, restart, rRESPA info	2613
	4.222.5 Restrictions	2613
	4.222.6 Related commands	2613
	4.222.7 Default	2614
4.223	pair_style pod command	2614
	4.223.1 Syntax	2614
	4.223.2 Examples	2614
	4.223.3 Description	2614
	4.223.4 Mixing, shift, table, tail correction, restart, rRESPA info	2615
	4.223.5 Restrictions	2616
	4.223.6 Related commands	2616
	4.223.7 Default	2616
4.224	pair_style polymorphic command	2616
	4.224.1 Syntax	2616
	4.224.2 Examples	2616
	4.224.3 Description	2616

	4.224.4	Mixing, shift, table, tail correction, restart, rRESPA info	2620
	4.224.5	Restrictions	2620
	4.224.6	Related commands	2620
4.225	pair_style	python command	2621
	4.225.1	Syntax	2621
	4.225.2	Examples	2621
	4.225.3	Description	2621
	4.225.4	Mixing, shift, table, tail correction, restart, rRESPA info	2625
	4.225.5	Restrictions	2625
	4.225.6	Related commands	2625
	4.225.7	Default	2625
4.226	pair_style	quip command	2625
	4.226.1	Syntax	2625
	4.226.2	Examples	2625
	4.226.3	Description	2626
	4.226.4	Mixing, shift, table, tail correction, restart, rRESPA info	2626
	4.226.5	Restrictions	2626
	4.226.6	Related commands	2627
4.227	pair_style	rann command	2627
	4.227.1	Syntax	2627
	4.227.2	Examples	2627
	4.227.3	Description	2627
	4.227.4	Potential file syntax	2627
	4.227.5	Formulation	2631
	4.227.6	Restrictions	2632
	4.227.7	Defaults	2633
4.228	pair_style	reaxff command	2633
	4.228.1	Syntax	2633
	4.228.2	Examples	2633
	4.228.3	Description	2634
	4.228.4	Control file	2636
	4.228.5	Mixing, shift, table, tail correction, restart, rRESPA info	2638
	4.228.6	Restrictions	2638
	4.228.7	Related commands	2638
	4.228.8	Default	2638
4.229	pair_style	rebomos command	2639
	4.229.1	Syntax	2639
	4.229.2	Examples	2639
	4.229.3	Description	2639
	4.229.4	Mixing, shift, table, tail correction, restart, rRESPA info	2640
	4.229.5	Restrictions	2640
	4.229.6	Related commands	2640
	4.229.7	Default	2641
4.230	pair_style	resquared command	2641
	4.230.1	Syntax	2641
	4.230.2	Examples	2641
	4.230.3	Description	2641
	4.230.4	Mixing, shift, table, tail correction, restart, rRESPA info	2643
	4.230.5	Restrictions	2643
	4.230.6	Related commands	2644
	4.230.7	Default	2644
4.231	pair_style	rheo command	2644
	4.231.1	Syntax	2644
	4.231.2	Examples	2644

4.231.3	Description	2644
4.231.4	Mixing, shift, table, tail correction, restart, rRESPA info	2645
4.231.5	Restrictions	2645
4.231.6	Related commands	2645
4.231.7	Default	2645
4.232	pair_style rheo/solid command	2645
4.232.1	Syntax	2645
4.232.2	Examples	2645
4.232.3	Description	2646
4.232.4	Mixing, shift, table, tail correction, restart, rRESPA info	2646
4.232.5	Restrictions	2647
4.232.6	Related commands	2647
4.232.7	Default	2647
4.233	pair_style saip/metal command	2647
4.233.1	Syntax	2647
4.233.2	Examples	2647
4.233.3	Description	2647
4.233.4	Mixing, shift, table, tail correction, restart, rRESPA info	2649
4.233.5	Restrictions	2649
4.233.6	Related commands	2649
4.233.7	Default	2649
4.234	pair_style sdpd/taitwater/isothermal command	2650
4.234.1	Syntax	2650
4.234.2	Examples	2650
4.234.3	Description	2650
4.234.4	Mixing, shift, table, tail correction, restart, rRESPA info	2651
4.234.5	Restrictions	2651
4.234.6	Related commands	2651
4.234.7	Default	2651
4.235	pair_style smatb command	2651
4.236	pair_style smatb/single command	2651
4.236.1	Syntax	2651
4.236.2	Examples	2652
4.236.3	Description	2652
4.236.4	Coefficients	2652
4.236.5	Mixing info	2653
4.236.6	Restrictions	2653
4.236.7	Related commands	2653
4.236.8	Default	2653
4.237	pair_style smd/hertz command	2653
4.237.1	Syntax	2653
4.237.2	Examples	2653
4.237.3	Description	2653
4.237.4	Mixing, shift, table, tail correction, restart, rRESPA info	2654
4.237.5	Restrictions	2654
4.237.6	Related commands	2654
4.237.7	Default	2654
4.238	pair_style smd/tlsph command	2654
4.238.1	Syntax	2654
4.238.2	Examples	2654
4.238.3	Description	2654
4.238.4	Mixing, shift, table, tail correction, restart, rRESPA info	2655
4.238.5	Restrictions	2655
4.238.6	Related commands	2655

	4.238.7	Default	2655
4.239	pair_style	smd/tri_surface command	2655
	4.239.1	Syntax	2655
	4.239.2	Examples	2656
	4.239.3	Description	2656
	4.239.4	Mixing, shift, table, tail correction, restart, rRESPA info	2656
	4.239.5	Restrictions	2656
	4.239.6	Related commands	2656
	4.239.7	Default	2656
4.240	pair_style	smd/ulsph command	2656
	4.240.1	Syntax	2656
	4.240.2	Examples	2657
	4.240.3	Description	2657
	4.240.4	Mixing, shift, table, tail correction, restart, rRESPA info	2657
	4.240.5	Restrictions	2657
	4.240.6	Related commands	2658
	4.240.7	Default	2658
4.241	pair_style	smtbq command	2658
	4.241.1	Syntax	2658
	4.241.2	Examples	2658
	4.241.3	Description	2658
	4.241.4	Mixing, shift, table, tail correction, restart, rRESPA info	2661
	4.241.5	Restrictions	2662
	4.241.6	Citing this work	2662
4.242	pair_style	snap command	2662
	4.242.1	Syntax	2662
	4.242.2	Examples	2662
	4.242.3	Description	2663
	4.242.4	Mixing, shift, table, tail correction, restart, rRESPA info	2665
	4.242.5	Restrictions	2666
	4.242.6	Related commands	2666
	4.242.7	Default	2666
4.243	pair_style	soft command	2666
	4.243.1	Syntax	2666
	4.243.2	Examples	2667
	4.243.3	Description	2667
	4.243.4	Mixing, shift, table, tail correction, restart, rRESPA info	2668
	4.243.5	Restrictions	2668
	4.243.6	Related commands	2668
	4.243.7	Default	2668
4.244	pair_style	sph/heatconduction command	2668
	4.244.1	Syntax	2669
	4.244.2	Examples	2669
	4.244.3	Description	2669
	4.244.4	Mixing, shift, table, tail correction, restart, rRESPA info	2669
	4.244.5	Restrictions	2669
	4.244.6	Related commands	2669
	4.244.7	Default	2670
4.245	pair_style	sph/idealgas command	2670
	4.245.1	Syntax	2670
	4.245.2	Examples	2670
	4.245.3	Description	2670
	4.245.4	Mixing, shift, table, tail correction, restart, rRESPA info	2670
	4.245.5	Restrictions	2671

	4.245.6	Related commands	2671
	4.245.7	Default	2671
4.246	pair_style sph/lj command		2671
	4.246.1	Syntax	2671
	4.246.2	Examples	2671
	4.246.3	Description	2671
	4.246.4	Mixing, shift, table, tail correction, restart, rRESPA info	2672
	4.246.5	Restrictions	2672
	4.246.6	Related commands	2672
	4.246.7	Default	2672
4.247	pair_style sph/rhsum command		2672
	4.247.1	Syntax	2672
	4.247.2	Examples	2672
	4.247.3	Description	2673
	4.247.4	Mixing, shift, table, tail correction, restart, rRESPA info	2673
	4.247.5	Restrictions	2673
	4.247.6	Related commands	2673
	4.247.7	Default	2673
4.248	pair_style sph/taitwater command		2673
	4.248.1	Syntax	2674
	4.248.2	Examples	2674
	4.248.3	Description	2674
	4.248.4	Mixing, shift, table, tail correction, restart, rRESPA info	2674
	4.248.5	Restrictions	2675
	4.248.6	Related commands	2675
	4.248.7	Default	2675
4.249	pair_style sph/taitwater/morris command		2675
	4.249.1	Syntax	2675
	4.249.2	Examples	2675
	4.249.3	Description	2675
	4.249.4	Mixing, shift, table, tail correction, restart, rRESPA info	2676
	4.249.5	Restrictions	2676
	4.249.6	Related commands	2676
	4.249.7	Default	2676
4.250	pair_style lj/spica command		2676
4.251	pair_style lj/spica/coul/long command		2676
4.252	pair_style lj/spica/coul/msm command		2676
	4.252.1	Syntax	2677
	4.252.2	Examples	2677
	4.252.3	Description	2677
	4.252.4	Mixing, shift, table, tail correction, restart, rRESPA info	2678
	4.252.5	Restrictions	2679
	4.252.6	Related commands	2679
	4.252.7	Default	2679
4.253	pair_style spin/dipole/cut command		2679
4.254	pair_style spin/dipole/long command		2679
	4.254.1	Syntax	2679
	4.254.2	Examples	2679
	4.254.3	Description	2680
	4.254.4	Restrictions	2680
	4.254.5	Related commands	2680
	4.254.6	Default	2680
4.255	pair_style spin/dmi command		2681
	4.255.1	Syntax	2681

4.255.2	Examples	2681
4.255.3	Description	2681
4.255.4	Restrictions	2682
4.255.5	Related commands	2682
4.255.6	Default	2682
4.256	pair_style spin/exchange command	2682
4.257	pair_style spin/exchange/biquadratic command	2682
4.257.1	Syntax	2682
4.257.2	Examples	2682
4.257.3	Description	2683
4.257.4	Restrictions	2685
4.257.5	Related commands	2685
4.257.6	Default	2685
4.258	pair_style spin/magelec command	2685
4.258.1	Syntax	2685
4.258.2	Examples	2685
4.258.3	Description	2685
4.258.4	Restrictions	2686
4.258.5	Related commands	2686
4.258.6	Default	2686
4.259	pair_style spin/neel command	2686
4.259.1	Syntax	2686
4.259.2	Examples	2687
4.259.3	Description	2687
4.259.4	Restrictions	2687
4.259.5	Related commands	2688
4.259.6	Default	2688
4.260	pair_style srp command	2688
4.261	pair_style srp/react command	2688
4.261.1	Syntax	2688
4.261.2	Examples	2688
4.261.3	Mixing, shift, table, tail correction, restart, rRESPA info	2690
4.261.4	Restrictions	2690
4.261.5	Related commands	2690
4.261.6	Default	2691
4.262	pair_style sw command	2691
4.263	pair_style sw/mod command	2691
4.263.1	Syntax	2691
4.263.2	Examples	2691
4.263.3	Description	2692
4.263.4	Mixing, shift, table, tail correction, restart, rRESPA info	2695
4.263.5	Restrictions	2695
4.263.6	Related commands	2695
4.263.7	Default	2695
4.264	pair_style sw/angle/table command	2696
4.264.1	Syntax	2696
4.264.2	Examples	2696
4.264.3	Description	2696
4.264.4	Mixing, shift, table, tail correction, restart, rRESPA info	2699
4.264.5	Restrictions	2699
4.264.6	Related commands	2699
4.265	pair_style table command	2700
4.265.1	Syntax	2700
4.265.2	Examples	2700

4.265.3	Description	2700
4.265.4	Mixing, shift, table, tail correction, restart, rRESPA info	2703
4.265.5	Restrictions	2703
4.265.6	Related commands	2703
4.265.7	Default	2703
4.266	pair_style table/rx command	2703
4.266.1	Syntax	2703
4.266.2	Examples	2704
4.266.3	Description	2704
4.266.4	Mixing, shift, table, tail correction, restart, rRESPA info	2706
4.266.5	Restrictions	2707
4.266.6	Related commands	2707
4.266.7	Default	2707
4.267	pair_style tersoff command	2707
4.268	pair_style tersoff/table command	2707
4.268.1	Syntax	2707
4.268.2	Examples	2707
4.268.3	Description	2708
4.268.4	Mixing, shift, table, tail correction, restart, rRESPA info	2711
4.268.5	Restrictions	2711
4.268.6	Related commands	2711
4.268.7	Default	2711
4.269	pair_style tersoff/mod command	2712
4.270	pair_style tersoff/mod/c command	2712
4.270.1	Syntax	2712
4.270.2	Examples	2712
4.270.3	Description	2713
4.270.4	Mixing, shift, table, tail correction, restart, rRESPA info	2715
4.270.5	Restrictions	2715
4.270.6	Related commands	2715
4.270.7	Default	2715
4.271	pair_style tersoff/zbl command	2716
4.271.1	Syntax	2716
4.271.2	Examples	2716
4.271.3	Description	2716
4.271.4	Mixing, shift, table, tail correction, restart, rRESPA info	2720
4.271.5	Restrictions	2720
4.271.6	Related commands	2720
4.271.7	Default	2720
4.272	pair_style thole command	2721
4.273	pair_style lj/cut/thole/long command	2721
4.273.1	Syntax	2721
4.273.2	Examples	2721
4.273.3	Description	2721
4.273.4	Mixing, shift, table, tail correction, restart, rRESPA info	2723
4.273.5	Restrictions	2723
4.273.6	Related commands	2723
4.273.7	Default	2723
4.274	pair_style threebody/table command	2723
4.274.1	Syntax	2723
4.274.2	Examples	2724
4.274.3	Description	2724
4.274.4	Mixing, shift, table, tail correction, restart, rRESPA info	2726
4.274.5	Restrictions	2727

	4.274.6	Related commands	2727
4.275	pair_style	tracker command	2727
	4.275.1	Syntax	2727
	4.275.2	Examples	2728
	4.275.3	Description	2728
	4.275.4	Mixing, shift, table, tail correction, restart, rRESPA info	2729
	4.275.5	Restrictions	2729
	4.275.6	Related commands	2729
	4.275.7	Default	2729
4.276	pair_style	tri/lj command	2729
	4.276.1	Syntax	2729
	4.276.2	Examples	2730
	4.276.3	Description	2730
	4.276.4	Mixing, shift, table, tail correction, restart, rRESPA info	2731
	4.276.5	Restrictions	2731
	4.276.6	Related commands	2731
	4.276.7	Default	2731
4.277	pair_style	uf3 command	2731
	4.277.1	Syntax	2731
	4.277.2	Examples	2732
	4.277.3	Description	2732
	4.277.4	Mixing, shift, table, tail correction, restart, rRESPA info	2734
	4.277.5	Restrictions	2734
	4.277.6	Related commands	2734
	4.277.7	Default	2734
4.278	pair_style	ufm command	2735
	4.278.1	Syntax	2735
	4.278.2	Examples	2735
	4.278.3	Description	2735
	4.278.4	Mixing, shift, table, tail correction, restart, rRESPA info	2736
	4.278.5	Restrictions	2736
	4.278.6	Related commands	2737
	4.278.7	Default	2737
4.279	pair_style	vashishta command	2737
4.280	pair_style	vashishta/table command	2737
	4.280.1	Syntax	2737
	4.280.2	Examples	2737
	4.280.3	Description	2738
	4.280.4	Mixing, shift, table, tail correction, restart, rRESPA info	2740
	4.280.5	Restrictions	2740
	4.280.6	Related commands	2740
	4.280.7	Default	2740
4.281	pair_style	wf/cut command	2741
	4.281.1	Syntax	2741
	4.281.2	Examples	2741
	4.281.3	Description	2741
	4.281.4	Restrictions	2742
	4.281.5	Related commands	2742
4.282	pair_style	ylz command	2742
	4.282.1	Syntax	2742
	4.282.2	Examples	2743
	4.282.3	Description	2743
	4.282.4	Mixing, shift, table, tail correction, restart, rRESPA info	2744
	4.282.5	Restrictions	2744

	4.282.6	Related commands	2744
	4.282.7	Default	2744
4.283	pair_style yukawa	command	2745
	4.283.1	Syntax	2745
	4.283.2	Examples	2745
	4.283.3	Description	2745
	4.283.4	Mixing, shift, table, tail correction, restart, rRESPA info	2746
	4.283.5	Restrictions	2746
	4.283.6	Related commands	2746
	4.283.7	Default	2746
4.284	pair_style yukawa/colloid	command	2746
	4.284.1	Syntax	2746
	4.284.2	Examples	2747
	4.284.3	Description	2747
	4.284.4	Mixing, shift, table, tail correction, restart, rRESPA info	2748
	4.284.5	Restrictions	2748
	4.284.6	Related commands	2749
	4.284.7	Default	2749
4.285	pair_style zbl	command	2749
	4.285.1	Syntax	2749
	4.285.2	Examples	2749
	4.285.3	Description	2749
	4.285.4	Mixing, shift, table, tail correction, restart, rRESPA info	2750
	4.285.5	Restrictions	2751
	4.285.6	Related commands	2751
	4.285.7	Default	2751
4.286	pair_style zero	command	2751
	4.286.1	Syntax	2751
	4.286.2	Examples	2751
	4.286.3	Description	2751
	4.286.4	Mixing, shift, table, tail correction, restart, rRESPA info	2752
	4.286.5	Restrictions	2752
	4.286.6	Related commands	2752
	4.286.7	Default	2752
5	Bond Styles		2753
5.1	bond_style bpm/rotational	command	2753
	5.1.1	Syntax	2753
	5.1.2	Examples	2754
	5.1.3	Description	2754
	5.1.4	Restart and other info	2756
	5.1.5	Restrictions	2756
	5.1.6	Related commands	2756
	5.1.7	Default	2756
5.2	bond_style bpm/spring	command	2757
	5.2.1	Syntax	2757
	5.2.2	Examples	2757
	5.2.3	Description	2757
	5.2.4	Restart and other info	2759
	5.2.5	Restrictions	2759
	5.2.6	Related commands	2759
	5.2.7	Default	2759
5.3	bond_style class2	command	2760
	5.3.1	Syntax	2760

5.3.2	Examples	2760
5.3.3	Description	2760
5.3.4	Restrictions	2761
5.3.5	Related commands	2761
5.3.6	Default	2761
5.4	bond_style fene command	2761
5.5	bond_style fene/nm command	2761
5.5.1	Syntax	2761
5.5.2	Examples	2761
5.5.3	Description	2761
5.5.4	Restrictions	2762
5.5.5	Related commands	2763
5.5.6	Default	2763
5.6	bond_style fene/expand command	2763
5.6.1	Syntax	2763
5.6.2	Examples	2763
5.6.3	Description	2763
5.6.4	Restrictions	2764
5.6.5	Related commands	2764
5.6.6	Default	2764
5.7	bond_style gaussian command	2764
5.7.1	Syntax	2764
5.7.2	Examples	2764
5.7.3	Description	2765
5.7.4	Restrictions	2765
5.7.5	Related commands	2765
5.7.6	Default	2765
5.8	bond_style gromos command	2765
5.8.1	Syntax	2766
5.8.2	Examples	2766
5.8.3	Description	2766
5.8.4	Restrictions	2766
5.8.5	Related commands	2767
5.8.6	Default	2767
5.9	bond_style harmonic command	2767
5.9.1	Syntax	2767
5.9.2	Examples	2767
5.9.3	Description	2767
5.9.4	Restrictions	2768
5.9.5	Related commands	2768
5.9.6	Default	2768
5.10	bond_style harmonic/restrain command	2768
5.10.1	Syntax	2768
5.10.2	Examples	2768
5.10.3	Description	2768
5.10.4	Restart info	2769
5.10.5	Restrictions	2769
5.10.6	Related commands	2769
5.10.7	Default	2769
5.11	bond_style harmonic/shift command	2769
5.11.1	Syntax	2769
5.11.2	Examples	2769
5.11.3	Description	2770
5.11.4	Restrictions	2770

	5.11.5	Related commands	2770
	5.11.6	Default	2770
5.12	bond_style	harmonic/shift/cut command	2771
	5.12.1	Syntax	2771
	5.12.2	Examples	2771
	5.12.3	Description	2771
	5.12.4	Restrictions	2772
	5.12.5	Related commands	2772
	5.12.6	Default	2772
5.13	bond_style	hybrid command	2772
	5.13.1	Syntax	2772
	5.13.2	Examples	2772
	5.13.3	Description	2772
	5.13.4	Restrictions	2773
	5.13.5	Related commands	2773
	5.13.6	Default	2773
5.14	bond_style	lepton command	2773
	5.14.1	Syntax	2774
	5.14.2	Examples	2774
	5.14.3	Description	2774
	5.14.4	Lepton expression syntax and features	2775
	5.14.5	Restrictions	2776
	5.14.6	Related commands	2776
	5.14.7	Default	2776
5.15	bond_style	mesocnt command	2776
	5.15.1	Syntax	2776
	5.15.2	Examples	2776
	5.15.3	Description	2777
	5.15.4	Restrictions	2777
	5.15.5	Related commands	2777
	5.15.6	Default	2777
5.16	bond_style	mm3 command	2778
	5.16.1	Syntax	2778
	5.16.2	Examples	2778
	5.16.3	Description	2778
	5.16.4	Restrictions	2778
	5.16.5	Related commands	2778
	5.16.6	Default	2778
5.17	bond_style	morse command	2779
	5.17.1	Syntax	2779
	5.17.2	Examples	2779
	5.17.3	Description	2779
	5.17.4	Restrictions	2780
	5.17.5	Related commands	2780
	5.17.6	Default	2780
5.18	bond_style	none command	2780
	5.18.1	Syntax	2780
	5.18.2	Examples	2780
	5.18.3	Description	2780
	5.18.4	Restrictions	2780
	5.18.5	Related commands	2780
	5.18.6	Default	2781
5.19	bond_style	nonlinear command	2781
	5.19.1	Syntax	2781

5.19.2	Examples	2781
5.19.3	Description	2781
5.19.4	Restrictions	2782
5.19.5	Related commands	2782
5.19.6	Default	2782
5.20	bond_style oxdna/fene command	2782
5.21	bond_style oxdna2/fene command	2782
5.22	bond_style oxrna2/fene command	2782
5.22.1	Syntax	2782
5.22.2	Examples	2782
5.22.3	Description	2783
5.22.4	Potential file reading	2784
5.22.5	Restrictions	2785
5.22.6	Related commands	2785
5.22.7	Default	2785
5.23	bond_style quartic command	2785
5.23.1	Syntax	2785
5.23.2	Examples	2785
5.23.3	Description	2786
5.23.4	Restrictions	2787
5.23.5	Related commands	2787
5.23.6	Default	2787
5.24	bond_style rheo/shell command	2787
5.24.1	Syntax	2787
5.24.2	Examples	2788
5.24.3	Description	2788
5.24.4	Restart and other info	2789
5.24.5	Restrictions	2789
5.24.6	Related commands	2789
5.24.7	Default	2789
5.25	bond_style special command	2790
5.25.1	Syntax	2790
5.25.2	Examples	2790
5.25.3	Description	2790
5.25.4	Restrictions	2791
5.25.5	Related commands	2791
5.25.6	Default	2791
5.26	bond_style table command	2791
5.26.1	Syntax	2791
5.26.2	Examples	2791
5.26.3	Description	2791
5.26.4	Restart info	2793
5.26.5	Restrictions	2793
5.26.6	Related commands	2793
5.26.7	Default	2793
5.27	bond_style zero command	2793
5.27.1	Syntax	2793
5.27.2	Examples	2794
5.27.3	Description	2794
5.27.4	Restrictions	2794
5.27.5	Related commands	2794
5.27.6	Default	2794

6 Angle Styles

2795

6.1	angle_style amoeba command	2795
6.1.1	Syntax	2795
6.1.2	Examples	2795
6.1.3	Description	2795
6.1.4	Restrictions	2797
6.1.5	Related commands	2797
6.1.6	Default	2797
6.2	angle_style charmm command	2797
6.2.1	Syntax	2797
6.2.2	Examples	2797
6.2.3	Description	2797
6.2.4	Restrictions	2798
6.2.5	Related commands	2798
6.2.6	Default	2798
6.3	angle_style class2 command	2798
6.4	angle_style class2/p6 command	2798
6.4.1	Syntax	2798
6.4.2	Examples	2799
6.4.3	Description	2799
6.4.4	Restrictions	2801
6.4.5	Related commands	2801
6.4.6	Default	2801
6.5	angle_style cosine command	2801
6.5.1	Syntax	2801
6.5.2	Examples	2801
6.5.3	Description	2801
6.5.4	Restrictions	2802
6.5.5	Related commands	2802
6.5.6	Default	2802
6.6	angle_style cosine/buck6d command	2802
6.6.1	Syntax	2802
6.6.2	Examples	2802
6.6.3	Description	2802
6.6.4	Restrictions	2803
6.6.5	Related commands	2803
6.6.6	Default	2803
6.7	angle_style cosine/delta command	2803
6.7.1	Syntax	2803
6.7.2	Examples	2803
6.7.3	Description	2803
6.7.4	Restrictions	2804
6.7.5	Related commands	2804
6.7.6	Default	2804
6.8	angle_style cosine/periodic command	2804
6.8.1	Syntax	2804
6.8.2	Examples	2805
6.8.3	Description	2805
6.8.4	Restrictions	2805
6.8.5	Related commands	2806
6.8.6	Default	2806
6.9	angle_style cosine/shift command	2806
6.9.1	Syntax	2806
6.9.2	Examples	2806
6.9.3	Description	2806

	6.9.4	Restrictions	2807
	6.9.5	Related commands	2807
	6.9.6	Default	2807
6.10	angle_style	cosine/shift/exp command	2807
	6.10.1	Syntax	2807
	6.10.2	Examples	2807
	6.10.3	Description	2807
	6.10.4	Restrictions	2808
	6.10.5	Related commands	2808
	6.10.6	Default	2808
6.11	angle_style	cosine/squared command	2808
	6.11.1	Syntax	2808
	6.11.2	Examples	2808
	6.11.3	Description	2809
	6.11.4	Restrictions	2809
	6.11.5	Related commands	2809
	6.11.6	Default	2809
6.12	angle_style	cosine/squared/restricted command	2810
	6.12.1	Syntax	2810
	6.12.2	Examples	2810
	6.12.3	Description	2810
	6.12.4	Restrictions	2811
	6.12.5	Related commands	2811
	6.12.6	Default	2811
6.13	angle_style	cross command	2811
	6.13.1	Syntax	2811
	6.13.2	Examples	2811
	6.13.3	Description	2811
	6.13.4	Restrictions	2812
	6.13.5	Related commands	2812
	6.13.6	Default	2812
6.14	angle_style	dipole command	2812
	6.14.1	Syntax	2812
	6.14.2	Examples	2812
	6.14.3	Description	2812
	6.14.4	Restrictions	2813
	6.14.5	Related commands	2814
	6.14.6	Default	2814
6.15	angle_style	fourier command	2814
	6.15.1	Syntax	2814
	6.15.2	Examples	2814
	6.15.3	Description	2814
	6.15.4	Restrictions	2815
	6.15.5	Related commands	2815
	6.15.6	Default	2815
6.16	angle_style	fourier/simple command	2815
	6.16.1	Syntax	2815
	6.16.2	Examples	2815
	6.16.3	Description	2816
	6.16.4	Restrictions	2816
	6.16.5	Related commands	2816
	6.16.6	Default	2816
6.17	angle_style	gaussian command	2816
	6.17.1	Syntax	2816

	6.17.2	Examples	2817
	6.17.3	Description	2817
	6.17.4	Restrictions	2817
	6.17.5	Related commands	2817
	6.17.6	Default	2817
6.18	angle_style	harmonic command	2818
	6.18.1	Syntax	2818
	6.18.2	Examples	2818
	6.18.3	Description	2818
	6.18.4	Restrictions	2819
	6.18.5	Related commands	2819
	6.18.6	Default	2819
6.19	angle_style	hybrid command	2819
	6.19.1	Syntax	2819
	6.19.2	Examples	2819
	6.19.3	Description	2819
	6.19.4	Restrictions	2820
	6.19.5	Related commands	2820
	6.19.6	Default	2820
6.20	angle_style	lepton command	2820
	6.20.1	Syntax	2821
	6.20.2	Examples	2821
	6.20.3	Description	2821
	6.20.4	Lepton expression syntax and features	2822
	6.20.5	Restrictions	2823
	6.20.6	Related commands	2823
	6.20.7	Default	2823
6.21	angle_style	mesocnt command	2823
	6.21.1	Syntax	2823
	6.21.2	Examples	2823
	6.21.3	Description	2824
	6.21.4	Restrictions	2825
	6.21.5	Related commands	2825
	6.21.6	Default	2825
6.22	angle_style	mm3 command	2825
	6.22.1	Syntax	2825
	6.22.2	Examples	2825
	6.22.3	Description	2826
	6.22.4	Restrictions	2826
	6.22.5	Related commands	2826
	6.22.6	Default	2826
6.23	angle_style	none command	2826
	6.23.1	Syntax	2826
	6.23.2	Examples	2826
	6.23.3	Description	2827
	6.23.4	Restrictions	2827
	6.23.5	Related commands	2827
	6.23.6	Default	2827
6.24	angle_style	quartic command	2827
	6.24.1	Syntax	2827
	6.24.2	Examples	2827
	6.24.3	Description	2827
	6.24.4	Restrictions	2828
	6.24.5	Related commands	2828

6.24.6	Default	2828
6.25	angle_style spica command	2828
6.25.1	Syntax	2828
6.25.2	Examples	2829
6.25.3	Description	2829
6.25.4	Restrictions	2829
6.25.5	Related commands	2830
6.25.6	Default	2830
6.26	angle_style table command	2830
6.26.1	Syntax	2830
6.26.2	Examples	2830
6.26.3	Description	2830
6.26.4	Restart, fix_modify, output, run start/stop, minimize info	2832
6.26.5	Restrictions	2832
6.26.6	Related commands	2832
6.26.7	Default	2832
6.27	angle_style zero command	2832
6.27.1	Syntax	2832
6.27.2	Examples	2832
6.27.3	Description	2833

LAMMPS stands for **L**arge-scale **A**tomic/**M**olecular **M**assively **P**arallel **S**imulator.

LAMMPS is a classical molecular dynamics simulation code focusing on materials modeling. It was designed to run efficiently on parallel computers and to be easy to extend and modify. Originally developed at Sandia National Laboratories, a US Department of Energy facility, LAMMPS now includes contributions from many research groups and individuals from many institutions. Most of the funding for LAMMPS has come from the US Department of Energy (DOE). LAMMPS is open-source software distributed under the terms of the GNU Public License Version 2 (GPLv2).

The [LAMMPS website](#) has a variety of information about the code. It includes links to an online version of this manual, an [online forum](#) where users can post questions and discuss LAMMPS, and a [GitHub site](#) where all LAMMPS development is coordinated.

The content for this manual is part of the LAMMPS distribution in its doc directory.

- The version of the manual on the LAMMPS website corresponds to the latest LAMMPS feature release. It is available at: <https://docs.lammps.org/>.
- A version of the manual corresponding to the latest LAMMPS stable release (state of the *stable* branch on GitHub) is available online at: <https://docs.lammps.org/stable/>
- A version of the manual with the features most recently added to LAMMPS (state of the *develop* branch on GitHub) is available at: <https://docs.lammps.org/latest/>

If needed, you can build a copy on your local machine of the manual (HTML pages or PDF file) for the version of LAMMPS you have downloaded. Follow the steps on the [Build the LAMMPS documentation](#) page. If you have difficulties viewing the pages, please [see this note](#).

The manual is organized into three parts:

1. The [User Guide](#) with information about how to obtain, configure, compile, install, and use LAMMPS,
 2. the [Programmer Guide](#) with information about how to use the LAMMPS library interface from different programming languages, how to modify and extend LAMMPS, the program design, internal programming interfaces, and code design conventions,
 3. the [Command Reference](#) with detailed descriptions of all input script commands available in LAMMPS.

Part I

User Guide

INTRODUCTION

These pages provide a brief introduction to LAMMPS.

1.1 Overview of LAMMPS

LAMMPS is a classical molecular dynamics (MD) code that models ensembles of particles in a liquid, solid, or gaseous state. It can model atomic, polymeric, biological, solid-state (metals, ceramics, oxides), granular, coarse-grained, or macroscopic systems using a variety of interatomic potentials (force fields) and boundary conditions. It can model 2d or 3d systems with sizes ranging from only a few particles up to billions.

LAMMPS can be built and run on single laptop or desktop machines, but is designed for parallel computers. It will run in serial and on any parallel machine that supports the [MPI](#) message-passing library. This includes shared-memory multicore, multi-CPU servers and distributed-memory clusters and supercomputers. Parts of LAMMPS also support [OpenMP multi-threading](#), vectorization, and GPU acceleration.

LAMMPS is written in C++ and requires a compiler that is at least compatible with the C++-11 standard. Earlier versions were written in F77, F90, and C++-98. See the [History page](#) of the website for details. All versions can be downloaded as source code from the [LAMMPS website](#).

LAMMPS is designed to be easy to modify or extend with new capabilities, such as new force fields, atom types, boundary conditions, or diagnostics. See the [Modifying & extending LAMMPS](#) section of for more details.

In the most general sense, LAMMPS integrates Newton's equations of motion for a collection of interacting particles. A single particle can be an atom or molecule or electron, a coarse-grained cluster of atoms, or a mesoscopic or macroscopic clump of material. The interaction models that LAMMPS includes are mostly short-ranged in nature; some long-range models are included as well.

LAMMPS uses neighbor lists to keep track of nearby particles. The lists are optimized for systems with particles that are repulsive at short distances, so that the local density of particles never becomes too large. This is in contrast to methods used for modeling plasma or gravitational bodies (like galaxy formation).

On parallel machines, LAMMPS uses spatial-decomposition techniques with MPI parallelization to partition the simulation domain into subdomains of equal computational cost, one of which is assigned to each processor. Processors communicate and store "ghost" atom information for atoms that border their subdomain. Multi-threading parallelization and GPU acceleration with particle-decomposition can be used in addition.

1.2 What does a LAMMPS version mean

The LAMMPS “version” is the date when it was released, such as 1 May 2014. LAMMPS is updated continuously, and we aim to keep it working correctly and reliably at all times. Also, several variants of static code analysis are run regularly to maintain or improve the overall code quality, consistency, and compliance with programming standards, best practices and style conventions. You can follow its development in a public [git repository on GitHub](#).

Each version of LAMMPS contains all the documented *features* up to and including its version date. For recently added features, we add markers to the documentation at which specific LAMMPS version a feature or keyword was added or significantly changed.

1.2.1 Identifying the Version

The version date is printed to the screen and log file every time you run LAMMPS. There also is an indication, if a LAMMPS binary was compiled from version with modifications **after** a release. It is also visible in the file `src/version.h` and in the LAMMPS directory name created when you unpack a downloaded tarball. And it is on the first page of the *manual*.

- If you browse the HTML pages of the online version of the LAMMPS manual, they will by default describe the most current feature release version of LAMMPS. In the navigation bar on the bottom left, there is the option to view instead the documentation for the most recent *stable* version or the documentation corresponding to the state of the development branch.
- If you browse the HTML pages included in your downloaded tarball, they describe the version you have, which may be older than the online version.

1.2.2 LAMMPS releases, branches, and tags

Fig. 1: Relations between releases, main branches, and tags in the LAMMPS git repository

Development

Modifications of the LAMMPS source code (like bug fixes, code refactoring, updates to existing features, or addition of new features) are organized into pull requests. Pull requests will be merged into the *develop* branch of the git repository after they pass automated testing and code review by the LAMMPS developers.

Feature Releases

When a sufficient number of new features and updates have accumulated *and* the LAMMPS version on the *develop* branch passes an extended set of automated tests, we release it as a *feature release*, which are currently made every 4 to 8 weeks. The *release* branch of the git repository is updated with every such *feature release* and a tag in the format `patch_1May2014` is added. A summary of the most important changes of these releases for the current year are posted on [this website page](#). More detailed release notes are [available on GitHub](#).

Stable Releases

About once a year, we release a *stable release* version of LAMMPS. This is done after a “stabilization period” where we apply only bug fixes and small, non-intrusive changes to the *develop* branch but no new features. At the same time, the code is subjected to more detailed and thorough manual testing than the default automated testing. After such a *stable release*, both the *release* and the *stable* branches are updated and two tags are applied, a `patch_1May2014` format and a `stable_1May2014` format tag.

Stable Release Updates

Between *stable releases*, we collect bug fixes and updates back-ported from the *develop* branch in a branch called *maintenance*. From the *maintenance* branch we make occasional *stable update releases* and update the *stable* branch accordingly. The first update to the `stable_1May2014` release would be tagged as `stable_1May2014_update1`. These updates contain no new features.

1.3 LAMMPS features

LAMMPS is a classical molecular dynamics (MD) code with these general classes of functionality:

1. *General features*
 2. *Particle and model types*
 3. *Interatomic potentials (force fields)*
 4. *Atom creation*
 5. *Ensembles, constraints, and boundary conditions*
 6. *Integrators*
 7. *Diagnostics*
 8. *Output*
 9. *Multi-replica models*
 10. *Pre- and post-processing*
 11. *Specialized features (beyond MD itself)*
-

1.3.1 General features

- runs on a single processor or in parallel
- distributed memory message-passing parallelism (MPI)
- shared memory multi-threading parallelism (OpenMP)
- spatial decomposition of simulation domain for MPI parallelism
- particle decomposition inside spatial decomposition for OpenMP and GPU parallelism
- GPLv2 licensed open-source distribution
- highly portable C++11 (optional packages may require C++17)
- modular code with most functionality in optional packages
- only depends on MPI library for basic parallel functionality, MPI stub for serial compilation
- other libraries are optional and only required for specific packages
- GPU (CUDA, OpenCL, HIP, SYCL), Intel Xeon Phi, and OpenMP support for many code features
- easy to extend with new features and functionality
- runs from an input script
- syntax for defining and using variables and formulas
- syntax for looping over runs and breaking out of loops
- run one or multiple simulations simultaneously (in parallel) from one script
- build as library, invoke LAMMPS through library interface (from C, C++, Fortran) or provided Python wrapper or SWIG based wrappers
- couple with other codes: LAMMPS calls other code, other code calls LAMMPS, umbrella code calls both, MDI coupling interface
- call out to Python for computing forces, time integration, or other tasks
- plugin interface for loading external features at runtime
- large integrated collection of tests

1.3.2 Particle and model types

(See *atom style* command)

- atoms
- coarse-grained particles (e.g. bead-spring polymers)
- united-atom polymers or organic molecules
- all-atom polymers, organic molecules, proteins, DNA
- metals
- metal oxides
- granular materials
- coarse-grained mesoscale models
- finite-size spherical and ellipsoidal particles

- finite-size line segment (2d) and triangle (3d) particles
- finite-size rounded polygons (2d) and polyhedra (3d) particles
- point dipole particles
- particles with magnetic spin
- rigid collections of n particles
- hybrid combinations of these

1.3.3 Interatomic potentials (force fields)

(See *pair style*, *bond style*, *angle style*, *dihedral style*, *improper style*, *kpace style* commands)

- pairwise potentials: Lennard-Jones, Buckingham, Morse, Born-Mayer-Huggins, Yukawa, soft, Class II (COMPASS), hydrogen bond, harmonic, gaussian, tabulated, scripted
- charged pairwise potentials: Coulombic, point-dipole
- many-body potentials: EAM, Finnis/Sinclair, MEAM, MEAM+SW, EIM, EDIP, ADP, Stillinger-Weber, Tersoff, REBO, AIREBO, ReaxFF, COMB, Streitz-Mintmire, 3-body polymorphic, BOP, Vashishta
- machine learning potentials: ACE, AGNI, GAP, Behler-Parrinello (N2P2), POD, RANN, SNAP
- interfaces to ML potentials distributed by external groups: ANI, ChIMES, DeepPot, HIPNN, MTP
- long-range interactions for charge, point-dipoles, and LJ dispersion: Ewald, Wolf, PPPM (similar to particle-mesh Ewald), MSM, ScaFaCoS
- polarization models: *QEq*, *core/shell model*, *Drude dipole model*
- charge equilibration (QEq via dynamic, point, shielded, Slater methods)
- coarse-grained potentials: DPD, GayBerne, RESquared, colloidal, DLVO, oxDNA / oxRNA, SPICA
- mesoscopic potentials: granular, Peridynamics, SPH, mesoscopic tubular potential (MESONT)
- semi-empirical potentials: multi-ion generalized pseudopotential theory (MGPT), second moment tight binding + QEq (SMTB-Q)
- electron force field (eFF, AWPMD)
- bond potentials: harmonic, FENE, Morse, nonlinear, Class II (COMPASS), quartic (breakable), tabulated, scripted
- angle potentials: harmonic, CHARMM, cosine, cosine/squared, cosine/periodic, Class II (COMPASS), tabulated, scripted
- dihedral potentials: harmonic, CHARMM, multi-harmonic, helix, Class II (COMPASS), OPLS, tabulated, scripted
- improper potentials: harmonic, cvff, umbrella, Class II (COMPASS), tabulated
- polymer potentials: all-atom, united-atom, bead-spring, breakable
- water potentials: TIP3P, TIP4P, SPC, SPC/E and variants
- interlayer potentials for graphene and analogues, hetero-junctions
- metal-organic framework potentials (QuickFF, MO-FF)
- implicit solvent potentials: hydrodynamic lubrication, Debye
- force-field compatibility with CHARMM, AMBER, DREIDING, OPLS, GROMACS, Class II (COMPASS), UFF, ClayFF, DREIDING, AMOEBA, INTERFACE

- access to the [OpenKIM Repository](#) of potentials via the *kim command*
- hybrid potentials: multiple pair, bond, angle, dihedral, improper potentials can be used in one simulation
- overlaid potentials: superposition of multiple pair potentials (including many-body) with optional scale factor

1.3.4 Atom creation

(See *read_data*, *lattice*, *create_atoms*, *delete_atoms*, *displace_atoms*, *replicate* commands)

- read in atom coordinates from files
- create atoms on one or more lattices (e.g. grain boundaries)
- delete geometric or logical groups of atoms (e.g. voids)
- replicate existing atoms multiple times
- displace atoms

1.3.5 Ensembles, constraints, and boundary conditions

(See *fix* command)

- 2d or 3d systems
- orthogonal or non-orthogonal (triclinic symmetry) simulation domains
- constant NVE, NVT, NPT, NPH, Parrinello/Rahman integrators
- thermostatting options for groups and geometric regions of atoms
- pressure control via Nose/Hoover or Berendsen barostatting in 1 to 3 dimensions
- simulation box deformation (tensile and shear)
- harmonic (umbrella) constraint forces
- rigid body constraints
- SHAKE / RATTLE bond and angle constraints
- motion constraints to manifold surfaces
- Monte Carlo bond breaking, formation, swapping, template based reaction modeling
- atom/molecule insertion and deletion
- walls of various kinds, static and moving
- non-equilibrium molecular dynamics (NEMD)
- variety of additional boundary conditions and constraints

1.3.6 Integrators

(See *run*, *run_style*, *minimize* commands)

- velocity-Verlet integrator
- Brownian dynamics
- rigid body integration
- energy minimization via conjugate gradient, steepest descent relaxation, or damped dynamics (FIRE, Quickmin)
- rRESPA hierarchical timestepping
- fixed or adaptive time step
- rerun command for post-processing of dump files

1.3.7 Diagnostics

- see various flavors of the *fix* and *compute* commands
- introspection command for system, simulation, and compile time settings and configurations

1.3.8 Output

(*dump*, *restart* commands)

- log file of thermodynamic info
- text dump files of atom coordinates, velocities, other per-atom quantities
- dump output on fixed and variable intervals, based timestep or simulated time
- binary restart files
- parallel I/O of dump and restart files
- per-atom quantities (energy, stress, centro-symmetry parameter, CNA, etc.)
- user-defined system-wide (log file) or per-atom (dump file) calculations
- custom partitioning (chunks) for binning, and static or dynamic grouping of atoms for analysis
- spatial, time, and per-chunk averaging of per-atom quantities
- time averaging and histogramming of system-wide quantities
- atom snapshots in native, XYZ, XTC, DCD, CFG, NetCDF, HDF5, ADIOS2, YAML formats
- on-the-fly compression of output and decompression of read in files

1.3.9 Multi-replica models

- *nudged elastic band*
- *hyperdynamics*
- *parallel replica dynamics*
- *temperature accelerated dynamics*
- *parallel tempering*
- path-integral MD: *first variant*, *second variant*
- multi-walker collective variables with *Colvars* and *Plumed*

1.3.10 Pre- and post-processing

- A handful of pre- and post-processing tools are packaged with LAMMPS, some of which can convert input and output files to/from formats used by other codes; see the *Tools* page.
- Our group has also written and released a separate toolkit called *Pizza.py* which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations. *Pizza.py* is written in *Python* and is available for download from the *Pizza.py* WWW site.

1.3.11 Specialized features

LAMMPS can be built with optional packages which implement a variety of additional capabilities. See the *Optional Packages* page for details.

These are LAMMPS capabilities which you may not think of as typical classical MD options:

- *static and dynamic load-balancing*, optional with recursive bisectioning decomposition
- *generalized aspherical particles*
- *stochastic rotation dynamics (SRD)*
- *real-time visualization and interactive MD, built-in renderer for images and movies*
- calculate *virtual diffraction patterns*
- calculate *finite temperature phonon dispersion* and the *dynamical matrix of minimized structures*
- *atom-to-continuum coupling* with finite elements
- coupled rigid body integration via the *POEMS* library
- *QM/MM coupling*
- Monte Carlo via *GCMC* and *tfMC* and *atom swapping*
- *path-integral molecular dynamics (PIMD)* and *this as well*
- *Direct Simulation Monte Carlo* for low-density fluids
- *Peridynamics modeling*
- *Lattice Boltzmann fluid*
- *targeted* and *steered* molecular dynamics
- *two-temperature electron model*

1.4 LAMMPS non-features

LAMMPS is designed to be a fast, parallel engine for molecular dynamics (MD) simulations. It provides only a modest amount of functionality for setting up simulations and analyzing their output.

Originally, LAMMPS was not conceived and designed for:

- being run through a GUI
- building molecular systems, or building molecular topologies
- assign force-field coefficients automatically
- perform sophisticated analysis of your MD simulation
- visualize your MD simulation interactively
- plot your output data

Over the years many of these limitations have been reduced or removed. In part through features added to LAMMPS and in part through external tools that either closely interface with LAMMPS or extend LAMMPS.

Here are suggestions on how to perform these tasks:

- **GUI:** LAMMPS can be built as a library and a Python module that wraps the library interface is provided. Thus, GUI interfaces can be written in Python or C/C++ that run LAMMPS and visualize or plot its output. Examples of this are provided in the python directory and described on the [Python](#) doc page. As of version 2 August 2023 a *GUI tool* is included in LAMMPS. Also, there are several external wrappers or GUI front ends.
- **Builder:** Several pre-processing tools are packaged with LAMMPS. Some of them convert input files in formats produced by other MD codes such as CHARMM, AMBER, or Insight into LAMMPS input formats. Some of them are simple programs that will build simple molecular systems, such as linear bead-spring polymer chains. The moltemplate program is a true molecular builder that will generate complex molecular models. See the [Tools](#) page for details on tools packaged with LAMMPS. The [Pre-/post-processing](#) page of the LAMMPS home-page describes a variety of third party tools for this task. Furthermore, some internal LAMMPS commands allow reconstructing, or selectively adding topology information, as well as provide the option to insert molecule templates instead of atoms for building bulk molecular systems.
- **Force-field assignment:** The conversion tools described in the previous bullet for CHARMM, AMBER, and Insight will also assign force field coefficients in the LAMMPS format, assuming you provide CHARMM, AMBER, or BIOVIA (formerly Accelrys) force field files. The tools [ParmEd](#) and [InterMol](#) are particularly powerful and flexible in converting force field and topology data between various MD simulation programs.
- **Simulation analysis:** If you want to perform analysis on-the-fly as your simulation runs, see the [compute](#) and [fix](#) doc pages, which list commands that can be used in a LAMMPS input script. Also see the [Modify](#) page for info on how to add your own analysis code or algorithms to LAMMPS. For post-processing, LAMMPS output such as [dump file snapshots](#) can be converted into formats used by other MD or post-processing codes. To some degree, that conversion can be done directly inside LAMMPS by interfacing to the VMD molfile plugins. The [rerun](#) command also allows post-processing of existing trajectories, and through being able to read a variety of file formats, this can also be used for analyzing trajectories from other MD codes. Some post-processing tools packaged with LAMMPS will do these conversions. Scripts provided in the tools/python directory can extract and massage data in dump files to make it easier to import into other programs. See the [Tools](#) page for details on these various options.
- **Visualization:** LAMMPS can produce NETPBM, JPG, or PNG format snapshot images on-the-fly via its [dump image](#) command and pass them to an external program, [FFmpeg](#), to generate movies from them. For high-quality, interactive visualization, there are many excellent and free tools available. See the [Visualization Tools](#) page of the LAMMPS website for visualization packages that can process LAMMPS output data.

- **Plotting:** See the next bullet about `Pizza.py` as well as the [Python](#) page for examples of plotting LAMMPS output. Scripts provided with the `python` tool in the `tools` directory will extract and process data in log and dump files to make it easier to analyze and plot. See the [Tools](#) doc page for more discussion of the various tools.
- **Pizza.py:** Our group has also written a separate toolkit called `Pizza.py` which can do certain kinds of setup, analysis, plotting, and visualization (via OpenGL) for LAMMPS simulations. It thus provides some functionality for several of the above bullets. `Pizza.py` is written in [Python](#) and is available for download from [this page](#).

1.5 LAMMPS portability and compatibility

The primary form of distributing LAMMPS is through highly portable source code. But also several ways of obtaining LAMMPS as *precompiled packages* or *through automated build mechanisms* exist. Most of LAMMPS is written in C++, some support tools are written in Fortran or Python or MATLAB.

1.5.1 Programming language standards

Most of the C++ code currently requires a compiler compatible with the C++11 standard, the KOKKOS package currently requires C++17. Most of the Python code is written to be compatible with Python 3.5 or later or Python 2.7. Some Python scripts *require* Python 3 and a few others still need to be ported from Python 2 to Python 3.

1.5.2 Build systems

LAMMPS can be compiled from source code using a (traditional) build system based on shell scripts, a few shell utilities (`grep`, `sed`, `cat`, `tr`) and the GNU make program. This requires running within a Bourne shell (`/bin/sh`). Alternatively, a build system with different back ends can be created using CMake. CMake must be at least version 3.16.

1.5.3 Operating systems

The primary development platform for LAMMPS is Linux. Thus, the chances for LAMMPS to compile without problems on Linux machines are the best. Also, compilation and correct execution on macOS and Windows (using Microsoft Visual C++) is checked automatically for largest part of the source code. Some (optional) features are not compatible with all operating systems, either through limitations of the corresponding LAMMPS source code or through source code or build system incompatibilities of required libraries.

Executables for Windows may be created natively using either Cygwin or Visual Studio or with a Linux to Windows MinGW cross-compiler.

Additionally, FreeBSD and Solaris have been tested successfully.

1.5.4 Compilers

The most commonly used compilers are the GNU compilers, but also Clang and the Intel compilers have been successfully used on Linux, macOS, and Windows. Also, the Nvidia HPC SDK (formerly PGI compilers) will compile LAMMPS (tested on Linux).

1.5.5 CPU architectures

The primary CPU architecture for running LAMMPS is 64-bit x86, but also 32-bit x86, and 64-bit ARM and PowerPC (64-bit, Little Endian) are regularly tested.

1.5.6 Portability compliance

Only a subset of the LAMMPS source code is *fully* compliant to *all* of the above mentioned standards. This is rather typical for projects like LAMMPS that largely depend on contributions from the user community. Not all contributors are trained as programmers and not all of them have access to multiple platforms for testing. As part of the continuous integration process, however, all contributions are automatically tested to compile, link, and pass some runtime tests on a selection of Linux flavors, macOS, and Windows, and on Linux with different compilers. Thus portability issues are often found before a pull request is merged. Other platforms may be checked occasionally or when portability bugs are reported.

1.6 LAMMPS open-source license

1.6.1 GPL version of LAMMPS

LAMMPS is an open-source code, available free-of-charge, and distributed under the terms of the [GNU Public License Version 2](#) (GPLv2), which means you can use or modify the code however you wish for your own purposes, but have to adhere to certain rules when redistributing it - specifically in binary form - or are distributing software derived from it or that includes parts of it.

LAMMPS comes with no warranty of any kind.

As each source file states in its header, it is a copyrighted code, and thus not in the public domain. For more information about open-source software and open-source distribution, see www.gnu.org or www.opensource.org. The legal text of the GPL as it applies to LAMMPS is in the LICENSE file included in the LAMMPS distribution.

Here is a more specific summary of what the GPL means for LAMMPS users:

- (1) Anyone is free to use, copy, modify, or extend LAMMPS in any way they choose, including for commercial purposes.
- (2) If you **distribute** a modified version of LAMMPS, it must remain open-source, meaning you are required to distribute **all** of it under the terms of the GPL. You should clearly annotate such a modified code as a derivative version of LAMMPS.
- (3) If you release any code that includes or uses LAMMPS source code, then it must also be open-sourced, meaning you distribute it under the terms of the GPL. You may write code that interfaces LAMMPS to a differently licensed library. In that case the code that provides the interface must be licensed GPL, but not necessarily that library unless you are distributing binaries that require the library to run.
- (4) If you give LAMMPS files to someone else, the GPL LICENSE file and source file headers (including the copyright and GPL notices) should remain part of the code.

1.6.2 LGPL version of LAMMPS

We occasionally make stable LAMMPS releases available under the [GNU Lesser Public License v2.1](#). This is on request only and with non-LGPL compliant files removed. This allows uses linking non-GPL compatible software with the (otherwise unmodified) LAMMPS library or loading it dynamically at runtime. Any **modifications** to the LAMMPS code however, even with the LGPL licensed version, must still be made available under the same open source terms as LAMMPS itself.

1.7 Authors of LAMMPS

The primary LAMMPS developers are at Sandia National Labs and Temple University:

- [Steve Plimpton](#), sjplimp at gmail.com
- Aidan Thompson, athomps at sandia.gov
- Stan Moore, stamoor at sandia.gov
- [Axel Kohlmeyer](#), akohlmey at gmail.com
- Richard Berger, richard.berger at outlook.com

Past developers include Paul Crozier and Mark Stevens, both at Sandia, and Ray Shan, now at Materials Design.

The [Authors page](#) of the [LAMMPS website](#) has a comprehensive list of all the individuals who have contributed code for a new feature or command or tool to LAMMPS.

The following folks deserve special recognition. Many of the packages they have written are unique for an MD code and LAMMPS would not be as general-purpose as it is without their expertise and efforts.

- Metin Aktulga (MSU), REAXFF package for C/C++ version of ReaxFF
- Mike Brown (Intel), GPU and INTEL packages
- Colin Denniston (U Western Ontario), LATBOLTZ package
- Georg Ganzenmuller (EMI), MACHDYN and SPH packages
- Andres Jaramillo-Botero (Caltech), EFF package for electron force field
- Reese Jones (Sandia) and colleagues, ATC package for atom/continuum coupling
- Christoph Kloss (DCS Computing), LIGGGHTS code for granular materials, built on top of LAMMPS
- Rudra Mukherjee (JPL), POEMS package for articulated rigid body motion
- Trung Ngyuen (U Chicago), GPU, RIGID, BODY, and DIELECTRIC packages
- Mike Parks (Sandia), PERI package for Peridynamics
- Roy Pollock (LLNL), Ewald and PPPM solvers
- Julien Tranchida (CEA Cadarache), SPIN package
- Christian Trott (Sandia), CUDA and KOKKOS packages
- Ilya Valuev (JIHT), AWPMD package for wave packet MD
- Greg Wagner (Northwestern U), MEAM package for MEAM potential

As discussed on the [History](#) page of the website, LAMMPS originated as a cooperative project between DOE labs and industrial partners. Folks involved in the design and testing of the original version of LAMMPS were the following:

- John Carpenter (Mayo Clinic, formerly at Cray Research)
- Terry Stouch (Lexicon Pharmaceuticals, formerly at Bristol Myers Squibb)
- Steve Lustig (Dupont)
- Jim Belak and Roy Pollock (LLNL)

1.8 Citing LAMMPS

1.8.1 Core Algorithms

The paper mentioned below is the best overview of LAMMPS, but there are also publications describing particular models or algorithms implemented in LAMMPS or complementary software that it has interfaces to. Please see below for how to cite contributions to LAMMPS.

The latest canonical publication that describes the basic features, the source code design, the program structure, the spatial decomposition approach, the neighbor finding, basic communications algorithms, and how users and developers have contributed to LAMMPS is:

LAMMPS - A flexible simulation tool for particle-based materials modeling at the atomic, meso, and continuum scales, *Comp. Phys. Comm.* 271, 108171 (2022)

So a project using LAMMPS or a derivative application that uses LAMMPS as a simulation engine should cite this paper. The paper is expected to be published in its final form under the same DOI in the first half of 2022. Please also give the URL of the LAMMPS website in your paper, namely <https://www.lammps.org>.

The original publication describing the parallel algorithms used in the initial versions of LAMMPS is:

S. Plimpton, Fast Parallel Algorithms for Short-Range Molecular Dynamics, *J Comp Phys*, 117, 1-19 (1995).

1.8.2 DOI for the LAMMPS source code

The LAMMPS developers use the [Zenodo service at CERN](#) to create digital object identifiers (DOI) for stable releases of the LAMMPS source code. There are two types of DOIs for the LAMMPS source code.

The canonical DOI for **all** versions of LAMMPS, which will always point to the **latest** stable release version, is:

- DOI: [10.5281/zenodo.3726416](https://doi.org/10.5281/zenodo.3726416)

In addition there are DOIs generated for individual stable releases:

- 3 March 2020 version: DOI:[10.5281/zenodo.3726417](https://doi.org/10.5281/zenodo.3726417)
- 29 October 2020 version: DOI:[10.5281/zenodo.4157471](https://doi.org/10.5281/zenodo.4157471)
- 29 September 2021 version: DOI:[10.5281/zenodo.6386596](https://doi.org/10.5281/zenodo.6386596)
- 23 June 2022 version: DOI:[10.5281/zenodo.10806836](https://doi.org/10.5281/zenodo.10806836)
- 2 August 2023 version: DOI:[10.5281/zenodo.10806852](https://doi.org/10.5281/zenodo.10806852)

1.8.3 Home page

The LAMMPS website at <https://www.lammps.org/> is the canonical location for information about LAMMPS and its features.

1.8.4 Citing contributions

LAMMPS has many features that use either previously published methods and algorithms or novel features. It also includes potential parameter files for specific models. Where available, a reminder about references for optional features used in a specific run is printed to the screen and log file. Style and output location can be selected with the *-cite command-line switch*. Additional references are given in the documentation of the *corresponding commands* or in the *Howto tutorials*. Please make certain, that you provide the proper acknowledgments and citations in any published works using LAMMPS.

1.9 Additional website links

The LAMMPS website has a variety of additional info about LAMMPS, beyond what is in this manual. Some other useful resources available online are listed below.

- LAMMPS source code repository on GitHub
- LAMMPS forum on matsci.org
- Recent bug fixes and new features
- Download info
- Glossary of terms relevant to LAMMPS
- LAMMPS highlights with images
- LAMMPS highlights with movies
- Workshops
- Tutorials
- Pre- and post-processing tools for LAMMPS
- Other software usable with LAMMPS
- Viz tools usable with LAMMPS
- Benchmark performance
- Publications that have cited LAMMPS
- Authors of LAMMPS
- History of LAMMPS development
- Funding for LAMMPS

INSTALL LAMMPS

You can download LAMMPS as an executable or as source code.

When downloading the LAMMPS source code, you also have to *build LAMMPS*. But you have more flexibility as to what features to include or exclude in the build. When you download and install pre-compiled LAMMPS executables, you are limited to install which version of LAMMPS is available and which features are included of these builds. If you plan to *modify or extend LAMMPS*, then you **must** build LAMMPS from the source code.

Note

If you have questions about the pre-compiled LAMMPS executables, you need to contact the people preparing those executables. The LAMMPS developers have no control over their choices of how they configure and build their packages and when they update them.

2.1 Download an executable for Linux

Binaries are available for different versions of Linux:

- *Pre-built static Linux x86_64 executables*
- *Pre-built Ubuntu and Debian Linux executables*
- *Pre-built Fedora Linux executables*
- *Pre-built EPEL Linux executables (RHEL, CentOS)*
- *Pre-built OpenSuse Linux executables*
- *Gentoo Linux executable*
- *Arch Linux build-script*

Note

If you have questions about these pre-compiled LAMMPS executables, you need to contact the people preparing those packages. The LAMMPS developers have no control over how they configure and build their packages and when they update them. They may only provide packages for stable release versions and not always update the packages in a timely fashion after a new LAMMPS release is made.

2.1.1 Pre-built static Linux x86_64 executables

Pre-built LAMMPS executables for Linux, that are statically linked and compiled for 64-bit x86 CPUs (x86_64 or AMD64) are available for download at <https://download.lammps.org/static/>. Because of that static linkage (and unlike the Linux distribution specific packages listed below), they do not depend on any installed software and thus should run on *any* 64-bit x86 machine with *any* Linux version.

These executable include most of the available packages and multi-thread parallelization (via INTEL, KOKKOS, or OPENMP package). They are **not** compatible with MPI. Several of the LAMMPS tools executables (e.g. `msi2lmp`) are included as well. Because of the static linkage, there is no `liblammps.so` library file and thus also the LAMMPS python module, which depends on it, is not included.

The compressed tar archives available for download have names following the pattern `lammps-linux-x86_64-<version>.tar.gz` and will all unpack into a `lammps-static` folder. The executables are then in the `lammps-static/bin/` folder. Since they do not depend on any other software, they may be freely moved or copied around.

2.1.2 Pre-built Ubuntu and Debian Linux executables

A pre-built LAMMPS executable, suitable for running on the latest Ubuntu and Debian Linux versions, can be downloaded as a Debian package. This allows you to install LAMMPS with a single command, and stay (mostly) up-to-date with the current stable version of LAMMPS by simply updating your operating system.

To install LAMMPS do the following once:

```
sudo apt-get install lammps
```

This downloads an executable named `lmp` to your box and multiple packages with supporting data, examples and libraries as well as any missing dependencies. For example, the LAMMPS binary in this package is built with the *KIM package* enabled, which results in the above command also installing the `kim-api` binaries when LAMMPS is installed, unless they were installed already. In order to use potentials from openkim.org, you can also install the `openkim-models` package:

```
sudo apt-get install openkim-models
```

Or use the *KIM-API commands* to download and install individual models.

This LAMMPS executable can then be used in the usual way to run input scripts:

```
lmp -in in.lj
```

To update LAMMPS to the latest packaged version, do the following:

```
sudo apt-get update
```

This will also update other packages on your system.

To uninstall LAMMPS, do the following:

```
sudo apt-get remove lammps
```

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Anton Gladky (gladky.anton at gmail.com) for setting up this Ubuntu package capability.

2.1.3 Pre-built Fedora Linux executables

Pre-built LAMMPS packages for stable releases are available in the Fedora Linux distribution since Fedora version 28. The packages can be installed via the `dnf` package manager. There are 3 basic varieties (`lammps` = no MPI, `lammps-mpich` = MPICH MPI library, `lammps-openmpi` = OpenMPI MPI library) and for each support for linking to the C library interface (`lammps-devel`, `lammps-mpich-devel`, `lammps-openmpi-devel`), the header for compiling programs using the C library interface (`lammps-headers`), and the LAMMPS python module for Python 3. All packages can be installed at the same time and the name of the LAMMPS executable is `lmp` and `lmp_openmpi` or `lmp_mpich` respectively. By default, `lmp` will refer to the serial executable, unless one of the MPI environment modules is loaded (`module load mpi/mpich-x86_64` or `module load mpi/openmpi-x86_64`). Then the corresponding parallel LAMMPS executable can be used. The same mechanism applies when loading the LAMMPS python module.

To install LAMMPS with OpenMPI and run an input `in.lj` with 2 CPUs do:

```
dnf install lammps-openmpi
module load mpi/openmpi-x86_64
mpirun -np 2 lmp -in in.lj
```

The `dnf install` command is needed only once. In case of a new LAMMPS stable release, `dnf update` will automatically update to the newer version as soon as the RPM files are built and uploaded to the download mirrors. The `module load` command is needed once per (shell) session or shell terminal instance, unless it is automatically loaded from the shell profile.

The LAMMPS binary is built with the *KIM package* which results in the above command also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the *openkim-models* package

```
dnf install openkim-models
```

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in Fedora.

2.1.4 Pre-built EPEL Linux executable

Pre-built LAMMPS (and KIM) packages for stable releases are available in the [Extra Packages for Enterprise Linux \(EPEL\) repository](#) for use with Red Hat Enterprise Linux (RHEL) or CentOS version 7.x and compatible Linux distributions. Names of packages, executable, and content are the same as described above for Fedora Linux. But RHEL/CentOS 7.x uses the `yum` package manager instead of `dnf` in Fedora 28.

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in EPEL.

2.1.5 Pre-built OpenSuse Linux executable

A pre-built LAMMPS package for stable releases is available in OpenSuse as of Leap 15.0. You can install the package with:

```
zypper install lammeps
```

This includes support for OpenMPI. The name of the LAMMPS executable is `lmp`. To run an input in parallel on 2 CPUs you would do:

```
mpirun -np 2 lmp -in in.lj
```

Please use `lmp -help` to see which compilation options, packages, and styles are included in the binary.

The LAMMPS binary is built with the *KIM package* which results in the above command also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the *openkim-models* package

```
zypper install openkim-models
```

Thanks to Christoph Junghans (LANL) for making LAMMPS available in OpenSuse.

2.1.6 Gentoo Linux executable

LAMMPS is part of [Gentoo's main package tree](#) and can be installed by typing:

```
emerge --ask lammeps
```

Note that in Gentoo the LAMMPS source code is downloaded and the package is then compiled and installed on your machine.

Certain LAMMPS packages can be enabled via USE flags, type

```
equery uses lammeps
```

for details.

Thanks to Nicolas Bock and Christoph Junghans (LANL) for setting up this Gentoo capability.

2.1.7 Archlinux build-script

LAMMPS is available via Arch's unofficial Arch User repository (AUR). There are three scripts available, named *lammeps*, *lammeps-beta* and *lammeps-git*. They respectively package the stable, feature, and git releases.

To install, you will need to have the git package installed. You may use any of the above names in-place of *lammeps*.

```
git clone https://aur.archlinux.org/lammeps-git
cd lammeps
makepkg -s
makepkg -i
```

To update LAMMPS, you may repeat the above, or change into the cloned directory, and execute the following, after which, if there are any changes, you may use `makepkg` as above.

```
git pull
```

Alternatively, you may use an AUR helper to install these packages.

Note that the AUR provides build-scripts that download the source code and then build and install the package on your machine.

2.2 Download an executable for macOS

LAMMPS can be downloaded, built, and configured for macOS with [Homebrew](#). (Alternatively, see the installation instructions for [downloading an executable via Conda](#).) The following LAMMPS packages are unavailable at this time because of additional requirements not yet met: GPU, KOKKOS, MSCG, POEMS, VORONOI.

After installing Homebrew, you can install LAMMPS on your system with the following commands:

```
brew install lammps
```

This will install the executables “`lammps_serial`” and “`lammps_mpi`”, as well as the LAMMPS “`doc`”, “`potentials`”, “`tools`”, “`bench`”, and “`examples`” directories.

Once LAMMPS is installed, you can test the installation with the Lennard-Jones benchmark file:

```
brew test lammps -v
```

The LAMMPS binary is built with the [KIM package](#), which results in Homebrew also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from [openkim.org](#), you can install the *openkim-models* package

```
brew install openkim-models
```

If you have problems with the installation, you can post issues to [this link](#).

Thanks to Derek Thomas (derek.t at cello.t.u-tokyo.ac.jp) for setting up the Homebrew capability.

2.3 Download an executable for Windows

Pre-compiled Windows installers which install LAMMPS executables on a Windows system can be downloaded from this site:

<https://packages.lammps.org/windows.html>

Note that each installer package has a date in its name, which corresponds to the LAMMPS version of the same date. Installers for current and older versions of LAMMPS are available. 32-bit and 64-bit installers are available, and each installer contains both a serial and parallel executable. The installer website also explains how to install the Windows MPI package (MPICH2 from Argonne National Labs), needed to run in parallel with MPI.

The LAMMPS binaries contain *all optional packages* included in the source distribution except: ADIOS, H5MD, KIM, ML-PACE, ML-QUIP, MSCG, NETCDF, QMMM, SCAFACOS, and VTK. The serial version also does not include the LATBOLTZ package. The PYTHON package is only available in the Python installers that bundle a Python runtime. The GPU package is compiled for OpenCL with mixed precision kernels.

The LAMMPS library is compiled as a shared library and the [LAMMPS Python module](#) is installed, so that it is possible to load LAMMPS into a Python interpreter.

The installer site also has instructions on how to run LAMMPS under Windows, once it is installed, in both serial and parallel.

When you download the installer package, you run it on your Windows machine. It will then prompt you with a dialog, where you can choose the installation directory, unpack and copy several executables, potential files, documentation PDFs, selected example files, etc. It will then update a few system settings (e.g. PATH, LAMMPS_POTENTIALS) and add an entry into the Start Menu (with references to the documentation, LAMMPS homepage and more). From that menu, there is also a link to an uninstaller that removes the files and undoes the environment manipulations.

Note that to update to a newer version of LAMMPS, you should typically uninstall the version you currently have, download a new installer, and go through the installation procedure described above. I.e. the same procedure for installing/updating most Windows programs. You can install multiple versions of LAMMPS (in different directories), but only the executable for the last-installed package will be found automatically, so this should only be done for debugging purposes.

2.4 Download an executable for Linux or macOS via Conda

Pre-compiled LAMMPS binaries are available for macOS and Linux via the [Conda](#) package management system.

First, one must set up the Conda package manager on your system. Follow the instructions to install [Miniconda](#), then create a conda environment (named *my-lammps-env* or whatever you prefer) for your LAMMPS install:

```
conda config --add channels conda-forge
conda create -n my-lammps-env
```

Then, you can install LAMMPS on your system with the following command:

```
conda activate my-lammps-env
conda install lammps
```

The LAMMPS binary is built with the [KIM package](#), which results in Conda also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from [openkim.org](#), you can install the *openkim-models* package

```
conda install openkim-models
```

If you have problems with the installation, you can post issues to [this link](#). Thanks to Jan Janssen (Max-Planck-Institut fuer Eisenforschung) for setting up the Conda capability.

Note

If you have questions about these pre-compiled LAMMPS executables, you need to contact the people preparing those packages. The LAMMPS developers have no control over their choices of how they configure and build their packages and when they update them.

2.5 Download source and documentation as a tarball

You can download a current LAMMPS tarball from the [download page](#) of the [LAMMPS website](#) or from GitHub (see below).

You have two choices of tarballs, either the most recent stable release or the most recent feature release. Stable releases occur a few times per year, and undergo more testing before release. Also, between stable releases bug fixes from the feature releases are back-ported and the tarball occasionally updated. Feature releases occur every 4 to 8 weeks. The new contents in all feature releases are listed on the [bug and feature page](#) of the LAMMPS homepage.

Tarballs of older LAMMPS versions can also be downloaded from [this page](#).

Tarballs downloaded from the LAMMPS homepage include the pre-translated LAMMPS documentation (HTML and PDF files) corresponding to that version.

Once you have a tarball, uncompress and untar it with the following command:

```
tar -xzf lammps*.tar.gz
```

This will create a LAMMPS directory with the version date in its name, e.g. lammps-28Mar23.

You can also download a compressed tar or zip archives from the “Assets” sections of the [LAMMPS GitHub releases site](#). The file name will be lammps-<version>.zip which can be unzipped with the following command, to create a lammps-<version> directory:

```
unzip lammps*.zip
```

This version corresponds to the selected LAMMPS feature or stable release (as indicated by the matching git tag) and will only contain the source code and no pre-built documentation.

2.6 Download the LAMMPS source with git

LAMMPS development is coordinated through the “LAMMPS GitHub site”. If you clone the LAMMPS repository onto your local machine, it has several advantages:

- You can stay current with changes to LAMMPS with a single git command.
- You can create your own development branches to add code to LAMMPS.
- You can submit your new features back to GitHub for inclusion in LAMMPS. For that, you should first create your own [fork on GitHub](#), though.

You must have [git](#) installed on your system to use the commands explained below to communicate with the git servers on GitHub. For people still using subversion (svn), GitHub also provides [limited support for subversion clients](#).

Note

As of October 2016, the official home of public LAMMPS development is on GitHub. The previously advertised LAMMPS git repositories on [git.lammps.org](#) and [bitbucket.org](#) are now offline or deprecated.

You can follow the LAMMPS development on 4 different git branches:

- **develop** : this branch follows the ongoing development and is updated with every merge commit of a pull request

- **release**

[this branch is updated with every “feature release”]; updates are always “fast-forward” merges from *develop*

- **maintenance** : this branch collects back-ported bug fixes from the *develop* branch to the *stable* branch. It is used to update the *stable* branch for “stable update releases”.
- **stable** : this branch is updated from the *release* branch with every “stable release” version and also has selected bug fixes with every “update release” when the *maintenance* branch is merged into it

To access the git repositories on your box, use the clone command to create a local copy of the LAMMPS repository with a command like:

```
git clone -b release https://github.com/lammps/lammps.git mylammps
```

where “mylammps” is the name of the directory you wish to create on your machine and “release” is one of the 3 branches listed above. (Note that you actually download all 3 branches; you can switch between them at any time using “git checkout <branch name>”.)

Saving time and disk space when using git clone

The complete git history of the LAMMPS project is quite large because it contains the entire commit history of the project since fall 2006, which includes the time when LAMMPS was managed with subversion. This includes a few commits that have added and removed some large files (mostly by accident). If you do not need access to the entire commit history (most people don’t), you can speed up the “cloning” process and reduce local disk space requirements by using the `-depth` git command line flag. That will create a “shallow clone” of the repository, which contains only a subset of the git history. Using a depth of 1000 is usually sufficient to include the head commits of the *develop*, the *release*, and the *maintenance* branches. To include the head commit of the *stable* branch you may need a depth of up to 10000. If you later need more of the git history, you can always convert the shallow clone into a “full clone”.

Once the command completes, your directory will contain the same files as if you unpacked a current LAMMPS tarball, with the exception, that the HTML documentation files are not included. They can be generated from the content provided in `doc/src` by typing `make html` from the `doc` directory.

After initial cloning, as bug fixes and new features are added to LAMMPS you can stay up-to-date by typing the following git commands from within the “mylammps” directory:

```
git checkout release      # not needed if you always stay in this branch
git checkout stable       # use one of these 4 checkout commands
git checkout develop      # to choose the branch to follow
git checkout maintenance
git pull
```

Doing a “pull” will not change any files you have added to the LAMMPS directory structure. It will also not change any existing LAMMPS files you have edited, unless those files have changed in the repository. In that case, git will attempt to merge the changes from the repository file with your version of the file and tell you if there are any conflicts. See the git documentation for details.

If you want to access a particular previous release version of LAMMPS, you can instead “check out” any version with a published tag. See the output of `git tag -l` for the list of tags. The git command to do this is as follows.

```
git checkout tagID
```

Stable versions and what tagID to use for a particular stable version are discussed on [this page](#). Note that this command will print some warnings, because in order to get back to the latest revision and to be able to update with `git pull` again, you will need to do `git checkout release` (or check out any other desired branch) first.

Once you have updated your local files with a `git pull` (or `git checkout`), you still need to re-build LAMMPS if any source files have changed. How to do this depends on the build system you are using.

CMake build

Change to your build folder and type:

```
cmake . --build
```

CMake should auto-detect whether it needs to re-run the CMake configuration step and otherwise redo the build for all files that have been changed or files that depend on changed files. In case some build options have been changed or renamed, you may have to update those by running:

```
cmake .
```

and then rebuild.

Traditional make

Switch to the `src` directory and type:

```
make purge           # remove any deprecated src files
make package-update  # sync package files with src files
make foo             # re-build for your machine (mpi, serial, etc)
```

to enforce consistency of the source between the `src` folder and package directories. This is OK to do even if you don't use any packages. The `make purge` command removes any deprecated `src` files if they were removed by the update from a package subdirectory.

Warning

If you wish to edit/change a `src` file that is from a package, you should edit the version of the file inside the package subdirectory with `src`, then re-install the package. The version in the source directory is merely a copy and will be wiped out if you type “`make package-update`”.

Git protocols

The servers at `github.com` support the “https” access protocol for anonymous, read-only access. If you have a suitably configured GitHub account, you may also use SSH protocol with the URL `git@github.com:lammps/lammps.git`.

The LAMMPS GitHub project is currently overseen by Axel Kohlmeyer (Temple U, `akohlmey@gmail.com`).

These are the files and subdirectories in the LAMMPS distribution:

README	Short description of the LAMMPS package
LICENSE	GNU General Public License (GPL)
SECURITY.md	Security policy for the LAMMPS package
bench	benchmark inputs
cmake	CMake build files
doc	documentation and tools to build the manual
examples	example input files
fortran	Fortran module for LAMMPS library interface
lib	additional provided or external libraries
potentials	selected interatomic potential files
python	Python module for LAMMPS library interface
src	LAMMPS source files
tools	pre- and post-processing tools
unittest	source code and inputs for testing LAMMPS

You will have all of these if you downloaded the LAMMPS source code. You will have only some of them if you downloaded executables, as explained on the pages listed above.

BUILD LAMMPS

LAMMPS is built as a library and an executable from source code using either traditional makefiles for use with GNU make (which may require manual editing), or using a build environment generated by CMake (Unix Makefiles, Ninja, Xcode, Visual Studio, KDevelop, CodeBlocks and more).

As an alternative, you can download a package with pre-built executables or automated build trees, as described in the *Install* section of the manual.

3.1 Build LAMMPS with CMake

This page describes how to use CMake in general to build LAMMPS. Details for specific compile time settings and options to enable and configure add-on packages are discussed with those packages. Links to those pages on the *Build overview* page.

The following text assumes some familiarity with CMake and focuses on using the command line tool `cmake` and what settings are supported for building LAMMPS. A more detailed tutorial on how to use CMake itself, the text mode or graphical user interface, to change the generated output files for different build tools and development environments is on a *separate page*.

Note

LAMMPS currently requires that CMake version 3.16 or later is available.

Warning

You must not mix the *traditional make based* LAMMPS build procedure with using CMake. No packages may be installed or a build been previously attempted in the LAMMPS source directory by using `make <machine>`. CMake will detect if this is the case and generate an error. To remove conflicting files from the `src` you can use the command `make no-all purge` which will uninstall all packages and delete all auto-generated files.

3.1.1 Advantages of using CMake

CMake is an alternative to compiling LAMMPS in the traditional way through *(manually customized) makefiles*. Using CMake has multiple advantages that are specifically helpful for people with limited experience in compiling software or for people that want to modify or extend LAMMPS.

- CMake can detect available hardware, tools, features, and libraries and adapt the LAMMPS default build configuration accordingly.
- CMake can generate files for different build tools and integrated development environments (IDE).
- CMake supports customization of settings with a command line, text mode, or graphical user interface. No manual editing of files, knowledge of file formats or complex command line syntax is required.
- All enabled components are compiled in a single build operation.
- Automated dependency tracking for all files and configuration options.
- Support for true out-of-source compilation. Multiple configurations and settings with different choices of LAMMPS packages, settings, or compilers can be configured and built concurrently from the same source tree.
- Simplified packaging of LAMMPS for Linux distributions, environment modules, or automated build tools like [Homebrew](#).
- Integration of automated unit and regression testing (the LAMMPS side of this is still under active development).

3.1.2 Getting started

Building LAMMPS with CMake is a two-step process. In the first step, you use CMake to generate a build environment in a new directory. For that purpose you can use either the command-line utility `cmake` (or `cmake3`), the text-mode UI utility `ccmake` (or `ccmake3`) or the graphical utility `cmake-gui`, or use them interchangeably. The second step is then the compilation and linking of all objects, libraries, and executables using the selected build tool. Here is a minimal example using the command line version of CMake to build LAMMPS with no add-on packages enabled and no customization:

```
cd lammps           # change to the LAMMPS distribution directory
mkdir build; cd build # create and use a build directory
cmake ../cmake       # configuration reading CMake scripts from ../cmake
cmake --build .       # compilation (or type "make")
```

This will create and change into a folder called `build`, then run the configuration step to generate build files for the default build command and then launch that build command to compile LAMMPS. During the configuration step CMake will try to detect whether support for MPI, OpenMP, FFTW, gzip, JPEG, PNG, and ffmpeg are available and enable the corresponding configuration settings. The progress of this configuration can be followed on the screen and a summary of selected options and settings will be printed at the end. The `cmake --build .` command will launch the compilation, which, if successful, will ultimately produce a library `liblammps.a` and the LAMMPS executable `lmp` inside the `build` folder.

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with `make -j N` (with `N` being the maximum number of concurrently executed tasks). Installation of the `ccache` (= Compiler Cache) software may speed up repeated compilation even more, e.g. during code development, especially when repeatedly switching between branches.

After the initial build, whenever you edit LAMMPS source files, enable or disable packages, change compiler flags or build options, you must re-compile and relink the LAMMPS executable with `cmake --build .` (or `make`). If the compilation fails for some reason, try running `cmake .` and then compile again. The included dependency tracking

should make certain that only the necessary subset of files is re-compiled. You can also delete compiled objects, libraries, and executables with `cmake --build . --target clean` (or `make clean`).

After compilation, you may optionally install the LAMMPS executable into your system with:

```
make install    # optional, copy compiled files into installation location
```

This will install the LAMMPS executable and library, some tools (if configured) and additional files like LAMMPS API headers, manpages, potential and force field files. The location of the installation tree defaults to `${HOME}/.local`.

3.1.3 Configuration and build options

The CMake commands have one mandatory argument: a folder containing a file called `CMakeLists.txt` (for LAMMPS it is located in the `cmake` folder) or a build folder containing a file called `CMakeCache.txt`, which is generated at the end of the CMake configuration step. The cache file contains all current CMake settings.

To modify settings, enable or disable features, you need to set *variables* with either the `-D` command line flag (`-D VARIABLE1_NAME=value`) or change them in the text mode of the graphical user interface. The `-D` flag can be used several times in one command.

For your convenience, we provide *CMake presets* that combine multiple settings to enable optional LAMMPS packages or use a different compiler tool chain. Those are loaded with the `-C` flag (`-C ../cmake/presets/basic.cmake`). This step would only be needed once, as the settings from the preset files are stored in the `CMakeCache.txt` file. It is also possible to customize the build by adding one or more `-D` flags to the CMake command line.

Generating files for alternate build tools (e.g. Ninja) and project files for IDEs like Eclipse, CodeBlocks, or Kate can be selected using the `-G` command line flag. A list of available generator settings for your specific CMake version is given when running `cmake --help`.

3.1.4 Multi-configuration build systems

Throughout this manual, it is mostly assumed that LAMMPS is being built on a Unix-like operating system with “make” as the underlying “builder”, since this is the most common case. In this case the build “configuration” is chose using `-D CMAKE_BUILD_TYPE=<configuration>` with `<configuration>` being one of “Release”, “Debug”, “RelWithDebInfo”, or “MinSizeRel”. Some build tools, however, can also use or even require having a so-called multi-configuration build system setup. For a multi-configuration build, the built type (or configuration) is selected at compile time using the same build files. E.g. with:

```
cmake --build build-multi --config Release
```

In that case the resulting binaries are not in the build folder directly but in subdirectories corresponding to the build type (i.e. Release in the example from above). Similarly, for running unit tests the configuration is selected with the `-C` flag:

```
ctest -C Debug
```

The CMake scripts in LAMMPS have basic support for being compiled using a multi-config build system, but not all of it has been ported. This is in particular applicable to compiling packages that require additional libraries that would be downloaded and compiled by CMake. The `windows.cmake` preset file tries to keep track of which packages can be compiled natively with the MSVC compilers out-of-the box. Not all of the external libraries are portable to Windows, either.

3.1.5 Installing CMake

Check if your machine already has CMake installed:

```
which cmake           # do you have it?
which cmake3          # version 3 may have this name
cmake --version       # what specific version you have
```

On clusters or supercomputers which use environment modules to manage software packages, do this:

```
module list           # is a module for cmake already loaded?
module avail          # is a module for cmake available?
module load cmake      # load cmake module with appropriate name
```

Most Linux distributions offer pre-compiled cmake packages through their package management system. If you do not have CMake or a recent enough version (Note: for CentOS 7.x you need to enable the EPEL repository), you can download the latest version from <https://cmake.org/download/>. Instructions on how to install it on various platforms can be found [on this page](#).

3.2 Build LAMMPS with make

Building LAMMPS with traditional makefiles requires that you have a `Makefile.<machine>` file appropriate for your system in either the `src/MAKE`, `src/MAKE/MACHINES`, `src/MAKE/OPTIONS`, or `src/MAKE/MINE` directory (see below). It can include various options for customizing your LAMMPS build with a number of global compilation options and features.

3.2.1 Requirements

Those makefiles are written for and tested with GNU make and may not be compatible with other make programs. In most cases, if the “make” program is not GNU make, then there will be a GNU make program available under the name “gmake”. If GNU make or a compatible make is not available, you may have to first install it or switch to building with *CMake*. The makefiles of the traditional make based build process and the scripts they are calling expect a few additional tools to be available and functioning.

- A working C/C++ compiler toolchain supporting the C++11 standard; on Linux, these are often the GNU compilers. Some older compiler versions require adding flags like `-std=c++11` to enable the C++11 mode.
- A Bourne shell compatible “Unix” shell program (frequently this is `bash`)
- A few shell utilities: `ls`, `mv`, `ln`, `rm`, `grep`, `sed`, `tr`, `cat`, `touch`, `diff`, `dirname`
- Python (optional, required for `make lib-<pkg>` in the `src` folder). Python scripts are currently tested with python 2.7 and 3.6 to 3.11. The procedure for *building the documentation* requires Python 3.5 or later.

3.2.2 Getting started

To include LAMMPS packages (i.e. optional commands and styles) you must enable (or “install”) them first, as discussed on the [Build package](#) page. If a package requires (provided or external) libraries, you must configure and build those libraries **before** building LAMMPS itself and especially **before** enabling such a package with `make yes-<package>`. [Building LAMMPS with CMake](#) can automate much of this for many types of machines, especially workstations, desktops, and laptops, so we suggest you try it first when building LAMMPS in those cases.

The commands below perform a default LAMMPS build, producing the LAMMPS executable `lmp_serial` and `lmp_mpi` in `lammps/src`:

```
cd lammps/src    # change to main LAMMPS source folder
make serial      # build a serial LAMMPS executable using GNU g++
make mpi         # build a parallel LAMMPS executable with MPI
make             # see a variety of make options
```

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with `make -j N` (with `N` being the maximum number of concurrently executed tasks). Installation of the `ccache` (= Compiler Cache) software may speed up repeated compilation even more, e.g. during code development, especially when repeatedly switching between branches.

After the initial build, whenever you edit LAMMPS source files, or add or remove new files to the source directory (e.g. by installing or uninstalling packages), you must re-compile and relink the LAMMPS executable with the same `make <machine>` command. The makefile’s dependency tracking should ensure that only the necessary subset of files is re-compiled. If you change settings in the makefile, you have to recompile *everything*. To delete all objects, you can use `make clean-<machine>`.

Note

Before the actual compilation starts, LAMMPS will perform several steps to collect information from the configuration and setup that is then embedded into the executable. When you build LAMMPS for the first time, it will also compile a tool to quickly determine a list of dependencies. Those are required for the make program to correctly detect, which files need to be recompiled or relinked after changes were made to the sources.

3.2.3 Customized builds and alternate makefiles

The `src/MAKE` directory tree contains the `Makefile.<machine>` files included in the LAMMPS distribution. Typing `make example` uses `Makefile.example` from one of those folders, if available. The `make serial` and `make mpi` lines above, for example, use `src/MAKE/Makefile.serial` and `src/MAKE/Makefile.mpi`, respectively. Other makefiles are in these directories:

```
OPTIONS    # Makefiles which enable specific options
MACHINES    # Makefiles for specific machines
MINE       # customized Makefiles you create (you may need to create this folder)
```

Simply typing `make` lists all the available `Makefile.<machine>` files with a single line description toward the end of the output. A file with the same name can appear in multiple folders (not a good idea). The order the directories are searched is as follows: `src/MAKE/MINE`, `src/MAKE`, `src/MAKE/OPTIONS`, `src/MAKE/MACHINES`. This gives preference to a customized file you put in `src/MAKE/MINE`. If you create your own custom makefile under a new name, please edit the first line with the description and machine name, so you will not confuse yourself, when looking at the machine summary.

Makefiles you may wish to try out, include those listed below (some require a package first be installed). Many of these include specific compiler flags for optimized performance. Please note, however, that some of these customized machine Makefile are contributed by users, and thus may have modifications specific to the systems of those users. Since compilers, OS configurations, and LAMMPS itself keep changing, their settings may become outdated, too:

```
make mac          # build serial LAMMPS on macOS
make mac_mpi      # build parallel LAMMPS on macOS
make intel_cpu    # build with the INTEL package optimized for CPUs
make knl          # build with the INTEL package optimized for KNLs
make opt          # build with the OPT package optimized for CPUs
make omp          # build with the OPENMP package optimized for OpenMP
make kokkos_omp   # build with the KOKKOS package for OpenMP
make kokkos_cuda_mpi # build with the KOKKOS package for GPUs
make kokkos_phi   # build with the KOKKOS package for KNLs
```

3.3 Link LAMMPS as a library to another code

LAMMPS is designed as a library of C++ objects that can be integrated into other applications, including Python scripts. The files `src/library.cpp` and `src/library.h` define a C-style API for using LAMMPS as a library. See the [Library interface to LAMMPS](#) page for a description of the interface and how to use it for your needs.

The [Basic build options](#) page explains how to build LAMMPS as either a shared or static library. This results in a file in the compilation folder called `liblammps.a` or `liblammps_<name>.a` in case of building a static library. In case of a shared library, the name is the same only that the suffix is going to be either `.so` or `.dylib` or `.dll` instead of `.a` depending on the OS. In some cases, the `.so` file may be a symbolic link to a file with the suffix `.so.0` (or some other number).

Note

Care should be taken to use the same MPI library for the calling code and the LAMMPS library, unless LAMMPS is to be compiled without (real) MPI support using the included STUBS MPI library.

3.3.1 Link with LAMMPS as a static library

The calling application can link to LAMMPS as a static library with compilation and link commands, as in the examples shown below. These are examples for a code written in C in the file `caller.c`. The benefit of linking to a static library is, that the resulting executable is independent of that library since all required executable code from the library is copied into the calling executable.

CMake build

This assumes that LAMMPS has been configured without setting a `LAMMPS_MACHINE` name, installed with “make install”, and the `PKG_CONFIG_PATH` environment variable has been updated to include the `liblammps.pc` file installed into the configured destination folder. The commands to compile and link a coupled executable are then:

```
mpicc -c -O $(pkg-config --cflags liblammps) caller.c
mpicxx -o caller caller.o $(pkg-config --libs liblammps)
```

Traditional make

This assumes that LAMMPS has been compiled in the folder `${HOME}/lammps/src` with “make mpi”. The commands to compile and link a coupled executable are then:

```
mpicc -c -O -I${HOME}/lammps/src caller.c
mpicxx -o caller caller.o -L${HOME}/lammps/src -llammps_mpi
```

The `-I` argument is the path to the location of the `library.h` header file containing the interface to the LAMMPS C-style library interface. The `-L` argument is the path to where the `liblammps_mpi.a` file is located. The `-llammps_mpi` argument is shorthand for telling the compiler to link the file `liblammps_mpi.a`. If LAMMPS has been built as a shared library, then the linker will use `liblammps_mpi.so` instead. If both files are available, the linker will usually prefer the shared library. In case of a shared library, you may need to update the `LD_LIBRARY_PATH` environment variable or running the caller executable will fail since it cannot find the shared library at runtime.

However, it is only as simple as shown above for the case of a plain LAMMPS library without any optional packages that depend on libraries (bundled or external) or when using a shared library. Otherwise, you need to include all flags, libraries, and paths for the coupled executable, that are also required to link the LAMMPS executable.

CMake build

When using CMake, additional libraries with sources in the `lib` folder are built, but not included in `liblammps.a` and (currently) not installed with `make install` and not included in the `pkgconfig` configuration file. They can be found in the top level build folder, but you have to determine the necessary link flags manually. It is therefore recommended to either use the traditional make procedure to build and link with a static library or build and link with a shared library instead.

Traditional make

After you have compiled a static LAMMPS library using the conventional build system for example with “make mode=static serial”. And you also have installed the POEMS package after building its bundled library in `lib/poems`. Then the commands to build and link the coupled executable change to:

```
gcc -c -O -I${HOME}/lammps/src -caller.c
g++ -o caller caller.o -L${HOME}/lammps/lib/poems \
    -L${HOME}/lammps/src/STUBS -L${HOME}/lammps/src \
    -llammps_serial -lpoems -lmpi_stubs
```

Note, that you need to link with `g++` instead of `gcc` even if you have written your code in C, since LAMMPS itself is C++ code. You can display the currently applied settings for building LAMMPS for the “serial” machine target by using the command:

```
make mode=print serial
```

Which should output something like:

```
# Compiler:
CXX=g++
# Linker:
LD=g++
# Compilation:
CXXFLAGS=-g -O3 -DLAMMPS_GZIP -DLAMMPS_MEMALIGN=64 -I${HOME}/compile/lammps/
→lib/poems -I${HOME}/compile/lammps/src/STUBS
# Linking:
LDFLAGS=-g -O
# Libraries:
LDLIBS=-L${HOME}/compile/lammps/src -llammps_serial -L${HOME}/compile/lammps/
→lib/poems -L${HOME}/compile/lammps/src/STUBS -lpoems -lmpi_stubs
```

From this you can gather the necessary paths and flags. With makefiles for other *machine* configurations you need to do the equivalent and replace “serial” with the corresponding “machine” name of the makefile.

3.3.2 Link with LAMMPS as a shared library

When linking to LAMMPS built as a shared library, the situation becomes much simpler, as all dependent libraries and objects are either included in the shared library or registered as a dependent library in the shared library file. Thus, those libraries need not be specified when linking the calling executable. Only the *-I* flags are needed. So the example case from above of the serial version static LAMMPS library with the POEMS package installed becomes:

CMake build

The commands with a shared LAMMPS library compiled with the CMake build process are the same as for the static library.

```
mpiccc -c -O $(pkg-config --cflags liblammps) caller.c
mpicxx -o caller caller.o -$(pkg-config --libs liblammps)
```

Traditional make

The commands with a shared LAMMPS library compiled with the traditional make build using `make mode=shared serial` becomes:

```
gcc -c -O -I${HOME}/lammps/src -caller.c
g++ -o caller caller.o -L${HOME}/lammps/src -llammps_serial
```

Locating liblammps.so at runtime

Unlike with a static link, now the liblammps.so file is required at runtime and needs to be in a folder, where the shared linker program of the operating system can find it. This would be either a folder like /usr/local/lib64 or \${HOME}/.local/lib64 or a folder pointed to by the LD_LIBRARY_PATH environment variable. You can type

```
printenv LD_LIBRARY_PATH
```

to see what directories are in that list.

Or you can add the LAMMPS src directory or the directory you performed a CMake style build in to your LD_LIBRARY_PATH environment variable, so that the current version of the shared library is always available to programs that use it.

For the Bourne or Korn shells (/bin/sh, /bin/ksh, /bin/bash etc.), you would add something like this to your \${HOME}/.profile file:

```
LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:/usr/lib64:${HOME}/lammps/src
export LD_LIBRARY_PATH
```

For the csh or tcsh shells, you would equivalently add something like this to your \${HOME}/.cshrc file:

```
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

You can verify whether all required shared libraries are found with the ldd tool. Example:

```
LD_LIBRARY_PATH=/home/user/lammps/src ldd caller
linux-vdso.so.1 (0x00007ffe729e0000)
liblammps.so => /home/user/lammps/src/liblammps.so (0x00007fc91bb9e000)

```

3.4 Basic build options

The following topics are covered on this page, for building with both CMake and make:

- *Serial vs parallel build*
- *Choice of compiler and compile/link options*
- *Build the LAMMPS executable and library*
- *Including and removing debug support*
- *Install LAMMPS after a build*

3.4.1 Serial vs parallel build

LAMMPS is written to use the ubiquitous [MPI \(Message Passing Interface\)](#) library API for distributed memory parallel computation. You need to have such a library installed for building and running LAMMPS in parallel using a domain decomposition parallelization. It is compatible with the MPI standard version 2.x and later. LAMMPS can also be built into a “serial” executable for use with a single processor using the bundled MPI STUBS library.

Independent of the distributed memory MPI parallelization, parts of LAMMPS are also written with support for shared memory parallelization using the [OpenMP](#) threading standard. A more detailed discussion of that is below.

CMake build

```
-D BUILD_MPI=value      # yes or no, default is yes if CMake finds MPI,
→else no
-D BUILD_OMP=value      # yes or no, default is yes if a compatible
→compiler is detected
-D LAMMPS_MACHINE=name  # name = mpi, serial, mybox, titan, laptop, etc
                        # no default value
```

The executable created by CMake (after running make) is named `lmp` unless the `LAMMPS_MACHINE` option is set. When setting `LAMMPS_MACHINE=name`, the executable will be called `lmp_name`. Using `BUILD_MPI=no` will enforce building a serial executable using the MPI STUBS library.

Traditional make

The build with traditional makefiles has to be done inside the source folder `src`.

```
make mpi                # parallel build, produces lmp_mpi using Makefile.mpi
make serial             # serial build, produces lmp_serial using Makefile/
→serial
make mybox              # uses Makefile.mybox to produce lmp_mybox
```

Any `make machine` command will look up the make settings from a file `Makefile.machine` in the folder `src/MAKE` or one of its subdirectories `MINE`, `MACHINES`, or `OPTIONS`, create a folder `Obj_machine` with all objects and generated files and an executable called `lmp_machine`. The standard parallel build with `make mpi` assumes a standard MPI installation with MPI compiler wrappers where all necessary compiler and linker flags to get access and link with the suitable MPI headers and libraries are set by the wrapper programs. For other cases or the serial build, you have to adjust

the make file variables `MPI_INC`, `MPI_PATH`, `MPI_LIB` as well as `CC` and `LINK`. To enable OpenMP threading usually a compiler specific flag needs to be added to the compile and link commands. For the GNU compilers, this is `-fopenmp`, which can be added to the `CC` and `LINK` makefile variables.

For the serial build the following make variables are set (see `src/MAKE/Makefile.serial`):

```
CC =          g++
LINK =        g++
MPI_INC =     -I../STUBS
MPI_PATH =    -L../STUBS
MPI_LIB =     -lmpi_stubs
```

You also need to build the STUBS library for your platform before making LAMMPS itself. A `make serial` build does this for you automatically, otherwise, type `make mpi-stubs` from the `src` directory, or `make` from the `src/STUBS` dir. If the build fails, you may need to edit the `STUBS/Makefile` for your platform. The stubs library does not provide MPI/IO functions required by some LAMMPS packages, e.g. LATBOLTZ, and thus is not compatible with those packages.

Note

The file `src/STUBS/mpi.cpp` provides a CPU timer function called `MPI_Wtime()` that calls `gettimeofday()`. If your operating system does not support `gettimeofday()`, you will need to insert code to call another timer. Note that the ANSI-standard function `clock()` rolls over after an hour or so, and is therefore insufficient for timing long LAMMPS simulations.

MPI and OpenMP support in LAMMPS

If you are installing MPI yourself to build a parallel LAMMPS executable, we recommend either MPICH or OpenMPI, which are regularly used and tested with LAMMPS by the LAMMPS developers. MPICH can be downloaded from the [MPICH home page](#), and OpenMPI can be downloaded correspondingly from the [OpenMPI home page](#). Other MPI packages should also work. No specific vendor provided and standard compliant MPI library is currently known to be incompatible with LAMMPS. If you are running on a large parallel machine, your system admins or the vendor should have already installed a version of MPI, which is likely to be faster than a self-installed MPICH or OpenMPI, so you should study the provided documentation to find out how to build and link with it.

The majority of OpenMP (threading) support in LAMMPS is provided by the [OPENMP package](#); see the [OPENMP package](#) page for details. The INTEL package also includes OpenMP threading (it is compatible with OPENMP and will usually fall back on styles from that package, if a INTEL does not exist) and adds vectorization support when compiled with compatible compilers, in particular the Intel compilers on top of OpenMP. Also, the KOKKOS package can be compiled to include OpenMP threading.

In addition, there are a few commands in LAMMPS that have native OpenMP support included as well. These are commands in the ML-SNAP, DIFFRACTION, and DPD-REACT packages. Furthermore, some packages support OpenMP threading indirectly through the libraries they interface to: e.g. KSPACE, and COLVARS. See the [Packages details](#) page for more info on these packages, and the pages for their respective commands for OpenMP threading info.

For CMake, if you use `BUILD_OMP=yes`, you can use these packages and turn on their native OpenMP support and turn on their native OpenMP support at run time, by setting the `OMP_NUM_THREADS` environment variable before you launch LAMMPS.

For building via conventional make, the `CCFLAGS` and `LINKFLAGS` variables in `Makefile.machine` need to include the compiler flag that enables OpenMP. For the GNU compilers or Clang, it is `-fopenmp`. For (recent) Intel compilers, it is `-qopenmp`. If you are using a different compiler, please refer to its documentation.

OpenMP Compiler compatibility

Some compilers do not fully support the `default(none)` directive and others (e.g. GCC version 9 and beyond, Clang version 10 and later) may implement strict OpenMP 4.0 and later semantics, which are incompatible with the OpenMP 3.1 semantics used in LAMMPS for maximal compatibility with compiler versions in use. If compilation with OpenMP enabled fails because of your compiler requiring strict OpenMP 4.0 semantics, you can change the behavior by adding `-D LAMMPS_OMP_COMPAT=4` to the `LMP_INC` variable in your makefile, or add it to the command line while configuring with CMake. LAMMPS will auto-detect a suitable setting for most GNU, Clang, and Intel compilers.

3.4.2 Choice of compiler and compile/link options

The choice of compiler and compiler flags can be important for maximum performance. Vendor provided compilers for a specific hardware can produce faster code than open-source compilers like the GNU compilers. On the most common x86 hardware, the most popular C++ compilers are quite similar in their ability to optimize regular C/C++ source code at high optimization levels. When using the INTEL package, there is a distinct advantage in using the [Intel C++ compiler](#) due to much improved vectorization through SSE and AVX instructions on compatible hardware. The source code in that package conditionally includes compiler specific directives to enable these high degrees of vectorization. This may change over time as equivalent vectorization directives are included into the OpenMP standard and other compilers adopt them.

On parallel clusters or supercomputers which use “environment modules” for their compile/link environments, you can often access different compilers by simply loading the appropriate module before building LAMMPS.

CMake build

By default CMake will use the compiler it finds according to internal preferences, and it will add optimization flags appropriate to that compiler and any *accelerator packages* you have included in the build. CMake will check if the detected or selected compiler is compatible with the C++ support requirements of LAMMPS and stop with an error, if this is not the case.

You can tell CMake to look for a specific compiler with setting CMake variables (listed below) during configuration. For a few common choices, there are also presets in the `cmake/presets` folder. For convenience, there is a `CMAKE_TUNE_FLAGS` variable that can be set to apply global compiler options (applied to compilation only), to be used for adding compiler or host specific optimization flags in addition to the “flags” variables listed below. You may also specify the corresponding `CMAKE_*_FLAGS` variables individually, if you want to experiment with alternate optimization flags. You should specify all 3 compilers, so that the (few) LAMMPS source files written in C or Fortran are built with a compiler consistent with the one used for the C++ files:

```
-D CMAKE_CXX_COMPILER=name           # name of C++ compiler
-D CMAKE_C_COMPILER=name             # name of C compiler
-D CMAKE_Fortran_COMPILER=name        # name of Fortran compiler

-D CMAKE_CXX_FLAGS=string             # flags to use with C++ compiler
-D CMAKE_C_FLAGS=string               # flags to use with C compiler
-D CMAKE_Fortran_FLAGS=string          # flags to use with Fortran compiler
```

A few example command lines are:

```
# Building with GNU Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=gcc -DCMAKE_CXX_COMPILER=g++ -DCMAKE_
→Fortran_COMPILER=gfortran
# Building with Intel Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=icc -DCMAKE_CXX_COMPILER=icpc -DCMAKE_
→Fortran_COMPILER=ifort
# Building with Intel oneAPI Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=icx -DCMAKE_CXX_COMPILER=icpx -DCMAKE_
→Fortran_COMPILER=ifx
# Building with LLVM/Clang Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=clang -DCMAKE_CXX_COMPILER=clang++ -DCMAKE_
→Fortran_COMPILER=flang
# Building with PGI/Nvidia Compilers:
cmake ../cmake -DCMAKE_C_COMPILER=pgcc -DCMAKE_CXX_COMPILER=pgc++ -DCMAKE_
→Fortran_COMPILER=pgfortran
```

For compiling with the Clang/LLVM compilers a CMake preset is provided that can be loaded with `-C ../cmake/presets/clang.cmake`. Similarly, `-C ../cmake/presets/intel.cmake` should switch the compiler toolchain to the legacy Intel compilers, `-C ../cmake/presets/oneapi.cmake` will switch to the LLVM based oneAPI Intel compilers, and `-C ../cmake/presets/pgi.cmake` will switch the compiler to the PGI compilers.

Furthermore, you can set `CMAKE_TUNE_FLAGS` to specifically add compiler flags to tune for optimal performance on given hosts. This variable is empty by default.

Note

When the `cmake` command completes, it prints a summary to the screen which compilers it is using and what flags and settings will be used for the compilation. Note that if the top-level compiler is `mpicxx`, it is simply a wrapper on a real compiler. The underlying compiler info is what CMake will try to determine and report. You should check to confirm you are using the compiler and optimization flags you want.

Makefile.machine settings for traditional make

The “compiler/linker settings” section of a `Makefile.machine` lists compiler and linker settings for your C++ compiler, including optimization flags. For a parallel build it is recommended to use `mpicxx` or `mpiCC`, since these compiler wrappers will include a variety of settings appropriate for your MPI installation and thus avoiding the guesswork of finding the right flags.

Parallel build (see `src/MAKE/Makefile.mpi`):

```
CC =          mpicxx
CCFLAGS =     -g -O3
LINK =        mpicxx
LINKFLAGS =   -g -O
```

Serial build with GNU gcc (see `src/MAKE/Makefile.serial`):

```
CC =          g++
CCFLAGS =     -g -O3
LINK =        g++
LINKFLAGS =   -g -O
```

Note

If compilation stops with a message like the following:

```
g++ -g -O3 -DLAMMPS_GZIP -DLAMMPS_MEMALIGN=64 -I../STUBS -c ../
↳main.cpp
In file included from ../pointers.h:24:0,
      from ../input.h:17,
      from ../main.cpp:16:
../lmptype.h:34:2: error: #error LAMMPS requires a C++11 (or later)
↳compliant compiler. Enable C++11 compatibility or upgrade the compiler.
```

then you have either an unsupported (old) compiler or you have to turn on C++11 mode. The latter applies to GCC 4.8.x shipped with RHEL 7.x and CentOS 7.x or GCC 5.4.x shipped with Ubuntu16.04. For those compilers, you need to add the `-std=c++11` flag. If there is no compiler that supports this flag (or equivalent), you would have to install a newer compiler that supports C++11; either as a binary package or through compiling from source.

If you build LAMMPS with any *Accelerator packages* included, there may be specific compiler or linker flags that are either required or recommended to enable required features and to achieve optimal performance. You need to include these in the CCFLAGS and LINKFLAGS settings above. For details, see the documentation for the individual packages listed on the *Accelerator packages* page. Or examine these files in the `src/MAKE/OPTIONS` directory. They correspond to each of the 5 accelerator packages and their hardware variants:

```
Makefile.opt           # OPT package
Makefile.omp           # OPENMP package
Makefile.intel_cpu     # INTEL package for CPUs
Makefile.intel_coprocessor # INTEL package for KNLs
Makefile.gpu           # GPU package
Makefile.kokkos_cuda_mpi # KOKKOS package for GPUs
Makefile.kokkos_omp     # KOKKOS package for CPUs (OpenMP)
Makefile.kokkos_phi     # KOKKOS package for KNLs (OpenMP)
```

3.4.3 Build the LAMMPS executable and library

LAMMPS is always built as a library of C++ classes plus an executable. The executable is a simple `main()` function that sets up MPI and then creates a LAMMPS class instance from the LAMMPS library, which will then process commands provided via a file or from the console input. The LAMMPS library can also be called from another application or a scripting language. See the *Howto couple* doc page for more info on coupling LAMMPS to other codes. See the *Python* page for more info on wrapping and running LAMMPS from Python via its library interface.

CMake build

For CMake builds, you can select through setting CMake variables between building a shared or a static LAMMPS library and what kind of suffix is added to them (in case you want to concurrently install multiple variants of binaries with different settings). If none are set, defaults are applied.

```
-D BUILD_SHARED_LIBS=value # yes or no (default)
-D LAMMPS_MACHINE=name     # name = mpi, serial, mybox, titan, laptop, etc
                           # no default value
```

The compilation will always produce a LAMMPS library and an executable linked to it. By default, this will be a static library named `liblammmps.a` and an executable named `lmp`. Setting `BUILD_SHARED_LIBS=yes` will instead produce a shared library called `liblammmps.so` (or `liblammmps.dylib` or `liblammmps.dll` depending on the platform). If `LAMMPS_MACHINE=name` is set in addition, the name of the generated libraries will be changed to either `liblammmps_name.a` or `liblammmps_name.so`, respectively and the executable will be called `lmp_name`.

Traditional make

With the traditional makefile based build process, the choice of the generated executable or library depends on the “mode” setting. Several options are available and `mode=static` is the default.

```
make machine           # build LAMMPS executable lmp_machine
make mode=static machine # same as "make machine"
make mode=shared machine # build LAMMPS shared lib liblammmps_machine.so
→ instead
```

The “static” build will generate a static library called `liblammmps_machine.a` and an executable named `lmp_machine`, while the “shared” build will generate a shared library `liblammmps_machine.so` instead and `lmp_machine` will be linked to it. The build step will also create generic soft links, named `liblammmps.a` and `liblammmps.so`, which point to the specific `liblammmps_machine.a/so` files.

Additional information

Note that for creating a shared library, all the libraries it depends on must be compiled to be compatible with shared libraries. This should be the case for libraries included with LAMMPS, such as the dummy MPI library in `src/STUBS` or any package libraries in the `lib` directory, since they are always built in a shared library compatible way using the `-fPIC` compiler switch. However, if an auxiliary library (like MPI or FFTW) does not exist as a compatible format, the shared library linking step may generate an error. This means you will need to install a compatible version of the auxiliary library. The build instructions for that library should tell you how to do this.

As an example, here is how to build and install the [MPICH library](#), a popular open-source version of MPI, as a shared library in the default `/usr/local/lib` location:

```
./configure --enable-shared
make
make install
```

You may need to use `sudo make install` in place of the last line if you do not have write privileges for `/usr/local/lib` or use the `--prefix` configuration option to select an installation folder, where you do have write access. The end result should be the file `/usr/local/lib/libmpich.so`. On many Linux installations, the folder `${HOME}/.local` is an alternative to using `/usr/local` and does not require superuser or `sudo` access. In that case the configuration step becomes:

```
./configure --enable-shared --prefix=${HOME}/.local
```

Avoiding the use of “sudo” for custom software installation (i.e. from source and not through a package manager tool provided by the OS) is generally recommended to ensure the integrity of the system software installation.

3.4.4 Including or removing debug support

By default the compilation settings will include the `-g` flag which instructs the compiler to include debug information (e.g. which line of source code a particular instruction correspond to). This can be extremely useful in case LAMMPS crashes and can help to provide crucial information in *tracking down the origin of a crash* and help the LAMMPS developers fix bugs in the source code. However, this increases the storage requirements for object files, libraries, and the executable 3-5 fold.

If this is a concern, you can change the compilation settings or remove the debug information from the LAMMPS executable:

- **Traditional make:** edit your Makefile.<machine> to remove the `-g` flag from the CCFLAGS and LINKFLAGS definitions
 - **CMake:** use `-D CMAKE_BUILD_TYPE=Release` or explicitly reset the applicable compiler flags (best done using the text mode or graphical user interface).
 - **Remove debug info:** If you are only concerned about the executable being too large, you can use the `strip` tool (e.g. `strip lmp_serial`) to remove the debug information from the executable file. Do not strip libraries or object files, as that will render them unusable.
-

3.4.5 Build LAMMPS tools

Some tools described in *Auxiliary tools* can be built directly using CMake or Make.

CMake build

```
-D BUILD_TOOLS=value          # yes or no (default). Build binary2txt, chain.  
→x, micelle2d.x, msi2lmp, phana, stl_bin2txt  
-D BUILD_LAMMPS_GUI=value     # yes or no (default). Build LAMMPS-GUI
```

The generated binaries will also become part of the LAMMPS installation (see below).

Traditional make

```
cd lammps/tools  
make all          # build all binaries of tools  
make binary2txt   # build only binary2txt tool  
make chain        # build only chain tool  
make micelle2d    # build only micelle2d tool
```

Note

Building the LAMMPS-GUI *requires* building LAMMPS with CMake.

3.4.6 Install LAMMPS after a build

After building LAMMPS, you may wish to copy the LAMMPS executable or library, along with other LAMMPS files (library header, doc files), to a globally visible place on your system, for others to access. Note that you may need super-user privileges (e.g. `sudo`) if the directory you want to copy files to is protected.

CMake build

```
cmake -D CMAKE_INSTALL_PREFIX=path [options ...] ../cmake
make                                     # perform make after CMake command
make install                           # perform the installation into prefix
```

During the installation process CMake will by default remove any runtime path settings for loading shared libraries. Because of this you may have to set or modify the `LD_LIBRARY_PATH` (or `DYLD_LIBRARY_PATH`) environment variable, if you are installing LAMMPS into a non-system location and/or are linking to libraries in a non-system location that depend on such runtime path settings. As an alternative, you may set the CMake variable `LAMMPS_INSTALL_RPATH` to `on` and then the runtime paths for any linked shared libraries and the library installation folder for the LAMMPS library will be embedded and thus the requirement to set environment variables is avoided. The `off` setting is usually preferred for packaged binaries or when setting up environment modules, the `on` setting is more convenient for installing software into a non-system or personal folder.

Traditional make

There is no “install” option in the `src/Makefile` for LAMMPS. If you wish to do this you will need to first build LAMMPS, then manually copy the desired LAMMPS files to the appropriate system directories.

3.5 Optional build settings

LAMMPS can be built with several optional settings. Each subsection explains how to do this for building both with CMake and make.

- *C++11 standard compliance* when building all of LAMMPS
- *FFT library* for use with the *kspace_style ppm* command
- *Size of LAMMPS integer types and size limits*
- *Read or write compressed files*
- *Output of JPG, PNG, and movie files* via the *dump image* or *dump movie* commands
- *Memory allocation alignment*
- *Workaround for long long integers*
- *Exception handling when using LAMMPS as a library* to capture errors
- *Trigger selected floating-point exceptions*

3.5.1 C++11 standard compliance

A C++11 standard compatible compiler is a requirement for compiling LAMMPS. LAMMPS version 3 March 2020 is the last version compatible with the previous C++98 standard for the core code and most packages. Most currently used C++ compilers are compatible with C++11, but some older ones may need extra flags to enable C++11 compliance. Example for GNU c++ 4.8.x:

```
CCFLAGS = -g -O3 -std=c++11
```

3.5.2 FFT library

When the KSPACE package is included in a LAMMPS build, the *kspace_style pppm* command performs 3d FFTs which require use of an FFT library to compute 1d FFTs. The KISS FFT library is included with LAMMPS, but other libraries can be faster. LAMMPS can use them if they are available on your system.

Added in version 7Feb2024.

Alternatively, LAMMPS can use the *heFFTe* library for the MPI communication algorithms, which comes with many optimizations for special cases, e.g. leveraging available 2D and 3D FFTs in the back end libraries and better pipelining for packing and communication.

CMake build

```
-D FFT=value           # FFTW3 or MKL or KISS, default is FFTW3 if found,
→else KISS
-D FFT_KOKKOS=value    # FFTW3 or MKL or KISS or CUFFT or HIPFFT, default
→is KISS
-D FFT_SINGLE=value    # yes or no (default), no = double precision
-D FFT_PACK=value      # array (default) or pointer or memcpy
-D FFT_USE_HEFFTE=value # yes or no (default), yes links to heFFTe
```

Note

When the Kokkos variant of a package is compiled and selected at run time, the FFT library selected by the FFT_KOKKOS variable applies. Otherwise, the FFT library selected by the FFT variable applies. The same FFT settings apply to both. FFT_KOKKOS must be compatible with the Kokkos back end - for example, when using the CUDA back end of Kokkos, you must use either CUFFT or KISS.

Usually these settings are all that is needed. If FFTW3 is selected, then CMake will try to detect, if threaded FFTW libraries are available and enable them by default. This setting is independent of whether OpenMP threads are enabled and a package like KOKKOS or OPENMP is used. If CMake cannot detect the FFT library, you can set these variables to assist:

```
-D FFTW3_INCLUDE_DIR=path # path to FFTW3 include files
-D FFTW3_LIBRARY=path     # path to FFTW3 libraries
-D FFTW3_OMP_LIBRARY=path # path to FFTW3 OpenMP wrapper libraries
-D FFT_FFTW_THREADS=on    # enable using OpenMP threaded FFTW3 libraries
-D MKL_INCLUDE_DIR=path   # ditto for Intel MKL library
-D FFT_MKL_THREADS=on     # enable using threaded FFTs with MKL libraries
-D MKL_LIBRARY=path       # path to MKL libraries
-D FFT_HEFFTE_BACKEND=value # FFTW or MKL or empty/undefined for the stock
→heFFTe back end
-D Heffte_ROOT=path       # path to an existing heFFTe installation
```

Note

heFFTe comes with a builtin (= stock) back end for FFTs, i.e. a default internal FFT implementation; however, this stock back end is intended for testing purposes only and is not optimized for production runs.

Traditional make

To change the FFT library to be used and its options, you have to edit your machine Makefile. Below are examples how the makefile variables could be changed.

```
FFT_INC = -DFFT_FFTW3          # -DFFT_FFTW3, -DFFT_FFTW (same as -DFFT_
→FFTW3), -DFFT_MKL, or -DFFT_KISS
                                # default is KISS if not specified
FFT_INC = -DFFT_KOKKOS_CUFFT   # -DFFT_KOKKOS_{FFTW,FFTW3,MKL,CUFFT,HIPFFT,
→KISS}
                                # default is KISS if not specified
FFT_INC = -DFFT_SINGLE         # do not specify for double precision
FFT_INC = -DFFT_FFTW_THREADS   # enable using threaded FFTW3 libraries
FFT_INC = -DFFT_MKL_THREADS    # enable using threaded FFTs with MKL libraries
FFT_INC = -DFFT_PACK_ARRAY     # or -DFFT_PACK_POINTER or -DFFT_PACK_MEMCPY
                                # default is FFT_PACK_ARRAY if not specified
```

```
FFT_INC = -I/usr/local/include
FFT_PATH = -L/usr/local/lib
FFT_LIB = -lhipfft             # hipFFT either precision
FFT_LIB = -lcufft              # cuFFT either precision
FFT_LIB = -lfftw3              # FFTW3 double precision
FFT_LIB = -lfftw3 -lfftw3_omp  # FFTW3 double precision with threads,
→(needs -DFFT_FFTW_THREADS)
FFT_LIB = -lfftw3 -lfftw3f     # FFTW3 single precision
FFT_LIB = -lmkl_intel_lp64 -lmkl_sequential -lmkl_core # MKL with,
→Intel compiler, serial interface
FFT_LIB = -lmkl_gf_lp64 -lmkl_sequential -lmkl_core    # MKL with,
→GNU compiler, serial interface
FFT_LIB = -lmkl_intel_lp64 -lmkl_intel_thread -lmkl_core # MKL with,
→Intel compiler, threaded interface
FFT_LIB = -lmkl_gf_lp64 -lmkl_gnu_thread -lmkl_core    # MKL with,
→GNU compiler, threaded interface
FFT_LIB = -lmkl_rt            # MKL with automatic runtime selection,
→of interface libs
```

As with CMake, you do not need to set paths in FFT_INC or FFT_PATH, if the compiler can find the FFT header and library files in its default search path. You must specify FFT_LIB with the appropriate FFT libraries to include in the link.

Traditional make can also link to heFFTe using an existing installation

```
include <path-to-heffte-installation>/share/heffte/HeffteMakefile.in
FFT_INC = -DFFT_HEFFTE -DFFT_HEFFTE_FFTW $(heffte_include)
FFT_PATH =
FFT_LIB = $(heffte_link) $(heffte_libs)
```

The heFFTe install path will contain *HeffteMakefile.in*, which will define the *heffte_* include variables needed to link to heFFTe from an external project using traditional make. The *-DFFT_HEFFTE* is required to switch to using heFFTe, while the optional *-DFFT_HEFFTE_FFTW* selects the desired heFFTe back end, e.g., *-DFFT_HEFFTE_FFTW* or *-DFFT_HEFFTE_MKL*, omitting the variable will default to the *stock* back end. The heFFTe *stock* back end is intended to be used for testing and debugging, but is not performance optimized for large scale production runs.

The **KISS FFT library** is included in the LAMMPS distribution. It is portable across all platforms. Depending on the size of the FFTs and the number of processors used, the other libraries listed here can be faster.

However, note that long-range Coulombics are only a portion of the per-timestep CPU cost, FFTs are only a portion of long-range Coulombics, and 1d FFTs are only a portion of the FFT cost (parallel communication can be costly). A breakdown of these timings is printed to the screen at the end of a run when using the *kpspace_style pppm* command. The *Screen and logfile output* page gives more details. A more detailed (and time consuming) report of the FFT performance is generated with the *kpspace_modify fftbench yes* command.

FFTW is a fast, portable FFT library that should also work on any platform and can be faster than the KISS FFT library. You can download it from www.fftw.org. LAMMPS requires version 3.X; the legacy version 2.1.X is no longer supported.

Building FFTW for your box should be as simple as `./configure; make; make install`. The install command typically requires root privileges (e.g. invoke it via `sudo`), unless you specify a local directory with the “--prefix” option of `configure`. Type `./configure --help` to see various options.

The Intel MKL math library is part of the Intel compiler suite. It can be used with the Intel or GNU compiler (see the `FFT_LIB` setting above).

The cuFFT and hipFFT FFT libraries are packaged with NVIDIA’s CUDA and AMD’s HIP installations, respectively. These FFT libraries require the Kokkos acceleration package to be enabled and the Kokkos back end to be GPU-resident (i.e., HIP or CUDA).

Performing 3d FFTs in parallel can be time-consuming due to data access and required communication. This cost can be reduced by performing single-precision FFTs instead of double precision. Single precision means the real and imaginary parts of a complex datum are 4-byte floats. Double precision means they are 8-byte doubles. Note that Fourier transform and related PPPM operations are somewhat less sensitive to floating point truncation errors, and thus the resulting error is generally less than the difference in precision. Using the `-DFFT_SINGLE` setting trades off a little accuracy for reduced memory use and parallel communication costs for transposing 3d FFT data.

When using `-DFFT_SINGLE` with FFTW3, you may need to ensure that the FFTW3 installation includes support for single-precision.

When compiler FFTW3 from source, you can do the following, which should produce the additional libraries `libfftw3f.a` and/or `libfftw3f.so`.

```
make clean
./configure --enable-single; make; make install
```

Performing 3d FFTs requires communication to transpose the 3d FFT grid. The data packing/unpacking for this can be done in one of 3 modes (ARRAY, POINTER, MEMCPY) as set by the `FFT_PACK` syntax above. Depending on the machine, the size of the FFT grid, the number of processors used, one option may be slightly faster. The default is ARRAY mode.

When using `-DFFT_HEFFTE` CMake will first look for an existing install with hints provided by `-DHeffte_ROOT`, as recommended by the CMake standard and note that the name is case sensitive. If CMake cannot find a heFFTe installation with the correct back end (e.g., FFTW or MKL), it will attempt to download and build the library automatically. In this case, LAMMPS CMake will also accept all heFFTe specific variables listed in the [heFFTe documentation](#) and those variables will be passed into the heFFTe build.

3.5.3 Size of LAMMPS integer types and size limits

LAMMPS uses a few custom integer data types, which can be defined as either 4-byte (= 32-bit) or 8-byte (= 64-bit) integers at compile time. This has an impact on the size of a system that can be simulated, or how large counters can become before “rolling over”. The default setting of “smallbig” is almost always adequate.

CMake build

With CMake the choice of integer types is made via setting a variable during configuration.

```
-D LAMMPS_SIZES=value    # smallbig (default) or bigbig or smallsmall
```

If the variable is not set explicitly, “smallbig” is used.

Traditional build

If you want a setting different from the default, you need to edit the LMP_INC variable setting your machine Makefile.

```
LMP_INC = -DLAMMPS_SMALLBIG    # or -DLAMMPS_BIGBIG or -DLAMMPS_SMALLSMALL
```

The default setting is -DLAMMPS_SMALLBIG if nothing is specified

LAMMPS system size restrictions

	smallbig	bigbig	smallsmall
Total atom count	2^{63} atoms (= $9.223 \cdot 10^{18}$)	2^{63} atoms (= $9.223 \cdot 10^{18}$)	2^{31} atoms (= $2.147 \cdot 10^9$)
Total timesteps	2^{63} steps (= $9.223 \cdot 10^{18}$)	2^{63} steps (= $9.223 \cdot 10^{18}$)	2^{31} steps (= $2.147 \cdot 10^9$)
Atom ID values	$1 \leq i \leq 2^{31}$ (= $2.147 \cdot 10^9$)	$1 \leq i \leq 2^{63}$ (= $9.223 \cdot 10^{18}$)	$1 \leq i \leq 2^{31}$ (= $2.147 \cdot 10^9$)
Image flag values	$-512 \leq i \leq 511$	$-1\,048\,576 \leq i \leq 1\,048\,575$	$-512 \leq i \leq 511$

The “bigbig” setting increases the size of image flags and atom IDs over “smallbig” and the “smallsmall” setting is only needed if your machine does not support 64-bit integers or incurs performance penalties when using them.

These are limits for the core of the LAMMPS code, specific features or some styles may impose additional limits. The *ATC* package cannot be compiled with the “bigbig” setting. Also, there are limitations when using the library interface where some functions with known issues have been replaced by dummy calls printing a corresponding error message rather than crashing randomly or corrupting data.

Atom IDs are not required for atomic systems which do not store bond topology information, though IDs are enabled by default. The *atom_modify id no* command will turn them off. Atom IDs are required for molecular systems with bond topology (bonds, angles, dihedrals, etc). Similarly, some force or compute or fix styles require atom IDs. Thus, if you model a molecular system or use one of those styles with more than 2 billion atoms, you need the “bigbig” setting.

Regardless of the total system size limits, the maximum number of atoms per MPI rank (local + ghost atoms) is limited to 2 billion for atomic systems and 500 million for systems with bonds (the additional restriction is due to using the 2 upper bits of the local atom index in neighbor lists for storing special bonds info).

Image flags store 3 values per atom in a single integer, which count the number of times an atom has moved through the periodic box in each dimension. See the [dump](#) manual page for a discussion. If an atom moves through the periodic box more than this limit, the value will “roll over”, e.g. from 511 to -512, which can cause diagnostics like the mean-squared displacement, as calculated by the [compute msd](#) command, to be faulty.

Also note that the GPU package requires its lib/gpu library to be compiled with the same size setting, or the link will fail. A CMake build does this automatically. When building with make, the setting in whichever lib/gpu/Makefile is used must be the same as above.

3.5.4 Output of JPG, PNG, and movie files

The [dump image](#) command has options to output JPEG or PNG image files. Likewise, the [dump movie](#) command outputs movie files in a variety of movie formats. Using these options requires the following settings:

CMake build

```
-D WITH_JPEG=value      # yes or no
                        # default = yes if CMake finds JPEG files, else no
-D WITH_PNG=value       # yes or no
                        # default = yes if CMake finds PNG and ZLIB files,
→else no
-D WITH_FFMPEG=value     # yes or no
                        # default = yes if CMake can find ffmpeg, else no
```

Usually these settings are all that is needed. If CMake cannot find the graphics header, library, executable files, you can set these variables:

```
-D JPEG_INCLUDE_DIR=path # path to jpeglib.h header file
-D JPEG_LIBRARY=path     # path to libjpeg.a (.so) file
-D PNG_INCLUDE_DIR=path  # path to png.h header file
-D PNG_LIBRARY=path      # path to libpng.a (.so) file
-D ZLIB_INCLUDE_DIR=path # path to zlib.h header file
-D ZLIB_LIBRARY=path     # path to libz.a (.so) file
-D FFMPEG_EXECUTABLE=path # path to ffmpeg executable
```

Traditional make

```
LMP_INC = -DLAMMPS_JPEG -DLAMMPS_PNG -DLAMMPS_FFMPEG <other LMP_INC_
→settings>

JPG_INC = -I/usr/local/include # path to jpeglib.h, png.h, zlib.h header_
→files if make cannot find them
JPG_PATH = -L/usr/lib          # paths to libjpeg.a, libpng.a, libz.a (.
→so) files if make cannot find them
JPG_LIB = -ljpeg -lpng -lz     # library names
```

As with CMake, you do not need to set JPG_INC or JPG_PATH, if make can find the graphics header and library files in their default system locations. You must specify JPG_LIB with a list of graphics libraries to include in the link. You must make certain that the ffmpeg executable (or ffmpeg.exe on

Windows) is in a directory where LAMMPS can find it at runtime; that is usually a directory list in your PATH environment variable.

Using `ffmpeg` to output movie files requires that your machine supports the “`popen`” function in the standard runtime library.

Note

On some clusters with high-speed networks, using the `fork()` library call (required by `popen()`) can interfere with the fast communication library and lead to simulations using `ffmpeg` to hang or crash.

3.5.5 Read or write compressed files

If this option is enabled, large files can be read or written with compression by `gzip` or similar tools by several LAMMPS commands, including `read_data`, `rerun`, and `dump`. Supported compression tools are currently `gzip`, `bzip2`, `zstd`, and `lzma`.

CMake build

```
-D WITH_GZIP=value      # yes or no
                        # default is yes if CMake can find the gzip program,
→ else no
```

Traditional make

```
LMP_INC = -DLAMMPS_GZIP  <other LMP_INC settings>
```

This option requires that your operating system fully supports the “`popen()`” function in the standard runtime library and that a `gzip` or other executable can be found by LAMMPS in the standard search path during a run.

Note

On clusters with high-speed networks, using the “`fork()`” library call (required by “`popen()`”) can interfere with the fast communication library and lead to simulations using compressed output or input to hang or crash. For selected operations, compressed file I/O is also available using a compression library instead, which is what the *COMPRESS package* enables.

3.5.6 Memory allocation alignment

This setting enables the use of the “posix_memalign()” call instead of “malloc()” when LAMMPS allocates large chunks of memory. Vector instructions on CPUs may become more efficient, if dynamically allocated memory is aligned on larger-than-default byte boundaries. On most current operating systems, the “malloc()” implementation returns pointers that are aligned to 16-byte boundaries. Using SSE vector instructions efficiently, however, requires memory blocks being aligned on 64-byte boundaries.

CMake build

```
-D LAMMPS_MEMALIGN=value           # 0, 8, 16, 32, 64 (default)
```

Use a LAMMPS_MEMALIGN value of 0 to disable using “posix_memalign()” and revert to using the “malloc()” C-library function instead. When compiling LAMMPS for Windows systems, “malloc()” will always be used and this setting is ignored.

Traditional make

```
LMP_INC = -DLAMMPS_MEMALIGN=value # 8, 16, 32, 64
```

Do not set -DLAMMPS_MEMALIGN, if you want to have memory allocated with the “malloc()” function call instead. -DLAMMPS_MEMALIGN **cannot** be used on Windows, as Windows different function calls with different semantics for allocating aligned memory, that are not compatible with how LAMMPS manages its dynamical memory.

3.5.7 Workaround for long long integers

If your system or MPI version does not recognize “long long” data types, the following setting will be needed. It converts “long long” to a “long” data type, which should be the desired 8-byte integer on those systems:

CMake build

```
-D LAMMPS_LONGLONG_TO_LONG=value   # yes or no (default)
```

Traditional make

```
LMP_INC = -DLAMMPS_LONGLONG_TO_LONG <other LMP_INC settings>
```

3.5.8 Exception handling when using LAMMPS as a library

LAMMPS errors do not kill the calling code, but throw an exception. In the C-library interface, the call stack is unwound and control returns to the caller, e.g. to Python or a code that is coupled to LAMMPS. The error status can then be queried. When using C++ directly, the calling code has to be set up to *catch* exceptions thrown from within LAMMPS.

Note

When LAMMPS is running in parallel, it is not always possible to cleanly recover from an exception since not all parallel ranks may throw an exception and thus other MPI ranks may get stuck waiting for messages from the ones with errors.

3.5.9 Trigger selected floating-point exceptions

Many kinds of CPUs have the capability to detect when a calculation results in an invalid math operation, like a division by zero or calling the square root with a negative argument. The default behavior on most operating systems is to continue and have values for NaN (= not a number) or Inf (= infinity). This allows software to detect and recover from such conditions. This behavior can be changed, however, often through use of compiler flags. On Linux systems (or more general on systems using the GNU C library), these so-called floating-point traps can also be selectively enabled through library calls. LAMMPS supports that by setting the `-DLAMMPS_TRAP_FPE` pre-processor define. As it is done in the `main()` function, this applies only to the standalone executable, not the library.

CMake build

```
-D CMAKE_TUNE_FLAGS=-DLAMMPS_TRAP_FPE
```

Traditional make

```
LMP_INC = -DLAMMPS_TRAP_FPE <other LMP_INC settings>
```

After compilation with this flag set, the LAMMPS executable will stop and produce a core dump when a division by zero, overflow, illegal math function argument or other invalid floating point operation is encountered.

3.6 Include packages in build

In LAMMPS, a package is a group of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. In the `src` directory, each package is a subdirectory with the package name in capital letters.

An overview of packages is given on the [Packages](#) doc page. Brief overviews of each package are on the [Packages details](#) page.

When building LAMMPS, you can choose to include or exclude each package. Generally, there is no need to include a package if you never plan to use its features.

If you get a run-time error that a LAMMPS command or style is “unknown”, it is often because the command is contained in a package, and your build did not include that package. If the command or style *is* available in a package included in the LAMMPS distribution, the error message will indicate which package would be needed. Running LAMMPS with the *-h command-line switch* will print *all* optional commands and packages that were enabled when building that executable.

For the majority of packages, if you follow the single step below to include it, you can then build LAMMPS exactly the same as you would without any packages installed. A few packages may require additional steps, as explained on the *Build extras* page.

These links take you to the extra instructions for those select packages:

<i>ADIOS</i>	<i>ATC</i>	<i>AWPMD</i>	<i>COLVARS</i>	<i>COMPRESS</i>	<i>ELECTRODE</i>
<i>GPU</i>	<i>H5MD</i>	<i>INTEL</i>	<i>KIM</i>	<i>KOKKOS</i>	<i>LEPTON</i>
<i>MACHDYN</i>	<i>MDI</i>	<i>ML-HDNNP</i>	<i>ML-IAP</i>	<i>ML-PACE</i>	<i>ML-POD</i>
<i>ML-QUIP</i>	<i>MOLFILE</i>	<i>NETCDF</i>	<i>OPENMP</i>	<i>OPT</i>	<i>PLUMED</i>
<i>POEMS</i>	<i>PYTHON</i>	<i>QMMM</i>	<i>RHEO</i>	<i>SCAFACOS</i>	<i>VORONOI</i>
<i>VTK</i>					

The mechanism for including packages is simple but different for CMake versus make.

CMake build

```
-D PKG_NAME=value           # yes or no (default)
```

Examples:

```
-D PKG_MANYBODY=yes
-D PKG_INTEL=yes
```

All packages are included the same way. See the shortcut section below for how to install many packages at once with CMake.

Note

If you switch between building with CMake and make builds, no packages in the src directory can be installed when you invoke cmake. CMake will give an error if that is not the case, indicating how you can uninstall all packages in the src dir.

Traditional make

```
cd lammps/src
make ps           # check which packages are currently installed
make yes-name     # install a package with name
make no-name      # uninstall a package with name
make mpi          # build LAMMPS with whatever packages are now
→installed
```

Examples:

```
make no-rigid
make yes-intel
```

All packages are included the same way. See the shortcut section below for how to install many packages at once with make.

Note

You must always re-build LAMMPS (via make) after installing or uninstalling a package, for the action to take effect. The included dependency tracking will make certain only files that are required to be rebuilt are recompiled.

Note

You cannot install or uninstall packages and build LAMMPS in a single make command with multiple targets, e.g. `make yes-colloid mpi`. This is because the make procedure creates a list of source files that will be out-of-date for the build if the package configuration changes within the same command. You can include or exclude multiple packages in a single make command, e.g. `make yes-colloid no-manybody`.

3.6.1 Information for both build systems

Almost all packages can be included or excluded in a LAMMPS build, independent of the other packages. However, some packages include files derived from files in other packages. LAMMPS checks for this and does the right thing. Individual files are only included if their dependencies are already included. Likewise, if a package is excluded, other files dependent on that package are also excluded.

Note

By default no packages are installed. Prior to August 2018, however, if you downloaded a tarball, 3 packages (KSPACE, MANYBODY, MOLECULE) were pre-installed via the traditional make procedure in the `src` directory. That is no longer the case, so that CMake will build as-is without needing to uninstall those packages.

3.6.2 CMake presets for installing many packages

Instead of specifying all the CMake options via the command-line, CMake allows initializing its settings cache using script files. These are regular CMake files which can manipulate and set CMake variables (which represent selected options), and can also contain control flow constructs for more complex operations.

LAMMPS includes several of these files to define configuration “presets”, similar to the options that exist for the Make based system. Using these files, you can enable/disable portions of the available packages in LAMMPS. If you need a custom preset, you can make a copy of one of them and modify it to suit your needs.

```
cmake -C ../cmake/presets/basic.cmake [OPTIONS] ../cmake # enable just a few core
→packages
cmake -C ../cmake/presets/most.cmake [OPTIONS] ../cmake # enable most packages
cmake -C ../cmake/presets/download.cmake [OPTIONS] ../cmake # enable packages which
→download sources or potential files
cmake -C ../cmake/presets/nolib.cmake [OPTIONS] ../cmake # disable packages that do
```

(continues on next page)

(continued from previous page)

```

→require extra libraries or tools
cmake -C ../cmake/presets/clang.cmake [OPTIONS] ../cmake # change settings to use
→the Clang compilers by default
cmake -C ../cmake/presets/gcc.cmake [OPTIONS] ../cmake # change settings to use
→the GNU compilers by default
cmake -C ../cmake/presets/intel.cmake [OPTIONS] ../cmake # change settings to use
→the Intel compilers by default
cmake -C ../cmake/presets/pgi.cmake [OPTIONS] ../cmake # change settings to use
→the PGI compilers by default
cmake -C ../cmake/presets/all_on.cmake [OPTIONS] ../cmake # enable all packages
cmake -C ../cmake/presets/all_off.cmake [OPTIONS] ../cmake # disable all packages
mingw64-cmake -C ../cmake/presets/mingw-cross.cmake [OPTIONS] ../cmake # compile with
→MinGW cross-compilers
cmake -C ../cmake/presets/macos-multiarch.cmake [OPTIONS] ../cmake # compile serial
→multi-arch binaries on macOS

```

Presets that have names starting with “windows” are specifically for compiling LAMMPS *natively on Windows* and presets that have names starting with “kokkos” are specifically for selecting configurations for compiling LAMMPS with *KOKKOS*.

Note

Running cmake this way manipulates the CMake settings cache in your current build directory. You can combine multiple presets and options in a single cmake run, or change settings incrementally by running cmake with new flags. If you use a present for selecting a set of compilers, it will reset all settings from previous CMake runs.

Example

```

# build LAMMPS with most commonly used packages, but then remove
# those requiring additional library or tools, but still enable
# GPU package and configure it for using CUDA. You can run.
mkdir build
cd build
cmake -C ../cmake/presets/most.cmake -C ../cmake/presets/nolib.cmake -D PKG_GPU=on -D
→GPU_API=cuda ../cmake

# to add another package, say BODY to the previous configuration you can run:
cmake -D PKG_BODY=on .

# to reset the package selection from above to the default of no packages
# but leaving all other settings untouched. You can run:
cmake -C ../cmake/presets/all_off.cmake .

```

3.6.3 Make shortcuts for installing many packages

The following commands are useful for managing package source files and their installation when building LAMMPS via traditional make. Just type make in lammps/src to see a one-line summary.

These commands install/uninstall sets of packages:

```
make yes-all      # install all packages
make no-all      # check for changes and uninstall all packages
make no-installed # only check and uninstall installed packages
make yes-basic    # install a few commonly used packages'
make no-basic     # remove a few commonly used packages'
make yes-most     # install most packages w/o libs'
make no-most      # remove most packages w/o libs'
make yes-lib      # install packages that require extra libraries
make no-lib       # uninstall packages that require extra libraries
make yes-ext      # install packages that require external libraries
make no-ext       # uninstall packages that require external libraries
```

which install/uninstall various sets of packages. Typing make package will list all the these commands.

Note

Installing or uninstalling a package for the make based build process works by simply copying files back and forth between the main source directory src and the subdirectories with the package name (e.g. src/KSPACE, src/ATC), so that the files are included or excluded when LAMMPS is built. Only source files in the src folder will be compiled.

The following make commands help manage files that exist in both the src directory and in package subdirectories. You do not normally need to use these commands unless you are editing LAMMPS files or are updating LAMMPS via git.

Type make package-status or make ps to show which packages are currently installed. For those that are installed, it will list any files that are different in the src directory and package subdirectory.

Type make package-installed or make pi to show which packages are currently installed, without listing the status of packages that are not installed.

Type make package-update or make pu to overwrite src files with files from the package subdirectories if the package is installed. It should be used after the checkout has been *updated or changed with git*, this will only update the files in the package subdirectories, but not the copies in the src folder.

Type make package-overwrite to overwrite files in the package subdirectories with src files.

Type make package-diff to list all differences between pairs of files in both the source directory and the package directory.

3.7 Packages with extra build options

When building with some packages, additional steps may be required, in addition to

CMake build	Traditional make
cmake -D PKG_NAME=yes	make yes-name

as described on the [Build_package](#) page.

For a CMake build there may be additional optional or required variables to set. For a build with make, a provided library under the lammps/lib directory may need to be built first. Or an external library may need to exist on your system or be downloaded and built. You may need to tell LAMMPS where it is found on your system.

This is the list of packages that may require additional steps.

<i>ADIOS</i>	<i>ATC</i>	<i>AWPMD</i>	<i>COLVARS</i>	<i>COMPRESS</i>	<i>ELECTRODE</i>
<i>GPU</i>	<i>H5MD</i>	<i>INTEL</i>	<i>KIM</i>	<i>KOKKOS</i>	<i>LEPTON</i>
<i>MACHDYN</i>	<i>MDI</i>	<i>ML-HDNNP</i>	<i>ML-IAP</i>	<i>ML-PACE</i>	<i>ML-POD</i>
<i>ML-QUIP</i>	<i>MOLFILE</i>	<i>NETCDF</i>	<i>OPENMP</i>	<i>OPT</i>	<i>PLUMED</i>
<i>POEMS</i>	<i>PYTHON</i>	<i>QMMM</i>	<i>RHEO</i>	<i>SCAFACOS</i>	<i>VORONOI</i>
<i>VTK</i>					

3.7.1 COMPRESS package

To build with this package you must have the [zlib compression library](#) available on your system to build dump styles with a ‘gz’ suffix. There are also styles using the [Zstandard](#) library which have a ‘zstd’ suffix. The zstd library version must be at least 1.4. Older versions use an incompatible API and thus LAMMPS will fail to compile.

CMake build

If CMake cannot find the zlib library or include files, you can set these variables:

```
-D ZLIB_INCLUDE_DIR=path      # path to zlib.h header file
-D ZLIB_LIBRARY=path          # path to libz.a (.so) file
```

Support for Zstandard compression is auto-detected and for that CMake depends on the [pkg-config](#) tool to identify the necessary flags to compile with this library, so the corresponding `libzstandard.pc` file must be in a folder where `pkg-config` can find it, which may require adding it to the `PKG_CONFIG_PATH` environment variable.

Traditional make

To include support for Zstandard compression, `-DLAMMPS_ZSTD` must be added to the compiler flags. If make cannot find the libraries, you can edit the file `lib/compress/Makefile.lammps` to specify the paths and library names. This must be done **before** the package is installed.

3.7.2 GPU package

To build with this package, you must choose options for precision and which GPU hardware to build for. The GPU package currently supports three different types of backends: OpenCL, CUDA and HIP.

CMake build

```
-D GPU_API=value           # value = opencl (default) or cuda or hip
-D GPU_PREC=value          # precision setting
                           # value = double or mixed (default) or single
-D GPU_ARCH=value          # primary GPU hardware choice for GPU_API=cuda
                           # value = sm_XX (see below, default is sm_50)
-D GPU_DEBUG=value         # enable debug code in the GPU package library, mostly
  →useful for developers
                           # value = yes or no (default)
-D HIP_PATH=value          # value = path to HIP installation. Must be set if GPU_
  →API=HIP
-D HIP_ARCH=value           # primary GPU hardware choice for GPU_API=hip
                           # value depends on selected HIP_PLATFORM
                           # default is 'gfx906' for HIP_PLATFORM=amd and 'sm_50' for HIP_
  →PLATFORM=nvcc
-D HIP_USE_DEVICE_SORT=value # enables GPU sorting
                           # value = yes (default) or no
-D CUDPP_OPT=value         # use GPU binning on with CUDA (should be off for modern
  →GPUs)
                           # enables CUDA Performance Primitives, must be "no" for
  →CUDA_MPS_SUPPORT=yes
                           # value = yes or no (default)
-D CUDA_MPS_SUPPORT=value  # enables some tweaks required to run with active nvidia-
  →cuda-mps daemon
                           # value = yes or no (default)
-D CUDA_BUILD_MULTIARCH=value # enables building CUDA kernels for all supported GPU
  →architectures
                           # value = yes (default) or no
-D USE_STATIC_OPENCL_LOADER=value # downloads/includes OpenCL ICD loader library, no
  →local OpenCL headers/libs needed
                           # value = yes (default) or no
```

GPU_ARCH settings for different GPU hardware is as follows:

- sm_30 for Kepler (supported since CUDA 5 and until CUDA 10.x)
- sm_35 or sm_37 for Kepler (supported since CUDA 5 and until CUDA 11.x)
- sm_50 or sm_52 for Maxwell (supported since CUDA 6)
- sm_60 or sm_61 for Pascal (supported since CUDA 8)
- sm_70 for Volta (supported since CUDA 9)
- sm_75 for Turing (supported since CUDA 10)
- sm_80 or sm_86 for Ampere (supported since CUDA 11, sm_86 since CUDA 11.1)
- sm_89 for Lovelace (supported since CUDA 11.8)
- sm_90 for Hopper (supported since CUDA 12.0)

A more detailed list can be found, for example, at [Wikipedia's CUDA article](#)

CMake can detect which version of the CUDA toolkit is used and thus will try to include support for **all** major GPU architectures supported by this toolkit. Thus the GPU_ARCH setting is merely an optimization, to have code for the preferred GPU architecture directly included rather than having to wait for the JIT compiler of the CUDA driver to translate it. This behavior can be turned off (e.g. to speed up compilation) by setting CUDA_ENABLE_MULTIARCH to no.

When compiling for CUDA or HIP with CUDA, version 8.0 or later of the CUDA toolkit is required and a GPU architecture of Kepler or later, which must *also* be supported by the CUDA toolkit in use **and** the CUDA driver in use. When compiling for OpenCL, OpenCL version 1.2 or later is required and the GPU must be supported by the GPU driver and OpenCL runtime bundled with the driver.

When building with CMake, you **must NOT** build the GPU library in lib/gpu using the traditional build procedure. CMake will detect files generated by that process and will terminate with an error and a suggestion for how to remove them.

If you are compiling for OpenCL, the default setting is to download, build, and link with a static OpenCL ICD loader library and standard OpenCL headers. This way no local OpenCL development headers or library needs to be present and only OpenCL compatible drivers need to be installed to use OpenCL. If this is not desired, you can set USE_STATIC_OPENCL_LOADER to no.

The GPU library has some multi-thread support using OpenMP. If LAMMPS is built with -D BUILD_OMP=on this will also be enabled.

If you are compiling with HIP, note that before running CMake you will have to set appropriate environment variables. Some variables such as HCC_AMDGPU_TARGET (for ROCm <= 4.0) or CUDA_PATH are necessary for hipcc and the linker to work correctly.

Added in version 3Aug2022.

Using the CHIP-SPV implementation of HIP is supported. It allows one to run HIP code on Intel GPUs via the OpenCL or Level Zero backends. To use CHIP-SPV, you must set -DHIP_USE_DEVICE_SORT=OFF in your CMake command line as CHIP-SPV does not yet support hipCUB. As of Summer 2022, the use of HIP for Intel GPUs is experimental. You should only use this option in preparations to run on Aurora system at Argonne.

```
# AMDGPU target (ROCm <= 4.0)
export HIP_PLATFORM=hcc
export HIP_PATH=/path/to/HIP/install
export HCC_AMDGPU_TARGET=gfx906
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=gfx906 -D CMAKE_CXX_COMPILER=hipcc ..
make -j 4
```

```
# AMDGPU target (ROCm >= 4.1)
export HIP_PLATFORM=amd
export HIP_PATH=/path/to/HIP/install
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=gfx906 -D CMAKE_CXX_COMPILER=hipcc ..
make -j 4
```

```
# CUDA target (not recommended, use GPU_ARCH=cuda)
# !!! DO NOT set CMAKE_CXX_COMPILER !!!
export HIP_PLATFORM=nvcc
export HIP_PATH=/path/to/HIP/install
export CUDA_PATH=/usr/local/cuda
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=sm_70 ..
make -j 4
```

```
# SPIR-V target (Intel GPUs)
export HIP_PLATFORM=spirv
export HIP_PATH=/path/to/HIP/install
export CMAKE_CXX_COMPILER=<hipcc/clang++>
cmake -D PKG_GPU=on -D GPU_API=HIP ..
make -j 4
```

Traditional make

Before building LAMMPS, you must build the GPU library in `lib/gpu`. You can do this manually if you prefer; follow the instructions in `lib/gpu/README`. Note that the GPU library uses MPI calls, so you must use the same MPI library (or the STUBS library) settings as the main LAMMPS code. This also applies to the `-DLAMMPS_BIGBIG`, `-DLAMMPS_SMALLBIG`, or `-DLAMMPS_SMALLSMALL` settings in whichever Makefile you use.

You can also build the library in one step from the `lammps/src` dir, using a command like these, which simply invokes the `lib/gpu/Install.py` script with the specified args:

```
make lib-gpu          # print help message
make lib-gpu args="-b" # build GPU library with default Makefile.linux
make lib-gpu args="-m xk7 -p single -o xk7.single" # create new Makefile.xk7.single,
→altered for single-precision
make lib-gpu args="-m mpi -a sm_60 -p mixed -b" # build GPU library with mixed precision,
→and P100 using other settings in Makefile.mpi
```

Note that this procedure starts with a `Makefile.machine` in `lib/gpu`, as specified by the “-m” switch. For your convenience, machine makefiles for “mpi” and “serial” are provided, which have the same settings as the corresponding machine makefiles in the main LAMMPS source folder. In addition you can alter 4 important settings in the `Makefile.machine` you start from via the corresponding `-c`, `-a`, `-p`, `-e` switches (as in the examples above), and also save a copy of the new Makefile if desired:

- `CUDA_HOME` = where NVIDIA CUDA software is installed on your system
- `CUDA_ARCH` = `sm_XX`, what GPU hardware you have, same as CMake `GPU_ARCH` above
- `CUDA_PRECISION` = precision (double, mixed, single)
- `EXTRAMAKE` = which `Makefile.lammps.*` file to copy to `Makefile.lammps`

The file `Makefile.cuda` is set up to include support for multiple GPU architectures as supported by the CUDA toolkit in use. This is done through using the “-gencode” flag, which can be used multiple times and thus support all GPU architectures supported by your CUDA compiler.

To enable GPU binning via CUDA performance primitives set the Makefile variable `CUDPP_OPT = -DUSE_CUDPP -Icudpp_mini`. This should **not** be used with most modern GPUs.

To support the CUDA multiprocessor server you can set the define `-DCUDA_MPS_SUPPORT`. Please note that in this case you must **not** use the CUDA performance primitives and thus set the variable `CUDPP_OPT` to empty.

The GPU library has some multi-thread support using OpenMP. You need to add the compiler flag that enables OpenMP to the `CUDR_OPTS` Makefile variable.

If the library build is successful, 3 files should be created: `lib/gpu/libgpu.a`, `lib/gpu/nvc_get_devices`, and `lib/gpu/Makefile.lammps`. The latter has settings that enable LAMMPS to link with CUDA libraries. If the settings in `Makefile.lammps` for your machine are not correct, the LAMMPS build will fail, and `lib/gpu/Makefile.lammps` may need to be edited.

Note

If you re-build the GPU library in `lib/gpu`, you should always uninstall the GPU package in `lammops/src`, then re-install it and re-build LAMMPS. This is because the compilation of files in the GPU package uses the library settings from the `lib/gpu/Makefile.machine` used to build the GPU library.

3.7.3 KIM package

To build with this package, the KIM library with API v2 must be downloaded and built on your system. It must include the KIM models that you want to use with LAMMPS.

If you would like to use the *kim query* command, you also need to have `libcurl` installed with the matching development headers and the `curl-config` tool.

If you would like to use the *kim property* command, you need to build LAMMPS with the `PYTHON` package installed and linked to Python 3.6 or later. See the *PYTHON package build info* for more details on this. After successfully building LAMMPS with Python, you also need to install the `kim-property` Python package, which can be easily done using `pip` as `pip install kim-property`, or from the *conda-forge* channel as `conda install kim-property` if LAMMPS is built in Conda. More detailed information is available at: [kim-property installation](#).

In addition to installing the KIM API, it is also necessary to install the library of KIM models (interatomic potentials). See [Obtaining KIM Models](#) to learn how to install a pre-build binary of the OpenKIM Repository of Models. See the list of all KIM models here: <https://openkim.org/browse/models>

(Also note that when downloading and installing from source the KIM API library with all its models, may take a long time (tens of minutes to hours) to build. Of course you only need to do that once.)

CMake build

```
-D DOWNLOAD_KIM=value           # download OpenKIM API v2 for build, value =  
→no (default) or yes  
-D LMP_DEBUG_CURL=value         # set libcurl verbose mode on/off, value =  
→off (default) or on  
-D LMP_NO_SSL_CHECK=value       # tell libcurl to not verify the peer, value=  
→no (default) or yes  
-D KIM_EXTRA_UNITTESTS=value    # enables extra unit tests, value = no  
→(default) or yes
```

If `DOWNLOAD_KIM` is set to *yes* (or *on*), the KIM API library will be downloaded and built inside the CMake build directory. If the KIM library is already installed on your system (in a location where CMake cannot find it), you may need to set the `PKG_CONFIG_PATH` environment variable so that `libkim-api` can be found, or run the command `source kim-api-activate`.

Extra unit tests can only be available if they are explicitly requested (`KIM_EXTRA_UNITTESTS` is set to *yes* (or *on*)) and the prerequisites are met. See *KIM Extra unit tests* for more details on this.

Traditional make

You can download and build the KIM library manually if you prefer; follow the instructions in `lib/kim/README`. You can also do this in one step from the `lammops/src` directory, using a command like these, which simply invokes the `lib/kim/Install.py` script with the specified args.

```

make lib-kim                # print help message
make lib-kim args="-b "     # (re-)install KIM API lib with only example models
make lib-kim args="-b -a Glue_Ercolessi_Adams_Al__MO_324507536345_001" #_
    ↳ditto plus one model
make lib-kim args="-b -a everything"      # install KIM API lib with all_
    ↳models
make lib-kim args="-n -a EAM_Dynamo_Ackland_W__MO_141627196590_002"      #_
    ↳add one model or model driver
make lib-kim args="-p /usr/local" # use an existing KIM API installation at_
    ↳the provided location
make lib-kim args="-p /usr/local -a EAM_Dynamo_Ackland_W__MO_141627196590_002
    ↳" # ditto but add one model or driver

```

When using the “-b” option, the KIM library is built using its native cmake build system. The lib/kim/Install.py script supports a CMAKE environment variable if the cmake executable is named other than cmake on your system. Additional environment variables may be provided on the command line for use by cmake. For example, to use the cmake3 executable and tell it to use the gnu version 11 compilers to build KIM, one could use the following command line.

```

CMAKE=cmake3 CXX=g++-11 CC=gcc-11 FC=gfortran-11 make lib-kim args="-b " #_
    ↳(re-)install KIM API lib using cmake3 and gnu v11 compilers with only_
    ↳example models

```

Settings for debugging OpenKIM web queries discussed below need to be applied by adding them to the LMP_INC variable through editing the Makefile.machine you are using. For example:

```
LMP_INC = -DLMP_NO_SSL_CHECK
```

Debugging OpenKIM web queries in LAMMPS

If LMP_DEBUG_CURL is set, the libcurl verbose mode will be turned on, and any libcurl calls within the KIM web query display a lot of information about libcurl operations. You hardly ever want this set in production use, you will almost always want this when you debug or report problems.

The libcurl library performs peer SSL certificate verification by default. This verification is done using a CA certificate store that the SSL library can use to make sure the peer’s server certificate is valid. If SSL reports an error (“certificate verify failed”) during the handshake and thus refuses further communicate with that server, you can set LMP_NO_SSL_CHECK to override that behavior. When LAMMPS is compiled with LMP_NO_SSL_CHECK set, libcurl does not verify the peer and connection attempts will succeed regardless of the names in the certificate. This option is insecure. As an alternative, you can specify your own CA cert path by setting the environment variable CURL_CA_BUNDLE to the path of your choice. A call to the KIM web query would get this value from the environment variable.

KIM Extra unit tests (CMake only)

During development, testing, or debugging, if *unit testing* is enabled in LAMMPS, one can also enable extra tests on *KIM commands* by setting the KIM_EXTRA_UNITTESTS to *yes* (or *on*).

Enabling the extra unit tests have some requirements,

- It requires to have internet access.
- It requires to have libcurl installed with the matching development headers and the curl-config tool.
- It requires to build LAMMPS with the PYTHON package installed and linked to Python 3.6 or later. See the *PYTHON package build info* for more details on this.

- It requires to have `kim-property` Python package installed, which can be easily done using `pip` as `pip install kim-property`, or from the *conda-forge* channel as `conda install kim-property` if LAMMPS is built in Conda. More detailed information is available at: [kim-property installation](#).
 - It is also necessary to install `EAM_Dynamo_MendeleevAckland_2007v3_Zr__MO_004835508849_000`, `EAM_Dynamo_ErcolessiAdams_1994_Al__MO_123629422045_005`, and `LennardJones612_UniversalShifted__MO_9592` KIM models. See [Obtaining KIM Models](#) to learn how to install a pre-built binary of the OpenKIM Repository of Models or see [Installing KIM Models](#) to learn how to install the specific KIM models.
-

3.7.4 KOKKOS package

Using the KOKKOS package requires choosing several settings. You have to select whether you want to compile with parallelization on the host and whether you want to include offloading of calculations to a device (e.g. a GPU). The default setting is to have no host parallelization and no device offloading. In addition, you can select the hardware architecture to select the instruction set. Since most hardware is backward compatible, you may choose settings for an older architecture to have an executable that will run on this and newer architectures.

Note

If you run Kokkos on a different GPU architecture than what LAMMPS was compiled with, there will be a delay during device initialization while the just-in-time compiler is recompiling all GPU kernels for the new hardware. This is, however, only supported for GPUs of the **same** major hardware version and different minor hardware versions, e.g. 5.0 and 5.2 but not 5.2 and 6.0. LAMMPS will abort with an error message indicating a mismatch, if that happens.

The settings discussed below have been tested with LAMMPS and are confirmed to work. Kokkos is an active project with ongoing improvements and projects working on including support for additional architectures. More information on Kokkos can be found on the [Kokkos GitHub project](#).

Available Architecture settings

These are the possible choices for the Kokkos architecture ID. They must be specified in uppercase.

Arch-ID	HOST or GPU	Description
NATIVE	HOST	Local machine
AMDAVX	HOST	AMD 64-bit x86 CPU (AVX 1)
ZEN	HOST	AMD Zen class CPU (AVX 2)
ZEN2	HOST	AMD Zen2 class CPU (AVX 2)
ZEN3	HOST	AMD Zen3 class CPU (AVX 2)
ARMV80	HOST	ARMv8.0 Compatible CPU
ARMV81	HOST	ARMv8.1 Compatible CPU
ARMV8_THUNDERX	HOST	ARMv8 Cavium ThunderX CPU
ARMV8_THUNDERX2	HOST	ARMv8 Cavium ThunderX2 CPU
A64FX	HOST	ARMv8.2 with SVE Support
SNB	HOST	Intel Sandy/Ivy Bridge CPU (AVX 1)
HSW	HOST	Intel Haswell CPU (AVX 2)
BDW	HOST	Intel Broadwell Xeon E-class CPU (AVX 2 + transactional mem)
SKL	HOST	Intel Skylake Client CPU
SKX	HOST	Intel Skylake Xeon Server CPU (AVX512)

continues on next page

Table 1 – continued from previous page

ICL	HOST	Intel Ice Lake Client CPU (AVX512)
ICX	HOST	Intel Ice Lake Xeon Server CPU (AVX512)
SPR	HOST	Intel Sapphire Rapids Xeon Server CPU (AVX512)
KNC	HOST	Intel Knights Corner Xeon Phi
KNL	HOST	Intel Knights Landing Xeon Phi
POWER8	HOST	IBM POWER8 CPU
POWER9	HOST	IBM POWER9 CPU
RISCV_SG2042	HOST	SG2042 (RISC-V) CPU
KEPLER30	GPU	NVIDIA Kepler generation CC 3.0 GPU
KEPLER32	GPU	NVIDIA Kepler generation CC 3.2 GPU
KEPLER35	GPU	NVIDIA Kepler generation CC 3.5 GPU
KEPLER37	GPU	NVIDIA Kepler generation CC 3.7 GPU
MAXWELL50	GPU	NVIDIA Maxwell generation CC 5.0 GPU
MAXWELL52	GPU	NVIDIA Maxwell generation CC 5.2 GPU
MAXWELL53	GPU	NVIDIA Maxwell generation CC 5.3 GPU
PASCAL60	GPU	NVIDIA Pascal generation CC 6.0 GPU
PASCAL61	GPU	NVIDIA Pascal generation CC 6.1 GPU
VOLTA70	GPU	NVIDIA Volta generation CC 7.0 GPU
VOLTA72	GPU	NVIDIA Volta generation CC 7.2 GPU
TURING75	GPU	NVIDIA Turing generation CC 7.5 GPU
AMPERE80	GPU	NVIDIA Ampere generation CC 8.0 GPU
AMPERE86	GPU	NVIDIA Ampere generation CC 8.6 GPU
ADA89	GPU	NVIDIA Ada Lovelace generation CC 8.9 GPU
HOPPER90	GPU	NVIDIA Hopper generation CC 9.0 GPU
AMD_GFX906	GPU	AMD GPU MI50/MI60
AMD_GFX908	GPU	AMD GPU MI100
AMD_GFX90A	GPU	AMD GPU MI200
AMD_GFX942	GPU	AMD GPU MI300
AMD_GFX1030	GPU	AMD GPU V620/W6800
AMD_GFX1100	GPU	AMD GPU RX7900XTX
INTEL_GEN	GPU	SPIR64-based devices, e.g. Intel GPUs, using JIT
INTEL_DG1	GPU	Intel Iris XeMAX GPU
INTEL_GEN9	GPU	Intel GPU Gen9
INTEL_GEN11	GPU	Intel GPU Gen11
INTEL_GEN12LP	GPU	Intel GPU Gen12LP
INTEL_XEHP	GPU	Intel GPU Xe-HP
INTEL_PVC	GPU	Intel GPU Ponte Vecchio

This list was last updated for version 4.3.0 of the Kokkos library.

Basic CMake build settings

For multicore CPUs using OpenMP, set these 2 variables.

```
-D Kokkos_ARCH_HOSTARCH=yes # HOSTARCH = HOST from list above
-D Kokkos_ENABLE_OPENMP=yes
-D BUILD_OMP=yes
```

Please note that enabling OpenMP for KOKKOS requires that OpenMP is also *enabled for the rest of LAMMPS*.

For Intel KNLs using OpenMP, set these variables:

```
-D Kokkos_ARCH_KNL=yes
-D Kokkos_ENABLE_OPENMP=yes
```

For NVIDIA GPUs using CUDA, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes    # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes     # GPUARCH = GPU from list above
-D Kokkos_ENABLE_CUDA=yes
-D Kokkos_ENABLE_OPENMP=yes
```

This will also enable executing FFTs on the GPU, either via the internal KISSFFT library, or - by preference - with the cuFFT library bundled with the CUDA toolkit, depending on whether CMake can identify its location.

For AMD or NVIDIA GPUs using HIP, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes    # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes     # GPUARCH = GPU from list above
-D Kokkos_ENABLE_HIP=yes
-D Kokkos_ENABLE_OPENMP=yes
```

This will enable FFTs on the GPU, either by the internal KISSFFT library or with the hipFFT wrapper library, which will call out to the platform-appropriate vendor library: rocFFT on AMD GPUs or cuFFT on NVIDIA GPUs.

To simplify compilation, five preset files are included in the `cmake/presets` folder, `kokkos-serial.cmake`, `kokkos-openmp.cmake`, `kokkos-cuda.cmake`, `kokkos-hip.cmake`, and `kokkos-sycl.cmake`. They will enable the KOKKOS package and enable some hardware choices. For GPU support those preset files must be customized to match the hardware used. So to compile with CUDA device parallelization with some common packages enabled, you can do the following:

```
mkdir build-kokkos-cuda
cd build-kokkos-cuda
cmake -C ../cmake/presets/basic.cmake -C ../cmake/presets/kokkos-cuda.cmake .
→ ./cmake
cmake --build .
```

Basic traditional make settings

Choose which hardware to support in `Makefile.machine` via `KOKKOS_DEVICES` and `KOKKOS_ARCH` settings. See the `src/MAKE/OPTIONS/Makefile.kokkos*` files for examples.

For multicore CPUs using OpenMP:

```
KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = HOSTARCH    # HOSTARCH = HOST from list above
```

For Intel KNLs using OpenMP:

```
KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = KNL
```

For NVIDIA GPUs using CUDA:

```

KOKKOS_DEVICES = Cuda
KOKKOS_ARCH = HOSTARCH,GPUARCH # HOSTARCH = HOST from list above that is,
→hosting the GPU
KOKKOS_CUDA_OPTIONS = "enable_lambda"
                                # GPUARCH = GPU from list above
FFT_INC = -DFFT_CUFFT          # enable use of cuFFT (optional)
FFT_LIB = -lcufft              # link to cuFFT library

```

For GPUs, you also need the following lines in your Makefile.machine before the CC line is defined. They tell mpicxx to use an nvcc compiler wrapper, which will use nvcc for compiling CUDA files and a C++ compiler for non-Kokkos, non-CUDA files.

```

# For OpenMPI
KOKKOS_ABSOLUTE_PATH = $(shell cd $(KOKKOS_PATH); pwd)
export OMPI_CXX = $(KOKKOS_ABSOLUTE_PATH)/config/nvcc_wrapper
CC = mpicxx

```

```

# For MPICH and derivatives
KOKKOS_ABSOLUTE_PATH = $(shell cd $(KOKKOS_PATH); pwd)
CC = mpicxx -cxx=$(KOKKOS_ABSOLUTE_PATH)/config/nvcc_wrapper

```

For AMD or NVIDIA GPUs using HIP:

```

KOKKOS_DEVICES = HIP
KOKKOS_ARCH = HOSTARCH,GPUARCH # HOSTARCH = HOST from list above that is,
→hosting the GPU
                                # GPUARCH = GPU from list above
FFT_INC = -DFFT_HIPFFT         # enable use of hipFFT (optional)
FFT_LIB = -lhipfft             # link to hipFFT library

```

Advanced KOKKOS compilation settings

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. Below are some examples that may be useful in combination with LAMMPS. For the full list (which keeps changing as the Kokkos package itself evolves), please consult the Kokkos library documentation.

As alternative to using multi-threading via OpenMP (-DKokkos_ENABLE_OPENMP=on or KOKKOS_DEVICES=OpenMP) it is also possible to use Posix threads directly (-DKokkos_ENABLE_PTHREAD=on or KOKKOS_DEVICES=Pthread). While binding of threads to individual or groups of CPU cores is managed in OpenMP with environment variables, you need assistance from either the “hwloc” or “libnuma” library for the Pthread thread parallelization option. To enable use with CMake: -DKokkos_ENABLE_HWLOC=on or -DKokkos_ENABLE_LIBNUMA=on; and with conventional make: KOKKOS_USE_TPLS=hwloc or KOKKOS_USE_TPLS=libnuma.

The CMake option -DKokkos_ENABLE_LIBRT=on or the makefile setting KOKKOS_USE_TPLS=librt enables the use of a more accurate timer mechanism on many Unix-like platforms for internal profiling.

The CMake option -DKokkos_ENABLE_DEBUG=on or the makefile setting KOKKOS_DEBUG=yes enables printing of run-time debugging information that can be useful. It also enables runtime bounds checking on Kokkos data structures. As to be expected, enabling this option will negatively impact the performance and thus is only recommended when developing a Kokkos-enabled style in LAMMPS.

The CMake option -DKokkos_ENABLE_CUDA_UVM=on or the makefile setting KOKKOS_CUDA_OPTIONS=enable_lambda,force_uvm enables the use of CUDA “Unified Virtual Memory” (UVM) in Kokkos. UVM allows to transparently use RAM on the host to supplement the memory used on the GPU

(with some performance penalty) and thus enables running larger problems that would otherwise not fit into the RAM on the GPU.

Please note, that the LAMMPS KOKKOS package must **always** be compiled with the `enable_lambda` option when using GPUs. The CMake configuration will thus always enable it.

3.7.5 LEPTON package

To build with this package, you must build the Lepton library which is included in the LAMMPS source distribution in the `lib/lepton` folder.

CMake build

This is the recommended build procedure for using Lepton in LAMMPS. No additional settings are normally needed besides `-D PKG_LEPTON=yes`.

On x86 hardware the Lepton library will also include a just-in-time compiler for faster execution. This is auto detected but can be explicitly disabled by setting `-D LEPTON_ENABLE_JIT=no` (or enabled by setting it to yes).

Traditional make

Before building LAMMPS, one must build the Lepton library in `lib/lepton`.

This can be done manually in the same folder by using or adapting one of the provided Makefiles: for example, `Makefile.serial` for the GNU C++ compiler, or `Makefile.mpi` for the MPI compiler wrapper. The Lepton library is written in C++-11 and thus the C++ compiler may need to be instructed to enable support for that.

In general, it is safer to use build setting consistent with the rest of LAMMPS. This is best carried out from the LAMMPS `src` directory using a command like these, which simply invokes the `lib/lepton/Install.py` script with the specified args:

```
make lib-lepton           # print help message
make lib-lepton args="-m serial" # build with GNU g++ compiler (settings
→as with "make serial")
make lib-lepton args="-m mpi"   # build with default MPI compiler
→(settings as with "make mpi")
```

The “machine” argument of the “-m” flag is used to find a `Makefile.machine` to use as build recipe.

The build should produce a build folder and the library `lib/lepton/liblmp_lepton.a`

3.7.6 MACHDYN package

To build with this package, you must download the Eigen3 library. Eigen3 is a template library, so you do not need to build it.

CMake build

```
-D DOWNLOAD_EIGEN3           # download Eigen3, value = no (default) or yes
-D EIGEN3_INCLUDE_DIR=path   # path to Eigen library (only needed if a
→ custom location)
```

If DOWNLOAD_EIGEN3 is set, the Eigen3 library will be downloaded and inside the CMake build directory. If the Eigen3 library is already on your system (in a location where CMake cannot find it), set EIGEN3_INCLUDE_DIR to the directory the Eigen3 include file is in.

Traditional make

You can download the Eigen3 library manually if you prefer; follow the instructions in `lib/machdyn/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invokes the `lib/machdyn/Install.py` script with the specified args:

```
make lib-machdyn           # print help message
make lib-machdyn args="-b"  # download to lib/machdyn/eigen3
make lib-machdyn args="-p /usr/include/eigen3" # use existing Eigen
→ installation in /usr/include/eigen3
```

Note that a symbolic (soft) link named `includelink` is created in `lib/machdyn` to point to the Eigen dir. When LAMMPS builds it will use this link. You should not need to edit the `lib/machdyn/Makefile.lammps` file.

3.7.7 ML-IAP package

Building the ML-IAP package requires including the *ML-SNAP* package. There will be an error message if this requirement is not satisfied. Using the *mliappy* model also requires enabling Python support, which in turn requires to include the *PYTHON* package **and** requires to have the *cython* software installed and with it a working *cythonize* command. This feature requires compiling LAMMPS with Python version 3.6 or later.

CMake build

```
-D MLIAP_ENABLE_PYTHON=value # enable mliappy model (default is autodetect)
```

Without this setting, CMake will check whether it can find a suitable Python version and the *cythonize* command and choose the default accordingly. During the build procedure the provided .pyx file(s) will be automatically translated to C++ code and compiled. Please do **not** run *cythonize* manually in the `src/ML-IAP` folder, as that can lead to compilation errors if Python support is not enabled. If you did it by accident, please remove the generated .cpp and .h files.

Traditional make

The build uses the `lib/python/Makefile.mliap_python` file in the compile/link process to add a rule to update the files generated by the `cythonize` command in case the corresponding `.pyx` file(s) were modified. You may need to modify `lib/python/Makefile.lammps` if the LAMMPS build fails.

To enable building the ML-IAP package with Python support enabled, you need to add `-DMLIAP_PYTHON` to the `LMP_INC` variable in your machine makefile. You may have to manually run the `cythonize` command on `.pyx` file(s) in the `src` folder, if this is not automatically done during installing the ML-IAP package. Please do **not** run `cythonize` in the `src/ML-IAP` folder, as that can lead to compilation errors if Python support is not enabled. If you did this by accident, please remove the generated `.cpp` and `.h` files.

3.7.8 OPT package

CMake build

No additional settings are needed besides `-D PKG_OPT=yes`

Traditional make

The compiler flag `-restrict` must be used to build LAMMPS with the OPT package when using Intel compilers. It should be added to the `CCFLAGS` line of your `Makefile.machine`. See `src/MAKE/OPTIONS/Makefile.opt` for an example.

3.7.9 POEMS package

CMake build

No additional settings are needed besides `-D PKG_OPT=yes`

Traditional make

Before building LAMMPS, you must build the POEMS library in `lib/poems`. You can do this manually if you prefer; follow the instructions in `lib/poems/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invokes the `lib/poems/Install.py` script with the specified args:

```
make lib-poems           # print help message
make lib-poems args="-m serial" # build with GNU g++ compiler (settings as
→with "make serial")
make lib-poems args="-m mpi"   # build with default MPI C++ compiler
→(settings as with "make mpi")
make lib-poems args="-m icc"   # build with Intel icc compiler
```

The build should produce two files: `lib/poems/libpoems.a` and `lib/poems/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the POEMS library (though typically the settings are just blank). If necessary, you can edit/create a new `lib/poems/Makefile.machine` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.machine` file.

3.7.10 PYTHON package

Building with the PYTHON package requires you have a the Python development headers and library available on your system, which needs to be a Python 2.7 version or a Python 3.x version. Since support for Python 2.x has ended, using Python 3.x is strongly recommended. See `lib/python/README` for additional details.

CMake build

```
-D Python_EXECUTABLE=path    # path to Python executable to use
```

Without this setting, CMake will guess the default Python version on your system. To use a different Python version, you can either create a virtualenv, activate it and then run `cmake`. Or you can set the `Python_EXECUTABLE` variable to specify which Python interpreter should be used. Note note that you will also need to have the development headers installed for this version, e.g. `python2-devel`.

Traditional make

The build uses the `lib/python/Makefile.lammps` file in the compile/link process to find Python. You should only need to create a new `Makefile.lammps.*` file (and copy it to `Makefile.lammps`) if the LAMMPS build fails.

3.7.11 VORONOI package

To build with this package, you must download and build the [Voro++ library](#) or install a binary package provided by your operating system.

CMake build

```
-D DOWNLOAD_VORO=value      # download Voro++ for build, value = no (default) or yes
-D VORO_LIBRARY=path        # Voro++ library file (only needed if at custom location)
-D VORO_INCLUDE_DIR=path    # Voro++ include directory (only needed if at custom location)
```

If `DOWNLOAD_VORO` is set, the Voro++ library will be downloaded and built inside the CMake build directory. If the Voro++ library is already on your system (in a location CMake cannot find it), `VORO_LIBRARY` is the filename (plus path) of the Voro++ library file, not the directory the library file is in. `VORO_INCLUDE_DIR` is the directory the Voro++ include file is in.

Traditional make

You can download and build the Voropp library manually if you prefer; follow the instructions in lib/voronoi/README. You can also do it in one step from the lammps/src dir, using a command like these, which simply invokes the lib/voronoi/Install.py script with the specified args:

```
make lib-voronoi                # print help message
make lib-voronoi args="-b"      # download and build the default
    ↪version in lib/voronoi/voro++-<version>
make lib-voronoi args="-p $HOME/voro++" # use existing Voropp installation
    ↪in $HOME/voro++
make lib-voronoi args="-b -v voro++0.4.6" # download and build the 0.4.6
    ↪version in lib/voronoi/voro++-0.4.6
```

Note that 2 symbolic (soft) links, `includelink` and `liblink`, are created in lib/voronoi to point to the Voropp source dir. When LAMMPS builds in src it will use these links. You should not need to edit the lib/voronoi/Makefile.lammps file.

3.7.12 ADIOS package

The ADIOS package requires the [ADIOS I/O library](#), version 2.3.1 or newer. Make sure that you have ADIOS built either with or without MPI to match if you build LAMMPS with or without MPI. ADIOS compilation settings for LAMMPS are automatically detected, if the `PATH` and `LD_LIBRARY_PATH` environment variables have been updated for the local ADIOS installation and the instructions below are followed for the respective build systems.

CMake build

```
-D ADIOS2_DIR=path      # path is where ADIOS 2.x is installed
-D PKG_ADIOS=yes
```

Traditional make

Turn on the ADIOS package before building LAMMPS. If the ADIOS 2.x software is installed in `PATH`, there is nothing else to do:

```
make yes-adios
```

otherwise, set `ADIOS2_DIR` environment variable when turning on the package:

```
ADIOS2_DIR=path make yes-adios    # path is where ADIOS 2.x is installed
```

3.7.13 ATC package

The ATC package requires the MANYBODY package also be installed.

CMake build

No additional settings are needed besides `-D PKG_ATC=yes` and `-D PKG_MANYBODY=yes`.

Traditional make

Before building LAMMPS, you must build the ATC library in `lib/atc`. You can do this manually if you prefer; follow the instructions in `lib/atc/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invokes the `lib/atc/Install.py` script with the specified args:

```
make lib-atc                                # print help message
make lib-atc args="-m serial"               # build with GNU g++ compiler and MPI
→STUBS (settings as with "make serial")
make lib-atc args="-m mpi"                 # build with default MPI compiler
→(settings as with "make mpi")
make lib-atc args="-m icc"                 # build with Intel icc compiler
```

The build should produce two files: `lib/atc/libatc.a` and `lib/atc/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the ATC library. If necessary, you can edit/create a new `lib/atc/Makefile.machine` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.<machine>` file.

Note that the `Makefile.lammps` file has settings for the BLAS and LAPACK linear algebra libraries. As explained in `lib/atc/README` these can either exist on your system, or you can use the files provided in `lib/linalg`. In the latter case you also need to build the library in `lib/linalg` with a command like these:

```
make lib-linalg                             # print help message
make lib-linalg args="-m serial"           # build with GNU C++ compiler (settings as
→with "make serial")
make lib-linalg args="-m mpi"              # build with default MPI C++ compiler
→(settings as with "make mpi")
make lib-linalg args="-m g++"              # build with GNU Fortran compiler
```

3.7.14 AWPMD package

CMake build

No additional settings are needed besides `-D PKG_AQPMMD=yes`.

Traditional make

Before building LAMMPS, you must build the AWPMD library in `lib/awpmd`. You can do this manually if you prefer; follow the instructions in `lib/awpmd/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invokes the `lib/awpmd/Install.py` script with the specified args:

```
make lib-awpmd                # print help message
make lib-awpmd args="-m serial" # build with GNU g++ compiler and MPI STUBS
→(settings as with "make serial")
make lib-awpmd args="-m mpi"   # build with default MPI compiler (settings
→as with "make mpi")
make lib-awpmd args="-m icc"   # build with Intel icc compiler
```

The build should produce two files: `lib/awpmd/libawpmd.a` and `lib/awpmd/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the AWPMD library. If necessary, you can edit/create a new `lib/awpmd/Makefile.machine` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.<machine>` file.

Note that the `Makefile.lammps` file has settings for the BLAS and LAPACK linear algebra libraries. As explained in `lib/awpmd/README` these can either exist on your system, or you can use the files provided in `lib/linalg`. In the latter case you also need to build the library in `lib/linalg` with a command like these:

```
make lib-linalg                # print help message
make lib-linalg args="-m serial" # build with GNU C++ compiler (settings as
→with "make serial")
make lib-linalg args="-m mpi"   # build with default MPI C++ compiler
→(settings as with "make mpi")
make lib-linalg args="-m g++"   # build with GNU C++ compiler
```

3.7.15 COLVARS package

This package enables the use of the `Colvars` module included in the LAMMPS source distribution.

CMake build

This is the recommended build procedure for using `Colvars` in LAMMPS. No additional settings are normally needed besides `-D PKG_COLVARS=yes`.

Traditional make

As with other libraries distributed with LAMMPS, the `Colvars` library needs to be built before building the LAMMPS program with the COLVARS package enabled.

From the LAMMPS `src` directory, this is most easily and safely done via one of the following commands, which implicitly rely on the `lib/colvars/Install.py` script with optional arguments:

```
make lib-colvars                # print help message
make lib-colvars args="-m serial" # build with GNU g++ compiler
→(settings as with "make serial")
```

```
make lib-colvars args="-m mpi"           # build with default MPI compiler
→(settings as with "make mpi")
make lib-colvars args="-m g++-debug"     # build with GNU g++ compiler and
→colvars debugging enabled
```

The “machine” argument of the “-m” flag is used to find a Makefile.machine file to use as build recipe. If such recipe does not already exist in lib/colvars, suitable settings will be auto-generated consistent with those used in the core LAMMPS makefiles.

Changed in version 8Feb2023.

Please note that Colvars uses the Lepton library, which is now included with the LEPTON package; if you use anything other than the make lib-colvars command, please make sure to *build Lepton beforehand*.

Optional flags may be specified as environment variables:

```
COLVARS_DEBUG=yes make lib-colvars args="-m machine" # Build with debug
→code (much slower)
COLVARS_LEPTON=no make lib-colvars args="-m machine" # Build without Lepton
→(included otherwise)
```

The build should produce two files: the library lib/colvars/libcolvars.a and the specification file lib/colvars/Makefile.lammps. The latter is auto-generated, and normally does not need to be edited.

3.7.16 ELECTRODE package

This package depends on the KSPACE package.

CMake build

```
-D PKG_ELECTRODE=yes           # enable the package itself
-D PKG_KSPACE=yes              # the ELECTRODE package requires KSPACE
-D USE_INTERNAL_LINALG=value   #
```

Features in the ELECTRODE package are dependent on code in the KSPACE package so the latter one *must* be enabled.

The ELECTRODE package also requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the ELECTRODE build script. But on some systems this may cause problems when linking or the dependency is not desired. Try enabling USE_INTERNAL_LINALG in those cases to use the bundled linear algebra library and work around the limitation.

Traditional make

Before building LAMMPS, you must configure the ELECTRODE support libraries and settings in lib/electrode. You can do this manually, if you prefer, or do it in one step from the lammps/src dir, using a command like these, which simply invokes the lib/electrode/Install.py script with the specified args:

```
make lib-electrode           # print help message
make lib-electrode args="-m serial" # build with GNU g++ compiler and MPI
→STUBS (settings as with "make serial")
make lib-electrode args="-m mpi"   # build with default MPI compiler
→(settings as with "make mpi")
```

Note that the `Makefile.lammps` file has settings for the BLAS and LAPACK linear algebra libraries. These can either exist on your system, or you can use the files provided in `lib/linalg`. In the latter case you also need to build the library in `lib/linalg` with a command like these:

```
make lib-linalg           # print help message
make lib-linalg args="-m serial" # build with GNU C++ compiler (settings as
→with "make serial")
make lib-linalg args="-m mpi"   # build with default MPI C++ compiler
→(settings as with "make mpi")
make lib-linalg args="-m g++"   # build with GNU C++ compiler
```

The package itself is activated with `make yes-KSPACE` and `make yes-ELECTRODE`

3.7.17 ML-PACE package

This package requires a library that can be downloaded and built in `lib/pace` or somewhere else, which must be done before building LAMMPS with this package. The code for the library can be found at: <https://github.com/ICAMS/lammps-user-pace/>

CMake build

By default the library will be downloaded from the git repository and built automatically when the ML-PACE package is enabled with `-D PKG_ML-PACE=yes`. The location for the sources may be customized by setting the variable `PACELIB_URL` when configuring with CMake (e.g. to use a local archive on machines without internet access). Since CMake checks the validity of the archive with `md5sum` you may also need to set `PACELIB_MD5` if you provide a different library version than what is downloaded automatically.

Traditional make

You can download and build the ML-PACE library in one step from the `lammps/src` dir, using these commands, which invoke the `lib/pace/Install.py` script.

```
make lib-pace           # print help message
make lib-pace args="-b"   # download and build the default
→version in lib/pace
```

You should not need to edit the `lib/pace/Makefile.lammps` file.

3.7.18 ML-POD package

CMake build

No additional settings are needed besides `-D PKG_ML-POD=yes`.

Traditional make

Before building LAMMPS, you must configure the ML-POD support settings in `lib/mlpod`. You can do this manually, if you prefer, or do it in one step from the `lammps/src` dir, using a command like the following, which simply invoke the `lib/mlpod/Install.py` script with the specified args:

```
make lib-mlpod                # print help message
make lib-mlpod args="-m serial" # build with GNU g++ compiler and MPI STUBS
→(settings as with "make serial")
make lib-mlpod args="-m mpi"   # build with default MPI compiler (settings
→as with "make mpi")
make lib-mlpod args="-m mpi -e linalg" # same as above but use the bundled
→linalg lib
```

Note that the `Makefile.lammps` file has settings to use the BLAS and LAPACK linear algebra libraries. These can either exist on your system, or you can use the files provided in `lib/linalg`. In the latter case you also need to build the library in `lib/linalg` with a command like these:

```
make lib-linalg                # print help message
make lib-linalg args="-m serial" # build with GNU C++ compiler (settings as
→with "make serial")
make lib-linalg args="-m mpi"   # build with default MPI C++ compiler
→(settings as with "make mpi")
make lib-linalg args="-m g++"   # build with GNU C++ compiler
```

The package itself is activated with `make yes-ML-POD`.

3.7.19 ML-QUIP package

To build with this package, you must download and build the QUIP library. It can be obtained from GitHub. For support of GAP potentials, additional files with specific licensing conditions need to be downloaded and configured. The automatic download will from within CMake will download the non-commercial use version.

CMake build

```
-D DOWNLOAD_QUIP=value        # download QUIP library for build, value = no
→(default) or yes
-D QUIP_LIBRARY=path         # path to libquip.a (only needed if a custom
→location)
-D USE_INTERNAL_LINALG=value # Use the internal linear algebra library
→instead of LAPACK
                                # value = no (default) or yes
```

CMake will try to download and build the QUIP library from GitHub, if it is not found on the local machine. This requires to have git installed. It will use the same compilers and flags as used for compiling LAMMPS. Currently this is only supported for the GNU and the Intel compilers. Set the QUIP_LIBRARY variable if you want to use a previously compiled and installed QUIP library and CMake cannot find it.

The QUIP library requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the QUIP build script. But on some systems this triggers a (current) limitation of CMake and the configuration will fail. Try enabling USE_INTERNAL_LINALG in those cases to use the bundled linear algebra library and work around the limitation.

Traditional make

The download/build procedure for the QUIP library, described in `lib/quip/README` file requires setting two environment variables, QUIP_ROOT and QUIP_ARCH. These are accessed by the `lib/quip/Makefile.lammps` file which is used when you compile and link LAMMPS with this package. You should only need to edit `Makefile.lammps` if the LAMMPS build can not use its settings to successfully build on your system.

3.7.20 PLUMED package

Before building LAMMPS with this package, you must first build PLUMED. PLUMED can be built as part of the LAMMPS build or installed separately from LAMMPS using the generic [PLUMED installation instructions](#). The PLUMED package has been tested to work with Plumed versions 2.4.x, 2.5.x, and 2.6.x and will error out, when trying to run calculations with a different version of the Plumed kernel.

PLUMED can be linked into MD codes in three different modes: static, shared, and runtime. With the “static” mode, all the code that PLUMED requires is linked statically into LAMMPS. LAMMPS is then fully independent from the PLUMED installation, but you have to rebuild/relink it in order to update the PLUMED code inside it. With the “shared” linkage mode, LAMMPS is linked to a shared library that contains the PLUMED code. This library should preferably be installed in a globally accessible location. When PLUMED is linked in this way the same library can be used by multiple MD packages. Furthermore, the PLUMED library LAMMPS uses can be updated without the need for a recompile of LAMMPS for as long as the shared PLUMED library is ABI-compatible.

The third linkage mode is “runtime” which allows the user to specify which PLUMED kernel should be used at runtime by using the PLUMED_KERNEL environment variable. This variable should point to the location of the `libplumed-Kernel.so` dynamical shared object, which is then loaded at runtime. This mode of linking is particularly convenient for doing PLUMED development and comparing multiple PLUMED versions as these sorts of comparisons can be done without recompiling the hosting MD code. All three linkage modes are supported by LAMMPS on selected operating systems (e.g. Linux) and using either CMake or traditional make build. The “static” mode should be the most portable, while the “runtime” mode support in LAMMPS makes the most assumptions about operating system and compiler environment. If one mode does not work, try a different one, switch to a different build system, consider a global PLUMED installation or consider downloading PLUMED during the LAMMPS build.

CMake build

When the `-D PKG_PLUMED=yes` flag is included in the `cmake` command you must ensure that *the GNU Scientific Library (GSL)* <<https://www.gnu.org/software/gsl/>> is installed in locations that are

accessible in your environment. There are then two additional variables that control the manner in which PLUMED is obtained and linked into LAMMPS.

```
-D DOWNLOAD_PLUMED=value      # download PLUMED for build, value = no (default)
→or yes
-D PLUMED_MODE=value          # Linkage mode for PLUMED, value = static
→(default), shared, or runtime
```

If `DOWNLOAD_PLUMED` is set to “yes”, the PLUMED library will be downloaded (the version of PLUMED that will be downloaded is hard-coded to a vetted version of PLUMED, usually a recent stable release version) and built inside the CMake build directory. If `DOWNLOAD_PLUMED` is set to “no” (the default), CMake will try to detect and link to an installed version of PLUMED. For this to work, the PLUMED library has to be installed into a location where the `pkg-config` tool can find it or the `PKG_CONFIG_PATH` environment variable has to be set up accordingly. PLUMED should be installed in such a location if you compile it using the default make; make install commands.

The `PLUMED_MODE` setting determines the linkage mode for the PLUMED library. The allowed values for this flag are “static” (default), “shared”, or “runtime”. If you want to switch the linkage mode, just re-run CMake with a different setting. For a discussion of PLUMED linkage modes, please see above. When `DOWNLOAD_PLUMED` is enabled the static linkage mode is recommended.

Traditional make

PLUMED needs to be installed before the PLUMED package is installed so that LAMMPS can find the right settings when compiling and linking the LAMMPS executable. You can either download and build PLUMED inside the LAMMPS plumed library folder or use a previously installed PLUMED library and point LAMMPS to its location. You also have to choose the linkage mode: “static” (default), “shared” or “runtime”. For a discussion of PLUMED linkage modes, please see above.

Download/compilation/configuration of the plumed library can be done from the src folder through the following make args:

```
make lib-plumed                # print help message
make lib-plumed args="-b"      # download and build PLUMED in lib/
→plumed/plumed2
make lib-plumed args="-p $HOME/.local" # use existing PLUMED installation
→in $HOME/.local
make lib-plumed args="-p /usr/local -m shared" # use existing PLUMED
→installation in
                                                # /usr/local and use
→shared linkage mode
```

Note that 2 symbolic (soft) links, `includelink` and `liblink` are created in `lib/plumed` that point to the location of the PLUMED build to use. A new file `lib/plumed/Makefile.lammps` is also created with settings suitable for LAMMPS to compile and link PLUMED using the desired linkage mode. After this step is completed, you can install the PLUMED package and compile LAMMPS in the usual manner:

```
make yes-plumed
make machine
```

Once this compilation completes you should be able to run LAMMPS in the usual way. For shared linkage mode, `libplumed.so` must be found by the LAMMPS executable, which on many operating systems means, you have to set the `LD_LIBRARY_PATH` environment variable accordingly.

Support for the different linkage modes in LAMMPS varies for different operating systems, using the

static linkage is expected to be the most portable, and thus set to be the default.

If you want to change the linkage mode, you have to re-run “make lib-plumed” with the desired settings **and** do a re-install if the PLUMED package with “make yes-plumed” to update the required makefile settings with the changes in the lib/plumed folder.

3.7.21 H5MD package

To build with this package you must have the HDF5 software package installed on your system, which should include the h5cc compiler and the HDF5 library.

CMake build

No additional settings are needed besides `-D PKG_H5MD=yes`.

This should auto-detect the H5MD library on your system. Several advanced CMake H5MD options exist if you need to specify where it is installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

Traditional make

Before building LAMMPS, you must build the CH5MD library in `lib/h5md`. You can do this manually if you prefer; follow the instructions in `lib/h5md/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invokes the `lib/h5md/Install.py` script with the specified args:

```
make lib-h5md                                # print help message
make lib-h5md args="-m h5cc"                 # build with h5cc compiler
```

The build should produce two files: `lib/h5md/libch5md.a` and `lib/h5md/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the system HDF5 library. If necessary, you can edit/create a new `lib/h5md/Makefile.machine` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.<machine>` file.

3.7.22 ML-HDNNP package

To build with the ML-HDNNP package it is required to download and build the external `n2p2` library v2.1.4 (or higher). The LAMMPS build process offers an automatic download and compilation of `n2p2` or allows you to choose the installation directory of `n2p2` manually. Please see the boxes below for the CMake and traditional build system for detailed information.

In case of a manual installation of `n2p2` you only need to build the `n2p2` core library `libnnp` and interface library `libnnpif`. When using GCC it should suffice to execute `make libnnpif` in the `n2p2` src directory. For more details please see `lib/hdnnp/README` and the `n2p2` [build documentation](#).

CMake build

```
-D DOWNLOAD_N2P2=value      # download n2p2 for build, value = no (default) or
→yes
-D N2P2_DIR=path           # n2p2 base directory (only needed if a custom
→location)
```

If `DOWNLOAD_N2P2` is set, the `n2p2` library will be downloaded and built inside the CMake build directory. If the `n2p2` library is already on your system (in a location CMake cannot find it), set the `N2P2_DIR` to path where `n2p2` is located. If `n2p2` is located directly in `lib/hdnnp/n2p2` it will be automatically found by CMake.

Traditional make

You can download and build the `n2p2` library manually if you prefer; follow the instructions in `lib/hdnnp/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invokes the `lib/hdnnp/Install.py` script with the specified args:

```
make lib-hdnnp              # print help message
make lib-hdnnp args="-b"    # download and build in lib/hdnnp/n2p2-...
make lib-hdnnp args="-b -v 2.1.4" # download and build specific version
make lib-hdnnp args="-p /usr/local/n2p2" # use the existing n2p2
→installation in /usr/local/n2p2
```

Note that 3 symbolic (soft) links, `includelink`, `liblink` and `Makefile.lammps`, will be created in `lib/hdnnp` to point to `n2p2/include`, `n2p2/lib` and `n2p2/lib/Makefile.lammps-extra`, respectively. When LAMMPS is built in `src` it will use these links.

3.7.23 INTEL package

To build with this package, you must choose which hardware you want to build for, either x86 CPUs or Intel KNLs in offload mode. You should also typically *install the OPENMP package*, as it can be used in tandem with the INTEL package to good effect, as explained on the *INTEL package* page.

When using Intel compilers version 16.0 or later is required. You can also use the GNU or Clang compilers and they will provide performance improvements over regular styles and OPENMP styles, but less so than with the Intel compilers. Please also note, that some compilers have been found to apply memory alignment constraints incompletely or incorrectly and thus can cause segmentation faults in otherwise correct code when using features from the INTEL package.

CMake build

```
-D INTEL_ARCH=value        # value = cpu (default) or knl
-D INTEL_LRT_MODE=value    # value = threads, none, or c++11
```

Traditional make

Choose which hardware to compile for in Makefile.machine via the following settings. See `src/MAKE/OPTIONS/Makefile.intel_cpu*` and `Makefile.knl` files for examples, and `src/INTEL/README` for additional information.

For CPUs:

```
OPTFLAGS =      -xHost -O2 -fp-model fast=2 -no-prec-div -qoverride-limits -  
→qopt-zmm-usage=high  
CCFLAGS =      -g -qopenmp -DLAMMPS_MEMALIGN=64 -no-offload -fno-alias -  
→ansi-alias -restrict $(OPTFLAGS)  
LINKFLAGS =    -g -qopenmp $(OPTFLAGS)  
LIB =          -ltbbmalloc
```

For KNLs:

```
OPTFLAGS =      -xMIC-AVX512 -O2 -fp-model fast=2 -no-prec-div -qoverride-  
→limits  
CCFLAGS =      -g -qopenmp -DLAMMPS_MEMALIGN=64 -no-offload -fno-alias -  
→ansi-alias -restrict $(OPTFLAGS)  
LINKFLAGS =    -g -qopenmp $(OPTFLAGS)  
LIB =          -ltbbmalloc
```

In Long-range thread mode (LRT) a modified verlet style is used, that operates the Kspace calculation in a separate thread concurrently to other calculations. This has to be enabled in the *package intel* command at runtime. With the setting “threads” it used the pthreads library, while “c++11” will use the built-in thread support of C++11 compilers. The option “none” skips compilation of this feature. The default is to use “threads” if pthreads is available and otherwise “none”.

Best performance is achieved with Intel hardware, Intel compilers, as well as the Intel TBB and MKL libraries. However, the code also compiles, links, and runs with other compilers / hardware and without TBB and MKL.

3.7.24 MDI package

CMake build

```
-D DOWNLOAD_MDI=value    # download MDI Library for build, value = no_  
→(default) or yes
```

Traditional make

Before building LAMMPS, you must build the MDI Library in `lib/mdi`. You can do this by executing a command like one of the following from the `lib/mdi` directory:

```
python Install.py -m gcc    # build using gcc compiler  
python Install.py -m icc    # build using icc compiler
```

The build should produce two files: `lib/mdi/includelink/mdi.h` and `lib/mdi/liblink/libmdi.so`.

3.7.25 MOLFILE package

CMake build

```
-D MOLFILE_INCLUDE_DIR=path # (optional) path where VMD molfile plugin  
→headers are installed  
-D PKG_MOLFILE=yes
```

Using `-D PKG_MOLFILE=yes` enables the package, and setting `-D MOLFILE_INCLUDE_DIR` allows to provide a custom location for the molfile plugin header files. These should match the ABI of the plugin files used, and thus one typically sets them to include folder of the local VMD installation in use. LAMMPS ships with a couple of default header files that correspond to a popular VMD version, usually the latest release.

Traditional make

The `lib/molfile/Makefile.lammps` file has a setting for a dynamic loading library `libdl.a` that is typically present on all systems. It is required for LAMMPS to link with this package. If the setting is not valid for your system, you will need to edit the `Makefile.lammps` file. See `lib/molfile/README` and `lib/molfile/Makefile.lammps` for details. It is also possible to configure a different folder with the VMD molfile plugin header files. LAMMPS ships with a couple of default headers, but these are not compatible with all VMD versions, so it is often best to change this setting to the location of the same include files of the local VMD installation in use.

3.7.26 NETCDF package

To build with this package you must have the NetCDF library installed on your system.

CMake build

No additional settings are needed besides `-D PKG_NETCDF=yes`.

This should auto-detect the NETCDF library if it is installed on your system at standard locations. Several advanced CMake NETCDF options exist if you need to specify where it was installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

Traditional make

The `lib/netcdf/Makefile.lammps` file has settings for NetCDF include and library files which LAMMPS needs to build with this package. If the settings are not valid for your system, you will need to edit the `Makefile.lammps` file. See `lib/netcdf/README` for details.

3.7.27 OPENMP package

CMake build

No additional settings are required besides `-D PKG_OPENMP=yes`. If CMake detects OpenMP compiler support, the OPENMP code will be compiled with multi-threading support enabled, otherwise as optimized serial code.

Traditional make

To enable multi-threading support in the OPENMP package (and other styles supporting OpenMP) the following compile and link flags must be added to your Makefile.machine file. See `src/MAKE/OPTIONS/Makefile.omp` for an example.

```
CCFLAGS: -fopenmp          # for GNU and Clang Compilers
CCFLAGS: -qopenmp -restrict # for Intel compilers on Linux
LINKFLAGS: -fopenmp        # for GNU and Clang Compilers
LINKFLAGS: -qopenmp        # for Intel compilers on Linux
```

For other platforms and compilers, please consult the documentation about OpenMP support for your compiler.

Adding OpenMP support on macOS

Apple offers the [Xcode package and IDE](#) for compiling software on macOS, so you have likely installed it to compile LAMMPS. Their compiler is based on [Clang](#), but while it is capable of processing OpenMP directives, the necessary header files and OpenMP runtime library are missing. The [R developers](#) have figured out a way to build those in a compatible fashion. One can download them from <https://mac.r-project.org/openmp/>. Simply adding those files as instructed enables the Xcode C++ compiler to compile LAMMPS with `-D BUILD_OMP=yes`.

3.7.28 QMMM package

For using LAMMPS to do QM/MM simulations via the QMMM package you need to build LAMMPS as a library. A LAMMPS executable with *fix qmmm* included can be built, but will not be able to do a QM/MM simulation on as such. You must also build a QM code - currently only Quantum ESPRESSO (QE) is supported - and create a new executable which links LAMMPS and the QM code together. Details are given in the `lib/qmmm/README` file. It is also recommended to read the instructions for [linking with LAMMPS as a library](#) for background information. This requires compatible Quantum Espresso and LAMMPS versions. The current interface and makefiles have last been verified to work in February 2020 with Quantum Espresso versions 6.3 to 6.5.

CMake build

When using CMake, building a LAMMPS library is required and it is recommended to build a shared library, since any libraries built from the sources in the `lib` folder (including the essential `libqmmm.a`) are not included in the static LAMMPS library and (currently) not installed, while their code is included in the shared LAMMPS library. Thus a typical command line to configure building LAMMPS for QMMM would be:

```
cmake -C ../cmake/presets/basic.cmake -D PKG_QMMM=yes \
-D BUILD_LIB=yes -DBUILD_SHARED_LIBS=yes ../cmake
```

After completing the LAMMPS build and also configuring and compiling Quantum ESPRESSO with external library support (via “make couple”), go back to the `lib/qmmm` folder and follow the instructions on the README file to build the combined LAMMPS/QE QM/MM executable (`pwqmmm.x`) in the `lib/qmmm` folder.

Traditional make

Before building LAMMPS, you must build the QMMM library in `lib/qmmm`. You can do this manually if you prefer; follow the first two steps explained in `lib/qmmm/README`. You can also do it in one step from the `lammps/src` dir, using a command like these, which simply invokes the `lib/qmmm/Install.py` script with the specified args:

```
make lib-qmmm                # print help message
make lib-qmmm args="-m serial" # build with GNU Fortran compiler
→(settings as in "make serial")
make lib-qmmm args="-m mpi"    # build with default MPI compiler
→(settings as in "make mpi")
make lib-qmmm args="-m gfortran" # build with GNU Fortran compiler
```

The build should produce two files: `lib/qmmm/libqmmm.a` and `lib/qmmm/Makefile.lammps`. The latter is copied from an existing `Makefile.lammps.*` and has settings needed to build LAMMPS with the QMMM library (though typically the settings are just blank). If necessary, you can edit/create a new `lib/qmmm/Makefile.<machine>` file for your system, which should define an `EXTRAMAKE` variable to specify a corresponding `Makefile.lammps.<machine>` file.

You can then install QMMM package and build LAMMPS in the usual manner. After completing the LAMMPS build and compiling Quantum ESPRESSO with external library support (via “make couple”), go back to the `lib/qmmm` folder and follow the instructions in the README file to build the combined LAMMPS/QE QM/MM executable (`pwqmmm.x`) in the `lib/qmmm` folder.

3.7.29 RHEO package

To build with this package you must have the *GNU Scientific Library (GSL)* <<https://www.gnu.org/software/gsl/>> installed in locations that are accessible in your environment. The GSL library should be at least version 2.7.

CMake build

If CMake cannot find the GSL library or include files, you can set:

```
-D GSL_ROOT_DIR=path    # path to root of GSL installation
```

Traditional make

LAMMPS will try to auto-detect the GSL compiler and linker flags from the corresponding `pkg-config` file (`gsl.pc`), otherwise you can edit the file `lib/rheo/Makefile.lammps` to spec-

ify the paths and library names where indicated by comments. This must be done **before** the package is installed.

3.7.30 SCAFACOS package

To build with this package, you must download and build the ScaFaCoS Coulomb solver library

CMake build

```
-D DOWNLOAD_SCAFACOS=value      # download ScaFaCoS for build, value = no,
→(default) or yes
-D SCAFACOS_LIBRARY=path        # ScaFaCos library file (only needed if at,
→custom location)
-D SCAFACOS_INCLUDE_DIR=path    # ScaFaCoS include directory (only needed if,
→at custom location)
```

If DOWNLOAD_SCAFACOS is set, the ScaFaCoS library will be downloaded and built inside the CMake build directory. If the ScaFaCoS library is already on your system (in a location CMake cannot find it), SCAFACOS_LIBRARY is the filename (plus path) of the ScaFaCoS library file, not the directory the library file is in. SCAFACOS_INCLUDE_DIR is the directory the ScaFaCoS include file is in.

Traditional make

You can download and build the ScaFaCoS library manually if you prefer; follow the instructions in lib/scafacos/README. You can also do it in one step from the lammps/src dir, using a command like these, which simply invokes the lib/scafacos/Install.py script with the specified args:

```
make lib-scafacos                # print help message
make lib-scafacos args="-b"      # download and build in lib/
→scafacos/scafacos-<version>
make lib-scafacos args="-p $HOME/scafacos # use existing ScaFaCoS,
→installation in $HOME/scafacos
```

Note that 2 symbolic (soft) links, `includelink` and `liblink`, are created in `lib/scafacos` to point to the ScaFaCoS src dir. When LAMMPS builds in src it will use these links. You should not need to edit the `lib/scafacos/Makefile.lammps` file.

3.7.31 VTK package

To build with this package you must have the VTK library installed on your system.

CMake build

No additional settings are needed besides `-D PKG_VTK=yes`.

This should auto-detect the VTK library if it is installed on your system at standard locations. Several advanced VTK options exist if you need to specify where it was installed. Use the `ccmake` (terminal window) or `cmake-gui` (graphical) tools to see these options and set them interactively from their user interfaces.

Traditional make

The `lib/vtk/Makefile.lammps` file has settings for accessing VTK files and its library, which LAMMPS needs to build with this package. If the settings are not valid for your system, check if one of the other `lib/vtk/Makefile.lammps.*` files is compatible and copy it to `Makefile.lammps`. If none of the provided files work, you will need to edit the `Makefile.lammps` file. See `lib/vtk/README` for details.

3.8 Build the LAMMPS documentation

Depending on how you obtained LAMMPS and whether you have built the manual yourself, this directory has a number of subdirectories and files. Here is a list with descriptions:

```

README           # brief info about the documentation
src              # content files for LAMMPS documentation
html            # HTML version of the LAMMPS manual (see html/Manual.html)
utils           # tools and settings for building the documentation
lammps.1        # man page for the lammps command
msi2lmp.1       # man page for the msi2lmp command
Manual.pdf      # large PDF version of entire manual
LAMMPS.epub     # Manual in ePUB e-book format
LAMMPS.mobi     # Manual in MOBI e-book format
docenv          # virtualenv folder for processing the manual sources
doctrees        # temporary data from processing the manual
doxygen         # doxygen configuration and output
.gitignore      # list of files and folders to be ignored by git
doxygen-warn.log # logfile with warnings from running doxygen
github-development-workflow.md # notes on the LAMMPS development workflow

```

If you downloaded LAMMPS as a tarball from [the LAMMPS website](https://www.lammps.org/), the `html` folder and the PDF files should be included.

If you downloaded LAMMPS from the public git repository, then the HTML and PDF files are not included. You can build the HTML or PDF files yourself, by typing `make html` or `make pdf` in the `doc` folder. This requires various tools and files. Some of them have to be installed (see below). For the rest the build process will attempt to download and install them into a python virtual environment and local folders.

A current version of the manual (latest feature release, that is the state of the *release* branch) is available online at: <https://docs.lammps.org/>. A version of the manual corresponding to the ongoing development (that is the state of the

develop branch) is available online at: <https://docs.lammps.org/latest/> A version of the manual corresponding to the latest stable LAMMPS release (that is the state of the *stable* branch) is available online at: <https://docs.lammps.org/stable/>

3.8.1 Build using GNU make

The LAMMPS manual is written in *reStructuredText* format which can be translated to different output format using the *Sphinx* document generator tool. It also incorporates programmer documentation extracted from the LAMMPS C++ sources through the *Doxygen* program. Currently the translation to HTML, PDF (via LaTeX), ePUB (for many e-book readers) and MOBI (for Amazon Kindle readers) are supported. For that to work a Python interpreter version 3.8 or later, the *doxygen* tools and internet access to download additional files and tools are required. This download is usually only required once or after the documentation folder is returned to a pristine state with `make clean-all`.

For the documentation build a python virtual environment is set up in the folder `doc/docenv` and various python packages are installed into that virtual environment via the `pip` tool. For rendering embedded LaTeX code also the *MathJax* JavaScript engine needs to be downloaded. If you need to pass additional options to the `pip` commands to work (e.g. to use a web proxy or to point to additional SSL certificates) you can set them via the `PIP_OPTIONS` environment variable or uncomment and edit the `PIP_OPTIONS` setting at beginning of the `makefile`.

The actual translation is then done via `make` commands in the `doc` folder. The following `make` commands are available:

```
make html      # generate HTML in html dir using Sphinx
make pdf       # generate PDF as Manual.pdf using Sphinx and PDFLaTeX
make epub     # generate LAMMPS.epub in ePUB format using Sphinx
make mobi     # generate LAMMPS.mobi in MOBI format using ebook-convert

make fasthtml  # generate approximate HTML in fasthtml dir using Sphinx
               # some Sphinx extensions do not work correctly with this

make clean     # remove intermediate RST files created by HTML build
make clean-all # remove entire build folder and any cached data

make anchor_check # check for duplicate anchor labels
make style_check  # check for complete and consistent style lists
make package_check # check for complete and consistent package lists
make link_check   # check for broken or outdated URLs
make spelling     # spell-check the manual
```

3.8.2 Build using CMake

It is also possible to create the HTML version (and **only** the HTML version) of the manual within the *CMake build directory*. The reason for this option is to include the installation of the HTML manual pages into the “install” step when installing LAMMPS after the CMake build via `cmake --build . --target install`. The documentation build is included in the default build target, but can also be requested independently with `cmake --build . --target doc`. If you need to pass additional options to the `pip` commands to work (e.g. to use a web proxy or to point to additional SSL certificates) you can set them via the `PIP_OPTIONS` environment variable.

```
-D BUILD_DOC=value      # yes or no (default)
```

3.8.3 Prerequisites for HTML

To run the HTML documentation build toolchain, python 3, git, doxygen, and virtualenv have to be installed locally. Here are instructions for common setups:

Ubuntu

```
sudo apt-get install git doxygen
```

RHEL or CentOS (Version 7.x)

```
sudo yum install git doxygen
```

Fedora or RHEL/CentOS (8.x or later)

```
sudo dnf install git doxygen
```

macOS

Python 3

If Python 3 is not available on your macOS system, you can download the latest Python 3 macOS package from <https://www.python.org> and install it. This will install both Python 3 and pip3.

3.8.4 Prerequisites for PDF

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with support for PDFLaTeX and a selection of LaTeX styles/packages are required. To run the PDFLaTeX translation the `latexmk` script needs to be installed as well.

3.8.5 Prerequisites for ePUB and MOBI

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with a few add-on LaTeX packages as well as the `dvipng` tool are required to convert embedded math expressions transparently into embedded images.

For converting the generated ePUB file to a MOBI format file (for e-book readers, like Kindle, that cannot read ePUB), you also need to have the `ebook-convert` tool from the “calibre” software installed. <https://calibre-ebook.com/> Typing `make mobi` will first create the ePUB file and then convert it. On the Kindle readers in particular, you also have support for PDF files, so you could download and view the PDF version as an alternative.

3.8.6 Instructions for Developers

When adding new styles or options to the LAMMPS code, corresponding documentation is required and either existing files in the `src` folder need to be updated or new files added. These files are written in `reStructuredText` markup for translation with the Sphinx tool.

Before contributing any documentation, please check that both the HTML and the PDF format documentation can translate without errors. During testing the html translation, you may use the `make fasthtml` command which does an approximate translation (i.e. not all Sphinx features and extensions will work), but runs very fast because it will only translate files that have been changed since the last `make fasthtml` command.

Please also check the output to the console for any warnings or problems. There will be multiple tests run automatically:

- A test for correctness of all anchor labels and their references
- A test that all LAMMPS packages (= folders with sources in `lammps/src`) are documented and listed. A typical warning shows the name of the folder with the suspected new package code and the documentation files where they need to be listed:

```
Found 88 packages
Package NEWPACKAGE missing in Packages_list.rst
Package NEWPACKAGE missing in Packages_details.rst
```

- A test that only standard, printable ASCII text characters are used. This runs the command `env LC_ALL=C grep -n '[^ ~]' src/*.rst` and thus prints all offending lines with filename and line number prepended to the screen. Special characters like Greek letters (α σ ϵ), super- or subscripts (x^2 U_{LJ}), mathematical expressions ($\frac{1}{2}N x \rightarrow \infty$), or the Angstrom symbol (\AA) should be typeset with embedded LaTeX (like this `:math:\`\ α \ σ \ ϵ \`, :math:\`x^2 \ $\mathrm{E}\}_{LJ}\`$, :math:\`\ $\frac{1}{2}\mathrm{N} x\to\infty$ \`, or :math:\`\ \AA \`).`
- Embedded LaTeX is rendered in HTML output with `MathJax` and in PDF output by passing the embedded text to LaTeX. Some care has to be taken, though, since there are limitations which macros and features can be used in either mode, so it is recommended to always check whether any new or changed documentation does translate and render correctly with either output.
- A test whether all styles are documented and listed in their respective overview pages. A typical output with warnings looks like this:

```
Parsed style names w/o suffixes from C++ tree in ../src:
Angle styles:      21   Atom styles:      24
Body styles:       3   Bond styles:      17
Command styles:    41   Compute styles:   143
Dihedral styles:   16   Dump styles:      26
Fix styles:        223  Improper styles:   13
Integrate styles:   4   Kspace styles:    15
Minimize styles:    9   Pair styles:      234
Reader styles:      4   Region styles:     8
Compute style entry newcomp is missing or incomplete in Commands_compute.rst
Compute style entry newcomp is missing or incomplete in compute.rst
Fix style entry newfix is missing or incomplete in Commands_fix.rst
Fix style entry newfix is missing or incomplete in fix.rst
Pair style entry new is missing or incomplete in Commands_pair.rst
Pair style entry new is missing or incomplete in pair_style.rst
Found 6 issue(s) with style lists
```

In addition, there is the option to run a spellcheck on the entire manual with `make spelling`. This requires a library called `enchant`. To avoid printing out *false positives* (e.g. keywords, names, abbreviations) those can be added to the

file lammps/doc/utils/sphinx-config/false_positives.txt.

3.9 Notes for building LAMMPS on Windows

- *General remarks*
 - *Running Linux on Windows*
 - *Using GNU GCC ported to Windows*
 - *Using Visual Studio*
 - *Using Intel oneAPI compilers and libraries*
 - *Using a cross-compiler*
-

3.9.1 General remarks

LAMMPS is developed and tested primarily on Linux machines. The vast majority of HPC clusters and supercomputers today run on Linux as well. While portability to other platforms is desired, it is not always achieved. That is sometimes due to non-portable code in LAMMPS itself, but more often due to portability limitations of external libraries and tools required to build a specific feature or package. The LAMMPS developers are dependent on LAMMPS users giving feedback and providing assistance in resolving portability issues. This is particularly true for compiling LAMMPS on Windows, since this platform has significant differences in some low-level functionality. As of LAMMPS version 14 December 2021, large parts of LAMMPS can be compiled natively with the Microsoft Visual C++ Compilers. As of LAMMPS version 31 May 2022, also the Intel oneAPI compilers can compile large parts of LAMMPS natively on Windows. This is mostly facilitated by using the *Platform abstraction functions* in the `platform` namespace and CMake.

Before trying to build LAMMPS on Windows yourself, please consider the [pre-compiled Windows installer packages](#) and see if they are sufficient for your needs.

3.9.2 Running Linux on Windows

If it is necessary for you to compile LAMMPS on a Windows machine (e.g. because it is your main desktop), please also consider using a virtual machine software and compile and run LAMMPS in a Linux virtual machine, or - if you have a sufficiently up-to-date Windows 10 or Windows 11 installation - consider using the Windows subsystem for Linux. This optional Windows feature allows you to run the bash shell of a Linux system (Ubuntu by default) from within Windows and from there on, you can pretty much use that shell like you are running on a regular Ubuntu Linux machine (e.g. installing software via apt-get and more). For more details on that, please see [this tutorial](#).

3.9.3 Using a GNU GCC ported to Windows

One option for compiling LAMMPS on Windows natively is to install a Bash shell, Unix shell utilities, Perl, Python, GNU make, and a GNU compiler ported to Windows. The Cygwin package provides a unix/linux interface to low-level Windows functions, so LAMMPS can be compiled on Windows. The necessary (minor) modifications to LAMMPS are included, but may not always up-to-date for recently added functionality and the corresponding new code. A machine makefile for using cygwin for the old build system is provided. Using CMake for this mode of compilation is untested and not likely to work.

When compiling for Windows do **not** set the `-DLAMMPS_MEMALIGN` define in the `LMP_INC` makefile variable and add `-lwsck32 -lpsapi` to the linker flags in `LIB` makefile variable. Try adding `-static-libgcc` or `-static` or both

to the linker flags when your resulting LAMMPS Windows executable complains about missing .dll files. The CMake configuration should set this up automatically, but is untested.

In case of problems, you are recommended to contact somebody with experience in using Cygwin. If you do come across portability problems requiring changes to the LAMMPS source code, or figure out corrections yourself, please report them on the [LAMMPS forum at MatSci](#), or file them as an issue or pull request on the LAMMPS GitHub project.

3.9.4 Using Microsoft Visual Studio

Following the integration of the *platform namespace* into the LAMMPS code base, portability of LAMMPS for native compilation on Windows using Visual Studio has been significantly improved. This has been tested with Visual Studio 2019 (aka version 16) and Visual Studio 2022 (aka version 17). We strongly recommend using Visual Studio 2022 version 17.1 or later. Not all features and packages in LAMMPS are currently supported out of the box, but a preset `cmake/presets/windows.cmake` is provided that contains the packages that have been compiled successfully so far. You **must** use the CMake based build procedure, since there is no support for GNU make or the Unix shell utilities required for the GNU make build procedure.

It is possible to use both the integrated CMake support of the Visual Studio IDE or use an external CMake installation (e.g. downloaded from [cmake.org](#)) to create build files and compile LAMMPS from the command line.

Compilation via command line and unit tests are checked automatically for the LAMMPS development branch through [GitHub Actions](#).

Note

Versions of Visual Studio before version 17.1 may scan the entire LAMMPS source tree and likely miss the correct master `CMakeLists.txt` and get confused since there are multiple files of that name in different folders but none in top level folder.

Please note, that for either approach CMake will create a so-called “*multi-configuration*” *build environment*, and the command lines for building and testing LAMMPS must be adjusted accordingly.

The LAMMPS `cmake` folder contains a `CMakeSettings.json` file with build configurations for MSVC compilers and the MS provided Clang compiler package in Debug and Release mode.

To support running in parallel you can compile with OpenMP enabled using the OPENMP package or install Microsoft MPI (including the SDK) and compile LAMMPS with MPI enabled.

Note

This is work in progress and you should contact the LAMMPS developers via GitHub or the [LAMMPS forum at MatSci](#), if you have questions or LAMMPS specific problems.

3.9.5 Using Intel oneAPI Compilers and Libraries

Added in version 31May2022.

After installing the [Intel oneAPI](#) base toolkit and the HPC toolkit, it is also possible to compile large parts of LAMMPS natively on Windows using Intel compilers. The HPC toolkit provides two sets of C/C++ and Fortran compilers: the so-called “classic” compilers (`icl.exe` and `ifort.exe`) and newer, LLVM based compilers (`icx.exe` and `ifx.exe`). In addition to the compilers and their dependent modules, also the thread building blocks (TBB) and the math

kernel library (MKL) need to be installed. Two presets (`cmake/presets/windows-intel-llvm.cmake` and `cmake/presets/windows-intel-classic.cmake`) are provided for selecting the LLVM based or classic compilers, respectively. The preset `cmake/presets/windows.cmake` enables compatible packages that are not dependent on additional features or libraries. You **must** use the CMake based build procedure and use Ninja as build tool. For compiling from the command prompt, thus both [CMake](#) and [Ninja-build](#) binaries must be installed. It is also possible to use Visual Studio, if it is started (`devenv.exe`) from a command prompt that has the Intel oneAPI compilers enabled. The Visual Studio settings file in the `cmake` folder contains configurations for both compiler variants in debug and release settings. Those will use the CMake and Ninja binaries bundled with Visual Studio, thus a separate installation is not required.

Known Limitations

In addition to portability issues with several packages and external libraries, the classic Intel compilers are currently not able to compile the googletest libraries and thus enabling the `-DENABLE_TESTING` option will result in compilation failure. The LLVM based compilers are compatible.

Note

This is work in progress and you should contact the LAMMPS developers via GitHub or the [LAMMPS forum at MatSci](#), if you have questions or LAMMPS specific problems.

3.9.6 Using a cross-compiler

If you need to provide custom LAMMPS binaries for Windows, but do not need to do the compilation on Windows, please consider using a Linux to Windows cross-compiler. This is how currently the Windows binary packages are created by the LAMMPS developers. Because of that, this is probably the currently best tested and supported way to build LAMMPS executables for Windows. A CMake preset selecting all packages compatible with this cross-compilation build is provided. The GPU package can only be compiled with OpenCL support. To compile with MPI support, a pre-compiled library and the corresponding header files are required. When building with CMake the matching package will be downloaded automatically, but MPI support has to be explicitly enabled with `-DBUILD_MPI=on`.

Please keep in mind, though, that this only applies to **compiling** LAMMPS. Whether the resulting binaries do work correctly is rarely tested by the LAMMPS developers. We instead rely on the feedback of the users of these pre-compiled LAMMPS packages for Windows. We will try to resolve issues to the best of our abilities if we become aware of them. However this is subject to time constraints and focus on HPC platforms.

3.10 Notes for saving disk space when building LAMMPS from source

LAMMPS is a large software project with a large number of source files, extensive documentation, and a large collection of example files. When downloading LAMMPS by cloning the [git repository from GitHub](#) this will by default also download the entire commit history since September 2006. Compiling LAMMPS will add the storage requirements of the compiled object files and libraries to the tally.

In a user account on an HPC cluster with filesystem quotas or in other environments with restricted disk space capacity it may be needed to reduce the storage requirements. Here are some suggestions:

- Create a so-called shallow repository by cloning only the last commit instead of the full project history by using `git clone git@github.com:lammps/lammps --depth=1 --branch=develop`. This reduces the downloaded size to about half. With `--depth=1` it is not possible to check out different versions/branches of

LAMMPS, using `--depth=1000` will make multiple recent versions available at little extra storage needs (the entire git history had nearly 30,000 commits in fall 2021).

- Download a tar archive from either the [download section on the LAMMPS homepage](#) or from the [LAMMPS releases page on GitHub](#) these will not contain the git history at all.
- Build LAMMPS without the debug flag (remove `-g` from the machine makefile or use `-DCMAKE_BUILD_TYPE=Release`) or use the `strip` command on the LAMMPS executable when no more debugging would be needed. The `strip` command may also be applied to the LAMMPS shared library. The static library may be deleted entirely.
- Delete compiled object files and libraries after copying the LAMMPS executable to a permanent location. When using the traditional build process, one may use `make clean-<machine>` or `make clean-all` to delete object files in the `src` folder. For CMake based builds, one may use `make clean` or just delete the entire build folder.
- The folders containing the documentation tree (`doc`), the examples (`examples`) are not needed to build and run LAMMPS and can be safely deleted. Some files in the `potentials` folder are large and may be deleted, if not needed. The largest of those files (occupying about 120 MBytes combined) will only be downloaded on demand, when the corresponding package is installed.
- When using the CMake build procedure, the compilation can be done on a (local) scratch storage that will not count toward the quota. A local scratch file system may offer the additional benefit of speeding up creating object files and linking with libraries compared to a networked file system. Also with CMake (and unlike with the traditional `make`) it is possible to compile LAMMPS executables with different settings and packages included from the same source tree since all the configuration information is stored in the build folder. So it is not necessary to have multiple copies of LAMMPS.

3.11 Development build options

The build procedures in LAMMPS offers a few extra options which are useful during development, testing or debugging.

3.11.1 Monitor compilation flags (CMake only)

Sometimes it is necessary to verify the complete sequence of compilation flags generated by the CMake build. To enable a more verbose output during compilation you can use the following option.

```
-D CMAKE_VERBOSE_MAKEFILE=value    # value = no (default) or yes
```

Another way of doing this without reconfiguration is calling `make` with variable `VERBOSE` set to 1:

```
make VERBOSE=1
```

3.11.2 Enable static code analysis with clang-tidy (CMake only)

The `clang-tidy` tool is a static code analysis tool to diagnose (and potentially fix) typical programming errors or coding style violations. It has a modular framework of tests that can be adjusted to help identifying problems before they become bugs and also assist in modernizing large code bases (like LAMMPS). It can be enabled for all C++ code with the following CMake flag

```
-D ENABLE_CLANG_TIDY=value    # value = no (default) or yes
```

With this flag enabled all source files will be processed twice, first to be compiled and then to be analyzed. Please note that the analysis can be significantly more time-consuming than the compilation itself.

3.11.3 Report missing and unneeded '#include' statements (CMake only)

The conventions for how and when to use and order include statements in LAMMPS are documented in *LAMMPS programming style*. To assist with following these conventions one can use the `Include What You Use` tool. This tool is still under development and for large and complex projects like LAMMPS there are some false positives, so suggested changes need to be verified manually. It is recommended to use at least version 0.16, which has much fewer incorrect reports than earlier versions. To install the IWYU toolkit, you need to have the clang compiler **and** its development package installed. Download the IWYU version that matches the version of the clang compiler, configure, build, and install it.

The necessary steps to generate the report can be enabled via a CMake variable during CMake configuration.

```
-D ENABLE_IWYU=value    # value = no (default) or yes
```

This will check if the required binary (include-what-you-use or iwyu) and python script script (iwyu-tool or iwyu_tool or iwyu_tool.py) can be found in the path. The analysis can then be started with:

```
make iwyu
```

This may first run some compilation, as the analysis is dependent on recording all commands required to do the compilation.

3.11.4 Address, Leak, Undefined Behavior, and Thread Sanitizer Support (CMake only)

Compilers such as GCC and Clang support generating instrumented binaries which use different sanitizer libraries to detect problems in the code during run-time. They can detect issues like:

- memory leaks
- undefined behavior
- data races

Please note that this kind of instrumentation usually comes with a performance hit (but much less than using tools like `Valgrind` with a more low level approach). To enable these features, additional compiler flags need to be added to the compilation and linking stages. This is done through setting the `ENABLE_SANITIZER` variable during configuration. Examples:

```

-D ENABLE_SANITIZER=none      # no sanitizer active (default)
-D ENABLE_SANITIZER=address   # enable address sanitizer / memory leak checker
-D ENABLE_SANITIZER=hwaddress # enable hardware assisted address sanitizer / memory
→leak checker
-D ENABLE_SANITIZER=leak      # enable memory leak checker (only)
-D ENABLE_SANITIZER=undefined # enable undefined behavior sanitizer
-D ENABLE_SANITIZER=thread    # enable thread sanitizer

```

3.11.5 Code Coverage and Unit Testing (CMake only)

The LAMMPS code is subject to multiple levels of automated testing during development:

- Integration testing (i.e. whether the code compiles on various platforms and with a variety of compilers and settings),
- Unit testing (i.e. whether certain functions or classes of the code produce the expected results for given inputs),
- Run testing (i.e. whether selected input decks can run to completion without crashing for multiple configurations),
- Regression testing (i.e. whether selected input examples reproduce the same results over a given number of steps and operations within a given error margin).

The status of this automated testing can be viewed on <https://ci.lammps.org>.

The scripts and inputs for integration, run, and regression testing are maintained in a [separate repository](#) of the LAMMPS project on GitHub. A few tests are also run as GitHub Actions and their configuration files are in the `.github/workflows/` folder of the LAMMPS git tree.

The unit testing facility is integrated into the CMake build process of the LAMMPS source code distribution itself. It can be enabled by setting `-D ENABLE_TESTING=on` during the CMake configuration step. It requires the [YAML](#) library and matching development headers to compile (if those are not found locally a recent version of that library will be downloaded and compiled along with LAMMPS and the test programs) and will download and compile a specific version of the [GoogleTest](#) C++ test framework that is used to implement the tests.

Software version and LAMMPS configuration requirements

The compiler and library version requirements for the testing framework are more strict than for the main part of LAMMPS. For example the default GNU C++ and Fortran compilers of RHEL/CentOS 7.x (version 4.8.x) are not sufficient. The CMake configuration will try to detect incompatible versions and either skip incompatible tests or stop with an error. Also the number of available tests will depend on installed LAMMPS packages, development environment, operating system, and configuration settings.

After compilation is complete, the unit testing is started in the build folder using the `ctest` command, which is part of the CMake software. The output of this command will be looking something like this:

```

$ ctest
Test project /home/akohlmeier/compile/lammps/build-testing
   Start    1: RunLammps
1/563 Test  #1: RunLammps ..... Passed    0.28
→sec
   Start    2: HelpMessage
2/563 Test  #2: HelpMessage ..... Passed    0.06

```

(continues on next page)

(continued from previous page)

```

→sec
  Start   3: InvalidFlag
3/563 Test #3: InvalidFlag ..... Passed    0.06┐
→sec
  Start   4: Tokenizer
4/563 Test #4: Tokenizer ..... Passed    0.05┐
→sec
  Start   5: MemPool
5/563 Test #5: MemPool ..... Passed    0.05┐
→sec
  Start   6: ArgUtils
6/563 Test #6: ArgUtils ..... Passed    0.05┐
→sec
  [...]
  Start 561: ImproperStyle:zero
561/563 Test #561: ImproperStyle:zero ..... Passed    0.07┐
→sec
  Start 562: TestMliapPyUnified
562/563 Test #562: TestMliapPyUnified ..... Passed    0.16┐
→sec
  Start 563: TestPairList
563/563 Test #563: TestPairList ..... Passed    0.06┐
→sec

100% tests passed, 0 tests failed out of 563

Label Time Summary:
generated    =  0.85 sec*proc (3 tests)
noWindows    =  4.16 sec*proc (2 tests)
slow         = 78.33 sec*proc (67 tests)
unstable     = 28.23 sec*proc (34 tests)

Total Test time (real) = 132.34 sec

```

The `ctest` command has many options, the most important ones are:

Option	Function
-V	verbose output: display output of individual test runs
-j <num>	parallel run: run <num> tests in parallel
-R <regex>	run subset of tests matching the regular expression <regex>
-E <regex>	exclude subset of tests matching the regular expression <regex>
-L <regex>	run subset of tests with a label matching the regular expression <regex>
-LE <regex>	exclude subset of tests with a label matching the regular expression <regex>
-N	dry-run: display list of tests without running them
-T memcheck	run tests with valgrind memory checker (if available)

In its full implementation, the unit test framework will consist of multiple kinds of tests implemented in different programming languages (C++, C, Python, Fortran) and testing different aspects of the LAMMPS software and its features. The tests will adapt to the compilation settings of LAMMPS, so that tests will be skipped if prerequisite features are not available in LAMMPS.

Work in Progress

The unit test framework was added in spring 2020 and is under active development. The coverage is not complete and will be expanded over time. Preference is given to parts of the code base that are easy to test or commonly used.

Tests as shown by the `ctest` program are command lines defined in the `CMakeLists.txt` files in the `unittest` directory tree. A few tests simply execute LAMMPS with specific command line flags and check the output to the screen for expected content. A large number of unit tests are special tests programs using the [GoogleTest framework](#) and linked to the LAMMPS library that test individual functions or create a LAMMPS class instance, execute one or more commands and check data inside the LAMMPS class hierarchy. There are also tests for the C-library, Fortran, and Python module interfaces to LAMMPS. The Python tests use the Python “unittest” module in a similar fashion than the others use *GoogleTest*. These special test programs are structured to perform multiple individual tests internally and each of those contains several checks (aka assertions) for internal data being changed as expected.

Tests for force computing or modifying styles (e.g. styles for non-bonded and bonded interactions and selected fixes) are run by using a more generic test program that reads its input from files in YAML format. The YAML file provides the information on how to customized the test program to test a specific style and - if needed - with specific settings. To add a test for another, similar style (e.g. a new pair style) it is usually sufficient to add a suitable YAML file. [Detailed instructions for adding tests](#) are provided in the Programmer Guide part of the manual. A description of what happens during the tests is given below.

Unit tests for force styles

A large part of LAMMPS are different “styles” for computing non-bonded and bonded interactions selected through the *pair_style command*, *bond_style command*, *angle_style command*, *dihedral_style command*, *improper_style command*, and *kpace_style command*. Since these all share common interfaces, it is possible to write generic test programs that will call those common interfaces for small test systems with less than 100 atoms and compare the results with pre-recorded reference results. A test run is then a collection multiple individual test runs each with many comparisons to reference results based on template input files, individual command settings, relative error margins, and reference data stored in a YAML format file with `.yaml` suffix. Currently the programs `test_pair_style`, `test_bond_style`, `test_angle_style`, `test_dihedral_style`, and `test_improper_style` are implemented. They will compare forces, energies and (global) stress for all atoms after a `run 0` calculation and after a few steps of MD with *fix nve*, each in multiple variants with different settings and also for multiple accelerated styles. If a prerequisite style or package is missing, the individual tests are skipped. All force style tests will be executed on a single MPI process, so using the CMake option `-D BUILD_MPI=off` can significantly speed up testing, since this will skip the MPI initialization for each test run. Below is an example command and output:

```
$ test_pair_style mol-pair-lj_cut.yaml
[=====] Running 6 tests from 1 test suite.
[-----] Global test environment set-up.
[-----] 6 tests from PairStyle
[ RUN      ] PairStyle.plain
[      OK  ] PairStyle.plain (24 ms)
[ RUN      ] PairStyle.omp
[      OK  ] PairStyle.omp (18 ms)
[ RUN      ] PairStyle.intel
[      OK  ] PairStyle.intel (6 ms)
[ RUN      ] PairStyle.opt
[ SKIPPED ] PairStyle.opt (0 ms)
[ RUN      ] PairStyle.single
[      OK  ] PairStyle.single (7 ms)
```

(continues on next page)

(continued from previous page)

```
[ RUN      ] PairStyle.extract
[          OK ] PairStyle.extract (6 ms)
[-----] 6 tests from PairStyle (62 ms total)

[-----] Global test environment tear-down
[=====] 6 tests from 1 test suite ran. (63 ms total)
[ PASSED   ] 5 tests.
[ SKIPPED  ] 1 test, listed below:
[ SKIPPED  ] PairStyle.opt
```

In this particular case, 5 out of 6 sets of tests were conducted, the tests for the `lj/cut/opt` pair style was skipped, since the tests executable did not include it. To learn what individual tests are performed, you (currently) need to read the source code. You can use code coverage recording (see next section) to confirm how well the tests cover the code paths in the individual source files.

The force style test programs have a common set of options:

Option	Function
<code>-g <newfile></code>	regenerate reference data in new YAML file
<code>-u</code>	update reference data in the original YAML file
<code>-s</code>	print error statistics for each group of comparisons
<code>-v</code>	verbose output: also print the executed LAMMPS commands

The `ctest` tool has no mechanism to directly pass flags to the individual test programs, but a workaround has been implemented where these flags can be set in an environment variable `TEST_ARGS`. Example:

```
env TEST_ARGS=-s ctest -V -R BondStyle
```

To add a test for a style that is not yet covered, it is usually best to copy a YAML file for a similar style to a new file, edit the details of the style (how to call it, how to set its coefficients) and then run test command with either the `-g` and the replace the initial test file with the regenerated one or the `-u` option. The `-u` option will destroy the original file, if the generation run does not complete, so using `-g` is recommended unless the YAML file is fully tested and working.

Some of the force style tests are rather slow to run and some are very sensitive to small differences like CPU architecture, compiler toolchain, compiler optimization. Those tests are flagged with a “slow” and/or “unstable” label, and thus those tests can be selectively excluded with the `-LE` flag or selected with the `-L` flag.

Recommendations and notes for YAML files

- The reference results should be recorded without any code optimization or related compiler flags enabled.
- The `epsilon` parameter defines the relative precision with which the reference results must be met. The test geometries often have high and low energy parts and thus a significant impact from floating-point math truncation errors is to be expected. Some functional forms and potentials are more noisy than others, so this parameter needs to be adjusted. Typically a value around $1.0\text{e-}13$ can be used, but it may need to be as large as $1.0\text{e-}8$ in some cases.
- The tests for pair styles from OPT, OPENMP and INTEL are performed with automatically rescaled epsilon to account for additional loss of precision from code optimizations and different summation orders.
- When compiling with (aggressive) compiler optimization, some tests are likely to fail. It is recommended to inspect the individual tests in detail to decide, whether the specific error for a specific property is acceptable (it often is), or this may be an indication of mis-compiled code (or an undesired large loss of precision due to significant reordering of operations and thus less error cancellation).

Unit tests for timestepping related fixes

A substantial subset of *fix styles* are invoked regularly during MD timestepping and manipulate per-atom properties like positions, velocities, and forces. For those fix styles, testing can be done in a very similar fashion as for force fields and thus there is a test program *test_fix_timestep* that shares a lot of code, properties, and command line flags with the force field style testers described in the previous section.

This tester will set up a small molecular system run with verlet run style for 4 MD steps, then write a binary restart and continue for another 4 MD steps. At this point coordinates and velocities are recorded and compared to reference data. Then the system is cleared, restarted and running the second 4 MD steps again and the data is compared to the same reference. That is followed by another restart after which per atom type masses are replaced with per-atom masses and the second 4 MD steps are repeated again and compared to the same reference. Also global scalar and vector data of the fix is recorded and compared. If the fix is a thermostat and thus the internal property `t_target` can be extracted, then this is compared to the reference data. The tests are repeated with the respa run style.

If the fix has a multi-threaded version in the OPENMP package, then the entire set of tests is repeated for that version as well.

For this to work, some additional conditions have to be met by the YAML format test inputs.

- The fix to be tested (and only this fix), should be listed in the `prerequisites:` section
- The fix to be tested must be specified in the `post_commands:` section with the fix-ID `test`. This section may contain other commands and other fixes (e.g. an instance of `fix nve` for testing a thermostat or force manipulation fix)
- For fixes that can tally contributions to the global virial, the line `fix_modify test virial yes` should be included in the `post_commands:` section of the test input.
- For thermostat fixes the target temperature should be ramped from an arbitrary value (e.g. 50K) to a pre-defined target temperature entered as `${t_target}`.
- For fixes that have thermostating support included, but do not have it enabled in the input (e.g. `fix rigid` with default settings), the `post_commands:` section should contain the line `variable t_target delete` to disable the target temperature ramp check to avoid false positives.

Use custom linker for faster link times when ENABLE_TESTING is active

When compiling LAMMPS with enabled tests, most test executables will need to be linked against the LAMMPS library. Since this can be a very large library with many C++ objects when many packages are enabled, link times can become very long on machines that use the GNU BFD linker (e.g. Linux systems). Alternatives like the `mo1d` linker, the `l1d` linker of the LLVM project, or the `gold` linker available with GNU binutils can speed up this step substantially (in this order). CMake will by default test if any of the three can be enabled and use it when `ENABLE_TESTING` is active. It can also be selected manually through the `CMAKE_CUSTOM_LINKER` CMake variable. Allowed values are `mo1d`, `l1d`, `gold`, `bfd`, or `default`. The `default` option will use the system default linker otherwise, the linker is chosen explicitly. This option is only available for the GNU or Clang C++ compilers.

Tests for other components and utility functions

Additional tests that validate utility functions or specific components of LAMMPS are implemented as standalone executable which may, or may not require creating a suitable LAMMPS instance. These tests are more specific and do not require YAML format input files. To add a test, either an existing source file needs to be extended or a new file added, which in turn requires additions to the CMakeLists.txt file in the source folder.

Collect and visualize code coverage metrics

You can also collect code coverage metrics while running LAMMPS or the tests by enabling code coverage support during the CMake configuration:

```
-D ENABLE_COVERAGE=on # enable coverage measurements (off by default)
```

This will instrument all object files to write information about which lines of code were accessed during execution in files next to the corresponding object files. These can be post-processed to visually show the degree of coverage and which code paths are accessed and which are not taken. When working on unit tests (see above), this can be extremely helpful to determine which parts of the code are not executed and thus what kind of tests are still missing. The coverage data is cumulative, i.e. new data is added with each new run.

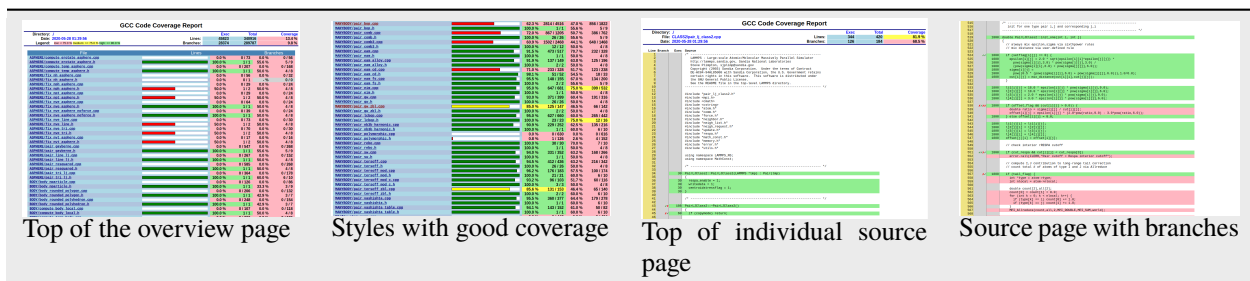

Enabling code coverage will also add the following build targets to generate coverage reports after running the LAMMPS executable or the unit tests:

```
make gen_coverage_html # generate coverage report in HTML format
make gen_coverage_xml  # generate coverage report in XML format
make clean_coverage_html # delete folder with HTML format coverage report
make reset_coverage    # delete all collected coverage data and HTML output
```

These reports require [GCOVR](#) to be installed. The easiest way to do this to install it via pip:

```
pip install git+https://github.com/gcovr/gcovr.git
```

After post-processing with `gen_coverage_html` the results are in a folder `coverage_html` and can be viewed with a web browser. The images below illustrate how the data is presented.

3.11.6 Coding style utilities

To aid with enforcing some of the coding style conventions in LAMMPS some additional build targets have been added. These require Python 3.5 or later and will only work properly on Unix-like operating and file systems.

The following options are available.

```
make check-whitespace  # search for files with whitespace issues
make fix-whitespace    # correct whitespace issues in files
make check-homepage    # search for files with old LAMMPS homepage URLs
make fix-homepage      # correct LAMMPS homepage URLs in files
make check-errordocs   # search for deprecated error docs in header files
make fix-errordocs     # remove error docs in header files
make check-permissions # search for files with permissions issues
make fix-permissions   # correct permissions issues in files
make check-docs        # search for several issues in the manual
make check-version     # list files with pending release version tags
make check             # run all check targets from above
```

These should help to make source and documentation files conforming to some the coding style preferences of the LAMMPS developers.

3.11.7 Clang-format support

For the code in the `unittest` and `src` trees we are transitioning to use the `clang-format` tool to assist with having a consistent source code formatting style. The `clang-format` command bundled with Clang version 8.0 or later is required. The configuration is in files called `.clang-format` in the respective folders. Since the modifications from `clang-format` can be significant and - especially for “legacy style code” - they are not always improving readability, a large number of files currently have a `// clang-format off` at the top, which will disable the processing. As of fall 2021 all files have been either “protected” this way or are enabled for full or partial `clang-format` processing. Over time, the “protected” files will be refactored and updated so that `clang-format` may be applied to them as well.

It is recommended for all newly contributed files to use the `clang-format` processing while writing the code or do the coding style processing (including the scripts mentioned in the previous paragraph)

If `clang-format` is available, files can be updated individually with commands like the following:

```
clang-format -i some_file.cpp
```

The following target are available for both, GNU make and CMake:

```
make format-src      # apply clang-format to all files in src and the package folders
make format-tests    # apply clang-format to all files in the unittest tree
```

3.11.8 GitHub command line interface

GitHub is developing a [tool for the command line](#) that interacts with the GitHub website via a command called `gh`. This can be extremely convenient when working with a Git repository hosted on GitHub (like LAMMPS). It is thus highly recommended to install it when doing LAMMPS development.

The capabilities of the `gh` command is continually expanding, so please see the documentation at <https://cli.github.com/manual/>

RUN LAMMPS

These pages explain how to run LAMMPS once you have *installed an executable* or *downloaded the source code* and *built an executable*. The *Commands* doc page describes how input scripts are structured and the commands they can contain.

4.1 Basics of running LAMMPS

LAMMPS is run from the command line, reading commands from a file via the `-in` command line flag, or from standard input. Using the “`-in in.file`” variant is recommended (see note below). The name of the LAMMPS executable is either `lmp` or `lmp_<machine>` with `<machine>` being the machine string used when compiling LAMMPS. This is required when compiling LAMMPS with the traditional build system (e.g. with `make mpi`), but optional when using CMake to configure and build LAMMPS:

```
lmp_serial -in in.file
lmp_serial < in.file
lmp -in in.file
lmp < in.file
/path/to/lammps/src/lmp_serial -i in.file
mpirun -np 4 lmp_mpi -in in.file
mpiexec -np 4 lmp -in in.file
mpirun -np 8 /path/to/lammps/src/lmp_mpi -in in.file
mpiexec -n 6 /usr/local/bin/lmp -in in.file
```

You normally run the LAMMPS command in the directory where your input script is located. That is also where output files are produced by default, unless you provide specific other paths in your input script or on the command line. As in some of the examples above, the LAMMPS executable itself can be placed elsewhere.

Note

The redirection operator “`<`” will not always work when running in parallel with `mpirun` or `mpiexec`; for those systems the `-in` form is required.

As LAMMPS runs it prints info to the screen and a logfile named *log.lammps*. More info about output is given on the *screen and logfile output* page.

If LAMMPS encounters errors in the input script or while running a simulation it will print an ERROR message and stop or a WARNING message and continue. See the *Common Problems* page for a discussion of the various kinds of errors LAMMPS can or can’t detect, a list of all ERROR and WARNING messages, and what to do about them.

LAMMPS can run the same problem on any number of processors, including a single processor. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off due to using floating-point math can cause slight differences and an eventual divergence of molecular dynamics trajectories. See the [Errors common](#) page for discussion of this.

LAMMPS can run as large a problem as will fit in the physical memory of one or more processors. If you run out of memory, you must run on more processors or define a smaller problem. The amount of memory needed and how well it can be distributed across processors may vary based on the models and settings and commands used.

If you run LAMMPS in parallel via `mpirun`, you should be aware of the [processors](#) command, which controls how MPI tasks are mapped to the simulation box, as well as `mpirun` options that control how MPI tasks are assigned to physical cores of the node(s) of the machine you are running on. These settings can improve performance, though the defaults are often adequate.

For example, it is often important to bind MPI tasks (processes) to physical cores (processor affinity), so that the operating system does not migrate them during a simulation. If this is not the default behavior on your machine, the `mpirun` option “`-bind-to core`” (OpenMPI) or “`-bind-to core`” (MPICH) can be used.

If the LAMMPS command(s) you are using support multi-threading, you can set the number of threads per MPI task via the environment variable `OMP_NUM_THREADS`, before you launch LAMMPS:

```
export OMP_NUM_THREADS=2      # bash
setenv OMP_NUM_THREADS 2      # csh or tcsh
```

This can also be done via the [package](#) command or via the [-pk command-line switch](#) which invokes the package command. See the [package](#) command or [Speed](#) doc pages for more details about which accelerator packages and which commands support multi-threading.

You can experiment with running LAMMPS using any of the input scripts provided in the `examples` or `bench` directory. Input scripts are named `in.*` and sample outputs are named `log.*.P` where `P` is the number of processors it was run on.

Some of the examples or benchmarks require LAMMPS to be built with optional packages.

4.2 Command-line options

At run time, LAMMPS recognizes several optional command-line switches which may be used in any order. Either the full word or a one or two letter abbreviation can be used:

- `-e` or `-echo`
- `-h` or `-help`
- `-i` or `-in`
- `-k` or `-kokkos`
- `-l` or `-log`
- `-mdi`
- `-m` or `-mpicolor`
- `-c` or `-cite`
- `-nc` or `-nocite`
- `-nb` or `-nonbuf`
- `-pk` or `-package`

- *-p or -partition*
- *-pl or -plog*
- *-ps or -pscreen*
- *-ro or -reorder*
- *-r2data or -restart2data*
- *-r2dump or -restart2dump*
- *-sc or -screen*
- *-sr or skiprun*
- *-sf or -suffix*
- *-v or -var*

For example, the `lmp_mpi` executable might be launched as follows:

```
mpirun -np 16 lmp_mpi -v f tmp.out -l my.log -sc none -i in.alloy
mpirun -np 16 lmp_mpi -var f tmp.out -log my.log -screen none -in in.alloy
```

-echo style

Set the style of command echoing. The style can be *none* or *screen* or *log* or *both*. Depending on the style, each command read from the input script will be echoed to the screen and/or logfile. This can be useful to figure out which line of your script is causing an input error. The default value is *log*. The echo style can also be set by using the *echo* command in the input script itself.

-help

Print a brief help summary and a list of options compiled into this executable for each LAMMPS style (*atom_style*, *fix*, *compute*, *pair_style*, *bond_style*, etc). This can tell you if the command you want to use was included via the appropriate package at compile time. LAMMPS will print the info and immediately exit if this switch is used.

-in file

Specify a file to use as an input script. This is an optional but recommended switch when running LAMMPS in one-partition mode. If it is not specified, LAMMPS reads its script from standard input, typically from a script via I/O redirection; e.g. `lmp_linux < in.run`. With many MPI implementations I/O redirection also works in parallel, but using the `-in` flag will always work.

Note that this is a required switch when running LAMMPS in multi-partition mode, since multiple processors cannot all read from stdin concurrently. The file name may be “none” for starting multi-partition calculations without reading an initial input file from the library interface.

-kokkos on/off keyword/value ...

Explicitly enable or disable KOKKOS support, as provided by the KOKKOS package. Even if LAMMPS is built with this package, as described in the *the KOKKOS package page*, this switch must be set to enable running with KOKKOS-enabled styles the package provides. If the switch is not set (the default), LAMMPS will operate as if the KOKKOS package were not installed; i.e. you can run standard LAMMPS or with the GPU or OPENMP packages, for testing or benchmarking purposes.

Additional optional keyword/value pairs can be specified which determine how Kokkos will use the underlying hardware on your platform. These settings apply to each MPI task you launch via the `mpirun` or `mpiexec` command. You may choose to run one or more MPI tasks per physical node. Note that if you are running on a desktop machine, you typically have one physical node. On a cluster or supercomputer there may be dozens or 1000s of physical nodes.

Either the full word or an abbreviation can be used for the keywords. Note that the keywords do not use a leading minus sign. I.e. the keyword is “t”, not “-t”. Also note that each of the keywords has a default setting. Examples of when to use these options and what settings to use on different platforms is given on the [KOKKOS package](#) doc page.

- d or device
- g or gpus
- t or threads

device Nd

This option is only relevant if you built LAMMPS with `CUDA=yes`, you have more than one GPU per node, and if you are running with only one MPI task per node. The `Nd` setting is the ID of the GPU on the node to run on. By default `Nd = 0`. If you have multiple GPUs per node, they have consecutive IDs numbered as 0,1,2,etc. This setting allows you to launch multiple independent jobs on the node, each with a single MPI task per node, and assign each job to run on a different GPU.

gpus Ng Ns

This option is only relevant if you built LAMMPS with `CUDA=yes`, you have more than one GPU per node, and you are running with multiple MPI tasks per node (up to one per GPU). The `Ng` setting is how many GPUs you will use. The `Ns` setting is optional. If set, it is the ID of a GPU to skip when assigning MPI tasks to GPUs. This may be useful if your desktop system reserves one GPU to drive the screen and the rest are intended for computational work like running LAMMPS. By default `Ng = 1` and `Ns` is not set.

Depending on which flavor of MPI you are running, LAMMPS will look for one of these 4 environment variables

SLURM_LOCALID (various MPI variants compiled with SLURM support)
MPT_LRANK (HPE MPI)
MV2_COMM_WORLD_LOCAL_RANK (Mvapich)
OMPI_COMM_WORLD_LOCAL_RANK (OpenMPI)

which are initialized by the `srun`, `mpirun`, or `mpiexec` commands. The environment variable setting for each MPI rank is used to assign a unique GPU ID to the MPI task.

threads Nt

This option assigns `Nt` number of threads to each MPI task for performing work when Kokkos is executing in OpenMP or pthreads mode. The default is `Nt = 1`, which essentially runs in MPI-only mode. If there are `Np` MPI tasks per physical node, you generally want `Np*Nt =` the number of physical cores per node, to use your available hardware optimally. This also sets the number of threads used by the host when LAMMPS is compiled with `CUDA=yes`.

Deprecated since version 22Dec2022.

Support for the “numa” or “n” option was removed as its functionality was ignored in Kokkos for some time already.

-log file

Specify a log file for LAMMPS to write status information to. In one-partition mode, if the switch is not used, LAMMPS writes to the file `log.lammps`. If this switch is used, LAMMPS writes to the specified file. In multi-partition mode, if the switch is not used, a `log.lammps` file is created with high-level status information. Each partition also writes to a `log.lammps.N` file where `N` is the partition ID. If the switch is specified in multi-partition mode, the high-level logfile

is named “file” and each partition also logs information to a file.N. For both one-partition and multi-partition mode, if the specified file is “none”, then no log files are created. Using a *log* command in the input script will override this setting. Option -plog will override the name of the partition log files file.N.

-mdi ‘multiple flags’

This flag is only recognized and used when LAMMPS has support for the MolSSI Driver Interface (MDI) included as part of the *MDI* package. This flag is specific to the MDI library and controls how LAMMPS interacts with MDI. There are usually multiple flags that have to follow it and those have to be placed in quotation marks. For more information about how to launch LAMMPS in MDI client/server mode please refer to the *MDI Howto*.

-mpicolor color

If used, this must be the first command-line argument after the LAMMPS executable name. It is only used when LAMMPS is launched by an mpirun command which also launches another executable(s) at the same time. (The other executable could be LAMMPS as well.) The color is an integer value which should be different for each executable (another application may set this value in a different way). LAMMPS and the other executable(s) perform an MPI_Comm_split() with their own colors to shrink the MPI_COMM_WORLD communication to be the subset of processors they are actually running on.

-cite style or file name

Select how and where to output a reminder about citing contributions to the LAMMPS code that were used during the run. Available keywords for styles are “both”, “none”, “screen”, or “log”. Any other keyword will be considered a file name to write the detailed citation info to instead of logfile or screen. Default is the “log” style where there is a short summary in the screen output and detailed citations in BibTeX format in the logfile. The option “both” selects the detailed output for both, “none”, the short output for both, and “screen” will write the detailed info to the screen and the short version to the log file. If a dedicated citation info file is requested, the screen and log file output will be in the short format (same as with “none”).

See the *citation page* for more details on how to correctly reference and cite LAMMPS.

-nocite

Disable generating a citation reminder (see above) at all.

-nonbuf

Added in version 15Sep2022.

Turn off buffering for screen and logfile output. For performance reasons, output to the screen and logfile is usually buffered, i.e. output is only written to a file if its buffer - typically 4096 bytes - has been filled. When LAMMPS crashes for some reason, however, that can mean that there is important output missing. With this flag the buffering can be turned off (only for screen and logfile output) and any output will be committed immediately. Note that when running in parallel with MPI, the screen output may still be buffered by the MPI library and this cannot be changed by LAMMPS. This flag should only be used for debugging and not for production simulations as the performance impact can be significant, especially for large parallel runs.

-package style args

Invoke the *package* command with style and args. The syntax is the same as if the command appeared at the top of the input script. For example “-package gpu 2” or “-pk gpu 2” is the same as *package gpu 2* in the input script. The possible styles and args are documented on the *package* doc page. This switch can be used multiple times, e.g. to set options for the INTEL and OPENMP packages which can be used together.

Along with the “-suffix” command-line switch, this is a convenient mechanism for invoking accelerator packages and their options without having to edit an input script.

-partition 8x2 4 5 ...

Invoke LAMMPS in multi-partition mode. When LAMMPS is run on P processors and this switch is not used, LAMMPS runs in one partition, i.e. all P processors run a single simulation. If this switch is used, the P processors are split into separate partitions and each partition runs its own simulation. The arguments to the switch specify the number of processors in each partition. Arguments of the form MxN mean M partitions, each with N processors. Arguments of the form N mean a single partition with N processors. The sum of processors in all partitions must equal P. Thus the command “-partition 8x2 4 5” has 10 partitions and runs on a total of 25 processors.

Running with multiple partitions can be useful for running *multi-replica simulations*, where each replica runs on one or a few processors. Note that with MPI installed on a machine (e.g. your desktop), you can run on more (virtual) processors than you have physical processors.

To run multiple independent simulations from one input script, using multiple partitions, see the *Howto multiple* page. World- and universe-style *variables* are useful in this context.

-plog file

Specify the base name for the partition log files, so partition N writes log information to file.N. If file is none, then no partition log files are created. This overrides the filename specified in the -log command-line option. This option is useful when working with large numbers of partitions, allowing the partition log files to be suppressed (-plog none) or placed in a subdirectory (-plog replica_files/log.lammps). If this option is not used the log file for partition N is log.lammps.N or whatever is specified by the -log command-line option.

-pscreen file

Specify the base name for the partition screen file, so partition N writes screen information to file.N. If file is “none”, then no partition screen files are created. This overrides the filename specified in the -screen command-line option. This option is useful when working with large numbers of partitions, allowing the partition screen files to be suppressed (-pscreen none) or placed in a subdirectory (-pscreen replica_files/screen). If this option is not used the screen file for partition N is screen.N or whatever is specified by the -screen command-line option.

-reorder

This option has 2 forms:

```
-reorder nth N
-reorder custom filename
```

Reorder the processors in the MPI communicator used to instantiate LAMMPS, in one of several ways. The original MPI communicator ranks all P processors from 0 to P-1. The mapping of these ranks to physical processors is done by MPI before LAMMPS begins. It may be useful in some cases to alter the rank order. E.g. to ensure that cores within each node are ranked in a desired order. Or when using the *run_style verlet/split* command with 2 partitions to ensure that a specific Kspace processor (in the second partition) is matched up with a specific set of processors in the first partition. See the *General tips* page for more details.

If the keyword *nth* is used with a setting *N*, then it means every *N*th processor will be moved to the end of the ranking. This is useful when using the [run_style verlet/split](#) command with 2 partitions via the `-partition` command-line switch. The first set of processors will be in the first partition, the second set in the second partition. The `-reorder` command-line switch can alter this so that the first *N* procs in the first partition and one proc in the second partition will be ordered consecutively, e.g. as the cores on one physical node. This can boost performance. For example, if you use “`-reorder nth 4`” and “`-partition 9 3`” and you are running on 12 processors, the processors will be reordered from

```
0 1 2 3 4 5 6 7 8 9 10 11
```

to

```
0 1 2 4 5 6 8 9 10 3 7 11
```

so that the processors in each partition will be

```
0 1 2 4 5 6 8 9 10
3 7 11
```

See the “processors” command for how to ensure processors from each partition could then be grouped optimally for quad-core nodes.

If the keyword is *custom*, then a file that specifies a permutation of the processor ranks is also specified. The format of the reorder file is as follows. Any number of initial blank or comment lines (starting with a “#” character) can be present. These should be followed by *P* lines of the form:

```
I J
```

where *P* is the number of processors LAMMPS was launched with. Note that if running in multi-partition mode (see the `-partition` switch above) *P* is the total number of processors in all partitions. The *I* and *J* values describe a permutation of the *P* processors. Every *I* and *J* should be values from 0 to *P*-1 inclusive. In the set of *P* *I* values, every proc ID should appear exactly once. Ditto for the set of *P* *J* values. A single *I,J* pairing means that the physical processor with rank *I* in the original MPI communicator will have rank *J* in the reordered communicator.

Note that rank ordering can also be specified by many MPI implementations, either by environment variables that specify how to order physical processors, or by config files that specify what physical processors to assign to each MPI rank. The `-reorder` switch simply gives you a portable way to do this without relying on MPI itself. See the [processors file](#) command for how to output info on the final assignment of physical processors to the LAMMPS simulation domain.

-restart2data restartfile datafile keyword value ...

Convert the restart file into a data file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile
write_data datafile keyword value ...
```

The specified restartfile and/or datafile name may contain the wild-card character “*”. The restartfile name may also contain the wild-card character “%”. The meaning of these characters is explained on the [read_restart](#) and [write_data](#) doc pages. The use of “%” means that a parallel restart file can be read. Note that a filename such as file.* may need to be enclosed in quotes or the “*” character prefixed with a backslash (“\”) to avoid shell expansion of the “*” character.

The syntax following restartfile, namely

```
datafile keyword value ...
```

is identical to the arguments of the [write_data](#) command. See its documentation page for details. This includes its optional keyword/value settings.

-restart2dump restartfile group-ID dumpstyle dumpfile arg1 arg2 ...

Convert the restart file into a dump file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile
write_dump group-ID dumpstyle dumpfile arg1 arg2 ...
```

Note that the specified restartfile and dumpfile names may contain wild-card characters ("*" or "%") as explained on the [read_restart](#) and [write_dump](#) doc pages. The use of "%" means that a parallel restart file and/or parallel dump file can be read and/or written. Note that a filename such as file.* may need to be enclosed in quotes or the "*" character prefixed with a backslash ("\") to avoid shell expansion of the "*" character.

The syntax following restartfile, namely

```
group-ID dumpstyle dumpfile arg1 arg2 ...
```

is identical to the arguments of the [write_dump](#) command. See its documentation page for details. This includes what per-atom fields are written to the dump file and optional dump_modify settings, including ones that affect how parallel dump files are written, e.g. the *nfile* and *fileper* keywords. See the [dump_modify](#) page for details.

-screen file

Specify a file for LAMMPS to write its screen information to. In one-partition mode, if the switch is not used, LAMMPS writes to the screen. If this switch is used, LAMMPS writes to the specified file instead and you will see no screen output. In multi-partition mode, if the switch is not used, high-level status information is written to the screen. Each partition also writes to a screen.N file where N is the partition ID. If the switch is specified in multi-partition mode, the high-level screen dump is named "file" and each partition also writes screen information to a file.N. For both one-partition and multi-partition mode, if the specified file is "none", then no screen output is performed. Option -pscreen will override the name of the partition screen files file.N.

-skiprun

Insert the command [timer timeout 0 every 1](#) at the beginning of an input file or after a [clear](#) command. This has the effect that the entire LAMMPS input script is processed without executing actual [run](#) or [minimize](#) and similar commands (their main loops are skipped). This can be helpful and convenient to test input scripts of long running calculations for correctness to avoid having them crash after a long time due to a typo or syntax error in the middle or at the end.

-suffix style args

Use variants of various styles if they exist. The specified style can be *gpu*, *intel*, *kk*, *omp*, *opt*, or *hybrid*. These refer to optional packages that LAMMPS can be built with, as described in [Accelerate performance](#). The "gpu" style corresponds to the GPU package, the "intel" style to the INTEL package, the "kk" style to the KOKKOS package, the "opt" style to the OPT package, and the "omp" style to the OPENMP package. The hybrid style is the only style that accepts arguments. It allows for two packages to be specified. The first package specified is the default and will be used if it is available. If no style is available for the first package, the style for the second package will be used if available. For example, "-suffix hybrid intel omp" will use styles from the INTEL package if they are installed and available, but styles for the OPENMP package otherwise.

Along with the “-package” command-line switch, this is a convenient mechanism for invoking accelerator packages and their options without having to edit an input script.

As an example, all of the packages provide a *pair_style lj/cut* variant, with style names *lj/cut/gpu*, *lj/cut/intel*, *lj/cut/kk*, *lj/cut/omp*, and *lj/cut/opt*. A variant style can be specified explicitly in your input script, e.g. *pair_style lj/cut/gpu*. If the -suffix switch is used the specified suffix (*gpu*, *intel*, *kk*, *omp*, *opt*) is automatically appended whenever your input script command creates a new *atom style*, *pair style*, *fix*, *compute*, or *run style*. If the variant version does not exist, the standard version is created.

For the GPU package, using this command-line switch also invokes the default GPU settings, as if the command “package gpu 1” were used at the top of your input script. These settings can be changed by using the “-package gpu” command-line switch or the *package gpu* command in your script.

For the INTEL package, using this command-line switch also invokes the default INTEL settings, as if the command “package intel 1” were used at the top of your input script. These settings can be changed by using the “-package intel” command-line switch or the *package intel* command in your script. If the OPENMP package is also installed, the hybrid style with “intel omp” arguments can be used to make the omp suffix a second choice, if a requested style is not available in the INTEL package. It will also invoke the default OPENMP settings, as if the command “package omp 0” were used at the top of your input script. These settings can be changed by using the “-package omp” command-line switch or the *package omp* command in your script.

For the KOKKOS package, using this command-line switch also invokes the default KOKKOS settings, as if the command “package kokkos” were used at the top of your input script. These settings can be changed by using the “-package kokkos” command-line switch or the *package kokkos* command in your script.

For the OMP package, using this command-line switch also invokes the default OMP settings, as if the command “package omp 0” were used at the top of your input script. These settings can be changed by using the “-package omp” command-line switch or the *package omp* command in your script.

The *suffix* command can also be used within an input script to set a suffix, or to turn off or back on any suffix setting made via the command line.

-var name value1 value2 ...

Specify a variable that will be defined for substitution purposes when the input script is read. This switch can be used multiple times to define multiple variables. “Name” is the variable name which can be a single character (referenced as \$x in the input script) or a full string (referenced as \${abc}). An *index-style variable* will be created and populated with the subsequent values, e.g. a set of filenames. Using this command-line option is equivalent to putting the line “variable name index value1 value2 ...” at the beginning of the input script. Defining an index variable as a command-line argument overrides any setting for the same index variable in the input script, since index variables cannot be re-defined.

See the *variable* command for more info on defining index and other kinds of variables and the *Parsing rules* page for more info on using variables in input scripts.

Note

Currently, the command-line parser looks for arguments that start with “-” to indicate new switches. Thus you cannot specify multiple variable values if any of them start with a “-”, e.g. a negative numeric value. It is OK if the first value1 starts with a “-”, since it is automatically skipped.

4.3 Screen and logfile output

As LAMMPS reads an input script, it prints information to both the screen and a log file about significant actions it takes to setup a simulation. When the simulation is ready to begin, LAMMPS performs various initializations, and prints info about the run it is about to perform, including the amount of memory (in MBytes per processor) that the simulation requires. It also prints details of the initial thermodynamic state of the system. During the run itself, thermodynamic information is printed periodically, every few timesteps. When the run concludes, LAMMPS prints the final thermodynamic state and a total run time for the simulation. It also appends statistics about the CPU time and storage requirements for the simulation. An example set of statistics is shown here:

Loop time of 0.942801 on 4 procs for 300 steps with 2004 atoms

Performance: 54.985 ns/day, 0.436 hours/ns, 318.201 timesteps/s, 637.674 katom-step/s
195.2% CPU use with 2 MPI tasks x 2 OpenMP threads

MPI task timing breakdown:

Section	min time	avg time	max time	%varavg	%total
Pair	0.61419	0.62872	0.64325	1.8	66.69
Bond	0.0028608	0.0028899	0.002919	0.1	0.31
Kspace	0.12652	0.14048	0.15444	3.7	14.90
Neigh	0.10242	0.10242	0.10242	0.0	10.86
Comm	0.026753	0.027593	0.028434	0.5	2.93
Output	0.00018341	0.00030942	0.00043542	0.0	0.03
Modify	0.039117	0.039348	0.039579	0.1	4.17
Other		0.001041			0.11

Nlocal: 1002 ave 1006 max 998 min

Histogram: 1 0 0 0 0 0 0 0 0 1

Nghost: 8670.5 ave 8691 max 8650 min

Histogram: 1 0 0 0 0 0 0 0 0 1

Neighs: 354010 ave 357257 max 350763 min

Histogram: 1 0 0 0 0 0 0 0 0 1

Total # of neighbors = 708020

Ave neighs/atom = 353.30339

Ave special neighs/atom = 2.3403194

Neighbor list builds = 26

Dangerous builds = 0

The first section provides a global loop timing summary. The *loop time* is the total wall-clock time for the MD steps of the simulation run, excluding the time for initialization and setup (i.e. the parts that may be skipped with *run N pre no*). The *Performance* line is provided for convenience to help predict how long it will take to run a desired physical simulation and to have numbers useful for performance comparison between different simulation settings or system sizes. The *CPU use* line provides the CPU utilization per MPI task; it should be close to 100% times the number of OpenMP threads (or 1 if not using OpenMP). Lower numbers correspond to delays due to file I/O or insufficient thread utilization from parts of the code that have not been multi-threaded.

The *MPI task* section gives the breakdown of the CPU run time (in seconds) into major categories:

- *Pair* = non-bonded force computations
- *Bond* = bonded interactions: bonds, angles, dihedrals, impropers

- *Kspace* = long-range interactions: Ewald, PPPM, MSM
- *Neigh* = neighbor list construction
- *Comm* = inter-processor communication of atoms and their properties
- *Output* = output of thermodynamic info and dump files
- *Modify* = fixes and computes invoked by fixes
- *Other* = all the remaining time

For each category, there is a breakdown of the least, average and most amount of wall time any processor spent on this category of computation. The “%varavg” is the percentage by which the max or min varies from the average. This is an indication of load imbalance. A percentage close to 0 is perfect load balance. A large percentage is imbalance. The final “%total” column is the percentage of the total loop time is spent in this category.

When using the *timer full* setting, an additional column is added that also prints the CPU utilization in percent. In addition, when using *timer full* and the *package omp* command are active, a similar timing summary of time spent in threaded regions to monitor thread utilization and load balance is provided. A new *Thread timings* section is also added, which lists the time spent in reducing the per-thread data elements to the storage for non-threaded computation. These thread timings are measured for the first MPI rank only and thus, because the breakdown for MPI tasks can change from MPI rank to MPI rank, this breakdown can be very different for individual ranks. Here is an example output for this section:

Thread timings breakdown (MPI rank 0):

Total threaded time 0.6846 / 90.6%

Section	min time	avg time	max time	%varavg	%total
Pair	0.5127	0.5147	0.5167	0.3	75.18
Bond	0.0043139	0.0046779	0.0050418	0.5	0.68
Kspace	0.070572	0.074541	0.07851	1.5	10.89
Neigh	0.084778	0.086969	0.089161	0.7	12.70
Reduce	0.0036485	0.003737	0.0038254	0.1	0.55

The third section above lists the number of owned atoms (Nlocal), ghost atoms (Nghost), and pairwise neighbors stored per processor. The max and min values give the spread of these values across processors with a 10-bin histogram showing the distribution. The total number of histogram counts is equal to the number of processors.

The last section gives aggregate statistics (across all processors) for pairwise neighbors and special neighbors that LAMMPS keeps track of (see the *special_bonds* command). The number of times neighbor lists were rebuilt is tallied, as is the number of potentially *dangerous* rebuilds. If atom movement triggered neighbor list rebuilding (see the *neigh_modify* command), then dangerous reneighborings are those that were triggered on the first timestep atom movement was checked for. If this count is non-zero you may wish to reduce the delay factor to ensure no force interactions are missed by atoms moving beyond the neighbor skin distance before a rebuild takes place.

If an energy minimization was performed via the *minimize* command, additional information is printed, e.g.

Minimization stats:

```

Stopping criterion = linesearch alpha is zero
Energy initial, next-to-last, final =
    -6372.3765206    -8328.46998942    -8328.46998942
Force two-norm initial, final = 1059.36 5.36874
Force max component initial, final = 58.6026 1.46872

```

(continues on next page)

(continued from previous page)

```
Final line search alpha, max atom move = 2.7842e-10 4.0892e-10
Iterations, force evaluations = 701 1516
```

The first line prints the criterion that determined minimization was converged. The next line lists the initial and final energy, as well as the energy on the next-to-last iteration. The next 2 lines give a measure of the gradient of the energy (force on all atoms). The 2-norm is the “length” of this 3N-component force vector; the largest component (x, y, or z) of force (infinity-norm) is also given. Then information is provided about the line search and statistics on how many iterations and force-evaluations the minimizer required. Multiple force evaluations are typically done at each iteration to perform a 1d line minimization in the search direction. See the [minimize](#) page for more details.

If a *kspc* long-range Coulombics solver that performs FFTs was used during the run (PPPM, Ewald), then additional information is printed, e.g.

```
FFT time (% of Kspc) = 0.200313 (8.34477)
FFT Gflps 3d 1d-only = 2.31074 9.19989
```

The first line is the time spent doing 3d FFTs (several per timestep) and the fraction it represents of the total KSpace time (listed above). Each 3d FFT requires computation (3 sets of 1d FFTs) and communication (transposes). The total flops performed is $5N\log_2(N)$, where N is the number of points in the 3d grid. The FFTs are timed with and without the communication and a Gflop rate is computed. The 3d rate is with communication; the 1d rate is without (just the 1d FFTs). Thus you can estimate what fraction of your FFT time was spent in communication, roughly 75% in the example above.

4.4 Running LAMMPS on Windows

To run a serial (non-MPI) executable, follow these steps:

- Get a command prompt by going to Start->Run... , then typing “cmd”.
- Move to the directory where you have your input script, (e.g. by typing: cd “Documents”).
- At the command prompt, type “lmp -in in.file”, where in.file is the name of your LAMMPS input script.

Note that the serial executable includes support for multi-threading parallelization from the styles in the OPENMP packages. To run with 4 threads, you can type this:

```
lmp -in in.lj -pk omp 4 -sf omp
```

For the MPI executable, which allows you to run LAMMPS under Windows in parallel, follow these steps.

Download and install a compatible MPI library binary package:

- for 32-bit Windows: [mpich2-1.4.1p1-win-ia32.msi](#)
- for 64-bit Windows: [mpich2-1.4.1p1-win-x86-64.msi](#)

The LAMMPS Windows installer packages will automatically adjust your path for the default location of this MPI package. After the installation of the MPICH2 software, it needs to be integrated into the system. For this you need to start a Command Prompt in *Administrator Mode* (right click on the icon and select it). Change into the MPICH2 installation directory, then into the subdirectory **bin** and execute **smpd.exe -install**. Exit the command window.

- Get a new, regular command prompt by going to Start->Run... , then typing “cmd”.
- Move to the directory where you have your input file (e.g. by typing: cd “Documents”).

Then you can run the executable in serial like in the example above or in parallel using MPI with one of the following commands:

```
mpiexec -localonly 4 lmp -in in.file  
mpiexec -np 4 lmp -in in.file
```

where in.file is the name of your LAMMPS input script. For the latter case, you may be prompted to enter the password that you set during installation of the MPI library software.

In this mode, output may not immediately show up on the screen, so if your input script takes a long time to execute, you may need to be patient before the output shows up.

The parallel executable can also run on a single processor by typing something like this:

```
lmp -in in.lj
```

Note that the parallel executable also includes OpenMP multi-threading, which can be combined with MPI using something like:

```
mpiexec -localonly 2 lmp -in in.lj -pk omp 2 -sf omp
```

COMMANDS

These pages describe how a LAMMPS input script is formatted and the commands in it are used to define a LAMMPS simulation.

5.1 LAMMPS input scripts

LAMMPS executes calculations by reading commands from an input script (text file), one line at a time. When the input script ends, LAMMPS exits. This is different from programs that read and process the entire input before starting a calculation.

Each command causes LAMMPS to take some immediate action without regard for any commands that may be processed later. Commands may set an internal variable, read in a file, or run a simulation. These actions can be grouped into three categories:

- a) commands that change a global setting (examples: `timestep`, `newton`, `echo`, `log`, `thermo`, `restart`),
- b) commands that add, modify, remove, or replace “styles” that are executed during a “run” (examples: `pair_style`, `fix`, `compute`, `dump`, `thermo_style`, `pair_modify`), and
- c) commands that execute a “run” or perform some other computation or operation (examples: `print`, `run`, `minimize`, `temper`, `write_dump`, `rerun`, `read_data`, `read_restart`)

Commands in category a) have default settings, which means you only need to use the command if you wish to change the defaults.

In many cases, the ordering of commands in an input script is not important, but can have consequences when the global state is changed between commands in the c) category. The following rules apply:

- (1) LAMMPS does not read your entire input script and then perform a simulation with all the settings. Rather, the input script is read one line at a time and each command takes effect when it is read. Thus this sequence of commands:

```
timestep 0.5
run      100
run      100
```

does something different than this sequence:

```
run      100
timestep 0.5
run      100
```

In the first case, the specified timestep (0.5 fs) is used for two simulations of 100 timesteps each. In the second case, the default timestep (1.0 fs) is used for the first 100 step simulation and a 0.5 fs timestep is used for the second one.

- (2) Some commands are only valid when they follow other commands. For example you cannot set the temperature of a group of atoms until atoms have been defined and a group command is used to define which atoms belong to the group.
- (3) Sometimes command B will use values that can be set by command A. This means command A must precede command B in the input script if it is to have the desired effect. For example, the [read_data](#) command initializes the system by setting up the simulation box and assigning atoms to processors. If default values are not desired, the [processors](#) and [boundary](#) commands need to be used before [read_data](#) to tell LAMMPS how to map processors to the simulation box.

Many input script errors are detected by LAMMPS and an ERROR or WARNING message is printed. The [Errors](#) page gives more information on what errors mean. The documentation for each command lists restrictions on how the command can be used.

You can use the [-skiprun](#) command line flag to have LAMMPS skip the execution of any “run”, “minimize”, or similar commands to check the entire input for correct syntax to avoid crashes on typos or syntax errors in long runs.

5.2 Parsing rules for input scripts

Each non-blank line in the input script is treated as a command. LAMMPS commands are case sensitive. Command names are lower-case, as are specified command arguments. Upper case letters may be used in file names or user-chosen ID strings.

Here are 6 rules for how each line in the input script is parsed by LAMMPS:

1. If the last printable character on the line is a “&” character, the command is assumed to continue on the next line. The next line is concatenated to the previous line by removing the “&” character and line break. This allows long commands to be continued across two or more lines. See the discussion of triple quotes in [6](#) for how to continue a command across multiple line without using “&” characters.
2. All characters from the first “#” character onward are treated as comment and discarded. The exception to this rule is described in [6](#). Note that a comment after a trailing “&” character will prevent the command from continuing on the next line. Also note that for multi-line commands a single leading “#” will comment out the entire command.

```
# this is a comment
timestep 1.0 # this is also a comment
```

3. The line is searched repeatedly for \$ characters, which indicate variables that are replaced with a text string. The exception to this rule is described in [6](#).

If the \$ is followed by text in curly brackets ‘{}’, then the variable name is the text inside the curly brackets. If no curly brackets follow the \$, then the variable name is the single character immediately following the \$. Thus \${myTemp} and \$x refer to variables named “myTemp” and “x”, while “\$xx” will be interpreted as a variable named “x” followed by an “x” character.

How the variable is converted to a text string depends on what style of variable it is; see the [variable](#) page for details. It can be a variable that stores multiple text strings, and return one of them. The returned text string can be multiple “words” (space separated) which will then be interpreted as multiple arguments in the input command. The variable can also store a numeric formula which will be evaluated and its numeric result returned as a string.

As a special case, if the \$ is followed by parenthesis “()”, then the text inside the parenthesis is treated as an “immediate” variable and evaluated as an *equal-style variable*. This is a way to use numeric formulas in an input script without having to assign them to variable names. For example, these 3 input script lines:

```
variable X equal (xlo+xhi)/2+sqrt(v_area)
region 1 block $X 2 INF INF EDGE EDGE
variable X delete
```

can be replaced by:

```
region 1 block $((xlo+xhi)/2+sqrt(v_area)) 2 INF INF EDGE EDGE
```

so that you do not have to define (or discard) a temporary variable, “X” in this case.

Additionally, the entire “immediate” variable expression may be followed by a colon, followed by a C-style format string, e.g. “:%f” or “:%.10g”. The format string must be appropriate for a double-precision floating-point value. The format string is used to output the result of the variable expression evaluation. If a format string is not specified, a high-precision “%.20g” is used as the default format.

This can be useful for formatting print output to a desired precision:

```
print "Final energy per atom: $(v_ke_per_atom+v_pe_per_atom:%10.3f) eV/atom"
```

Note that neither the curly-bracket or immediate form of variables can contain nested \$ characters for other variables to substitute for. Thus you may **NOT** do this:

```
variable a equal 2
variable b2 equal 4
print "B2 = ${b$a}"
```

Nor can you specify an expression like “\$(x-1.0)” for an immediate variable, but you could use \$(v_x-1.0), since the latter is valid syntax for an *equal-style variable*.

See the *variable* command for more details of how strings are assigned to variables and evaluated, and how they can be used in input script commands.

4. The line is broken into “words” separated by white-space (tabs, spaces). Note that words can thus contain letters, digits, underscores, or punctuation characters.
5. The first word is the command name. All successive words in the line are arguments.
6. If you want text with spaces to be treated as a single argument, it can be enclosed in either single (') or double (") or triple (""") quotes. A long single argument enclosed in single or double quotes can span multiple lines if the “&” character is used, as described in *l* above. When the lines are concatenated together by LAMMPS (and the “&” characters and line breaks removed), the combined text will become a single line. If you want multiple lines of an argument to retain their line breaks, the text can be enclosed in triple quotes, in which case “&” characters are not needed and do not function as line continuation character. For example:

```
print "Volume = $v"
print 'Volume = $v'
if "${steps} > 1000" then quit
variable a string "red green blue &
                  purple orange cyan"
print ""
System volume = $v
System temperature = $t
"""
```

In each of these cases, the single, double, or triple quotes are removed and the enclosed text stored internally as a single argument.

See the *dump* *modify format*, *print*, *if*, and *python* commands for examples.

A “#” or “\$” character that is between quotes will not be treated as a comment indicator in 2 or substituted for as a variable in 3.

Note

If the argument is itself a command that requires a quoted argument (e.g. using a *print* command as part of an *if* or *run every* command), then single, double, or triple quotes can be nested in the usual manner. See the doc pages for those commands for examples. Only one of level of nesting is allowed, but that should be sufficient for most use cases.

ASCII versus UTF-8

LAMMPS expects and processes 7-bit ASCII format text internally. Many modern environments use UTF-8 encoding, which is a superset of the 7-bit ASCII character table and thus mostly compatible. However, there are several non-ASCII characters that can look very similar to their ASCII equivalents or are invisible (so they look like a blank), but are encoded differently. Web browsers, PDF viewers, document editors are known to sometimes replace one with the other for a better looking output. However, that can lead to problems, for instance, when using cut-n-paste of input file examples from web pages, or when using a document editor (not a dedicated plain text editor) for writing LAMMPS inputs. LAMMPS will try to detect this and substitute the non-ASCII characters with their ASCII equivalents where known. There also is going to be a warning printed, if this occurs. It is recommended to avoid such characters altogether in LAMMPS input, data and potential files. The replacement tables are likely incomplete and dependent on users reporting problems processing correctly looking input containing UTF-8 encoded non-ASCII characters.

5.3 Input script structure

This page describes the structure of a typical LAMMPS input script. The examples directory in the LAMMPS distribution contains many sample input scripts; it is discussed on the *Examples* doc page.

A LAMMPS input script typically has 4 parts:

1. *Initialization*
2. *System definition*
3. *Simulation settings*
4. *Run a simulation*

The last 2 parts can be repeated as many times as desired. I.e. run a simulation, change some settings, run some more, etc. Each of the 4 parts is now described in more detail. Remember that almost all commands need only be used if a non-default value is desired.

5.3.1 Initialization

Set parameters that need to be defined before atoms are created or read-in from a file.

The relevant commands are *units*, *dimension*, *newton*, *processors*, *boundary*, *atom_style*, *atom_modify*.

If force-field parameters appear in the files that will be read, these commands tell LAMMPS what kinds of force fields are being used: *pair_style*, *bond_style*, *angle_style*, *dihedral_style*, *improper_style*.

5.3.2 System definition

There are 3 ways to define the simulation cell and reserve space for force field info and fill it with atoms in LAMMPS. Read them in from (1) a data file or (2) a restart file via the *read_data* or *read_restart* commands, respectively. These files can also contain molecular topology information. Or (3) create a simulation cell and fill it with atoms on a lattice (with no molecular topology), using these commands: *lattice*, *region*, *create_box*, *create_atoms* or *read_dump*.

The entire set of atoms can be duplicated to make a larger simulation using the *replicate* command.

5.3.3 Simulation settings

Once atoms and molecular topology are defined, a variety of settings can be specified: force field coefficients, simulation parameters, output options, and more.

Force field coefficients are set by these commands (they can also be set in the read-in files): *pair_coeff*, *bond_coeff*, *angle_coeff*, *dihedral_coeff*, *improper_coeff*, *kspace_style*, *dielectric*, *special_bonds*.

Various simulation parameters are set by these commands: *neighbor*, *neigh_modify*, *group*, *timestep*, *reset_timestep*, *run_style*, *min_style*, *min_modify*.

Fixes impose a variety of boundary conditions, time integration, and diagnostic options. The *fix* command comes in many flavors.

Various computations can be specified for execution during a simulation using the *compute*, *compute_modify*, and *variable* commands.

Output options are set by the *thermo*, *dump*, and *restart* commands.

5.3.4 Run a simulation

A molecular dynamics simulation is run using the *run* command. Energy minimization (molecular statics) is performed using the *minimize* command. A parallel tempering (replica-exchange) simulation can be run using the *temper* command.

5.4 Commands by category

This page lists most of the LAMMPS commands, grouped by category. The *General commands* page lists all general commands alphabetically. Style options for entries like *fix*, *compute*, *pair* etc. have their own pages where they are listed alphabetically.

5.4.1 Initialization:

<i>newton</i>	<i>package</i>	<i>processors</i>	<i>suffix</i>	<i>units</i>
---------------	----------------	-------------------	---------------	--------------

5.4.2 Setup simulation box:

<i>boundary</i>	<i>change_box</i>	<i>create_box</i>	<i>dimension</i>
<i>lattice</i>	<i>region</i>		

5.4.3 Setup atoms:

<i>atom_modify</i>	<i>atom_style</i>	<i>balance</i>	<i>create_atoms</i>
<i>create_bonds</i>	<i>delete_atoms</i>	<i>delete_bonds</i>	<i>displace_atoms</i>
<i>group</i>	<i>mass</i>	<i>molecule</i>	<i>read_data</i>
<i>read_dump</i>	<i>read_restart</i>	<i>replicate</i>	<i>set</i>
<i>velocity</i>			

5.4.4 Force fields:

<i>angle_coeff</i>	<i>angle_style</i>	<i>bond_coeff</i>	<i>bond_style</i>
<i>bond_write</i>	<i>dielectric</i>	<i>dihedral_coeff</i>	<i>dihedral_style</i>
<i>improper_coeff</i>	<i>improper_style</i>	<i>kspace_modify</i>	<i>kspace_style</i>
<i>pair_coeff</i>	<i>pair_modify</i>	<i>pair_style</i>	<i>pair_write</i>
<i>special_bonds</i>			

5.4.5 Settings:

<i>comm_modify</i>	<i>comm_style</i>	<i>info</i>	<i>min_modify</i>
<i>min_style</i>	<i>neigh_modify</i>	<i>neighbor</i>	<i>partition</i>
<i>reset_timestep</i>	<i>run_style</i>	<i>timer</i>	<i>timestep</i>

5.4.6 Operations within timestepping (fixes) and diagnostics (computes):

<i>compute</i>	<i>compute_modify</i>	<i>fix</i>	<i>fix_modify</i>
<i>uncompute</i>	<i>unfix</i>		

5.4.7 Output:

<i>dump image</i>	<i>dump movie</i>	<i>dump</i>	<i>dump_modify</i>
<i>restart</i>	<i>thermo</i>	<i>thermo_modify</i>	<i>thermo_style</i>
<i>undump</i>	<i>write_coeff</i>	<i>write_data</i>	<i>write_dump</i>
<i>write_restart</i>			

5.4.8 Actions:

<i>minimize</i>	<i>neb</i>	<i>neb_spin</i>	<i>prd</i>	<i>rerun</i>	<i>run</i>
<i>tad</i>	<i>temper</i>				

5.4.9 Input script control:

<i>clear</i>	<i>echo</i>	<i>if</i>	<i>include</i>	<i>info</i>	<i>jump</i>	<i>label</i>
<i>log</i>	<i>next</i>	<i>print</i>	<i>python</i>	<i>quit</i>	<i>shell</i>	<i>variable</i>

<i>General commands</i>	<i>Fix styles</i>	<i>Compute styles</i>
<i>Pair styles</i>	<i>Bond styles</i>	<i>Angle styles</i>
<i>Dihedral styles</i>	<i>Improper styles</i>	<i>KSpace styles</i>
<i>Dump styles</i>		

5.5 General commands

An alphabetic list of general LAMMPS commands. Note that style commands with many variants, can be more easily accessed via the small table above.

<i>angle_coeff</i>	<i>angle_style</i>	<i>angle_write</i>	<i>atom_modify</i>	<i>atom_style</i>
<i>balance</i>	<i>bond_coeff</i>	<i>bond_style</i>	<i>bond_write</i>	<i>boundary</i>
<i>change_box</i>	<i>clear</i>	<i>comm_modify</i>	<i>comm_style</i>	<i>compute</i>
<i>compute_modify</i>	<i>create_atoms</i>	<i>create_bonds</i>	<i>create_box</i>	<i>delete_atoms</i>
<i>delete_bonds</i>	<i>dielectric</i>	<i>dihedral_coeff</i>	<i>dihedral_style</i>	<i>dihedral_write</i>
<i>dimension</i>	<i>displace_atoms</i>	<i>dump</i>	<i>dump_modify</i>	<i>echo</i>
<i>fix</i>	<i>fix_modify</i>	<i>group</i>	<i>if</i>	<i>improper_coeff</i>
<i>improper_style</i>	<i>include</i>	<i>info</i>	<i>jump</i>	<i>kspace_modify</i>
<i>kspace_style</i>	<i>label</i>	<i>labelmap</i>	<i>lattice</i>	<i>log</i>
<i>mass</i>	<i>minimize</i>	<i>min_modify</i>	<i>min_style</i>	<i>molecule</i>
<i>neigh_modify</i>	<i>neighbor</i>	<i>newton</i>	<i>next</i>	<i>package</i>
<i>pair_coeff</i>	<i>pair_modify</i>	<i>pair_style</i>	<i>pair_write</i>	<i>partition</i>
<i>print</i>	<i>processors</i>	<i>quit</i>	<i>read_data</i>	<i>read_dump</i>
<i>read_restart</i>	<i>region</i>	<i>replicate</i>	<i>rerun</i>	<i>reset_atoms</i>
<i>reset_timestep</i>	<i>restart</i>	<i>run</i>	<i>run_style</i>	<i>set</i>
<i>shell</i>	<i>special_bonds</i>	<i>suffix</i>	<i>thermo</i>	<i>thermo_modify</i>
<i>thermo_style</i>	<i>timer</i>	<i>timestep</i>	<i>uncompute</i>	<i>undump</i>
<i>unfix</i>	<i>units</i>	<i>variable</i>	<i>velocity</i>	<i>write_coeff</i>
<i>write_data</i>	<i>write_dump</i>	<i>write_restart</i>		

Additional general LAMMPS commands provided by packages. A few commands have accelerated versions. This is indicated by an additional letter in parenthesis: k = KOKKOS.

<i>dynamical_matrix</i> (k)	<i>group2ndx</i>	<i>hyper</i>	<i>kim</i>	<i>fitpod</i>
<i>mdi</i>	<i>ndx2group</i>	<i>neb</i>	<i>neb/spin</i>	<i>plugin</i>
<i>prd</i>	<i>python</i>	<i>tad</i>	<i>temper</i>	<i>temper/grem</i>
<i>temper/npt</i>	<i>third_order</i> (k)			

<i>General commands</i>	<i>Fix styles</i>	<i>Compute styles</i>
<i>Pair styles</i>	<i>Bond styles</i>	<i>Angle styles</i>
<i>Dihedral styles</i>	<i>Improper styles</i>	<i>KSpace styles</i>
<i>Dump styles</i>		

5.6 Fix commands

An alphabetic list of all LAMMPS *fix* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>accelerate/cos</i>	<i>acks2/reaxff</i> (k)	<i>adapt</i>	<i>adapt/fep</i>	<i>addforce</i>
<i>add/heat</i>	<i>addtorque</i>	<i>alchemy</i>	<i>amoeba/bitorsion</i>	<i>amoeba/pitortion</i>
<i>append/atoms</i>	<i>atc</i>	<i>atom/swap</i>	<i>ave/atom</i>	<i>ave/chunk</i>
<i>ave/correlate</i>	<i>ave/correlate/long</i>	<i>ave/grid</i>	<i>ave/histo</i>	<i>ave/histo/weight</i>
<i>ave/time</i>	<i>aveforce</i>	<i>balance</i>	<i>bocs</i>	<i>bond/break</i>
<i>bond/create</i>	<i>bond/create/angle</i>	<i>bond/react</i>	<i>bond/swap</i>	<i>box/relax</i>
<i>brownian</i>	<i>brownian/asphere</i>	<i>brownian/sphere</i>	<i>charge/regulation</i>	<i>cmap</i>
<i>colvars</i>	<i>controller</i>	<i>damping/cundall</i>	<i>deform</i> (k)	<i>deform/pressure</i>
<i>deposit</i>	<i>dpd/energy</i> (k)	<i>drag</i>	<i>drude</i>	<i>drude/transform/direct</i>

<i>quartic (o)</i>	<i>rheo/shell</i>	<i>special</i>	<i>table (o)</i>

5.10 Angle_style potentials

All LAMMPS *angle_style* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>none</i>	<i>zero</i>	<i>hybrid (k)</i>	
<i>amoeba</i>	<i>charmm (iko)</i>	<i>class2 (ko)</i>	<i>class2/p6</i>
<i>cosine (ko)</i>	<i>cosine/buck6d</i>	<i>cosine/delta (o)</i>	<i>cosine/periodic (o)</i>
<i>cosine/shift (o)</i>	<i>cosine/shift/exp (o)</i>	<i>cosine/squared (o)</i>	<i>cosine/squared/restricted (o)</i>
<i>cross</i>	<i>dipole (o)</i>	<i>fourier (o)</i>	<i>fourier/simple (o)</i>
<i>gaussian</i>	<i>harmonic (iko)</i>	<i>lepton (o)</i>	<i>mesocnt</i>
<i>mm3</i>	<i>quartic (o)</i>	<i>spica (ko)</i>	<i>table (o)</i>

5.11 Dihedral_style potentials

All LAMMPS *dihedral_style* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>none</i>	<i>zero</i>	<i>hybrid (k)</i>	
<i>charmm (iko)</i>	<i>charmmfsw (k)</i>	<i>class2 (ko)</i>	<i>cosine/shift/exp (o)</i>
<i>cosine/squared/restricted</i>	<i>fourier (io)</i>	<i>harmonic (iko)</i>	<i>helix (o)</i>
<i>lepton (o)</i>	<i>multi/harmonic (o)</i>	<i>nharmonic (o)</i>	<i>opls (iko)</i>
<i>quadratic (o)</i>	<i>spherical</i>	<i>table (o)</i>	<i>table/cut</i>

5.12 Improper_style potentials

All LAMMPS *improper_style* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

<i>none</i>	<i>zero</i>	<i>hybrid (k)</i>	
<i>amoeba</i>	<i>class2 (ko)</i>	<i>cossq (o)</i>	<i>cvff (io)</i>
<i>distance</i>	<i>distharm</i>	<i>fourier (o)</i>	<i>harmonic (iko)</i>

<i>Dump styles</i>		

5.14 Dump commands

An alphabetic list of all LAMMPS *dump* commands.

<i>atom</i>	<i>atom/adios</i>	<i>atom/gz</i>	<i>atom/zstd</i>	<i>cfg</i>
<i>cfg/gz</i>	<i>cfg/uef</i>	<i>cfg/zstd</i>	<i>custom</i>	<i>custom/adios</i>
<i>custom/gz</i>	<i>custom/zstd</i>	<i>dcd</i>	<i>grid</i>	<i>grid/vtk</i>
<i>h5md</i>	<i>image</i>	<i>local</i>	<i>local/gz</i>	<i>local/zstd</i>
<i>molfile</i>	<i>movie</i>	<i>netcdf</i>	<i>netcdf/mpiio</i>	<i>vtk</i>
<i>xtc</i>	<i>xyz</i>	<i>xyz/gz</i>	<i>xyz/zstd</i>	<i>yaml</i>

5.15 Removed commands and packages

This page lists LAMMPS commands and packages that have been removed from the distribution and provides suggestions for alternatives or replacements. LAMMPS has special dummy styles implemented, that will stop LAMMPS and print a suitable error message in most cases, when a style/command is used that has been removed or will replace the command with the direct alternative (if available) and print a warning.

5.15.1 restart2data tool

Changed in version 23Nov2013.

The functionality of the restart2data tool has been folded into the LAMMPS executable directly instead of having a separate tool. A combination of the commands *read_restart* and *write_data* can be used to the same effect. For added convenience this conversion can also be triggered by *command line flags*

5.15.2 Fix ave/spatial and fix ave/spatial/sphere

Deprecated since version 11Dec2015.

The fixes *ave/spatial* and *ave/spatial/sphere* have been removed from LAMMPS since they were superseded by the more general and extensible “chunk infrastructure”. Here the system is partitioned in one of many possible ways through the *compute chunk/atom* command and then averaging is done using *fix ave/chunk*. Please refer to the *chunk HOWTO* section for an overview.

5.15.3 Box command

Deprecated since version 22Dec2022.

The *box* command has been removed and the LAMMPS code changed so it won’t be needed. If present, LAMMPS will ignore the command and print a warning.

5.15.4 Reset_ids, reset_atom_ids, reset_mol_ids commands

Deprecated since version 22Dec2022.

The *reset_ids*, *reset_atom_ids*, and *reset_mol_ids* commands have been folded into the *reset_atoms* command. If present, LAMMPS will replace the commands accordingly and print a warning.

5.15.5 LATTE package

Deprecated since version 15Jun2023.

The LATTE package with the *fix latte* command was removed from LAMMPS. This functionality has been superseded by *fix mdi/qm* and *fix mdi/qmmm* from the *MDI package*. These fixes are compatible with several quantum software packages, including LATTE. See the *examples/QUANTUM* dir and the *MDI coupling HOWTO* page. MDI supports running LAMMPS with LATTE as a plugin library (similar to the way *fix latte* worked), as well as on a different set of MPI processors.

5.15.6 MEAM package

The MEAM package in Fortran has been replaced by a C++ implementation. The code in the *MEAM package* is a translation of the Fortran code of MEAM into C++, which removes several restrictions (e.g. there can be multiple instances in hybrid pair styles) and allows for some optimizations leading to better performance. The pair style *meam* has the exact same syntax. For a transition period the C++ version of MEAM was called USER-MEAMC so it could coexist with the Fortran version.

5.15.7 Minimize style fire/old

Deprecated since version 8Feb2023.

Minimize style *fire/old* has been removed. Its functionality can be reproduced with *fire* with specific options. Please see the *min_modify command* documentation for details.

5.15.8 Pair style mesont/tpm, compute style mesont, atom style mesont

Deprecated since version 8Feb2023.

Pair style *mesont/tpm*, compute style *mesont*, and atom style *mesont* have been removed from the *MESONT package*. The same functionality is available through *pair style mesocnt*, *bond style mesocnt* and *angle style mesocnt*.

5.15.9 MPIIO package

Deprecated since version 21Nov2023.

The MPIIO package has been removed from LAMMPS since it was unmaintained for many years and thus not updated to incorporate required changes that had been applied to the corresponding non-MPIIO commands. As a consequence the MPIIO commands had become unreliable and sometimes crashing LAMMPS or corrupting data. Similar functionality is available through the *ADIOS package* and the *NETCDF package*. Also, the *dump_modify nfile* or *dump_modify fileper* keywords may be used for an efficient way of writing out dump files when running on large numbers of processors. Similarly, the “nfile” and “fileper” keywords exist for restarts: see *restart*, *read_restart*, *write_restart*.

5.15.10 MSCG package

Deprecated since version 21Nov2023.

The MSCG package has been removed from LAMMPS since it was unmaintained for many years and instead superseded by the *OpenMSCG software* of the Voth group at the University of Chicago, which can be used independent from LAMMPS.

5.15.11 REAX package

The REAX package has been removed since it was superseded by the *REAXFF package*. The REAXFF package has been tested to yield equivalent results to the REAX package, offers better performance, supports OpenMP multi-threading via OPENMP, and GPU and threading parallelization through KOKKOS. The new pair styles are not syntax compatible with the removed reax pair style, so input files will have to be adapted. The REAXFF package was originally called USER-REAXC.

5.15.12 USER-REAXC package

Deprecated since version 7Feb2024.

The USER-REAXC package has been renamed to *REAXFF*. In the process also the pair style and related fixes were renamed to use the “reaxff” string instead of “reax/c”. For a while LAMMPS was maintaining backward compatibility by providing aliases for the styles. These have been removed, so using “reaxff” is now *required*.

5.15.13 USER-CUDA package

The USER-CUDA package had been removed, since it had been unmaintained for a long time and had known bugs and problems. Significant parts of the design were transferred to the *KOKKOS package*, which has similar performance characteristics on NVIDIA GPUs. Both, the KOKKOS and the *GPU package* are maintained and allow running LAMMPS with GPU acceleration.

5.15.14 i-PI tool

Changed in version 27Jun2024.

The i-PI tool has been removed from the LAMMPS distribution. Instead, instructions to install i-PI from PyPI via pip are provided.

5.15.15 LAMMPS shell

Changed in version TBD.

The LAMMPS shell has been removed from the LAMMPS distribution. Users are encouraged to use the [LAMMPS-GUI](#) tool instead.

OPTIONAL PACKAGES

This section gives an overview of the optional packages that extend LAMMPS functionality. Packages are groups of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. You can see the list of all packages and “make” commands to manage them by typing “make package” from within the src directory of the LAMMPS distribution. The [Build package](#) page gives general info on how to install and uninstall packages as part of the LAMMPS build process.

6.1 Available Packages

This is the list of packages included in LAMMPS. The link for each package name gives more details.

Packages are supported by either the LAMMPS developers or the contributing authors and written in a syntax and style consistent with the rest of LAMMPS.

The “Examples” column is a subdirectory in the examples directory of the distribution which has one or more input scripts that use the package. E.g. “peptide” refers to the examples/peptide directory; PACKAGES/atc refers to the examples/PACKAGES/atc directory. The “Lib” column indicates whether an extra library is needed to build and use the package:

- no = no library
- sys = system library: you likely have it on your machine
- int = internal library: provided with LAMMPS, but you may need to build it
- ext = external library: you will need to download and install it on your machine

Package	Description	Doc page	Examples
ADIOS	dump output via ADIOS	dump adios	PACKAGES/adios
AMOEBA	AMOEBA and HIPPO force fields	AMOEBA and HIPPO howto	amoeba
ASPHERE	aspherical particle models	Howto spherical	ellipse
ATC	Atom-to-Continuum coupling	fix atc	PACKAGES/atc
AWPMD	wave packet MD	pair_style awpmd/cut	PACKAGES/awpmd
BOCS	BOCS bottom up coarse graining	fix bocs	PACKAGES/bocs
BODY	body-style particles	Howto body	body
BPM	bonded particle models	Howto bpm	bpm
BROWNIAN	Brownian dynamics, self-propelled particles	fix brownian, fix propel/self	PACKAGES/brownian
CG-DNA	coarse-grained DNA force fields	src/CG-DNA/README	PACKAGES/cgdna
CG-SPICA	SPICA (SDK) coarse-graining model	pair_style lj/spica	PACKAGES/cgspica
CLASS2	class 2 force fields	pair_style lj/class2	n/a
COLLOID	colloidal particles	atom_style colloid	colloid

continues on next

Table 1 – continued from previous page

Package	Description	Doc page	Examples
<i>COLVARS</i>	Colvars collective variables library	<i>fix colvars</i>	PACKAGES/colvars
<i>COMPRESS</i>	I/O compression	<i>dump */gz</i>	n/a
<i>CORESHELL</i>	adiabatic core/shell model	<i>Howto coreshell</i>	coreshell
<i>DIELECTRIC</i>	dielectric boundary solvers and force styles	<i>compute efield/atom</i>	PACKAGES/dielectric
<i>DIFFRACTION</i>	virtual x-ray and electron diffraction	<i>compute xrd</i>	PACKAGES/diffraction
<i>DIPOLE</i>	point dipole particles	<i>pair_style lj/.../dipole</i>	dipole
<i>DPD-BASIC</i>	basic DPD models	<i>pair_styles dpd dpd/ext</i>	PACKAGES/dpd-basic
<i>DPD-MESO</i>	mesoscale DPD models	<i>pair_style edpd</i>	PACKAGES/dpd-meso
<i>DPD-REACT</i>	reactive dissipative particle dynamics	src/DPD-REACT/README	PACKAGES/dpd-react
<i>DPD-SMOOTH</i>	smoothed dissipative particle dynamics	src/DPD-SMOOTH/README	PACKAGES/dpd-smooth
<i>DRUDE</i>	Drude oscillators	<i>Howto drude</i>	PACKAGES/drude
<i>EFF</i>	electron force field	<i>pair_style eff/cut</i>	PACKAGES/eff
<i>ELECTRODE</i>	electrode charges to match potential	<i>fix electrode/conp</i>	PACKAGES/electrode
<i>EXTRA-COMMAND</i>	additional command styles	<i>general commands</i>	n/a
<i>EXTRA-COMPUTE</i>	additional compute styles	<i>compute</i>	n/a
<i>EXTRA-DUMP</i>	additional dump styles	<i>dump</i>	n/a
<i>EXTRA-FIX</i>	additional fix styles	<i>fix</i>	n/a
<i>EXTRA-MOLECULE</i>	additional molecular styles	<i>molecular styles</i>	n/a
<i>EXTRA-PAIR</i>	additional pair styles	<i>pair_style</i>	n/a
<i>FEP</i>	free energy perturbation	<i>compute fep</i>	PACKAGES/fep
<i>GPU</i>	GPU-enabled styles	<i>Section gpu</i>	Benchmarks
<i>GRANULAR</i>	granular systems	<i>Howto granular</i>	pour
<i>H5MD</i>	dump output via HDF5	<i>dump h5md</i>	n/a
<i>INTEL</i>	optimized Intel CPU and KNL styles	<i>Speed intel</i>	Benchmarks
<i>INTERLAYER</i>	Inter-layer pair potentials	<i>several pair styles</i>	PACKAGES/interlayer
<i>KIM</i>	OpenKIM wrapper	<i>pair_style kim</i>	kim
<i>KOKKOS</i>	Kokkos-enabled styles	<i>Speed kokkos</i>	Benchmarks
<i>KSPACE</i>	long-range Coulombic solvers	<i>kspace_style</i>	peptide
<i>LATBOLTZ</i>	Lattice Boltzmann fluid	<i>fix lb/fluid</i>	PACKAGES/latboltz
<i>LEPTON</i>	evaluate strings as potential function	<i>pair_style lepton</i>	PACKAGES/lepton
<i>MACHDYN</i>	smoothed Mach dynamics	SMD User Guide	PACKAGES/machdyn
<i>MANIFOLD</i>	motion on 2d surfaces	<i>fix manifoldforce</i>	PACKAGES/manifold
<i>MANYBODY</i>	many-body potentials	<i>pair_style tersoff</i>	shear
<i>MC</i>	Monte Carlo options	<i>fix gcmc</i>	n/a
<i>MDI</i>	client-server code coupling	<i>MDI Howto</i>	PACKAGES/mdi
<i>MEAM</i>	modified EAM potential (C++)	<i>pair_style meam</i>	meam
<i>MESONT</i>	mesoscopic tubular potential model	<i>pair styles mesocnt</i>	PACKAGES/mesont
<i>MGPT</i>	fast MGPT multi-ion potentials	<i>pair_style mgpt</i>	PACKAGES/mgpt
<i>MISC</i>	miscellaneous single-file commands	n/a	no
<i>ML-HDNNP</i>	High-dimensional neural network potentials	<i>pair_style hdnnp</i>	PACKAGES/hdnnp
<i>ML-IAP</i>	multiple machine learning potentials	<i>pair_style mliap</i>	mliap
<i>ML-PACE</i>	Atomic Cluster Expansion potential	<i>pair pace</i>	PACKAGES/pace
<i>ML-POD</i>	Proper orthogonal decomposition potentials	<i>pair pod</i>	pod
<i>ML-QUIP</i>	QUIP/libatoms interface	<i>pair_style quip</i>	PACKAGES/quip
<i>ML-RANN</i>	Pair style for RANN potentials	<i>pair rann</i>	PACKAGES/rann
<i>ML-SNAP</i>	quantum-fitted potential	<i>pair_style snap</i>	snap
<i>ML-UF3</i>	quantum-fitted ultra fast potentials	<i>pair_style uf3</i>	PACKAGES/uf3
<i>MOFFF</i>	styles for MOF-FF force field	<i>pair_style buck6d/coul/gauss</i>	PACKAGES/mofff
<i>MOLECULE</i>	molecular system force fields	<i>Howto bioFF</i>	peptide
<i>MOLFILE</i>	VMD molfile plug-ins	<i>dump molfile</i>	n/a

continues on next

Table 1 – continued from previous page

Package	Description	Doc page	Examples
<i>NETCDF</i>	dump output via NetCDF	<i>dump netcdf</i>	n/a
<i>OPENMP</i>	OpenMP-enabled styles	<i>Speed omp</i>	Benchmarks
<i>OPT</i>	optimized pair styles	<i>Speed opt</i>	Benchmarks
<i>ORIENT</i>	fixes for orientation depended forces	<i>fix orient/*</i>	PACKAGES/orient_eco
<i>PERI</i>	Peridynamics models	<i>pair_style peri</i>	peri
<i>PHONON</i>	phonon dynamical matrix	<i>fix phonon</i>	PACKAGES/phonon
<i>PLUGIN</i>	Plugin loader command	<i>plugin</i>	plugins
<i>PLUMED</i>	PLUMED free energy library	<i>fix plumed</i>	PACKAGES/plumed
<i>POEMS</i>	coupled rigid body motion	<i>fix poems</i>	rigid
<i>PTM</i>	Polyhedral Template Matching	<i>compute ptm/atom</i>	n/a
<i>PYTHON</i>	embed Python code in an input script	<i>python</i>	python
<i>QEQ</i>	QEq charge equilibration	<i>fix qeq</i>	qeq
<i>QMMM</i>	QM/MM coupling	<i>fix qmmm</i>	PACKAGES/qmmm
<i>QTB</i>	quantum nuclear effects	<i>fix qtb</i> <i>fix qbmsst</i>	qtb
<i>RHEO</i>	reproducing hydrodynamics and elastic objects	<i>Howto rheo</i>	rheo
<i>REACTION</i>	chemical reactions in classical MD	<i>fix bond/react</i>	PACKAGES/reaction
<i>REAXFF</i>	ReaxFF potential (C/C++)	<i>pair_style reaxff</i>	reax
<i>REPLICA</i>	multi-replica methods	<i>Howto replica</i>	tad
<i>RIGID</i>	rigid bodies and constraints	<i>fix rigid</i>	rigid
<i>SCAFACOS</i>	wrapper for ScaFaCoS Kspace solver	<i>kspace_style scafacos</i>	PACKAGES/scafacos
<i>SHOCK</i>	shock loading methods	<i>fix msst</i>	n/a
<i>SMTBQ</i>	second moment tight binding potentials	<i>pair styles smtbq, smatb</i>	PACKAGES/smtbq
<i>SPH</i>	smoothed particle hydrodynamics	<i>SPH User Guide</i>	PACKAGES/sph
<i>SPIN</i>	magnetic atomic spin dynamics	<i>Howto spins</i>	SPIN
<i>SRD</i>	stochastic rotation dynamics	<i>fix srd</i>	srd
<i>TALLY</i>	pairwise tally computes	<i>compute XXX/tally</i>	PACKAGES/tally
<i>UEF</i>	extensional flow	<i>fix nvt/uef</i>	PACKAGES/uef
<i>VORONOI</i>	Voronoi tessellation	<i>compute voronoi/atom</i>	n/a
<i>VTK</i>	dump output via VTK	<i>compute vtk</i>	n/a
<i>YAFF</i>	additional styles implemented in YAFF	<i>angle_style cross</i>	PACKAGES/yaff

6.2 Package details

Here is a brief description of all packages in LAMMPS. It lists authors (if applicable) and summarizes the package contents. It has specific instructions on how to install the package, including, if necessary, info on how to download or build any extra library it requires. It also gives links to documentation, example scripts, and pictures/movies (if available) that illustrate use of the package.

The majority of packages can be included in a LAMMPS build with a single setting (`-D PKG_<NAME>=on` for CMake) or command (`make yes-<name>` for make). See the [Build package](#) page for more info. A few packages may require additional steps; this is indicated in the descriptions below. The [Build extras](#) page gives those details.

Note

To see the complete list of commands a package adds to LAMMPS, you can examine the files in its src directory, e.g. `ls src/GRANULAR`. Files with names that start with `fix`, `compute`, `atom`, `pair`, `bond`, `angle`, etc correspond to commands with the same style name as contained in the file name.

<i>ADIOS</i>	<i>AMOEBA</i>	<i>ASPHERE</i>	<i>ATC</i>	<i>AWPMD</i>	<i>BOCS</i>
<i>BODY</i>	<i>BPM</i>	<i>BROWNIAN</i>	<i>CG-DNA</i>	<i>CG-SPICA</i>	<i>CLASS2</i>

<i>VORONOI</i>	<i>VTK</i>	<i>YAFF</i>			

6.2.1 ADIOS package

Contents:

ADIOS is a high-performance I/O library. This package implements the *dump atom/adios*, *dump custom/adios* and *read_dump ... format adios* commands to write and read data using the ADIOS library.

Authors: Norbert Podhorszki (ORNL) from the ADIOS developer team.

Added in version 28Feb2019.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/ADIOS: filenames -> commands
 - src/ADIOS/README
 - examples/PACKAGES/adios
 - <https://github.com/ornladios/ADIOS2>
 - *dump atom/adios*
 - *dump custom/adios*
 - *read_dump*
-

6.2.2 AMOEBA package

Contents:

Implementation of the AMOEBA and HIPPO polarized force fields originally developed by Jay Ponder's group at the U Washington at St Louis. The LAMMPS implementation is based on Fortran 90 code provided by the Ponder group in their [Tinker MD](#) software.

Authors: Josh Rackers and Steve Plimpton (Sandia), Trung Nguyen (U Chicago)

Supporting info:

- `src/AMOEBA`: filenames -> commands
 - *AMOEBA and HIPPO howto*
 - *pair_style amoeba*
 - *pair_style hippo*
 - *atom_style amoeba*
 - *angle_style amoeba*
 - *improper_style amoeba*
 - *fix amoeba/bitorsion*
 - *fix amoeba/pitortion*
 - `tools/tinker/tinker2Imp.py`
 - `examples/amoeba`
-

6.2.3 ASPHERE package

Contents:

Computes, time-integration fixes, and pair styles for aspherical particle models including ellipsoids, 2d lines, and 3d triangles.

Supporting info:

- `src/ASPHERE`: filenames -> commands
- *Howto spherical*
- *pair_style gayberne*
- *pair_style resquared*
- *pair_style ylz*
- `doc/PDF/pair_gayberne_extra.pdf`
- `doc/PDF/pair_resquared_extra.pdf`
- `examples/ASPHERE`
- `examples/ellipse`
- <https://www.lammps.org/movies.html#line>
- <https://www.lammps.org/movies.html#tri>

6.2.4 ATC package

Contents:

ATC stands for atoms-to-continuum. This package implements a *fix atc* command to either couple molecular dynamics with continuum finite element equations or perform on-the-fly conversion of atomic information to continuum fields.

Authors: Reese Jones, Jeremy Templeton, Jon Zimmerman (Sandia).

Install:

This package has *specific installation instructions* on the *Build extras* page. The ATC package requires that also the *MANYBODY* package is installed.

Supporting info:

- src/ATC: filenames -> commands
 - src/ATC/README
 - *fix atc*
 - examples/PACKAGES/atc
 - <https://www.lammps.org/pictures.html#atc>
-

6.2.5 AWPMD package

Contents:

AWPMD stands for Antisymmetrized Wave Packet Molecular Dynamics. This package implements an atom, pair, and fix style which allows electrons to be treated as explicit particles in a classical molecular dynamics model.

Author: Ilya Valuev (JIHT, Russia).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/AWPMD: filenames -> commands
 - src/AWPMD/README
 - *pair_style awpmd/cut*
 - examples/PACKAGES/awpmd
-

6.2.6 BOCS package

Contents:

This package provides *fix bocs*, a modified version of *fix npt* which includes the pressure correction to the barostat as outlined in:

N. J. H. Dunn and W. G. Noid, “Bottom-up coarse-grained models that accurately describe the structure, pressure, and compressibility of molecular liquids”, J. Chem. Phys. 143, 243148 (2015).

Authors: Nicholas J. H. Dunn and Michael R. DeLyser (The Pennsylvania State University)

Supporting info:

The BOCS package for LAMMPS is part of the BOCS software package: <https://github.com/noid-group/BOCS>

See the following reference for information about the entire package:

Dunn, NJH; Lebold, KM; DeLyser, MR; Rudzinski, JF; Noid, WG. “BOCS: Bottom-Up Open-Source Coarse-Graining Software.” J. Phys. Chem. B. 122, 13, 3363-3377 (2018).

Example inputs are in the examples/PACKAGES/bocs folder.

6.2.7 BODY package

Contents:

Body-style particles with internal structure. Computes, time-integration fixes, pair styles, as well as the body styles themselves. See the *Howto body* page for an overview.

Supporting info:

- src/BODY filenames -> commands
 - *Howto_body*
 - *atom_style body*
 - *fix nve/body*
 - *pair_style body/nparticle*
 - examples/body
-

6.2.8 BPM package

Contents:

Pair styles, bond styles, fixes, and computes for bonded particle models for mesoscale simulations of solids and fracture. See the *Howto bpm* page for an overview.

Authors: Joel T. Clemmer (Sandia National Labs)

Added in version 4May2022.

Supporting info:

- src/BPM filenames -> commands
 - *Howto_bpm*
-

- *atom_style bpm/sphere*
 - *bond_style bpm/rotational*
 - *bond_style bpm/spring*
 - *compute nbond/atom*
 - *fix nve/bpm/sphere*
 - *pair_style bpm/spring*
 - *examples/bpm*
-

6.2.9 BROWNIAN package

Contents:

This package provides *fix brownian*, *fix brownian/sphere*, and *fix brownian/asphere* as well as *fix propel/self* which allow to do Brownian Dynamics time integration of point, spherical and aspherical particles and also support self-propelled particles.

Authors: Sam Cameron (University of Bristol), Stefan Paquay (while at Brandeis University) (initial version of *fix propel/self*)

Added in version 14May2021.

Example inputs are in the *examples/PACKAGES/brownian* folder.

6.2.10 CG-DNA package

Contents:

Several pair styles, bond styles, and integration fixes for coarse-grained modelling of single- and double-stranded DNA and RNA based on the oxDNA and oxRNA model of Doye, Louis and Ouldridge. The package includes Langevin-type rigid-body integrators with improved stability.

Author: Oliver Henrich (University of Strathclyde, Glasgow).

Install:

The CG-DNA package requires that also the *MOLECULE* and *ASPHERE* packages are installed.

Supporting info:

- *src/CG-DNA*: filenames -> commands
- */src/CG-DNA/README*
- *pair_style oxdna/**
- *pair_style oxdna2/**
- *pair_style oxrna2/**
- *bond_style oxdna/**
- *bond_style oxdna2/**
- *bond_style oxrna2/**

- *fix nve/dotc/langevin*
 - `examples/PACKAGES/cgdna`
-

6.2.11 CG-SPICA package

Contents:

Several pair styles and an angle style which implement the coarse-grained SPICA (formerly called SDK) model which enables simulation of biological or soft material systems.

Original Author: Axel Kohlmeyer (Temple U).

Maintainers: Yusuke Miyazaki and Wataru Shinoda (Okayama U).

Supporting info:

- `src/CG-SPICA: filenames -> commands`
 - `src/CG-SPICA/README`
 - *pair_style lj/spica/**
 - *angle_style spica*
 - `examples/PACKAGES/cgspica`
 - <https://www.lammps.org/pictures.html#cg>
 - <https://www.spica-ff.org/>
-

6.2.12 CLASS2 package

Contents:

Bond, angle, dihedral, improper, and pair styles for the COMPASS CLASS2 molecular force field.

Supporting info:

- `src/CLASS2: filenames -> commands`
 - *bond_style class2*
 - *angle_style class2*
 - *dihedral_style class2*
 - *improper_style class2*
 - *pair_style lj/class2*
-

6.2.13 COLLOID package

Contents:

Coarse-grained finite-size colloidal particles. Pair styles and fix wall styles for colloidal interactions. Includes the Fast Lubrication Dynamics (FLD) method for hydrodynamic interactions, which is a simplified approximation to Stokesian dynamics.

Authors: This package includes Fast Lubrication Dynamics pair styles which were created by Amit Kumar and Michael Bybee from Jonathan Higdon's group at UIUC.

Supporting info:

- `src/COLLOID`: filenames -> commands
 - *`fix wall/colloid`*
 - *`pair_style colloid`*
 - *`pair_style yukawa/colloid`*
 - *`pair_style brownian`*
 - *`pair_style lubricate`*
 - *`pair_style lubricateU`*
 - `examples/colloid`
 - `examples/srd`
-

6.2.14 COLVARS package

Contents:

Colvars stands for collective variables, which can be used to implement various enhanced sampling methods, including Adaptive Biasing Force, Metadynamics, Steered MD, Umbrella Sampling and Restraints. A *`fix colvars`* command is implemented which wraps a COLVARS library, which implements these methods. simulations.

Authors: The COLVARS library is written and maintained by Giacomo Fiorin (NIH, Bethesda, MD, USA) and Jerome Henin (CNRS, Paris, France), originally for the NAMD MD code, but with portability in mind. Axel Kohlmeyer (Temple U) provided the interface to LAMMPS.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/COLVARS`: filenames -> commands
- `doc/PDF/colvars-refman-lammps.pdf`
- `src/COLVARS/README`
- `lib/colvars/README`
- *`fix colvars`*
- *`group2ndx`*
- *`ndx2group`*
- `examples/PACKAGES/colvars`

6.2.15 COMPRESS package

Contents:

Compressed output of dump files via the zlib compression library, using dump styles with a “gz” in their style name.

To use this package you must have the zlib compression library available on your system.

Author: Axel Kohlmeyer (Temple U).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/COMPRESS: filenames -> commands
 - src/COMPRESS/README
 - lib/compress/README
 - *dump atom/gz*
 - *dump cfg/gz*
 - *dump custom/gz*
 - *dump xyz/gz*
-

6.2.16 CORESHELL package

Contents:

Compute and pair styles that implement the adiabatic core/shell model for polarizability. The pair styles augment Born, Buckingham, and Lennard-Jones styles with core/shell capabilities. The *compute temp/cs* command calculates the temperature of a system with core/shell particles. See the *Howto coreshell* page for an overview of how to use this package.

Author: Hendrik Heenen (Technical U of Munich).

Supporting info:

- src/CORESHELL: filenames -> commands
 - *Howto coreshell*
 - *Howto polarizable*
 - *compute temp/cs*
 - *pair_style born/coul/long/cs*
 - *pair_style buck/coul/long/cs*
 - *pair_style lj/cut/coul/long/cs*
 - *examples/coreshell*
-

6.2.17 DIELECTRIC package

Contents:

An atom style, multiple pair styles, several fixes, Kspace styles and a compute for simulating systems using boundary element solvers for computing the induced charges at the interface between two media with different dielectric constants.

Install:

To use this package, also the *KSPACE* and *EXTRA-PAIR* packages need to be installed.

Author: Trung Nguyen and Monica Olvera de la Cruz (Northwestern U)

Added in version 2Jul2021.

Supporting info:

- `src/DIELECTRIC: filenames -> commands`
 - *atom_style dielectric*
 - *pair_style coul/cut/dielectric*
 - *pair_style coul/long/dielectric*
 - *pair_style lj/cut/coul/cut/dielectric*
 - *pair_style lj/cut/coul/debye/dielectric*
 - *pair_style lj/cut/coul/long/dielectric*
 - *pair_style lj/cut/coul/msm/dielectric*
 - *pair_style ppm/dielectric*
 - *pair_style ppm/disp/dielectric*
 - *pair_style msm/dielectric*
 - *fix_style polarize/bem/icc*
 - *fix_style polarize/bem/gmres*
 - *fix_style polarize/functional*
 - *compute efield/atom*
 - `examples/PACKAGES/dielectric`
-

6.2.18 DIFFRACTION package

Contents:

Two computes and a fix for calculating x-ray and electron diffraction intensities based on kinematic diffraction theory.

Author: Shawn Coleman while at the U Arkansas.

Supporting info:

- `src/DIFFRACTION: filenames -> commands`
- *compute saed*
- *compute xrd*
- *fix saed/vtk*

- `examples/PACKAGES/diffraction`
-

6.2.19 DIPOLE package

Contents:

An atom style and several pair styles for point dipole models with short-range or long-range interactions.

Supporting info:

- `src/DIPOLE`: filenames -> commands
 - *atom_style dipole*
 - *pair_style lj/cut/dipole/cut*
 - *pair_style lj/cut/dipole/long*
 - *pair_style lj/long/dipole/long*
 - *angle_style dipole*
 - `examples/dipole`
-

6.2.20 DPD-BASIC package

Contents:

Pair styles for the basic dissipative particle dynamics (DPD) method and DPD thermostatting.

Pair style *dpd/coul/slater/long* also includes smeared charges for coulomb interactions and thus requires the *KSPACE* package to be installed to handle the long-range Coulomb part of the interactions.

Authors: Kurt Smith (U Pittsburgh), Martin Svoboda, Martin Lisl (ICPF and UJEP), Eddy Barraud (IFPEN)

Supporting info:

- `src/DPD-BASIC`: filenames -> commands
 - *pair_style dpd*
 - *pair_style dpd/tstat*
 - *pair_style dpd/ext*
 - *pair_style dpd/ext/tstat*
 - *pair_style dpd/coul/slater/long*
 - `examples/PACKAGES/dpd-basic`
-

6.2.21 DPD-MESO package

Contents:

Several extensions of the dissipative particle dynamics (DPD) method. Specifically, energy-conserving DPD (eDPD) that can model non-isothermal processes, many-body DPD (mDPD) for simulating vapor-liquid coexistence, and transport DPD (tDPD) for modeling advection-diffusion-reaction systems. The equations of motion of these DPD extensions are integrated through a modified velocity-Verlet (MVV) algorithm.

Author: Zhen Li (Department of Mechanical Engineering, Clemson University)

Supporting info:

- `src/DPD-MESO: filenames -> commands`
 - `src/DPD-MESO/README`
 - *atom_style edpd*
 - *pair_style edpd*
 - *pair_style mdpd*
 - *pair_style tdpd*
 - *fix mvv/dpd*
 - `examples/PACKAGES/mesodpd`
 - <https://www.lammps.org/movies.html#mesodpd>
-

6.2.22 DPD-REACT package

Contents:

DPD stands for dissipative particle dynamics. This package implements coarse-grained DPD-based models for energetic, reactive molecular crystalline materials. It includes many pair styles specific to these systems, including for reactive DPD, where each particle has internal state for multiple species and a coupled set of chemical reaction ODEs are integrated each timestep. Highly accurate time integrators for isothermal, isoenergetic, isobaric and isenthalpic conditions are included. These enable long timesteps via the Shardlow splitting algorithm.

Authors: Jim Larentzos (ARL), Tim Mattox (Engility Corp), and John Brennan (ARL).

Supporting info:

- `src/DPD-REACT: filenames -> commands`

-

6.2.23 DPD-SMOOTH package

Contents:

A pair style for smoothed dissipative particle dynamics (SDPD), which is an extension of smoothed particle hydrodynamics (SPH) to mesoscale where thermal fluctuations are important (see the *SPH package*). Also two fixes for moving and rigid body integration of SPH/SDPD particles (particles of atom_style meso).

Author: Morteza Jalalvand (Institute for Advanced Studies in Basic Sciences, Iran).

Supporting info:

- src/DPD-SMOOTH: filenames -> commands
 - src/DPD-SMOOTH/README
 - *pair_style sdpd/taitwater/isothermal*
 - *fix meso/move*
 - *fix rigid/meso*
 - examples/PACKAGES/dpd-smooth
-

6.2.24 DRUDE package

Contents:

Fixes, pair styles, and a compute to simulate thermalized Drude oscillators as a model of polarization. See the *Howto drude* and *Howto drude2* pages for an overview of how to use the package. There are auxiliary tools for using this package in tools/drude.

Authors: Alain Dequidt (U Clermont Auvergne), Julien Devemy (CNRS), and Agilio Padua (ENS de Lyon).

Supporting info:

- src/DRUDE: filenames -> commands
- *Howto drude*
- *Howto drude2*
- *Howto polarizable*
- src/DRUDE/README
- *fix drude*
- *fix drude/transform/**

-

6.2.25 EFF package

Contents:

EFF stands for electron force field which allows a classical MD code to model electrons as particles of variable radius. This package contains atom, pair, fix and compute styles which implement the eFF as described in A. Jaramillo-Botero, J. Su, Q. An, and W.A. Goddard III, JCC, 2010. The eFF potential was first introduced by Su and Goddard, in 2007. There are auxiliary tools for using this package in tools/eff; see its README file.

Author: Andres Jaramillo-Botero (CalTech).

Supporting info:

- src/EFF: filenames -> commands
 - src/EFF/README
 - *atom_style electron*
 - *fix nve/eff*
 - *fix nvt/eff*
 - *fix npt/eff*
 - *fix langevin/eff*

-

6.2.26 ELECTRODE package

Contents:

The ELECTRODE package allows the user to enforce a constant potential method for groups of atoms that interact with the remaining atoms as electrolyte.

Authors: The ELECTRODE package is written and maintained by Ludwig Ahrens-Iwers (TUHH, Hamburg, Germany), Shern Tee (UQ, Brisbane, Australia) and Robert Meissner (TUHH, Hamburg, Germany).

Added in version 4May2022.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- *fix electrode/conp*
 - *fix electrode/conq*
 - *fix electrode/thermo*
-

6.2.27 EXTRA-COMMAND package

Contents:

Additional command styles that are less commonly used.

Supporting info:

- src/EXTRA-COMMAND: filenames -> commands
 - *general commands*
-

6.2.28 EXTRA-COMPUTE package

Contents:

Additional compute styles that are less commonly used.

Supporting info:

- src/EXTRA-COMPUTE: filenames -> commands
 - *compute*
-

6.2.29 EXTRA-DUMP package

Contents:

Additional dump styles that are less commonly used.

Supporting info:

- src/EXTRA-DUMP: filenames -> commands
 - *dump*
-

6.2.30 EXTRA-FIX package

Contents:

Additional fix styles that are less commonly used.

Supporting info:

- src/EXTRA-FIX: filenames -> commands
 - *fix*
-

6.2.31 EXTRA-MOLECULE package

Contents:

Additional bond, angle, dihedral, and improper styles that are less commonly used.

Install:

To use this package, also the *MOLECULE* package needs to be installed.

Supporting info:

- src/EXTRA-MOLECULE: filenames -> commands
 - *molecular styles*
-

6.2.32 EXTRA-PAIR package

Contents:

Additional pair styles that are less commonly used.

Supporting info:

- src/EXTRA-PAIR: filenames -> commands
 - *pair_style*
-

6.2.33 FEP package

Contents:

FEP stands for free energy perturbation. This package provides methods for performing FEP simulations by using a *fix adapt/fep* command with soft-core pair potentials, which have a “soft” in their style name. There are auxiliary tools for using this package in tools/fep; see its README file.

Author: Agilio Padua (ENS de Lyon)

Supporting info:

- src/FEP: filenames -> commands
 - src/FEP/README
 - *fix adapt/fep*
 - *compute fep*
 - *pair_style */soft*
 - examples/PACKAGES/fep
 - tools/fep/README
 - tools/fep
-

6.2.34 GPU package

Contents:

Dozens of pair styles and a version of the PPPM long-range Coulombic solver optimized for GPUs. All such styles have a “gpu” as a suffix in their style name. The GPU code can be compiled with either CUDA or OpenCL, however the OpenCL variants are no longer actively maintained and only the CUDA versions are regularly tested. The *GPU package* page gives details of what hardware and GPU software is required on your system, and details on how to build and use this package. Its styles can be invoked at run time via the “-sf gpu” or “-suffix gpu” *command-line switches*. See also the *KOKKOS* package, which has GPU-enabled styles.

Authors: Mike Brown (Intel) while at Sandia and ORNL and Trung Nguyen (Northwestern U) while at ORNL and later. AMD HIP support by Evgeny Kuznetsov, Vladimir Stegailov, and Vsevolod Nikolskiy (HSE University).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/GPU: filenames -> commands
- src/GPU/README
- lib/gpu/README
- *Accelerator packages*
- *GPU package*
- *Section 2.6 -sf gpu*
- *Section 2.6 -pk gpu*
- *package gpu*

 - <https://www.lammps.org/movies.html#granregion>
-

6.2.36 H5MD package

Contents:

H5MD stands for HDF5 for MD. [HDF5](#) is a portable, binary, self-describing file format, used by many scientific simulations. H5MD is a format for molecular simulations, built on top of HDF5. This package implements a *dump h5md* command to output LAMMPS snapshots in this format.

To use this package you must have the HDF5 library available on your system.

Author: Pierre de Buyl (KU Leuven) created both the package and the H5MD format.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/H5MD: filenames -> commands

- [src/H5MD/README](#)
 - [lib/h5md/README](#)
 - [dump h5md](#)
-

6.2.37 INTEL package

Contents:

Dozens of pair, fix, bond, angle, dihedral, improper, and kspace styles which are optimized for Intel CPUs and KNLs (Knights Landing). All of them have an “intel” in their style name. The [INTEL package](#) page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the “-sf intel” or “-suffix intel” [command-line switches](#). Also see the [KOKKOS](#), [OPT](#), and [OPENMP](#) packages, which have styles optimized for CPUs and KNLs.

You need to have an Intel compiler, version 14 or higher to take full advantage of this package. While compilation with GNU compilers is supported, performance will be sub-optimal.

Note

the INTEL package contains styles that require using the -restrict flag, when compiling with Intel compilers.

Author: Mike Brown (Intel).

Install:

This package has [specific installation instructions](#) on the [Build extras](#) page.

Supporting info:

- [src/INTEL: filenames -> commands](#)
 - [src/INTEL/README](#)
 - [Accelerator packages](#)
 - [INTEL package](#)
 - [Section 2.6 -sf intel](#)
 - [Section 2.6 -pk intel](#)
 - [package intel](#)
 - Search the [commands](#) pages ([fix](#), [compute](#), [pair](#), [bond](#), [angle](#), [dihedral](#), [improper](#), [kspace](#)) for styles followed by (i)
 - [src/INTEL/TEST](#)
 - [Benchmarks](#) page of website
-

6.2.38 INTERLAYER package

Contents:

A collection of pair styles specifically to be used for modeling layered materials, most commonly graphene sheets (or equivalents).

Supporting info:

- `src/INTERLAYER`: filenames -> commands
 - *Pair style* page
 - `examples/PACKAGES/interlayer`
-

6.2.39 KIM package

Contents:

This package contains a command with a set of sub-commands that serve as a wrapper on the [Open Knowledgebase of Interatomic Models \(OpenKIM\)](#) repository of interatomic models (IMs) enabling compatible ones to be used in LAMMPS simulations.

This includes *kim init*, and *kim interactions* commands to select, initialize and instantiate the IM, a *kim query* command to perform web queries for material property predictions of OpenKIM IMs, a *kim param* command to access KIM Model Parameters from LAMMPS, and a *kim property* command to write material properties computed in LAMMPS to standard KIM property instance format.

Support for KIM IMs that conform to the [KIM Application Programming Interface \(API\)](#) is provided by the *pair_style kim* command.

Note
The command <i>pair_style kim</i> is called by <i>kim interactions</i> and is not recommended to be directly used in input scripts.

To use this package you must have the KIM API library available on your system. The KIM API is available for download on the [OpenKIM website](#). When installing LAMMPS from binary, the kim-api package is a dependency that is automatically downloaded and installed.

Information about the KIM project can be found at its website: <https://openkim.org>. The KIM project is led by Ellad Tadmor and Ryan Elliott (U Minnesota) and is funded by the [National Science Foundation](#).

Authors: Ryan Elliott (U Minnesota) is the main developer for the KIM API and the *pair_style kim* command. Yaser Afshar (U Minnesota), Axel Kohlmeyer (Temple U), Ellad Tadmor (U Minnesota), and Daniel Karls (U Minnesota) contributed to the *kim command* interface in close collaboration with Ryan Elliott.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- *kim command*
- *pair_style kim*
- `src/KIM`: filenames -> commands

- [src/KIM/README](#)
 - [lib/kim/README](#)
 - [examples/kim](#)
-

6.2.40 KOKKOS package

Contents:

Dozens of atom, pair, bond, angle, dihedral, improper, fix, compute styles adapted to compile using the Kokkos library which can convert them to OpenMP or CUDA code so that they run efficiently on multicore CPUs, KNLs, or GPUs. All the styles have a “kk” as a suffix in their style name. The [KOKKOS package](#) page gives details of what hardware and software is required on your system, and how to build and use this package. Its styles can be invoked at run time via the “-sf kk” or “-suffix kk” *command-line switches*. Also see the [GPU](#), [OPT](#), [INTEL](#), and [OPENMP](#) packages, which have styles optimized for CPUs, KNLs, and GPUs.

You must have a C++17 compatible compiler to use this package. KOKKOS makes extensive use of advanced C++ features, which can expose compiler bugs, especially when compiling for maximum performance at high optimization levels. Please see the file `lib/kokkos/README` for a list of compilers and their respective platforms, that are known to work.

Authors: The KOKKOS package was created primarily by Christian Trott and Stan Moore (Sandia), with contributions from other folks as well. It uses the open-source [Kokkos library](#) which was developed by Carter Edwards, Christian Trott, and others at Sandia, and which is included in the LAMMPS distribution in `lib/kokkos`.

Install:

This package has *specific installation instructions* on the [Build extras](#) page.

Supporting info:

- `src/KOKKOS`: filenames -> commands
 - `src/KOKKOS/README`
 - `lib/kokkos/README`
 - [Accelerator packages](#)
 - [KOKKOS package](#)
 - [Section 2.6 -k on ...](#)
 - [Section 2.6 -sf kk](#)
 - [Section 2.6 -pk kokkos](#)
 - [package kokkos](#)
 - Search the *commands* pages ([fix](#), [compute](#), [pair](#), [bond](#), [angle](#), [dihedral](#), [improper](#), [kspace](#)) for styles followed by (k)
 - [Benchmarks](#) page of website
-

6.2.41 KSPACE package

Contents:

A variety of long-range Coulombic solvers, as well as pair styles which compute the corresponding short-range pairwise Coulombic interactions. These include Ewald, particle-particle particle-mesh (PPPM), and multilevel summation method (MSM) solvers.

Install:

Building with this package requires a 1d FFT library be present on your system for use by the PPPM solvers. This can be the KISS FFT library provided with LAMMPS, third party libraries like FFTW, or a vendor-supplied FFT library. See the [Build settings](#) page for details on how to select different FFT options for your LAMMPS build.

Supporting info:

- src/KSPACE: filenames -> commands
 - [kspace_style](#)
 - doc/PDF/kspace.pdf
 - [Howto tip3p](#)
 - [Howto tip4p](#)
 - [Howto spc](#)
 - [pair_style coul](#)
 - Search the [pair style](#) page for styles with “long” or “msm” in name
 - examples/peptide
 - bench/in.rhodo
-

6.2.42 LATBOLTZ package

Contents:

Fixes which implement a background Lattice-Boltzmann (LB) fluid, which can be used to model MD particles influenced by hydrodynamic forces.

Authors: Frances Mackay and Colin Denniston (University of Western Ontario).

Install:

The LATBOLTZ package requires that LAMMPS is build in [MPI parallel mode](#).

Supporting info:

- src/LATBOLTZ: filenames -> commands
 - src/LATBOLTZ/README
 - [fix lb/fluid](#)
 - [fix lb/momentum](#)
 - [fix lb/viscous](#)
 - examples/PACKAGES/latboltz
-

6.2.43 LEPTON package

Contents:

Styles for pair, bond, and angle forces that evaluate the potential function from a string using the [Lepton mathematical expression parser](#). Lepton is a C++ library that is bundled with [OpenMM](#) and can be used for parsing, evaluating, differentiating, and analyzing mathematical expressions. This is a more lightweight and efficient alternative for evaluating custom potential function to an embedded Python interpreter as used in the [PYTHON package](#). On the other hand, since the potentials are evaluated from analytical expressions, they are more precise than what can be done with *tabulated potentials*.

Authors: Axel Kohlmeyer (Temple U). Lepton itself is developed by Peter Eastman at Stanford University.

Added in version 8Feb2023.

Install:

This package has *specific installation instructions* on the [Build extras](#) page.

Supporting info:

- src/LEPTON: filenames -> commands
 - lib/lepton/README.md
 - [pair_style lepton](#)
 - [bond_style lepton](#)
 - [angle_style lepton](#)
 - [dihedral_style lepton](#)
-

6.2.44 MACHDYN package

Contents:

An atom style, fixes, computes, and several pair styles which implements smoothed Mach dynamics (SMD) for solids, which is a model related to smoothed particle hydrodynamics (SPH) for liquids (see the [SPH package](#)).

This package solves solids mechanics problems via a state of the art stabilized meshless method with hourglass control. It can specify hydrostatic interactions independently from material strength models, i.e. pressure and deviatoric stresses are separated. It provides many material models (Johnson-Cook, plasticity with hardening, Mie-Grueneisen, Polynomial EOS) and allows new material models to be added. It implements rigid boundary conditions (walls) which can be specified as surface geometries from *.STL files.

Author: Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

Install:

This package has *specific installation instructions* on the [Build extras](#) page.

Supporting info:

- src/MACHDYN: filenames -> commands
- src/MACHDYN/README
- [doc/PDF/MACHDYN_LAMMPS_userguide.pdf](#)
- [examples/PACKAGES/machdyn](#)
- <https://www.lammps.org/movies.html#smd>

6.2.45 MANIFOLD package

Contents:

Several fixes and a “manifold” class which enable simulations of particles constrained to a manifold (a 2D surface within the 3D simulation box). This is done by applying the RATTLE constraint algorithm to formulate single-particle constraint functions $g(x_i, y_i, z_i) = 0$ and their derivative (i.e. the normal of the manifold) $n = \text{grad}(g)$.

Author: Stefan Paquay (until 2017: Eindhoven University of Technology (TU/e), The Netherlands; since 2017: Brandeis University, Waltham, MA, USA)

Supporting info:

- src/MANIFOLD: filenames -> commands
 - src/MANIFOLD/README
 - *Howto manifold*
 - *fix manifoldforce*
 - *fix nve/manifold/rattle*
 - *fix nvt/manifold/rattle*
 - examples/PACKAGES/manifold
 - <https://www.lammps.org/movies.html#manifold>
-

6.2.46 MANYBODY package

Contents:

A variety of many-body and bond-order potentials. These include (AI)REBO, BOP, EAM, EIM, Stillinger-Weber, and Tersoff potentials.

Supporting info:

- src/MANYBODY: filenames -> commands
 - *Pair style* page
 - examples/comb
 - examples/eim
 - examples/nb3d
 - examples/shear
 - examples/streitz
 - examples/vashishta
 - bench/in.eam
-

6.2.47 MC package

Contents:

Several fixes and a pair style that have Monte Carlo (MC) or MC-like attributes. These include fixes for creating, breaking, and swapping bonds, for performing atomic swaps, and performing grand canonical MC (GCMC), semi-grand canonical MC (SGCMC), or similar processes in conjunction with molecular dynamics (MD).

Supporting info:

- `src/MC`: filenames -> commands
 - *fix atom/swap*
 - *fix bond/break*
 - *fix bond/create*
 - *fix bond/create/angle*
 - *fix bond/swap*
 - *fix charge/regulation*
 - *fix gcmc*
 - *fix sgcmc*
 - *fix tfmc*
 - *fix widom*
 - *pair_style dsmc*
 - <https://www.lammps.org/movies.html#gcmc>
-

6.2.48 MDI package

Contents:

A LAMMPS command and fixes to allow client-server coupling of LAMMPS to other atomic or molecular simulation codes or materials modeling workflows via the [MolSSI Driver Interface \(MDI\) library](#).

Author: Taylor Barnes - MolSSI, [taylor.a.barnes at gmail.com](mailto:taylor.a.barnes@gmail.com)

Added in version 14May2021.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/MDI/README`
 - `lib/mdi/README`
 - *Howto MDI*
 - *mdi*
 - *fix mdi/qm*
 - `examples/PACKAGES/mdi`
-

6.2.49 MEAM package

Contents:

A pair style for the modified embedded atom (MEAM) potential translated from the Fortran version in the (obsolete) MEAM package to plain C++. The MEAM fully replaces the MEAM package, which has been removed from LAMMPS after the 12 December 2018 version.

Author: Sebastian Huetter, (Otto-von-Guericke University Magdeburg) based on the Fortran version of Greg Wagner (Northwestern U) while at Sandia.

Supporting info:

- src/MEAM: filenames -> commands
 - src/MEAM/README
 - *pair_style meam*
 - examples/meam
-

6.2.50 MESONT package

Contents:

MESONT is a LAMMPS package for simulation of nanomechanics of nanotubes (NTs). The model is based on a coarse-grained representation of NTs as “flexible cylinders” consisting of a variable number of segments. Internal interactions within a NT and the van der Waals interaction between the tubes are described by a mesoscopic force field designed and parameterized based on the results of atomic-level molecular dynamics simulations. The description of the force field is provided in the papers listed in src/MESONT/README.

This package used to have two independent implementations of this model: the original implementation using a Fortran library written by the developers of the model and a second implementation written in C++ by Philipp Kloza (U Cambridge). Since the C++ implementation offers the same features as the original implementation with the addition of friction, is typically faster, and easier to compile/install, the Fortran library based implementation has since been obsoleted and removed from the distribution. You have to download and compile an older version of LAMMPS if you want to use those.

Download of potential files:

The potential files for these pair styles are *very* large and thus are not included in the regular downloaded packages of LAMMPS or the git repositories. Instead, they will be automatically downloaded from a web server when the package is installed for the first time.

Authors of the obsoleted *mesont* styles:

Maxim V. Shugayev (University of Virginia), Alexey N. Volkov (University of Alabama), Leonid V. Zhigilei (University of Virginia)

Deprecated since version 8Feb2023.

Author of the C++ styles: Philipp Kloza (U Cambridge)

Added in version 15Jun2020.

Supporting info:

- src/MESONT: filenames -> commands
- src/MESONT/README

- *bond_style mesocnt*
 - *angle_style mesocnt*
 - *pair_style mesocnt*
 - examples/PACKAGES/mesont
-

6.2.51 MGPT package

Contents:

A pair style which provides a fast implementation of the quantum-based MGPT multi-ion potentials. The MGPT or model GPT method derives from first-principles DFT-based generalized pseudopotential theory (GPT) through a series of systematic approximations valid for mid-period transition metals with nearly half-filled d bands. The MGPT method was originally developed by John Moriarty at LLNL. The pair style in this package calculates forces and energies using an optimized matrix-MGPT algorithm due to Tomas Oppelstrup at LLNL.

Authors: Tomas Oppelstrup and John Moriarty (LLNL).

Supporting info:

- src/MGPT: filenames -> commands
 - src/MGPT/README
 - *pair_style mgpt*
 - examples/PACKAGES/mgpt
-

6.2.52 MISC package

Contents:

A variety of compute, fix, pair, bond styles with specialized capabilities that don't align with other packages. Do a directory listing, "ls src/MISC", to see the list of commands.

Note

the MISC package contains styles that require using the -restrict flag, when compiling with Intel compilers.

Supporting info:

- src/MISC: filenames -> commands
- *bond_style special*
- *compute viscosity/cos*
- *fix accelerate/cos*
- *fix imd*
- *fix ipi*
- *pair_style agni*

- *pair_style list*
 - *pair_style srp*
 - *pair_style tracker*
-

6.2.53 ML-HDNNP package

Contents:

A *pair_style hdnnp* command which allows to use high-dimensional neural network potentials (HDNNPs), a form of machine learning potentials. HDNNPs must be carefully trained prior to their application in a molecular dynamics simulation.

To use this package you must have the `n2p2` library installed and compiled on your system.

Author: Andreas Singraber

Added in version 27May2021.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/ML-HDNNP: filenames -> commands`
 - `src/ML-HDNNP/README`
 - `lib/hdnnp/README`
 - *pair_style hdnnp*
 - `examples/PACKAGES/hdnnp`
-

6.2.54 ML-IAP package

Contents:

A general interface for machine-learning interatomic potentials, including PyTorch.

Install:

To use this package, also the *ML-SNAP* package needs to be installed. To make the *mliappy* model available, also the *PYTHON* package needs to be installed, the version of Python must be 3.6 or later, and the `cython` software must be installed.

Author: Aidan Thompson (Sandia), Nicholas Lubbers (LANL).

Added in version 30Jun2020.

Supporting info:

- `src/ML-IAP: filenames -> commands`
 - `src/ML-IAP/README.md`
 - *pair_style mliap*
 - *compute_style mliap*
-

- examples/mliap (see README)

When built with the *mliappy* model this package includes an extension for coupling with Python models, including PyTorch. In this case, the Python interpreter linked to LAMMPS will need the *cython* and *numpy* modules installed. The provided examples build models with PyTorch, which would therefore also need to be installed to run those examples.

6.2.55 ML-PACE package

Contents:

A pair style for the Atomic Cluster Expansion potential (ACE). ACE is a methodology for deriving a highly accurate classical potential fit to a large archive of quantum mechanical (DFT) data. The ML-PACE package provides an efficient implementation for running simulations with ACE potentials.

Authors:

This package was written by Yury Lysogorskiy¹, Cas van der Oord², Anton Bochkarev¹, Sarath Menon¹, Matteo Rinaldi¹, Thomas Hammerschmidt¹, Matous Mrovec¹, Aidan Thompson³, Gabor Csanyi², Christoph Ortner⁴, Ralf Drautz¹.

¹: Ruhr-University Bochum, Bochum, Germany

²: University of Cambridge, Cambridge, United Kingdom

³: Sandia National Laboratories, Albuquerque, New Mexico, USA

⁴: University of British Columbia, Vancouver, BC, Canada

Added in version 14May2021.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/ML-PACE: filenames -> commands
 - *pair_style pace*
 - examples/PACKAGES/pace
-

6.2.56 ML-POD package

Contents:

A pair style and fitpod style for Proper Orthogonal Descriptors (POD). POD is a methodology for deriving descriptors based on the proper orthogonal decomposition. The ML-POD package provides an efficient implementation for running simulations with POD potentials, along with fitting the potentials natively in LAMMPS.

Authors:

Ngoc Cuong Nguyen (MIT), Andrew Rohskopf (Sandia)

Added in version 22Dec2022.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/ML-POD: filenames -> commands
 - *pair_style pod*
 - *command_style fitpod*
 - examples/PACKAGES/pod
-

6.2.57 ML-QUIP package

Contents:

A *pair_style quip* command which wraps the QUIP libAtoms library, which includes a variety of interatomic potentials, including Gaussian Approximation Potential (GAP) models developed by the Cambridge University group.

To use this package you must have the QUIP libAtoms library available on your system.

Author: Albert Bartok (Cambridge University)

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/ML-QUIP: filenames -> commands
 - src/ML-QUIP/README
 - *pair_style quip*
 - examples/PACKAGES/quip
-

6.2.58 ML-RANN package

Contents:

A pair style for using rapid atomistic neural network (RANN) potentials. These neural network potentials work by first generating a series of symmetry functions from the neighbor list and then using these values as the input layer of a neural network.

Authors:

This package was written by Christopher Barrett with contributions by Doyl Dickel, Mississippi State University.

Added in version 27May2021.

Supporting info:

- src/ML-RANN: filenames -> commands
 - *pair_style rann*
 - examples/PACKAGES/rann
-

6.2.59 ML-SNAP package

Contents:

A pair style for the spectral neighbor analysis potential (SNAP). SNAP is methodology for deriving a highly accurate classical potential fit to a large archive of quantum mechanical (DFT) data. Also several computes which analyze attributes of the potential.

Author: Aidan Thompson (Sandia).

Supporting info:

- src/ML-SNAP: filenames -> commands
 - *pair_style snap*
 - *compute sna/atom*
 - *compute sna/grid*
 - *compute sna/grid/local*
 - *compute snad/atom*
 - *compute snav/atom*
 - examples/snap
-

6.2.60 ML-UF3 package

Contents:

A pair style for the ultra-fast force field potentials (UF3). UF3 is a methodology for deriving a highly accurate classical potential which is fast to evaluate and is fitted to a large archives of quantum mechanical (DFT) data. The use of b-spline basis set in UF3 enables the rapid evaluation of 2-body and 3-body interactions.

Authors: Ajinkya C Hire (University of Florida), Hendrik Krass (University of Constance), Matthias Rupp (Luxembourg Institute of Science and Technology), Richard Hennig (University of Florida)

Supporting info:

- src/ML-UF3: filenames -> commands
- *pair_style uf3*
- examples/uf3
- <https://github.com/uf3/uf3>

6.2.61 MOFFF package

Contents:

Pair, angle and improper styles needed to employ the MOF-FF force field by Schmid and coworkers with LAMMPS. MOF-FF is a first principles derived force field with the primary aim to simulate MOFs and related porous framework materials, using spherical Gaussian charges. It is described in S. Bureekaew et al., Phys. Stat. Sol. B 2013, 250, 1128-1141. For the usage of MOF-FF see the example in the example directory as well as the [MOF+](#) website.

Author: Hendrik Heenen (Technical U of Munich), Rochus Schmid (Ruhr-University Bochum).

Supporting info:

- src/MOFFF: filenames -> commands
 - src/MOFFF/README
 - *pair_style buck6d/coul/gauss*
 - *angle_style class2*
 - *angle_style cosine/buck6d*
 - *improper_style inversion/harmonic*
 - examples/PACKAGES/mofff
-

6.2.62 MOLECULE package

Contents:

A large number of atom, pair, bond, angle, dihedral, improper styles that are used to model molecular systems with fixed covalent bonds. The pair styles include the Dreiding (hydrogen-bonding) and CHARMM force fields, and a TIP4P water model.

Supporting info:

- src/MOLECULE: filenames -> commands
 - *atom_style*
 - *bond_style*
 - *angle_style*
 - *dihedral_style*
 - *improper_style*
 - *pair_style hbond/dreiding/lj*
 - *pair_style lj/charmm/coul/charmm*
 - *Howto bioFF*
 - examples/cmap
 - examples/dreiding
 - examples/micelle,
 - examples/peptide
 - bench/in.chain
 - bench/in.rhodo
-

6.2.63 MOLFILE package

Contents:

A *dump molfile* command which uses molfile plugins that are bundled with the **VMD** molecular visualization and analysis program, to enable LAMMPS to dump snapshots in formats compatible with various molecular simulation tools.

To use this package you must have the desired VMD plugins available on your system.

Note that this package only provides the interface code, not the plugins themselves, which will be accessed when requesting a specific plugin via the *dump molfile* command. Plugins can be obtained from a VMD installation which has to match the platform that you are using to compile LAMMPS for. By adding plugins to VMD, support for new file formats can be added to LAMMPS (or VMD or other programs that use them) without having to re-compile the application itself. More information about the VMD molfile plugins can be found at <https://www.ks.uiuc.edu/Research/vmd/plugins/molfile>.

Author: Axel Kohlmeyer (Temple U).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/MOLFILE: filenames -> commands
 - src/MOLFILE/README
 - lib/molfile/README
 - *dump molfile*
-

6.2.64 NETCDF package

Contents:

Dump styles for writing NetCDF formatted dump files. NetCDF is a portable, binary, self-describing file format developed on top of HDF5. The file contents follow the AMBER NetCDF trajectory conventions (<https://ambermd.org/netcdf/nctraj.xhtml>), but include extensions.

To use this package you must have the NetCDF library available on your system.

Note that NetCDF files can be directly visualized with the following tools:

- **Ovito** (Ovito supports the AMBER convention and the extensions mentioned above)
- **VMD**

Author: Lars Pastewka (Karlsruhe Institute of Technology).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/NETCDF: filenames -> commands
- src/NETCDF/README
- lib/netcdf/README

- *dump netcdf*
-

6.2.65 OPENMP package

Contents:

Hundreds of pair, fix, compute, bond, angle, dihedral, improper, and kspace styles which are altered to enable threading on many-core CPUs via OpenMP directives. All of them have an “omp” in their style name. The [OPENMP package](#) page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the “-sf omp” or “-suffix omp” *command-line switches*. Also see the [KOKKOS](#), [OPT](#), and [INTEL](#) packages, which have styles optimized for CPUs.

Author: Axel Kohlmeyer (Temple U).

Note

To enable multi-threading support the compile flag “-fopenmp” and the link flag “-fopenmp” (for GNU compilers, you have to look up the equivalent flags for other compilers) must be used to build LAMMPS. When using Intel compilers, also the “-restrict” flag is required. The OPENMP package can be compiled without enabling OpenMP; then all code will be compiled as serial and the only improvement over the regular styles are some data access optimization. These flags should be added to the CCFLAGS and LINKFLAGS lines of your Makefile.machine. See src/MAKE/OPTIONS/Makefile.omp for an example.

Once you have an appropriate Makefile.machine, you can install/uninstall the package and build LAMMPS in the usual manner:

Install:

This package has *specific installation instructions* on the [Build extras](#) page.

Supporting info:

- src/OPENMP: filenames -> commands
 - src/OPENMP/README
 - [Accelerator packages](#)
 - [OPENMP package](#)
 - *Command line option -suffix/-sf omp*
 - *Command line option -package/-pk omp*
 - *package omp*
 - Search the *commands* pages (*fix, compute, pair, bond, angle, dihedral, improper, kspace*) for styles followed by (o)
 - [Benchmarks](#) page of website
-

6.2.66 OPT package

Contents:

A handful of pair styles which are optimized for improved CPU performance on single or multiple cores. These include EAM, LJ, CHARMM, and Morse potentials. The styles have an “opt” suffix in their style name. The *OPT package* page gives details of how to build and use this package. Its styles can be invoked at run time via the “-sf opt” or “-suffix opt” *command-line switches*. See also the *KOKKOS*, *INTEL*, and *OPENMP* packages, which have styles optimized for CPU performance.

Authors: James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technology).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/OPT: filenames -> commands
- *Accelerator packages*
- *OPT package*
- *Section 2.6 -sf opt*
- Search the *pair style* page for styles followed by (t)
- *Benchmarks* page of website

6.2.67 ORIENT package

Contents:

A few fixes that apply orientation dependent forces for studying grain boundary migration.

Supporting info:

- src/ORIENT: filenames -> commands
 - *fix orient/bcc*
 - *fix orient/fcc*
 - *fix orient/eco*
-

6.2.68 PERI package

Contents:

An atom style, several pair styles which implement different Peridynamics materials models, and several computes which calculate diagnostics. Peridynamics is a particle-based meshless continuum model.

Authors: The original package was created by Mike Parks (Sandia). Additional Peridynamics models were added by Rezwanur Rahman and John Foster (UTSA).

Supporting info:

- src/PERI: filenames -> commands

- *Peridynamics Howto*
 - [doc/PDF/PDLammps_overview.pdf](#)
 - [doc/PDF/PDLammps_EPS.pdf](#)
 - [doc/PDF/PDLammps_VES.pdf](#)
 - *atom_style peri*
 - *pair_style peri/**
 - *compute damage/atom*
 - *compute plasticity/atom*
 - [examples/peri](#)
 - <https://www.lammps.org/movies.html#peri>
-

6.2.69 PHONON package

Contents:

A *fix phonon* command that calculates dynamical matrices, which can then be used to compute phonon dispersion relations, directly from molecular dynamics simulations. And a *dynamical_matrix* as well as a *third_order* command to compute the dynamical matrix and third order tensor from finite differences.

Install:

The fix phonon command also requires that the *KSPACE* package is installed.

Authors: Ling-Ti Kong (Shanghai Jiao Tong University) for “fix phonon” and Charlie Sievers (UC Davis) for “dynamical_matrix” and “third_order”

Supporting info:

- [src/PHONON: filenames -> commands](#)
 - [src/PHONON/README](#)
 - *fix phonon*
 - *dynamical_matrix*
 - *third_order*
 - [examples/PACKAGES/phonon](#)
-

6.2.70 PLUGIN package

Contents:

A *plugin* command that can load and unload several kind of styles in LAMMPS from shared object files at runtime without having to recompile and relink LAMMPS.

When the environment variable `LAMMPS_PLUGIN_PATH` is set, then LAMMPS will search the directory (or directories) listed in this path for files with names that end in `plugin.so` (e.g. `helloplugin.so`) and will try to load the contained plugins automatically at start-up.

Authors: Axel Kohlmeyer (Temple U)

Added in version 8Apr2021.

Supporting info:

- src/PLUGIN: filenames -> commands
 - *plugin command*
 - *Information on writing plugins*
 - examples/plugin
-

6.2.71 PLUMED package

Contents:

The fix plumed command allows you to use the PLUMED free energy plugin for molecular dynamics to analyze and bias your LAMMPS trajectory on the fly. The PLUMED library is called from within the LAMMPS input script by using the *fix plumed* command.

Authors: The *PLUMED library* is written and maintained by Massimiliano Bonomi, Giovanni Bussi, Carlo Camilioni, and Gareth Tribello.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/PLUMED/README
 - lib/plumed/README
 - *fix plumed*
 - examples/PACKAGES/plumed
-

6.2.72 POEMS package

Contents:

A fix that wraps the Parallelizable Open source Efficient Multibody Software (POEMS) library, which is able to simulate the dynamics of articulated body systems. These are systems with multiple rigid bodies (collections of particles) whose motion is coupled by connections at hinge points.

Author: Rudra Mukherjee (JPL) while at RPI.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/POEMS: filenames -> commands
- src/POEMS/README
- lib/poems/README

- *fix poems*
 - *examples/rigid*
-

6.2.73 PTM package

Contents:

A *compute ptm/atom* command that calculates local structure characterization using the Polyhedral Template Matching methodology.

Author: Peter Mahler Larsen (MIT).

Supporting info:

- *src/PTM*: filenames not starting with *ptm_* -> commands
 - *src/PTM*: filenames starting with *ptm_* -> supporting code
 - *src/PTM/LICENSE*
 - *compute ptm/atom*
-

6.2.74 PYTHON package

Contents:

A *python* command which allow you to execute Python code from a LAMMPS input script. The code can be in a separate file or embedded in the input script itself. See the *Python call* page for an overview of using Python from LAMMPS in this manner and all the *Python* manual pages for other ways to use LAMMPS and Python together.

Note

Building with the PYTHON package assumes you have a Python development environment (headers and libraries) available on your system, which needs to be either Python version 2.7 or Python 3.5 and later.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- *src/PYTHON*: filenames -> commands
 - *Python call*
 - *lib/python/README*
 - *examples/python*
-

6.2.75 QEQ package

Contents:

Several fixes for performing charge equilibration (QEq) via different algorithms. These can be used with pair styles that perform QEq as part of their formulation.

Supporting info:

- src/QEQ: filenames -> commands
 - *fix qeq/**
 - examples/qeq
 - examples/streitz
-

6.2.76 QMMM package

Contents:

A *fix qmmm* command which allows LAMMPS to be used as the MM code in a QM/MM simulation. This is currently only available in combination with the [Quantum ESPRESSO](#) package.

To use this package you must have Quantum ESPRESSO (QE) available on your system and include its coupling library in the compilation and then compile LAMMPS as a library. For QM/MM calculations you then build a custom binary with MPI support, that sets up 3 partitions with MPI sub-communicators (for inter- and intra-partition communication) and then calls the corresponding library interfaces on each partition (2x LAMMPS and 1x QE).

The current implementation supports an ONIOM style mechanical coupling and a multi-pole based electrostatic coupling to the Quantum ESPRESSO plane wave DFT package. The QM/MM interface has been written in a manner that coupling to other QM codes should be possible without changes to LAMMPS itself.

Authors: Axel Kohlmeyer (Temple U), Mariella Ippolito and Carlo Cavazzoni (CINECA, Italy)

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/QMMM: filenames -> commands
 - src/QMMM/README
 - lib/qmmm/README
 - *fix phonon*
 - lib/qmmm/example-ec/README
 - lib/qmmm/example-mc/README
-

6.2.77 QTB package

Contents:

Two fixes which provide a self-consistent quantum treatment of vibrational modes in a classical molecular dynamics simulation. By coupling the MD simulation to a colored thermostat, it introduces zero point energy into the system, altering the energy power spectrum and the heat capacity to account for their quantum nature. This is useful when modeling systems at temperatures lower than their classical limits or when temperatures ramp across the classical limits in a simulation.

Author: Yuan Shen (Stanford U).

Supporting info:

- src/QTB: filenames -> commands
 - src/QTB/README
 - *fix qtb*
 - *fix qbmsst*
 - examples/PACKAGES/qtb
-

6.2.78 REACTION package

Contents:

This package implements the REACTER protocol, which allows for complex bond topology changes (reactions) during a running MD simulation when using classical force fields. Topology changes are defined in pre- and post-reaction molecule templates and can include creation and deletion of bonds, angles, dihedrals, improper, atom types, bond types, angle types, dihedral types, improper types, and/or atomic charges. Other options currently available include reaction constraints (e.g., angle and Arrhenius constraints), deletion of reaction byproducts or other small molecules, creation of new atoms or molecules bonded to existing atoms, and using LAMMPS variables for input parameters.

Author: Jacob R. Gissinger (NASA Langley Research Center).

Supporting info:

- src/REACTION: filenames -> commands
 - src/REACTION/README
 - *fix bond/react*
 - examples/PACKAGES/reaction
 - 2017 LAMMPS Workshop
 - 2019 LAMMPS Workshop
 - 2021 LAMMPS Workshop
 - REACTER website (reacter.org)
-

6.2.79 REAXFF package

Contents:

A pair style which implements the ReaxFF potential in C/C++. ReaxFF is a universal reactive force field. See the [src/REAXFF/README](#) file for more info on differences between the two packages. Also two fixes for monitoring molecules as bonds are created and destroyed.

Author: Hasan Metin Aktulga (MSU) while at Purdue University.

Supporting info:

- [src/REAXFF: filenames -> commands](#)
 - [src/REAXFF/README](#)
 - [pair_style reaxff](#)
 - [fix reaxff/bonds](#)
 - [fix reaxff/species](#)
 - [examples/reaxff](#)
-

6.2.80 REPLICA package

Contents:

A collection of multi-replica methods which can be used when running multiple LAMMPS simulations (replicas). See the [Howto replica](#) page for an overview of how to run multi-replica simulations in LAMMPS. Methods in the package include nudged elastic band (NEB), parallel replica dynamics (PRD), temperature accelerated dynamics (TAD), parallel tempering, and a verlet/split algorithm for performing long-range Coulombics on one set of processors, and the remainder of the force field calculation on another set.

Supporting info:

 - [examples/tad](#)
 - [examples/PACKAGES/grem](#)
-

6.2.81 RHEO package

Contents:

Pair styles, bond styles, fixes, and computes for reproducing hydrodynamics and elastic objects. See the [Howto rheo](#) page for an overview.

Install:

This package has *specific installation instructions* on the [Build extras](#) page.

Authors: Joel T. Clemmer (Sandia National Labs), Thomas C. O'Connor (Carnegie Mellon University)

Added in version TBD.

Supporting info:

- src/RHEO filenames -> commands
 - [Howto_rheo](#)
 - [atom_style rheo](#)
 - [atom_style rheo/thermal](#)
 - [bond_style rheo/shell](#)
 - [compute rheo/property/atom](#)
 - [fix rheo](#)
 - [fix rheo/oxidation](#)
 - [fix rheo/pressure](#)
 - [fix rheo/thermal](#)
 - [fix rheo/viscosity](#)
 - [pair_style rheo](#)
 - [pair_style rheo/solid](#)
 - examples/rheo
-

6.2.82 RIGID package

Contents:

Fixes which enforce rigid constraints on collections of atoms or particles. This includes SHAKE and RATTLE, as well as various rigid-body integrators for a few large bodies or many small bodies. Also several computes which calculate properties of rigid bodies.

Supporting info:

- src/RIGID: filenames -> commands
- [compute erotate/rigid](#)
- [fix shake](#)
- [fix rattle](#)
- [fix rigid/*](#)

- `examples/ASPHERE`
 - `examples/rigid`
 - `bench/in.rhodo`
 - <https://www.lammps.org/movies.html#box>
 - <https://www.lammps.org/movies.html#star>
-

6.2.83 SCAFACOS package

Contents:

A KSpace style which wraps the [ScaFaCoS Coulomb solver library](#) to compute long-range Coulombic interactions.

To use this package you must have the ScaFaCoS library available on your system.

Author: Rene Halver (JSC) wrote the `scafacos` LAMMPS command.

ScaFaCoS itself was developed by a consortium of German research facilities with a BMBF (German Ministry of Science and Education) funded project in 2009-2012. Participants of the consortium were the Universities of Bonn, Chemnitz, Stuttgart, and Wuppertal as well as the Forschungszentrum Juelich.

Install:

This package has *specific installation instructions* on the [Build extras](#) page. The SCAFACOS package requires that LAMMPS is build in *MPI parallel mode*.

Supporting info:

- `src/SCAFACOS: filenames -> commands`
 - `src/SCAFACOS/README`
 - *`kpace_style scafacos`*
 - *`kpace_modify`*
 - `examples/PACKAGES/sfacacos`
-

6.2.84 SHOCK package

Contents:

Fixes for running impact simulations where a shock-wave passes through a material.

Supporting info:

- `src/SHOCK: filenames -> commands`
- *`fix append/atoms`*
- *`fix msst`*
- *`fix np Hug`*
- *`fix wall/piston`*
- `examples/hugonostat`

- [examples/msst](#)
-

6.2.85 SMTBQ package

Contents:

Pair styles which implement Second Moment Tight Binding models. One with QEq charge equilibration (SMTBQ) for the description of ionocovalent bonds in oxides, and two more as plain SMATB models.

Authors: SMTBQ: Nicolas Salles, Emile Maras, Olivier Politano, and Robert Tetot (LAAS-CNRS, France); SMATB: Daniele Rapetti (Politecnico di Torino)

Supporting info:

- [src/SMTBQ](#): filenames -> commands
 - [src/SMTBQ/README](#)
 - [pair_style smtbq](#)
 - [pair_style smatb](#), [pair_style smatb/single](#)
 - [examples/PACKAGES/smtbq](#)
-

6.2.86 SPH package

Contents:

An atom style, fixes, computes, and several pair styles which implements smoothed particle hydrodynamics (SPH) for liquids. See the related [MACHDYN package](#) for smooth Mach dynamics (SMD) for solids.

This package contains ideal gas, Lennard-Jones equation of states, Tait, and full support for complete (i.e. internal-energy dependent) equations of state. It allows for plain or Monaghans XSPH integration of the equations of motion. It has options for density continuity or density summation to propagate the density field. It has [set](#) command options to set the internal energy and density of particles from the input script and allows the same quantities to be output with thermodynamic output or to dump files via the [compute property/atom](#) command.

Author: Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

Supporting info:

- [src/SPH](#): filenames -> commands
 - [src/SPH/README](#)
 - [doc/PDF/SPH_LAMMPS_userguide.pdf](#)
 - [examples/PACKAGES/sph](#)
 - <https://www.lammps.org/movies.html#sph>
-

6.2.87 SPIN package

Contents:

Model atomic magnetic spins classically, coupled to atoms moving in the usual manner via MD. Various pair, fix, and compute styles.

Author: Julien Tranchida (Sandia).

Supporting info:

- src/SPIN: filenames -> commands
 - *Howto spins*
 - *pair_style spin/dipole/cut*
 - *pair_style spin/dipole/long*
 - *pair_style spin/dmi*
 - *pair_style spin/exchange*
 - *pair_style spin/exchange/biquadratic*
 - *pair_style spin/magelec*
 - *pair_style spin/neel*
 - *fix nve/spin*
 - *fix langevin/spin*
 - *fix precession/spin*
 - *compute spin*
 - *neb/spin*
 - examples/SPIN
-

6.2.88 SRD package

Contents:

A pair of fixes which implement the Stochastic Rotation Dynamics (SRD) method for coarse-graining of a solvent, typically around large colloidal particles.

Supporting info:

- src/SRD: filenames -> commands
- *fix srd*
- *fix wall/srd*
- examples/srd
- examples/ASPHERE
- <https://www.lammps.org/movies.html#tri>
- <https://www.lammps.org/movies.html#line>
- <https://www.lammps.org/movies.html#poly>

6.2.89 TALLY package

Contents:

Several compute styles that can be called when pairwise interactions are calculated to tally information (forces, heat flux, energy, stress, etc) about individual interactions.

Author: Axel Kohlmeyer (Temple U).

Supporting info:

- src/TALLY: filenames -> commands
 - src/TALLY/README
 - *compute */tally*
 - examples/PACKAGES/tally
-

6.2.90 UEF package

Contents:

A fix style for the integration of the equations of motion under extensional flow with proper boundary conditions, as well as several supporting compute styles and an output option.

Author: David Nicholson (MIT).

Supporting info:

- src/UEF: filenames -> commands
 - src/UEF/README
 - *fix nvt/uef*
 - *fix npt/uef*
 - *compute pressure/uef*
 - *compute temp/uef*
 - *dump cfg/uef*
 - examples/uef
-

6.2.91 VORONOI package

Contents:

A `compute` command which calculates the Voronoi tessellation of a collection of atoms by wrapping the [Voro++ library](#). This can be used to calculate the local volume of each atom or its near neighbors.

To use this package you must have the Voro++ library available on your system.

Author: Daniel Schwen (INL) while at LANL. The open-source Voro++ library was written by Chris Rycroft (Harvard U) while at UC Berkeley and LBNL.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/VORONOI`: filenames -> commands
 - `src/VORONOI/README`
 - `lib/voronoi/README`
 - *`compute voronoi/atom`*
 - `examples/voronoi`
-

6.2.92 VTK package

Contents:

A *`dump vtk`* command which outputs snapshot info in the [VTK format](#), enabling visualization by [Paraview](#) or other visualization packages.

To use this package you must have VTK library available on your system.

Authors: Richard Berger (JKU) and Daniel Queteschiner (DCS Computing).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- `src/VTK`: filenames -> commands
 - `src/VTK/README`
 - `lib/vtk/README`
 - *`dump vtk`*
-

6.2.93 YAFF package

Contents:

Some potentials that are also implemented in the Yet Another Force Field (YAFF) code. The expressions and their use are discussed in the following papers

- Vanduyfhuys et al., J. Comput. Chem., 36 (13), 1015-1027 (2015) [link](#)
- Vanduyfhuys et al., J. Comput. Chem., 39 (16), 999-1011 (2018) [link](#)

which discuss the QuickFF methodology.

Author: Steven Vandenbrande.

Added in version 1Feb2019.

Supporting info:

- src/YAFF/README
- *angle_style cross*
- *angle_style mm3*
- *bond_style mm3*
- *improper_style distharm*
- *improper_style sqdistharm*
- *pair_style mm3/switch3/coulgauss/long*
- *pair_style lj/switch3/coulgauss/long*
- examples/PACKAGES/yaff

ACCELERATE PERFORMANCE

This section describes various methods for improving LAMMPS performance for different classes of problems running on different kinds of machines.

There are two thrusts to the discussion that follows. The first is using code options that implement alternate algorithms that can speed-up a simulation. The second is to use one of the several accelerator packages provided with LAMMPS that contain code optimized for certain kinds of hardware, including multicore CPUs, GPUs, and Intel Xeon Phi co-processors.

The [Benchmark page](#) of the LAMMPS website gives performance results for the various accelerator packages discussed on the [Accelerator packages](#) page, for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

7.1 Benchmarks

Current LAMMPS performance is discussed on the [Benchmarks page](#) of the [LAMMPS website](#) where timings and parallel efficiency are listed. The page has several sections, which are briefly described below:

- CPU performance on 5 standard problems, strong and weak scaling
- GPU and Xeon Phi performance on same and related problems
- Comparison of cost of interatomic potentials
- Performance of huge, billion-atom problems

The 5 standard problems are as follow:

1. LJ = atomic fluid, Lennard-Jones potential with 2.5 sigma cutoff (55 neighbors per atom), NVE integration
2. Chain = bead-spring polymer melt of 100-mer chains, FENE bonds and LJ pairwise interactions with a $2^{1/6}$ sigma cutoff (5 neighbors per atom), NVE integration
3. EAM = metallic solid, Cu EAM potential with 4.95 Angstrom cutoff (45 neighbors per atom), NVE integration
4. Chute = granular chute flow, frictional history potential with 1.1 sigma cutoff (7 neighbors per atom), NVE integration
5. Rhodo = rhodopsin protein in solvated lipid bilayer, CHARMM force field with a 10 Angstrom LJ cutoff (440 neighbors per atom), particle-particle particle-mesh (PPPM) for long-range Coulombics, NPT integration

Input files for these 5 problems are provided in the bench directory of the LAMMPS distribution. Each has 32,000 atoms and runs for 100 timesteps. The size of the problem (number of atoms) can be varied using command-line switches as described in the bench/README file. This is an easy way to test performance and either strong or weak scalability on your machine.

The bench directory includes a few log.* files that show performance of these 5 problems on 1 or 4 cores of Linux desktop. The bench/FERMI and bench/KEPLER directories have input files and scripts and instructions for running the same (or similar) problems using OpenMP or GPU or Xeon Phi acceleration options. See the README files in those directories and the [Accelerator packages](#) pages for instructions on how to build LAMMPS and run on that kind of hardware.

The bench/POTENTIALS directory has input files which correspond to the table of results on the [Potentials](#) section of the Benchmarks web page. So you can also run those test problems on your machine.

The [billion-atom](#) section of the Benchmarks web page has performance data for very large benchmark runs of simple Lennard-Jones (LJ) models, which use the bench/in.lj input script.

For all the benchmarks, a useful metric is the CPU cost per atom per timestep. Since performance scales roughly linearly with problem size and timesteps for all LAMMPS models (i.e. interatomic or coarse-grained potentials), the run time of any problem using the same model (atom style, force field, cutoff, etc) can then be estimated.

Performance on a parallel machine can also be predicted from one-core or one-node timings if the parallel efficiency can be estimated. The communication bandwidth and latency of a particular parallel machine affects the efficiency. On most machines LAMMPS will give a parallel efficiency on these benchmarks above 50% so long as the number of atoms/core is a few 100 or greater, and closer to 100% for large numbers of atoms/core. This is for all-MPI mode with one MPI task per core. For nodes with accelerator options or hardware (OpenMP, GPU, Phi), you should first measure single node performance. Then you can estimate parallel performance for multi-node runs using the same logic as for all-MPI mode, except that now you will typically need many more atoms/node to achieve good scalability.

7.2 Measuring performance

Before trying to make your simulation run faster, you should understand how it currently performs and where the bottlenecks are.

The best way to do this is run the your system (actual number of atoms) for a modest number of timesteps (say 100 steps) on several different processor counts, including a single processor if possible. Do this for an equilibrium version of your system, so that the 100-step timings are representative of a much longer run. There is typically no need to run for 1000s of timesteps to get accurate timings; you can simply extrapolate from short runs.

For the set of runs, look at the timing data printed to the screen and log file at the end of each LAMMPS run. The [screen and logfile output](#) page gives an overview.

Running on one (or a few processors) should give a good estimate of the serial performance and what portions of the timestep are taking the most time. Running the same problem on a few different processor counts should give an estimate of parallel scalability. I.e. if the simulation runs 16x faster on 16 processors, its 100% parallel efficient; if it runs 8x faster on 16 processors, it's 50% efficient.

The most important data to look at in the timing info is the timing breakdown and relative percentages. For example, trying different options for speeding up the long-range solvers will have little impact if they only consume 10% of the run time. If the pairwise time is dominating, you may want to look at GPU or OMP versions of the pair style, as discussed below. Comparing how the percentages change as you increase the processor count gives you a sense of how different operations within the timestep are scaling. Note that if you are running with a Kspace solver, there is additional output on the breakdown of the Kspace time. For PPPM, this includes the fraction spent on FFTs, which can be communication intensive.

Another important detail in the timing info are the histograms of atoms counts and neighbor counts. If these vary widely across processors, you have a load-imbalance issue. This often results in inaccurate relative timing data, because processors have to wait when communication occurs for other processors to catch up. Thus the reported times for “Communication” or “Other” may be higher than they really are, due to load-imbalance. If this is an issue, you can use the [timer sync](#) command to obtain synchronized timings.

7.3 General tips

Note

this page is still a work in progress

Here is a list of general ideas for improving simulation performance. Most of them are only applicable to certain models and certain bottlenecks in the current performance, so let the timing data you generate be your guide. It is hard, if not impossible, to predict how much difference these options will make, since it is a function of problem size, number of processors used, and your machine. There is no substitute for identifying performance bottlenecks, and trying out various options.

- rRESPA
- Two-FFT PPPM
- Staggered PPPM
- single vs double PPPM
- partial charge PPPM
- verlet/split run style
- processor command for proc layout and numa layout
- load-balancing: balance and fix balance

Two-FFT PPPM, also called *analytic differentiation* or *ad* PPPM, uses 2 FFTs instead of the 4 FFTs used by the default *ik differentiation* PPPM. However, 2-FFT PPPM also requires a slightly larger mesh size to achieve the same accuracy as 4-FFT PPPM. For problems where the FFT cost is the performance bottleneck (typically large problems running on many processors), 2-FFT PPPM may be faster than 4-FFT PPPM.

Staggered PPPM performs calculations using two different meshes, one shifted slightly with respect to the other. This can reduce force aliasing errors and increase the accuracy of the method, but also doubles the amount of work required. For high relative accuracy, using staggered PPPM allows one to half the mesh size in each dimension as compared to regular PPPM, which can give around a 4x speedup in the kspace time. However, for low relative accuracy, using staggered PPPM gives little benefit and can be up to 2x slower in the kspace time. For example, the rhodopsin benchmark was run on a single processor, and results for kspace time vs. relative accuracy for the different methods are shown in the figure below. For this system, staggered PPPM (using *ik differentiation*) becomes useful when using a relative accuracy of slightly greater than $1e-5$ and above.

**Note**

Using staggered PPPM may not give the same increase in accuracy of energy and pressure as it does in forces, so some caution must be used if energy and/or pressure are quantities of interest, such as when using a barostat.

7.4 Accelerator packages

Accelerated versions of various *pair_style*, *fixes*, *computes*, and other commands have been added to LAMMPS, which will typically run faster than the standard non-accelerated versions. Some require appropriate hardware to be present on your system, e.g. GPUs or Intel Xeon Phi co-processors.

All of these commands are in packages provided with LAMMPS. An overview of packages is give on the [Packages](#) doc pages.

These are the accelerator packages currently in LAMMPS:

<i>GPU Package</i>	for GPUs via CUDA, OpenCL, or ROCm HIP
<i>INTEL Package</i>	for Intel CPUs and Intel Xeon Phi
<i>KOKKOS Package</i>	for NVIDIA GPUs, Intel Xeon Phi, and OpenMP threading
<i>OPENMP Package</i>	for OpenMP threading and generic CPU optimizations
<i>OPT Package</i>	generic CPU optimizations

7.4.1 GPU package

The GPU package was developed by Mike Brown while at SNL and ORNL (now at Intel Corp.) and his collaborators, particularly Trung Nguyen (now at Northwestern). Support for AMD GPUs via HIP was added by Vsevolod Nikolskiy and coworkers at HSE University.

The GPU package provides GPU versions of many pair styles and for parts of the *k-space style pppm* for long-range Coulombics. It has the following general features:

- It is designed to exploit common GPU hardware configurations where one or more GPUs are coupled to many cores of one or more multicore CPUs, e.g. within a node of a parallel machine.
- Atom-based data (e.g. coordinates, forces) are moved back-and-forth between the CPU(s) and GPU every timestep.
- Neighbor lists can be built on the CPU or on the GPU
- The charge assignment and force interpolation portions of PPPM can be run on the GPU. The FFT portion, which requires MPI communication between processors, runs on the CPU.
- Force computations of different style (pair vs. bond/angle/dihedral/improper) can be performed concurrently on the GPU and CPU(s), respectively.
- It allows for GPU computations to be performed in single or double precision, or in mixed-mode precision, where pairwise forces are computed in single precision, but accumulated into double-precision force vectors.
- LAMMPS-specific code is in the GPU package. It makes calls to a generic GPU library in the `lib/gpu` directory. This library provides either Nvidia support, AMD support, or more general OpenCL support (for Nvidia GPUs, AMD GPUs, Intel GPUs, and multicore CPUs). so that the same functionality is supported on a variety of hardware.

Required hardware/software:

To compile and use this package in CUDA mode, you currently need to have an NVIDIA GPU and install the corresponding NVIDIA CUDA toolkit software on your system (this is only tested on Linux and unsupported on Windows):

- Check if you have an NVIDIA GPU: `cat /proc/driver/nvidia/gpus/*/information`
- Go to <https://developer.nvidia.com/cuda-downloads>
- Install a driver and toolkit appropriate for your system (SDK is not necessary)
- Run `lammps/lib/gpu/nvc_get_devices` (after building the GPU library, see below) to list supported devices and properties

To compile and use this package in OpenCL mode, you currently need to have the OpenCL headers and the (vendor neutral) OpenCL library installed. In OpenCL mode, the acceleration depends on having an [OpenCL Installable Client Driver \(ICD\)](#) installed. There can be multiple of them for the same or different hardware (GPUs, CPUs, Accelerators) installed at the same time. OpenCL refers to those as ‘platforms’. The GPU library will try to auto-select the best suitable platform, but this can be overridden using the `platform` option of the `package` command. run `lammps/lib/gpu/ocl_get_devices` to get a list of available platforms and devices with a suitable ICD available.

To compile and use this package for Intel GPUs, OpenCL or the Intel oneAPI HPC Toolkit can be installed using linux package managers. The latter also provides optimized C++, MPI, and many other libraries and tools. See:

- <https://software.intel.com/content/www/us/en/develop/tools/oneapi/hpc-toolkit/download.html>

If you do not have a discrete GPU card installed, this package can still provide significant speedups on some CPUs that include integrated GPUs. Additionally, for many macs, OpenCL is already included with the OS and Makefiles are available in the `lib/gpu` directory.

To compile and use this package in HIP mode, you have to have the AMD ROCm software installed. Versions of ROCm older than 3.5 are currently deprecated by AMD.

Building LAMMPS with the GPU package:

See the [Build extras](#) page for instructions.

Run with the GPU package from the command line:

The `mpirun` or `mpiexec` command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the `mpirun` command in MPICH does this via its `-np` and `-ppn` switches. Ditto for OpenMPI via `-np` and `-npnnode`.

When using the GPU package, you cannot assign more than one GPU to a single MPI task. However multiple MPI tasks can share the same GPU, and in many cases it will be more efficient to run this way. Likewise it may be more efficient to use less MPI tasks/node than the available # of CPU cores. Assignment of multiple MPI tasks to a GPU will happen automatically if you create more MPI tasks/node than there are GPUs/node. E.g. with 8 MPI tasks/node and 2 GPUs, each GPU will be shared by 4 MPI tasks.

The GPU package also has limited support for OpenMP for both multi-threading and vectorization of routines that are run on the CPUs. This requires that the GPU library and LAMMPS are built with flags to enable OpenMP support (e.g. `-fopenmp`). Some styles for time integration are also available in the GPU package. These run completely on the CPUs in full double precision, but exploit multi-threading and vectorization for faster performance.

Use the “`-sf gpu`” *command-line switch*, which will automatically append “`gpu`” to styles that support it. Use the “`-pk gpu Ng`” *command-line switch* to set `Ng` = # of GPUs/node to use. If `Ng` is 0, the number is selected automatically as the number of matching GPUs that have the highest number of compute cores.

```

lmp_machine -sf gpu -pk gpu 1 -in in.script           # 1 MPI task uses 1 GPU
mpirun -np 12 lmp_machine -sf gpu -pk gpu 2 -in in.script # 12 MPI tasks share 2 GPUs on a single 16-core (or whatever) node
mpirun -np 48 -ppn 12 lmp_machine -sf gpu -pk gpu 2 -in in.script # ditto on 4 16-core nodes

```

Note that if the “`-sf gpu`” switch is used, it also issues a default `package gpu 0` command, which will result in automatic selection of the number of GPUs to use.

Using the “`-pk`” switch explicitly allows for setting of the number of GPUs/node to use and additional options. Its syntax is the same as the “`package gpu`” command. See the [package](#) command page for details, including the default values used for all its options if it is not specified.

Note that the default for the `package gpu` command is to set the Newton flag to “off” pairwise interactions. It does not affect the setting for bonded interactions (LAMMPS default is “on”). The “off” setting for pairwise interaction is currently required for GPU package pair styles.

Or run with the GPU package by editing an input script:

The discussion above for the `mpirun` or `mpiexec` command, MPI tasks/node, and use of multiple MPI tasks/GPU is the same.

Use the `suffix gpu` command, or you can explicitly add an “`gpu`” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/gpu 2.5
```

You must also use the `package gpu` command to enable the GPU package, unless the “`-sf gpu`” or “`-pk gpu`” *command-line switches* were used. It specifies the number of GPUs/node to use, as well as other options.

Speed-ups to expect:

The performance of a GPU versus a multicore CPU is a function of your hardware, which pair style is used, the number of atoms/GPU, and the precision used on the GPU (double, single, mixed). Using the GPU package in OpenCL mode on CPUs (which uses vectorization and multithreading) is usually resulting in inferior performance compared to using LAMMPS’ native threading and vectorization support in the OPENMP and INTEL packages.

See the [Benchmark](#) page of the LAMMPS website for performance of the GPU package on various hardware, including the Titan HPC platform at ORNL.

You should also experiment with how many MPI tasks per GPU to use to give the best performance for your problem and machine. This is also a function of the problem size and the pair style being using. Likewise, you should experiment with the precision setting for the GPU library to see if single or mixed precision will give accurate results, since they will typically be faster.

MPI parallelism typically outperforms OpenMP parallelism, but in some cases using fewer MPI tasks and multiple OpenMP threads with the GPU package can give better performance. 3-body potentials can often perform better with multiple OMP threads because the inter-process communication is higher for these styles with the GPU package in order to allow deterministic results.

Guidelines for best performance:

- Using multiple MPI tasks per GPU will often give the best performance, as allowed my most multicore CPU/GPU configurations.
- If the number of particles per MPI task is small (e.g. 100s of particles), it can be more efficient to run with fewer MPI tasks per GPU, even if you do not use all the cores on the compute node.
- The [package gpu](#) command has several options for tuning performance. Neighbor lists can be built on the GPU or CPU. Force calculations can be dynamically balanced across the CPU cores and GPUs. GPU-specific settings can be made which can be optimized for different hardware. See the [package](#) command page for details.
- As described by the [package gpu](#) command, GPU accelerated pair styles can perform computations asynchronously with CPU computations. The “Pair” time reported by LAMMPS will be the maximum of the time required to complete the CPU pair style computations and the time required to complete the GPU pair style computations. Any time spent for GPU-enabled pair styles for computations that run simultaneously with [bond](#), [angle](#), [dihedral](#), [improper](#), and [long-range](#) calculations will not be included in the “Pair” time.
- Since only part of the pppm kspace style is GPU accelerated, it may be faster to only use GPU acceleration for Pair styles with long-range electrostatics. See the “pair/only” keyword of the package command for a shortcut to do that. The work between kspace on the CPU and non-bonded interactions on the GPU can be balanced through adjusting the coulomb cutoff without loss of accuracy.
- When the *mode* setting for the package gpu command is force/neigh, the time for neighbor list calculations on the GPU will be added into the “Pair” time, not the “Neigh” time. An additional breakdown of the times required for various tasks on the GPU (data copy, neighbor calculations, force computations, etc) are output only with the LAMMPS screen output (not in the log file) at the end of each run. These timings represent total time spent on the GPU for each routine, regardless of asynchronous CPU calculations.
- The output section “GPU Time Info (average)” reports “Max Mem / Proc”. This is the maximum memory used at one time on the GPU for data storage by a single MPI process.

Restrictions

None.

7.4.2 INTEL package

The INTEL package is maintained by Mike Brown at Intel Corporation. It provides two methods for accelerating simulations, depending on the hardware you have. The first is acceleration on Intel CPUs by running in single, mixed, or double precision with vectorization. The second is acceleration on Intel Xeon Phi co-processors via offloading neighbor list and non-bonded force calculations to the Phi. The same C++ code is used in both cases. When offloading to a co-processor from a CPU, the same routine is run twice, once on the CPU and once with an offload flag. This allows LAMMPS to run on the CPU cores and co-processor cores simultaneously.

Currently Available INTEL Styles

- Angle Styles: charmm, harmonic
- Bond Styles: fene, fourier, harmonic
- Dihedral Styles: charmm, fourier, harmonic, oplis
- Fixes: nve, npt, nvt, nvt/sllod, nve/asphere
- Improper Styles: cvff, harmonic
- Pair Styles: airebo, airebo/morse, buck/coul/cut, buck/coul/long, buck, dpd, eam, eam/alloy, eam/fs, gayberne, lj/charmm/coul/charmm, lj/charmm/coul/long, lj/cut, lj/cut/coul/long, lj/long/coul/long, rebo, sw, tersoff
- K-Space Styles: pppm, pppm/disp

Warning

None of the styles in the INTEL package currently support computing per-atom stress. If any compute or fix in your input requires it, LAMMPS will abort with an error message.

Speed-up to expect

The speedup will depend on your simulation, the hardware, which styles are used, the number of atoms, and the floating-point precision mode. Performance improvements are shown compared to LAMMPS *without using other acceleration packages* as these are under active development (and subject to performance changes). The measurements were performed using the input files available in the src/INTEL/TEST directory with the provided run script. These are scalable in size; the results given are with 512K particles (524K for Liquid Crystal). Most of the simulations are standard LAMMPS benchmarks (indicated by the filename extension in parenthesis) with modifications to the run length and to add a warm-up run (for use with offload benchmarks).

Results are speedups obtained on Intel Xeon E5-2697v4 processors (code-named Broadwell), Intel Xeon Phi 7250 processors (code-named Knights Landing), and Intel Xeon Gold 6148 processors (code-named Skylake) with “June 2017” LAMMPS built with Intel Parallel Studio 2017 update 2. Results are with 1 MPI task per physical core. See [src/INTEL/TEST/README](#) for the raw simulation rates and instructions to reproduce.

Accuracy and order of operations

In most molecular dynamics software, parallelization parameters (# of MPI, OpenMP, and vectorization) can change the results due to changing the order of operations with finite-precision calculations. The INTEL package is deterministic. This means that the results should be reproducible from run to run with the *same* parallel configurations and when using deterministic libraries or library settings (MPI, OpenMP, FFT). However, there are differences in the INTEL package that can change the order of operations compared to LAMMPS without acceleration:

- Neighbor lists can be created in a different order
- Bins used for sorting atoms can be oriented differently
- The default stencil order for PPPM is 7. By default, LAMMPS will calculate other PPPM parameters to fit the desired accuracy with this order
- The *newton* setting applies to all atoms, not just atoms shared between MPI tasks
- Vectorization can change the order for adding pairwise forces
- When using the `-DLMP_USE_MKL_RNG` define (all included intel optimized makefiles do) at build time, the random number generator for dissipative particle dynamics (pair style dpd/intel) uses the Mersenne Twister generator included in the Intel MKL library (that should be more robust than the default Masaglia random number generator)

The precision mode (described below) used with the INTEL package can change the *accuracy* of the calculations. For the default *mixed* precision option, calculations between pairs or triplets of atoms are performed in single precision, intended to be within the inherent error of MD simulations. All accumulation is performed in double precision to prevent the error from growing with the number of atoms in the simulation. *Single* precision mode should not be used without appropriate validation.

Quick Start for Experienced Users

LAMMPS should be built with the INTEL package installed. Simulations should be run with 1 MPI task per physical *core*, not *hardware thread*.

- Edit src/MAKE/OPTIONS/Makefile.intel_cpu_intelmpi as necessary.
- Set the environment variable KMP_BLOCKTIME=0
- “-pk intel 0 omp \$t -sf intel” added to LAMMPS command-line
- \$t should be 2 for Intel Xeon CPUs and 2 or 4 for Intel Xeon Phi
- For some of the simple 2-body potentials without long-range electrostatics, performance and scalability can be better with the “newton off” setting added to the input script
- For simulations on higher node counts, add “processors * * * grid numa” to the beginning of the input script for better scalability
- If using *kpace_style pppm* in the input script, add “kpace_modify diff ad” for better performance

For Intel Xeon Phi CPUs:

- Runs should be performed using MCDRAM.

For simulations using *kpace_style pppm* on Intel CPUs supporting AVX-512:

- Add “kpace_modify diff ad” to the input script
- The command-line option should be changed to “-pk intel 0 omp \$r lrt yes -sf intel” where \$r is the number of threads minus 1.
- Do not use thread affinity (set KMP_AFFINITY=none)
- The “newton off” setting may provide better scalability

For Intel Xeon Phi co-processors (Offload):

- Edit src/MAKE/OPTIONS/Makefile.intel_co-processor as necessary
- “-pk intel N omp 1” added to command-line where N is the number of co-processors per node.

Required hardware/software

When using Intel compilers version 16.0 or later is required.

In order to use offload to co-processors, an Intel Xeon Phi co-processor and an Intel compiler are required.

Although any compiler can be used with the INTEL package, currently, vectorization directives are disabled by default when not using Intel compilers due to lack of standard support and observations of decreased performance. The OpenMP standard now supports directives for vectorization and we plan to transition the code to this standard once it is available in most compilers. We expect this to allow improved performance and support with other compilers.

For Intel Xeon Phi x200 series processors (code-named Knights Landing), there are multiple configuration options for the hardware. For best performance, we recommend that the MCDRAM is configured in “Flat” mode and with the cluster mode set to “Quadrant” or “SNC4”. “Cache” mode can also be used, although the performance might be slightly lower.

Notes about Simultaneous Multithreading

Modern CPUs often support Simultaneous Multithreading (SMT). On Intel processors, this is called Hyper-Threading (HT) technology. SMT is hardware support for running multiple threads efficiently on a single core. *Hardware threads* or *logical cores* are often used to refer to the number of threads that are supported in hardware. For example, the Intel Xeon E5-2697v4 processor is described as having 36 cores and 72 threads. This means that 36 MPI processes or OpenMP threads can run simultaneously on separate cores, but that up to 72 MPI processes or OpenMP threads can be running on the CPU without costly operating system context switches.

Molecular dynamics simulations will often run faster when making use of SMT. If a thread becomes stalled, for example because it is waiting on data that has not yet arrived from memory, another thread can start running so that the CPU pipeline is still being used efficiently. Although benefits can be seen by launching a MPI task for every hardware thread, for multinode simulations, we recommend that OpenMP threads are used for SMT instead, either with the INTEL package, *OPENMP package*, or *KOKKOS package*. In the example above, up to 36X speedups can be observed by using all 36 physical cores with LAMMPS. By using all 72 hardware threads, an additional 10-30% performance gain can be achieved.

The BIOS on many platforms allows SMT to be disabled, however, we do not recommend this on modern processors as there is little to no benefit for any software package in most cases. The operating system will report every hardware thread as a separate core allowing one to determine the number of hardware threads available. On Linux systems, this information can normally be obtained with:

```
cat /proc/cpuinfo
```

Building LAMMPS with the INTEL package

See the [Build extras](#) page for instructions. Some additional details are covered here.

For building with make, several example Makefiles for building with the Intel compiler are included with LAMMPS in the src/MAKE/OPTIONS/ directory:

```
Makefile.intel_cpu_intelmpi # Intel Compiler, Intel MPI, No Offload
Makefile.knl                # Intel Compiler, Intel MPI, No Offload
Makefile.intel_cpu_mpich    # Intel Compiler, MPICH, No Offload
Makefile.intel_cpu_openmpi  # Intel Compiler, OpenMPI, No Offload
Makefile.intel_co-processor # Intel Compiler, Intel MPI, Offload
```

Makefile.knl is identical to Makefile.intel_cpu_intelmpi except that it explicitly specifies that vectorization should be for Intel Xeon Phi x200 processors making it easier to cross-compile. For users with recent installations of Intel Parallel Studio, the process can be as simple as:

```
make yes-intel
source /opt/intel/parallel_studio_xe_2016.3.067/psxevars.sh
# or psxevars.csh for C-shell
make intel_cpu_intelmpi
```

Note that if you build with support for a Phi co-processor, the same binary can be used on nodes with or without co-processors installed. However, if you do not have co-processors on your system, building without offload support will produce a smaller binary.

The general requirements for Makefiles with the INTEL package are as follows. When using Intel compilers, “-restrict” is required and “-qopenmp” is highly recommended for CCFLAGS and LINKFLAGS. CCFLAGS should include “-DLMP_INTEL_USELRT” (unless POSIX Threads are not supported in the build environment) and “-DLMP_USE_MKL_RNG” (unless Intel Math Kernel Library (MKL) is not available in the build environment). For Intel compilers, LIB should include “-ltbbmalloc” or if the library is not available, “-DLMP_INTEL_NO_TBB” can be

added to CCFLAGS. For builds supporting offload, “-DLMP_INTEL_OFFLOAD” is required for CCFLAGS and “-qoffload” is required for LINKFLAGS. Other recommended CCFLAG options for best performance are “-O2 -fno-alias -ansi-alias -qoverride-limits fp-model fast=2 -no-prec-div”.

Note

See the src/INTEL/README file for additional flags that might be needed for best performance on Intel server processors code-named “Skylake”.

Note

The vectorization and math capabilities can differ depending on the CPU. For Intel compilers, the “-x” flag specifies the type of processor for which to optimize. “-xHost” specifies that the compiler should build for the processor used for compiling. For Intel Xeon Phi x200 series processors, this option is “-xMIC-AVX512”. For fourth generation Intel Xeon (v4/Broadwell) processors, “-xCORE-AVX2” should be used. For older Intel Xeon processors, “-xAVX” will perform best in general for the different simulations in LAMMPS. The default in most of the example Makefiles is to use “-xHost”, however this should not be used when cross-compiling.

Running LAMMPS with the INTEL package

Running LAMMPS with the INTEL package is similar to normal use with the exceptions that one should 1) specify that LAMMPS should use the INTEL package, 2) specify the number of OpenMP threads, and 3) optionally specify the specific LAMMPS styles that should use the INTEL package. 1) and 2) can be performed from the command-line or by editing the input script. 3) requires editing the input script. Advanced performance tuning options are also described below to get the best performance.

When running on a single node (including runs using offload to a co-processor), best performance is normally obtained by using 1 MPI task per physical core and additional OpenMP threads with SMT. For Intel Xeon processors, 2 OpenMP threads should be used for SMT. For Intel Xeon Phi CPUs, 2 or 4 OpenMP threads should be used (best choice depends on the simulation). In cases where the user specifies that LRT mode is used (described below), 1 or 3 OpenMP threads should be used. For multi-node runs, using 1 MPI task per physical core will often perform best, however, depending on the machine and scale, users might get better performance by decreasing the number of MPI tasks and using more OpenMP threads. For performance, the product of the number of MPI tasks and OpenMP threads should not exceed the number of available hardware threads in almost all cases.

Note

Setting core affinity is often used to pin MPI tasks and OpenMP threads to a core or group of cores so that memory access can be uniform. Unless disabled at build time, affinity for MPI tasks and OpenMP threads on the host (CPU) will be set by default on the host *when using offload to a co-processor*. In this case, it is unnecessary to use other methods to control affinity (e.g. taskset, numactl, I_MPI_PIN_DOMAIN, etc.). This can be disabled with the *no_affinity* option to the *package intel* command or by disabling the option at build time (by adding -DINTEL_OFFLOAD_NOAFFINITY to the CCFLAGS line of your Makefile). Disabling this option is not recommended, especially when running on a machine with Intel Hyper-Threading technology disabled.

Run with the INTEL package from the command line

To enable INTEL optimizations for all available styles used in the input script, the “-sf intel” *command-line switch* can be used without any requirement for editing the input script. This switch will automatically append “intel” to styles that support it. It also invokes a default command: *package intel 1*. This package command is used to set options for the INTEL package. The default package command will specify that INTEL calculations are performed in mixed precision, that the number of OpenMP threads is specified by the OMP_NUM_THREADS environment variable, and that if co-processors are present and the binary was built with offload support, that 1 co-processor per node will be used with automatic balancing of work between the CPU and the co-processor.

You can specify different options for the INTEL package by using the “-pk intel Nphi” *command-line switch* with keyword/value pairs as specified in the documentation. Here, Nphi = # of Xeon Phi co-processors/node (ignored without offload support). Common options to the INTEL package include *omp* to override any OMP_NUM_THREADS setting and specify the number of OpenMP threads, *mode* to set the floating-point precision mode, and *lrt* to enable Long-Range Thread mode as described below. See the *package intel* command for details, including the default values used for all its options if not specified, and how to set the number of OpenMP threads via the OMP_NUM_THREADS environment variable if desired.

Examples (see documentation for your MPI/Machine for differences in launching MPI applications):

```
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script
→ # 2 nodes, 36 MPI tasks/node, $OMP_NUM_THREADS OpenMP Threads
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script -pk intel 0 omp 2 mode double
→ # Don't use any co-processors that might be available, use 2 OpenMP threads for each
→ task, use double precision
```

Or run with the INTEL package by editing an input script

As an alternative to adding command-line arguments, the input script can be edited to enable the INTEL package. This requires adding the *package intel* command to the top of the input script. For the second example above, this would be:

```
package intel 0 omp 2 mode double
```

To enable the INTEL package only for individual styles, you can add an “intel” suffix to the individual style, e.g.:

```
pair_style lj/cut/intel 2.5
```

Alternatively, the *suffix intel* command can be added to the input script to enable INTEL styles for the commands that follow in the input script.

Tuning for Performance

Note

The INTEL package will perform better with modifications to the input script when *PPPM* is used: *kspace_modify diff ad* should be added to the input script.

Long-Range Thread (LRT) mode is an option to the *package intel* command that can improve performance when using *PPPM* for long-range electrostatics on processors with SMT. It generates an extra pthread for each MPI task. The thread is dedicated to performing some of the PPPM calculations and MPI communications. This feature requires setting the pre-processor flag -DLMP_INTEL_USELRT in the makefile when compiling LAMMPS. It is unset in the default makefiles (*Makefile.mpi* and *Makefile.serial*) but it is set in all makefiles tuned for the INTEL package. On

Intel Xeon Phi x200 series CPUs, the LRT feature will likely improve performance, even on a single node. On Intel Xeon processors, using this mode might result in better performance when using multiple nodes, depending on the specific machine configuration. To enable LRT mode, specify that the number of OpenMP threads is one less than would normally be used for the run and add the “lrt yes” option to the “-pk” command-line suffix or “package intel” command. For example, if a run would normally perform best with “-pk intel 0 omp 4”, instead use “-pk intel 0 omp 3 lrt yes”. When using LRT, you should set the environment variable “KMP_AFFINITY=none”. LRT mode is not supported when using offload.

Note

Changing the *newton* setting to off can improve performance and/or scalability for simple 2-body potentials such as lj/cut or when using LRT mode on processors supporting AVX-512.

Not all styles are supported in the INTEL package. You can mix the INTEL package with styles from the *OPT* package or the *OPENMP* package. Of course, this requires that these packages were installed at build time. This can be performed automatically by using “-sf hybrid intel opt” or “-sf hybrid intel omp” command-line options. Alternatively, the “opt” and “omp” suffixes can be appended manually in the input script. For the latter, the *package omp* command must be in the input script or the “-pk omp Nt” *command-line switch* must be used where Nt is the number of OpenMP threads. The number of OpenMP threads should not be set differently for the different packages. Note that the *suffix hybrid intel omp* command can also be used within the input script to automatically append the “omp” suffix to styles when INTEL styles are not available.

Note

For simulations on higher node counts, add *processors * * * grid numa* to the beginning of the input script for better scalability.

When running on many nodes, performance might be better when using fewer OpenMP threads and more MPI tasks. This will depend on the simulation and the machine. Using the *verlet/split* run style might also give better performance for simulations with *PPPM* electrostatics. Note that this is an alternative to LRT mode and the two cannot be used together.

Currently, when using Intel MPI with Intel Xeon Phi x200 series CPUs, better performance might be obtained by setting the environment variable “I_MPI_SHM_LMT=shm” for Linux kernels that do not yet have full support for AVX-512. Runs on Intel Xeon Phi x200 series processors will always perform better using MCDRAM. Please consult your system documentation for the best approach to specify that MPI runs are performed in MCDRAM.

Tuning for Offload Performance

The default settings for offload should give good performance.

When using LAMMPS with offload to Intel co-processors, best performance will typically be achieved with concurrent calculations performed on both the CPU and the co-processor. This is achieved by offloading only a fraction of the neighbor and pair computations to the co-processor or using *hybrid* pair styles where only one style uses the “intel” suffix. For simulations with long-range electrostatics or bond, angle, dihedral, improper calculations, computation and data transfer to the co-processor will run concurrently with computations and MPI communications for these calculations on the host CPU. This is illustrated in the figure below for the rhodopsin protein benchmark running on E5-2697v2 processors with a Intel Xeon Phi 7120p co-processor. In this plot, the vertical axis is time and routines running at the same time are running concurrently on both the host and the co-processor.

The fraction of the offloaded work is controlled by the *balance* keyword in the *package intel* command. A balance of 0 runs all calculations on the CPU. A balance of 1 runs all supported calculations on the co-processor. A balance of 0.5 runs half of the calculations on the co-processor. Setting the balance to -1 (the default) will enable dynamic load balancing that continuously adjusts the fraction of offloaded work throughout the simulation. Because data transfer cannot be timed, this option typically produces results within 5 to 10 percent of the optimal fixed balance.

If running short benchmark runs with dynamic load balancing, adding a short warm-up run (10-20 steps) will allow the load-balancer to find a near-optimal setting that will carry over to additional runs.

The default for the *package intel* command is to have all the MPI tasks on a given compute node use a single Xeon Phi co-processor. In general, running with a large number of MPI tasks on each node will perform best with offload. Each MPI task will automatically get affinity to a subset of the hardware threads available on the co-processor. For example, if your card has 61 cores, with 60 cores available for offload and 4 hardware threads per core (240 total threads), running with 24 MPI tasks per node will cause each MPI task to use a subset of 10 threads on the co-processor. Fine tuning of the number of threads to use per MPI task or the number of threads to use per core can be accomplished with keyword settings of the *package intel* command.

The INTEL package has two modes for deciding which atoms will be handled by the co-processor. This choice is controlled with the *ghost* keyword of the *package intel* command. When set to 0, ghost atoms (atoms at the borders between MPI tasks) are not offloaded to the card. This allows for overlap of MPI communication of forces with computation on the co-processor when the *newton* setting is “on”. The default is dependent on the style being used, however, better performance may be achieved by setting this option explicitly.

When using offload with CPU Hyper-Threading disabled, it may help performance to use fewer MPI tasks and OpenMP threads than available cores. This is due to the fact that additional threads are generated internally to handle the asynchronous offload tasks.

If pair computations are being offloaded to an Intel Xeon Phi co-processor, a diagnostic line is printed to the screen (not to the log file), during the setup phase of a run, indicating that offload mode is being used and indicating the number of co-processor threads per MPI task. Additionally, an offload timing summary is printed at the end of each run. When offloading, the frequency for *atom sorting* is changed to 1 so that the per-atom data is effectively sorted at every rebuild of the neighbor lists. All the available co-processor threads on each Phi will be divided among MPI tasks, unless the *tp task* option of the “-pk intel” *command-line switch* is used to limit the co-processor threads per MPI task.

Restrictions

When offloading to a co-processor, *hybrid* styles that require skip lists for neighbor builds cannot be offloaded. Using *hybrid/overlay* is allowed. Only one intel accelerated style may be used with hybrid styles when offloading. *Special_bonds* exclusion lists are not currently supported with offload, however, the same effect can often be accomplished by setting cutoffs for excluded atom types to 0. None of the pair styles in the INTEL package currently support the “inner”, “middle”, “outer” options for rRESPA integration via the *run_style respa* command; only the “pair” option is supported.

7.4.3 KOKKOS package

Kokkos is a templated C++ library that provides abstractions to allow a single implementation of an application kernel (e.g. a pair style) to run efficiently on different kinds of hardware, such as GPUs, Intel Xeon Phis, or many-core CPUs. Kokkos maps the C++ kernel onto different back end languages such as CUDA, OpenMP, or Pthreads. The Kokkos library also provides data abstractions to adjust (at compile time) the memory layout of data structures like 2d and 3d arrays to optimize performance on different hardware. For more information on Kokkos, see [the Kokkos GitHub page](#).

The LAMMPS KOKKOS package contains versions of pair, fix, and atom styles that use data structures and macros provided by the Kokkos library, which is included with LAMMPS in `/lib/kokkos`. The KOKKOS package was developed primarily by Christian Trott (Sandia) and Stan Moore (Sandia) with contributions of various styles by others, including Sikandar Mashayak (UIUC), Ray Shan (Sandia), and Dan Ibanez (Sandia). For more information on developing using Kokkos abstractions see the [Kokkos Wiki](#).

Note

The Kokkos library is under active development and tracking the availability of accelerator hardware, so is the KOKKOS package in LAMMPS. This means that only a certain range of versions of the Kokkos library are compatible with the KOKKOS package of a certain range of LAMMPS versions. For that reason LAMMPS comes with a bundled version of the Kokkos library that has been validated on multiple platforms and may contain selected back-ported bug fixes from upstream Kokkos versions. While it is possible to build LAMMPS with an external version of Kokkos, it is untested and may result in incorrect execution or crashes.

Kokkos currently provides full support for 4 modes of execution (per MPI task). These are Serial (MPI-only for CPUs and Intel Phi), OpenMP (threading for many-core CPUs and Intel Phi), CUDA (for NVIDIA GPUs) and HIP (for AMD GPUs). Additional modes (e.g. OpenMP target, Intel data center GPUs) are under development. You choose the mode at build time to produce an executable compatible with a specific hardware.

The following compatibility notes have been last updated for LAMMPS version 23 November 2023 and Kokkos version 4.2.

C++17 support

Kokkos requires using a compiler that supports the c++17 standard. For some compilers, it may be necessary to add a flag to enable c++17 support. For example, the GNU compiler uses the `-std=c++17` flag. For a list of compilers that have been tested with the Kokkos library, see the [requirements document of the Kokkos Wiki](#).

NVIDIA CUDA support

To build with Kokkos support for NVIDIA GPUs, the NVIDIA CUDA toolkit software version 11.0 or later must be installed on your system. See the discussion for the [GPU package](#) for details of how to check and do this.

AMD ROCm (HIP) support

To build with Kokkos support for AMD GPUs, the AMD ROCm toolkit software version 5.2.0 or later must be installed on your system.

CUDA and MPI library compatibility

Kokkos with CUDA currently implicitly assumes that the MPI library is GPU-aware. This is not always the case, especially when using pre-compiled MPI libraries provided by a Linux distribution. This is not a problem when using only a single GPU with a single MPI rank. When running with multiple MPI ranks, you may see segmentation faults without GPU-aware MPI support. These can be avoided by adding the flags `-pk kokkos gpu/aware off` to the LAMMPS command line or by using the command `package kokkos gpu/aware off` in the input file.

Intel Data Center GPU support

Support for Kokkos with Intel Data Center GPU accelerators (formerly known under the code name “Ponte Vecchio”) in LAMMPS is still a work in progress. Only a subset of the functionality works correctly. Please contact the LAMMPS developers if you run into problems.

Building LAMMPS with the KOKKOS package

See the [Build extras](#) page for instructions.

Running LAMMPS with the KOKKOS package

All Kokkos operations occur within the context of an individual MPI task running on a single node of the machine. The total number of MPI tasks used by LAMMPS (one or multiple per compute node) is set in the usual manner via the `mpirun` or `mpiexec` commands, and is independent of Kokkos. E.g. the `mpirun` command in OpenMPI does this via its `-np` and `-npnnode` switches. Ditto for MPICH via `-np` and `-ppn`.

Running on a multicore CPU

Here is a quick overview of how to use the KOKKOS package for CPU acceleration, assuming one or more 16-core nodes.

```
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk -in in.lj      # 1 node, 16 MPI tasks/
→node, no multi-threading
mpirun -np 2 -ppn 1 lmp_kokkos_omp -k on t 16 -sf kk -in in.lj # 2 nodes, 1 MPI task/
→node, 16 threads/task
mpirun -np 2 lmp_kokkos_omp -k on t 8 -sf kk -in in.lj      # 1 node, 2 MPI tasks/
→node, 8 threads/task
mpirun -np 32 -ppn 4 lmp_kokkos_omp -k on t 4 -sf kk -in in.lj # 8 nodes, 4 MPI tasks/
→node, 4 threads/task
```

To run using the KOKKOS package, use the “-k on”, “-sf kk” and “-pk kokkos” *command-line switches* in your mpirun command. You must use the “-k on” *command-line switch* to enable the KOKKOS package. It takes additional arguments for hardware settings appropriate to your system. For OpenMP use:

```
-k on t Nt
```

The “t Nt” option specifies how many OpenMP threads per MPI task to use with a node. The default is Nt = 1, which is MPI-only mode. Note that the product of MPI tasks * OpenMP threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer. If Hyper-Threading (HT) is enabled, then the product of MPI tasks * OpenMP threads/task should not exceed the physical number of cores * hardware threads. The “-k on” switch also issues a “package kokkos” command (with no additional arguments) which sets various KOKKOS options to default values, as discussed on the *package* command doc page.

The “-sf kk” *command-line switch* will automatically append the “/kk” suffix to styles that support it. In this manner no modification to the input script is needed. Alternatively, one can run with the KOKKOS package by editing the input script as described below.

Note

When using a single OpenMP thread, the Kokkos Serial back end (i.e. Makefile.kokkos_mpi_only) will give better performance than the OpenMP back end (i.e. Makefile.kokkos_omp) because some of the overhead to make the code thread-safe is removed.

Note

Use the “-pk kokkos” *command-line switch* to change the default *package kokkos* options. See its doc page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk -pk kokkos newton on neigh half comm no -
→in in.lj      # Newton on, Half neighbor list, non-threaded comm
```

If the *newton* command is used in the input script, it can also override the Newton flag defaults.

For half neighbor lists and OpenMP, the KOKKOS package uses data duplication (i.e. thread-private arrays) by default to avoid thread-level write conflicts in the force arrays (and other data structures as necessary). Data duplication is typically fastest for small numbers of threads (i.e. 8 or less) but does increase memory footprint and is not scalable to large numbers of threads. An alternative to data duplication is to use thread-level atomic operations which

do not require data duplication. The use of atomic operations can be enforced by compiling LAMMPS with the “-DLMP_KOKKOS_USE_ATOMICS” pre-processor flag. Most but not all Kokkos-enabled pair_styles support data duplication. Alternatively, full neighbor lists avoid the need for duplication or atomic operations but require more compute operations per atom. When using the Kokkos Serial back end or the OpenMP back end with a single thread, no duplication or atomic operations are used. For CUDA and half neighbor lists, the KOKKOS package always uses atomic operations.

CPU Cores, Sockets and Thread Affinity

When using multi-threading, it is important for performance to bind both MPI tasks to physical cores, and threads to physical cores, so they do not migrate during a simulation.

If you are not certain MPI tasks are being bound (check the defaults for your MPI installation), binding can be forced with these flags:

```
OpenMPI 1.8: mpirun -np 2 --bind-to socket --map-by socket ./lmp_openmpi ...
Mvapich2 2.0: mpiexec -np 2 --bind-to socket --map-by socket ./lmp_mvapich ...
```

For binding threads with KOKKOS OpenMP, use thread affinity environment variables to force binding. With OpenMP 3.1 (gcc 4.7 or later, intel 12 or later) setting the environment variable OMP_PROC_BIND=true should be sufficient. In general, for best performance with OpenMP 4.0 or later set OMP_PROC_BIND=spread and OMP_PLACES=threads. For binding threads with the KOKKOS pthreads option, compile LAMMPS with the hwloc or libnuma support enabled as described in the [extra build options page](#).

Running on Knight’s Landing (KNL) Intel Xeon Phi

Here is a quick overview of how to use the KOKKOS package for the Intel Knight’s Landing (KNL) Xeon Phi:

KNL Intel Phi chips have 68 physical cores. Typically 1 to 4 cores are reserved for the OS, and only 64 or 66 cores are used. Each core has 4 Hyper-Threads, so there are effectively $N = 256$ (4×64) or $N = 264$ (4×66) cores to run on. The product of MPI tasks * OpenMP threads/task should not exceed this limit, otherwise performance will suffer. Note that with the KOKKOS package you do not need to specify how many KNLs there are per node; each KNL is simply treated as running some number of MPI tasks.

Examples of mpirun commands that follow these rules are shown below.

```
# Running on an Intel KNL node with 68 cores (272 threads/node via 4x hardware_
→threading):
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj      # 1 node, 64 MPI tasks/node,
→ 4 threads/task
mpirun -np 66 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj      # 1 node, 66 MPI tasks/node,
→ 4 threads/task
mpirun -np 32 lmp_kokkos_phi -k on t 8 -sf kk -in in.lj      # 1 node, 32 MPI tasks/node,
→ 8 threads/task
mpirun -np 512 -ppn 64 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj # 8 nodes, 64 MPI_
→tasks/node, 4 threads/task
```

The -np setting of the mpirun command sets the number of MPI tasks/node. The “-k on t Nt” command-line switch sets the number of threads/task as Nt. The product of these two values should be N, i.e. 256 or 264.

Note

The default for the *package kokkos* command when running on KNL is to use “half” neighbor lists and set the Newton flag to “on” for both pairwise and bonded interactions. This will typically be best for many-body potentials. For simpler pairwise potentials, it may be faster to use a “full” neighbor list with Newton flag to “off”. Use the “-pk kokkos” *command-line switch* to change the default *package kokkos* options. See its documentation page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -pk kokkos comm host -in in.reax # 1 node, 2 MPI tasks/node, 2 GPUs/node
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -pk kokkos newton off neigh full comm no -in in.lj # Newton off, full neighbor list, non-threaded comm
```

Note

MPI tasks and threads should be bound to cores as described above for CPUs.

Note

To build with Kokkos support for Intel Xeon Phi co-processors such as Knight’s Corner (KNC), your system must be configured to use them in “native” mode, not “offload” mode like the INTEL package supports.

Running on GPUs

Use the “-k” *command-line switch* to specify the number of GPUs per node. Typically the -np setting of the mpirun command should set the number of MPI tasks/node to be equal to the number of physical GPUs on the node. You can assign multiple MPI tasks to the same GPU with the KOKKOS package, but this is usually only faster if some portions of the input script have not been ported to use Kokkos. In this case, also packing/unpacking communication buffers on the host may give speedup (see the KOKKOS *package* command). Using CUDA MPS is recommended in this scenario.

Using a GPU-aware MPI library is highly recommended. GPU-aware MPI use can be avoided by using *-pk kokkos gpu/aware off*. As above for multicore CPUs (and no GPU), if N is the number of physical cores/node, then the number of MPI tasks/node should not exceed N.

```
-k on g Ng
```

Here are examples of how to use the KOKKOS package for GPUs, assuming one or more nodes, each with two GPUs:

```
mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj # 1 node, 2 MPI tasks/node, 2 GPUs/node
mpirun -np 32 -ppn 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj # 16 nodes, 2 MPI tasks/node, 2 GPUs/node (32 GPUs total)
```

Note

The default for the *package kokkos* command when running on GPUs is to use “full” neighbor lists and set the Newton flag to “off” for both pairwise and bonded interactions, along with threaded communication. When running on Maxwell or Kepler GPUs, this will typically be best. For Pascal GPUs and beyond, using “half” neighbor lists and setting the Newton flag to “on” may be faster. For many pair styles, setting the neighbor binsize equal to

twice the CPU default value will give speedup, which is the default when running on GPUs. Use the “-pk kokkos” *command-line switch* to change the default *package kokkos* options. See its documentation page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -pk kokkos newton on neigh half_
→binsize 2.8 -in in.lj          # Newton on, half neighbor list, set binsize = neighbor_
→ghost cutoff
```

Note

The default binsize for *atom sorting* on GPUs is equal to the default CPU neighbor binsize (i.e. 2x smaller than the default GPU neighbor binsize). When running simple pair-wise potentials like Lennard Jones on GPUs, using a 2x larger binsize for atom sorting (equal to the default GPU neighbor binsize) and a more frequent sorting than default (e.g. sorting every 100 time steps instead of 1000) may improve performance.

Note

When running on GPUs with many MPI ranks (tens of thousands and more), the creation of the atom map (required for molecular systems) on the GPU can slow down significantly or run out of GPU memory and thus slow down the whole calculation or cause a crash. You can use the “-pk kokkos atom/map no” *command-line switch* of the *package kokkos atom/map no* command to create the atom map on the CPU instead.

Note

When using a GPU, you will achieve the best performance if your input script does not use fix or compute styles which are not yet Kokkos-enabled. This allows data to stay on the GPU for multiple timesteps, without being copied back to the host CPU. Invoking a non-Kokkos fix or compute, or performing I/O for *thermo* or *dump* output will cause data to be copied back to the CPU incurring a performance penalty.

Note

To get an accurate timing breakdown between time spend in pair, kspace, etc., you must set the environment variable CUDA_LAUNCH_BLOCKING=1. However, this will reduce performance and is not recommended for production runs.

Run with the KOKKOS package by editing an input script

Alternatively the effect of the “-sf” or “-pk” switches can be duplicated by adding the *package kokkos* or *suffix kk* commands to your input script.

The discussion above for building LAMMPS with the KOKKOS package, the `mpirun` or `mpiexec` command, and setting appropriate thread properties are the same.

You must still use the “-k on” *command-line switch* to enable the KOKKOS package, and specify its additional arguments for hardware options appropriate to your system, as documented above.

You can use the *suffix kk* command, or you can explicitly add a “kk” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/kk 2.5
```

You only need to use the *package kokkos* command if you wish to change any of its option defaults, as set by the “-k on” *command-line switch*.

Using OpenMP threading and CUDA together:

With the KOKKOS package, both OpenMP multi-threading and GPUs can be compiled and used together in a few special cases. In the makefile for the conventional build, the KOKKOS_DEVICES variable must include both, “Cuda” and “OpenMP”, as is the case for `/src/MAKE/OPTIONS/Makefile.kokkos_cuda_mpi`.

```
KOKKOS_DEVICES=Cuda,OpenMP
```

When building with CMake you need to enable both features as it is done in the `kokkos-cuda.cmake` CMake preset file.

```
cmake ../cmake -DKokkos_ENABLE_CUDA=yes -DKokkos_ENABLE_OPENMP=yes
```

The suffix “/kk” is equivalent to “/kk/device”, and for Kokkos CUDA, using the “-sf kk” in the command line gives the default CUDA version everywhere. However, if the “/kk/host” suffix is added to a specific style in the input script, the Kokkos OpenMP (CPU) version of that specific style will be used instead. Set the number of OpenMP threads as “t Nt” and the number of GPUs as “g Ng”

```
-k on t Nt g Ng
```

For example, the command to run with 1 GPU and 8 OpenMP threads is then:

```
mpirun -np 1 lmp_kokkos_cuda_openmpi -in in.lj -k on g 1 t 8 -sf kk
```

Conversely, if the “-sf kk/host” is used in the command line and then the “/kk” or “/kk/device” suffix is added to a specific style in your input script, then only that specific style will run on the GPU while everything else will run on the CPU in OpenMP mode. Note that the execution of the CPU and GPU styles will NOT overlap, except for a special case:

A kspace style and/or molecular topology (bonds, angles, etc.) running on the host CPU can overlap with a pair style running on the GPU. First compile with “-default-stream per-thread” added to CCFLAGS in the Kokkos CUDA Makefile. Then explicitly use the “/kk/host” suffix for kspace and bonds, angles, etc. in the input file and the “kk” suffix (equal to “kk/device”) on the command line. Also make sure the environment variable `CUDA_LAUNCH_BLOCKING` is not set to “1” so CPU/GPU overlap can occur.

Performance to expect

The performance of KOKKOS running in different modes is a function of your hardware, which KOKKOS-enable styles are used, and the problem size.

Generally speaking, the following rules of thumb apply:

- When running on CPUs only, with a single thread per MPI task, performance of a KOKKOS style is somewhere between the standard (un-accelerated) styles (MPI-only mode), and those provided by the OPENMP package. However the difference between all 3 is small (less than 20%).
- When running on CPUs only, with multiple threads per MPI task, performance of a KOKKOS style is a bit slower than the OPENMP package.
- When running large number of atoms per GPU, KOKKOS is typically faster than the GPU package when compiled for double precision. The benefit of using single or mixed precision with the GPU package depends significantly on the hardware in use and the simulated system and pair style.

- When running on Intel Phi hardware, KOKKOS is not as fast as the INTEL package, which is optimized for x86 hardware (not just from Intel) and compilation with the Intel compilers. The INTEL package also can increase the vector length of vector instructions by switching to single or mixed precision mode.
- The KOKKOS package by default assumes that you are using exactly one MPI rank per GPU. When trying to use multiple MPI ranks per GPU it is mandatory to enable [CUDA Multi-Process Service \(MPS\)](#) to get good performance. In this case it is better to not use all available MPI ranks in order to avoid competing with the MPS daemon for CPU resources.

See the [Benchmark](#) page of the LAMMPS website for performance of the KOKKOS package on different hardware.

Advanced Kokkos options

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. They are explained on the [KOKKOS section of the build extras](#) doc page,

Restrictions

Currently, there are no precision options with the KOKKOS package. All compilation and computation is performed in double precision.

7.4.4 OPENMP package

The OPENMP package was developed by Axel Kohlmeyer at Temple University. It provides optimized and multi-threaded versions of many pair styles, nearly all bonded styles (bond, angle, dihedral, improper), several Kspace styles, and a few fix styles. It uses the OpenMP interface for multi-threading, but can also be compiled without OpenMP support, providing optimized serial styles in that case.

Required hardware/software

To enable multi-threading, your compiler must support the OpenMP interface. You should have one or more multicore CPUs, as multiple threads can only be launched by each MPI task on the local node (using shared memory).

Building LAMMPS with the OPENMP package

See the [Build extras](#) page for instructions.

Run with the OPENMP package from the command line

These examples assume one or more 16-core nodes.

```
env OMP_NUM_THREADS=16 lmp_omp -sf omp -in in.script           # 1 MPI task, 16 threads,
→according to OMP_NUM_THREADS
lmp_mpi -sf omp -in in.script                                   # 1 MPI task, no threads,
→optimized kernels
mpirun -np 4 lmp_omp -sf omp -pk omp 4 -in in.script           # 4 MPI tasks, 4 threads/
→task
mpirun -np 32 -ppn 4 lmp_omp -sf omp -pk omp 4 -in in.script   # 8 nodes, 4 MPI tasks/
→node, 4 threads/task
```

The `mpirun` or `mpiexec` command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the `mpirun` command in MPICH does this via its `-np` and `-ppn` switches. Ditto for OpenMPI via `-np` and `-npernode`.

You need to choose how many OpenMP threads per MPI task will be used by the OPENMP package. Note that the product of MPI tasks * threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer.

As in the lines above, use the “-sf omp” *command-line switch*, which will automatically append “omp” to styles that support it. The “-sf omp” switch also issues a default *package omp 0* command, which will set the number of threads per MPI task via the `OMP_NUM_THREADS` environment variable.

You can also use the “-pk omp Nt” *command-line switch*, to explicitly set `Nt` = # of OpenMP threads per MPI task to use, as well as additional options. Its syntax is the same as the *package omp* command whose page gives details, including the default values used if it is not specified. It also gives more details on how to set the number of threads via the `OMP_NUM_THREADS` environment variable.

Or run with the OPENMP package by editing an input script

The discussion above for the `mpirun` or `mpiexec` command, MPI tasks/node, and threads/MPI task is the same.

Use the *suffix omp* command, or you can explicitly add an “omp” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/omp 2.5
```

You must also use the *package omp* command to enable the OPENMP package. When you do this you also specify how many threads per MPI task to use. The command page explains other options and how to set the number of threads via the `OMP_NUM_THREADS` environment variable.

Speed-up to expect

Depending on which styles are accelerated, you should look for a reduction in the “Pair time”, “Bond time”, “KSpace time”, and “Loop time” values printed at the end of a run.

You may see a small performance advantage (5 to 20%) when running a OPENMP style (in serial or parallel) with a single thread per MPI task, versus running standard LAMMPS with its standard un-accelerated styles (in serial or all-MPI parallelization with 1 task/core). This is because many of the OPENMP styles contain similar optimizations to those used in the OPT package, described in *the OPT package* doc page.

With multiple threads/task, the optimal choice of number of MPI tasks/node and OpenMP threads/task can vary a lot and should always be tested via benchmark runs for a specific simulation running on a specific machine, paying attention to guidelines discussed in the next subsection.

A description of the multi-threading strategy used in the OPENMP package and some performance examples are [pre-sented here](#).

Guidelines for best performance

For many problems on current generation CPUs, running the OPENMP package with a single thread/task is faster than running with multiple threads/task. This is because the MPI parallelization in LAMMPS is often more efficient than multi-threading as implemented in the OPENMP package. The parallel efficiency (in a threaded sense) also varies for different OPENMP styles.

Using multiple threads/task can be more effective under the following circumstances:

- Individual compute nodes have a significant number of CPU cores but the CPU itself has limited memory bandwidth, e.g. for Intel Xeon 53xx (Clovertown) and 54xx (Harpertown) quad-core processors. Running one MPI task per CPU core will result in significant performance degradation, so that running with 4 or even only 2 MPI tasks per node is faster. Running in hybrid MPI+OpenMP mode will reduce the inter-node communication bandwidth contention in the same way, but offers an additional speedup by utilizing the otherwise idle CPU cores.
- The interconnect used for MPI communication does not provide sufficient bandwidth for a large number of MPI tasks per node. For example, this applies to running over gigabit ethernet or on Cray XT4 or XT5 series supercomputers. As in the aforementioned case, this effect worsens when using an increasing number of nodes.
- The system has a spatially inhomogeneous particle density which does not map well to the *domain decomposition scheme* or *load-balancing* options that LAMMPS provides. This is because multi-threading achieves parallelism over the number of particles, not via their distribution in space.
- A machine is being used in “capability mode”, i.e. near the point where MPI parallelism is maxed out. For example, this can happen when using the *PPPM solver* for long-range electrostatics on large numbers of nodes. The scaling of the KSpace calculation (see the *kpace_style* command) becomes the performance-limiting factor. Using multi-threading allows less MPI tasks to be invoked and can speed-up the long-range solver, while increasing overall performance by parallelizing the pairwise and bonded calculations via OpenMP. Likewise additional speedup can be sometimes be achieved by increasing the length of the Coulombic cutoff and thus reducing the work done by the long-range solver. Using the *run_style verlet/split* command, which is compatible with the OPENMP package, is an alternative way to reduce the number of MPI tasks assigned to the KSpace calculation.

Additional performance tips are as follows:

- The best parallel efficiency from *omp* styles is typically achieved when there is at least one MPI task per physical CPU chip, i.e. socket or die.
- It is usually most efficient to restrict threading to a single socket, i.e. use one or more MPI task per socket.
- NOTE: By default, several current MPI implementations use a processor affinity setting that restricts each MPI task to a single CPU core. Using multi-threading in this mode will force all threads to share the one core and thus is likely to be counterproductive. Instead, binding MPI tasks to a (multicore) socket, should solve this issue.

Restrictions

None.

7.4.5 OPT package

The OPT package was developed by James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technologies). It contains a handful of pair styles whose compute() methods were rewritten in C++ templated form to reduce the overhead due to if tests and other conditional code.

Required hardware/software

Any hardware. Any compiler.

Building LAMMPS with the OPT package

See the *Build extras* page for instructions.

Run with the OPT package from the command line

```
lmp_mpi -sf opt -in in.script      # run in serial
mpirun -np 4 lmp_mpi -sf opt -in in.script  # run in parallel
```

Use the “-sf opt” *command-line switch*, which will automatically append “opt” to styles that support it.

Or run with the OPT package by editing an input script

Use the *suffix opt* command, or you can explicitly add an “opt” suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/opt 2.5
```

Speed-up to expect

You should see a reduction in the “Pair time” value printed at the end of a run. On most machines for reasonable problem sizes, it will be a 5 to 20% savings.

Guidelines for best performance

Just try out an OPT pair style to see how it performs.

Restrictions

None.

Inverting this list, LAMMPS currently has acceleration support for three kinds of hardware, via the listed packages:

Many-core CPUs	<i>INTEL, KOKKOS, OPENMP, OPT</i> packages
GPUs	<i>GPU, KOKKOS</i> packages
Intel Phi/AVX	<i>INTEL, KOKKOS</i> packages

Which package is fastest for your hardware may depend on the size problem you are running and what commands (accelerated and non-accelerated) are invoked by your input script. While these doc pages include performance guidelines, there is no substitute for trying out the different packages appropriate to your hardware.

Any accelerated style has the same name as the corresponding standard style, except that a suffix is appended. Otherwise, the syntax for the command that uses the style is identical, their functionality is the same, and the numerical results it produces should also be the same, except for precision and round-off effects.

For example, all of these styles are accelerated variants of the Lennard-Jones *pair_style lj/cut*:

- *pair_style lj/cut/gpu*
- *pair_style lj/cut/intel*
- *pair_style lj/cut/kk*
- *pair_style lj/cut/omp*
- *pair_style lj/cut/opt*

To see what accelerate styles are currently available for a particular style, find the style name in the [Commands](#) style pages (fix,compute,pair,etc) and see what suffixes are listed (g,i,k,o,t) with it. The doc pages for individual commands (e.g. *pair lj/cut* or *fix nve*) also list any accelerated variants available for that style.

To use an accelerator package in LAMMPS, and one or more of the styles it provides, follow these general steps. Details vary from package to package and are explained in the individual accelerator doc pages, listed above:

build the accelerator library	only for GPU package
install the accelerator package	make yes-opt, make yes-intel, etc
add compile/link flags to Makefile.machine in src/MAKE	only for INTEL, KOKKOS, OPENMP, OPT packages
re-build LAMMPS	make machine
prepare and test a regular LAMMPS simulation	lmp_machine -in in.script; mpirun -np 32 lmp_machine -in in.script
enable specific accelerator support via ‘-k on’ <i>command-line switch</i> ,	only needed for KOKKOS package
set any needed options for the package via “-pk” <i>command-line switch</i> or <i>package</i> command,	only if defaults need to be changed
use accelerated styles in your input via “-sf” <i>command-line switch</i> or <i>suffix</i> command	lmp_machine -in in.script -sf gpu

Note that the first 4 steps can be done as a single command with suitable make command invocations. This is discussed on the [Packages](#) doc pages, and its use is illustrated in the individual accelerator sections. Typically these steps only need to be done once, to create an executable that uses one or more accelerator packages.

The last 4 steps can all be done from the command-line when LAMMPS is launched, without changing your input script, as illustrated in the individual accelerator sections. Or you can add *package* and *suffix* commands to your input script.

Note

With a few exceptions, you can build a single LAMMPS executable with all its accelerator packages installed. Note however that the INTEL and KOKKOS packages require you to choose one of their hardware options when building for a specific platform. I.e. CPU or Phi option for the INTEL package. Or the OpenMP, CUDA, HIP, SYCL, or Phi option for the KOKKOS package. Or the OpenCL, HIP, or CUDA option for the GPU package.

These are the exceptions. You cannot build a single executable with:

- both the INTEL Phi and KOKKOS Phi options
- the INTEL Phi or Kokkos Phi option, and the GPU package

As mentioned above, the [Benchmark page](#) of the LAMMPS website gives performance results for the various accelerator packages for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

Here is a brief summary of what the various packages provide. Details are in the individual accelerator sections.

- Styles with a “gpu” suffix are part of the GPU package and can be run on Intel, NVIDIA, or AMD GPUs. The speed-up on a GPU depends on a variety of factors, discussed in the accelerator sections.
- Styles with an “intel” suffix are part of the INTEL package. These styles support vectorized single and mixed precision calculations, in addition to full double precision. In extreme cases, this can provide speedups over 3.5x on CPUs. The package also supports acceleration in “offload” mode to Intel(R) Xeon Phi(TM) co-processors. This can result in additional speedup over 2x depending on the hardware configuration.
- Styles with a “kk” suffix are part of the KOKKOS package, and can be run using OpenMP on multicore CPUs, on an NVIDIA or AMD GPU, or on an Intel Xeon Phi in “native” mode. The speed-up depends on a variety of factors, as discussed on the KOKKOS accelerator page.
- Styles with an “omp” suffix are part of the OPENMP package and allow a pair-style to be run in multi-threaded mode using OpenMP. This can be useful on nodes with high-core counts when using less MPI processes than cores is advantageous, e.g. when running with PPPM so that FFTs are run on fewer MPI processors or when the many MPI tasks would overload the available bandwidth for communication.
- Styles with an “opt” suffix are part of the OPT package and typically speed-up the pairwise calculations of your simulation by 5-25% on a CPU.

The individual accelerator package doc pages explain:

- what hardware and software the accelerated package requires
- how to build LAMMPS with the accelerated package
- how to run with the accelerated package either via command-line switches or modifying the input script
- speed-ups to expect
- guidelines for best performance
- restrictions

7.5 Comparison of various accelerator packages

The next section compares and contrasts the various accelerator options, since there are multiple ways to perform OpenMP threading, run on GPUs, optimize for vector units on CPUs and run on Intel Xeon Phi (co-)processors.

All of these packages can accelerate a LAMMPS calculation taking advantage of hardware features, but they do it in different ways and acceleration is not always guaranteed.

As a consequence, for a particular simulation on specific hardware, one package may be faster than the other. We give some guidelines below, but the best way to determine which package is faster for your input script is to try multiple of them on your machine and experiment with available performance tuning settings. See the benchmarking section below for examples where this has been done.

Guidelines for using each package optimally:

- Both, the GPU and the KOKKOS package allows you to assign multiple MPI ranks (= CPU cores) to the same GPU. For the GPU package, this can lead to a speedup through better utilization of the GPU (by overlapping computation and data transfer) and more efficient computation of the non-GPU accelerated parts of LAMMPS through MPI parallelization, as all system data is maintained and updated on the host. For KOKKOS, there is less to no benefit from this, due to its different memory management model, which tries to retain data on the GPU.
- The GPU package moves per-atom data (coordinates, forces, and (optionally) neighbor list data, if not computed on the GPU) between the CPU and GPU at every timestep. The KOKKOS/CUDA package only does this on timesteps when a CPU calculation is required (e.g. to invoke a fix or compute that is non-GPU-ized). Hence, if you can formulate your input script to only use GPU-ized fixes and computes, and avoid doing I/O too often

(thermo output, dump file snapshots, restart files), then the data transfer cost of the KOKKOS/CUDA package can be very low, causing it to run faster than the GPU package.

- The GPU package is often faster than the KOKKOS/CUDA package, when the number of atoms per GPU is on the smaller side. The crossover point, in terms of atoms/GPU at which the KOKKOS/CUDA package becomes faster depends strongly on the pair style. For example, for a simple Lennard Jones system the crossover (in single precision) is often about 50K-100K atoms per GPU. When performing double precision calculations the crossover point can be significantly smaller.
- Both KOKKOS and GPU package compute bonded interactions (bonds, angles, etc) on the CPU. If the GPU package is running with several MPI processes assigned to one GPU, the cost of computing the bonded interactions is spread across more CPUs and hence the GPU package can run faster in these cases.
- When using LAMMPS with multiple MPI ranks assigned to the same GPU, its performance depends to some extent on the available bandwidth between the CPUs and the GPU. This can differ significantly based on the available bus technology, capability of the host CPU and mainboard, the wiring of the buses and whether switches are used to increase the number of available bus slots, or if GPUs are housed in an external enclosure. This can become quite complex.
- To achieve significant acceleration through GPUs, both KOKKOS and GPU package require capable GPUs with fast on-device memory and efficient data transfer rates. This requests capable upper mid-level to high-end (desktop) GPUs. Using lower performance GPUs (e.g. on laptops) may result in a slowdown instead.
- For the GPU package, specifically when running in parallel with MPI, it is often more efficient to exclude the PPPM kspace style from GPU acceleration and instead run it - concurrently with a GPU accelerated pair style - on the CPU. This can often be easily achieved with placing a *suffix off* command before and a *suffix on* command after the *kspace_style pppm* command.
- The KOKKOS/OpenMP and OPENMP package have different thread management strategies, which should result in OPENMP being more efficient for a small number of threads with increasing overhead as the number of threads per MPI rank grows. The KOKKOS/OpenMP kernels have less overhead in that case, but have lower performance with few threads.
- The INTEL package contains many options and settings for achieving additional performance on Intel hardware (CPU and accelerator cards), but to unlock this potential, an Intel compiler is required. The package code will compile with GNU gcc, but it will not be as efficient.

Differences between the GPU and KOKKOS packages:

- The GPU package accelerates only pair force, neighbor list, and (parts of) PPPM calculations. The KOKKOS package attempts to run most of the calculation on the GPU, but can transparently support non-accelerated code (with a performance penalty due to having data transfers between host and GPU).
- The GPU package requires neighbor lists to be built on the CPU when using exclusion lists, or a triclinic simulation box.
- The GPU package can be compiled for CUDA or OpenCL and thus supports both, NVIDIA and AMD GPUs well. On NVIDIA hardware, using CUDA is typically resulting in equal or better performance over OpenCL.
- OpenCL in the GPU package does theoretically also support Intel CPUs or Intel Xeon Phi, but the native support for those in KOKKOS (or INTEL) is superior.

HOWTO DISCUSSIONS

These doc pages describe how to perform various tasks with LAMMPS, both for users and developers. The [glossary](#) website page also lists MD terminology, with links to corresponding LAMMPS manual pages. The example input scripts included in the `examples` directory of the LAMMPS source code distribution and highlighted on the [Example scripts](#) page also show how to set up and run various kinds of simulations.

8.1 General howto

8.1.1 Restart a simulation

There are 3 ways to continue a long LAMMPS simulation. Multiple [run](#) commands can be used in the same input script. Each run will continue from where the previous run left off. Or binary restart files can be saved to disk using the [restart](#) command. At a later time, these binary files can be read via a [read_restart](#) command in a new script. Or they can be converted to text data files using the [-r command-line switch](#) and read by a [read_data](#) command in a new script.

Here we give examples of 2 scripts that read either a binary restart file or a converted data file and then issue a new run command to continue where the previous run left off. They illustrate what settings must be made in the new script. Details are discussed in the documentation for the [read_restart](#) and [read_data](#) commands.

Look at the `in.chain` input script provided in the `bench` directory of the LAMMPS distribution to see the original script that these 2 scripts are based on. If that script had the line

```
restart          50 tmp.restart
```

added to it, it would produce 2 binary restart files (`tmp.restart.50` and `tmp.restart.100`) as it ran.

This script could be used to read the first restart file and re-run the last 50 timesteps:

```
read_restart     tmp.restart.50

neighbor        0.4 bin
neigh_modify     every 1 delay 1

fix             1 all nve
fix             2 all langevin 1.0 1.0 10.0 904297

timestep        0.012

run             50
```

Note that the following commands do not need to be repeated because their settings are included in the restart file: *units*, *atom_style*, *special_bonds*, *pair_style*, *bond_style*. However, these commands do need to be used, since their settings are not in the restart file: *neighbor*, *fix*, *timestep*.

If you actually use this script to perform a restarted run, you will notice that the thermodynamic data match at step 50 (if you also put a “thermo 50” command in the original script), but do not match at step 100. This is because the *fix langevin* command uses random numbers in a way that does not allow for perfect restarts.

As an alternate approach, the restart file could be converted to a data file as follows:

```
lmp_g++ -r tmp.restart.50 tmp.restart.data
```

Then, this script could be used to re-run the last 50 steps:

```
units          lj
atom_style     bond
pair_style     lj/cut 1.12
pair_modify    shift yes
bond_style     fene
special_bonds  0.0 1.0 1.0

read_data      tmp.restart.data

neighbor       0.4 bin
neigh_modify   every 1 delay 1

fix            1 all nve
fix            2 all langevin 1.0 1.0 10.0 904297

timestep       0.012

reset_timestep 50
run            50
```

Note that nearly all the settings specified in the original *in.chain* script must be repeated, except the *pair_coeff* and *bond_coeff* commands, since the new data file lists the force field coefficients. Also, the *reset_timestep* command is used to tell LAMMPS the current timestep. This value is stored in restart files, but not in data files.

8.1.2 Visualize LAMMPS snapshots

Snapshots from LAMMPS simulations can be viewed, visualized, and analyzed in a variety of ways.

LAMMPS snapshots are created by the *dump* command, which can create files in several formats. The native LAMMPS dump format is a text file (see “dump atom” or “dump custom”) which can be visualized by [several visualization tools](#) for MD simulation trajectories. [OVITO](#) and [VMD](#) seem to be the most popular choices among them.

The *dump image* and *dump movie* styles can output internally rendered images or convert them to a movie during the MD run.

Programs included with LAMMPS as auxiliary tools can convert between LAMMPS format files and other formats. See the [Tools](#) page for details. These are rarely needed these days.

8.1.3 Run multiple simulations from one input script

This can be done in several ways. See the documentation for individual commands for more details on how these examples work.

If “multiple simulations” means to continue a previous simulation for more timesteps, then you simply use the *run* command multiple times. For example, this script

```
units lj
atom_style atomic
read_data data.lj
run 10000
run 10000
run 10000
run 10000
run 10000
```

would run 5 successive simulations of the same system for a total of 50,000 timesteps.

If you wish to run totally different simulations, one after the other, the *clear* command can be used in between them to re-initialize LAMMPS. For example, this script

```
units lj
atom_style atomic
read_data data.lj
run 10000
clear
units lj
atom_style atomic
read_data data.lj.new
run 10000
```

would run 2 independent simulations, one after the other.

For large numbers of independent simulations, you can use *variables* and the *next* and *jump* commands to loop over the same input script multiple times with different settings. For example, this script, named *in.polymer*

```
variable d index run1 run2 run3 run4 run5 run6 run7 run8
shell cd $d
read_data data.polymer
run 10000
shell cd ..
clear
next d
jump in.polymer
```

would run 8 simulations in different directories, using a *data.polymer* file in each directory. The same concept could be used to run the same system at 8 different temperatures, using a temperature variable and storing the output in different log and dump files, for example

```
variable a loop 8
variable t index 0.8 0.85 0.9 0.95 1.0 1.05 1.1 1.15
log log.$a
read data.polymer
velocity all create $t 352839
```

(continues on next page)

(continued from previous page)

```
fix 1 all nvt $t $t 100.0
dump 1 all atom 1000 dump.$a
run 100000
clear
next t
next a
jump in.polymer
```

All of the above examples work whether you are running on 1 or multiple processors, but assumed you are running LAMMPS on a single partition of processors. LAMMPS can be run on multiple partitions via the *-partition command-line switch*.

In the last 2 examples, if LAMMPS were run on 3 partitions, the same scripts could be used if the “index” and “loop” variables were replaced with *universe*-style variables, as described in the *variable* command. Also, the “next t” and “next a” commands would need to be replaced with a single “next t” command. With these modifications, the 8 simulations of each script would run on the 3 partitions one after the other until all were finished. Initially, 3 simulations would be started simultaneously, one on each partition. When one finished, that partition would then start the fourth simulation, and so forth, until all 8 were completed.

8.1.4 Multi-replica simulations

Several commands in LAMMPS run multi-replica simulations, meaning that multiple instances (replicas) of your simulation are run simultaneously, with small amounts of data exchanged between replicas periodically.

These are the relevant commands:

- *hyper* for bond boost hyperdynamics (HD)
- *neb* for nudged elastic band calculations (NEB)
- *neb_spin* for magnetic nudged elastic band calculations
- *prd* for parallel replica dynamics (PRD)
- *tad* for temperature accelerated dynamics (TAD)
- *temper* for parallel tempering with fixed volume
- *temper/npt* for parallel tempering extended for NPT
- *temper/grem* for parallel tempering with generalized replica exchange (gREM)
- *fix pimd* for path-integral molecular dynamics (PIMD)

NEB is a method for finding transition states and barrier potential energies. HD, PRD, and TAD are methods for performing accelerated dynamics to find and perform infrequent events. Parallel tempering or replica exchange runs different replicas at a series of temperature to facilitate rare-event sampling. PIMD runs different replicas whose individual particles in different replicas are coupled together by springs to model a system of ring-polymers which can represent the quantum nature of atom cores.

These commands can only be used if LAMMPS was built with the REPLICA package. See the *Build package* page for more info.

In all these cases, you must run with one or more processors per replica. The processors assigned to each replica are determined at run-time by using the *-partition command-line switch* to launch LAMMPS on multiple partitions, which in this context are the same as replicas. E.g. these commands:

```
mpirun -np 16 lmp_linux -partition 8x2 -in in.temper
mpirun -np 8 lmp_linux -partition 8x1 -in in.neb
```

would each run 8 replicas, on either 16 or 8 processors. Note the use of the *-in command-line switch* to specify the input script which is required when running in multi-replica mode.

Also note that with MPI installed on a machine (e.g. your desktop), you can run on more (virtual) processors than you have physical processors. Thus, the above commands could be run on a single-processor (or few-processor) desktop so that you can run a multi-replica simulation on more replicas than you have physical processors. This is useful for testing and debugging, since with most modern processors and MPI libraries, the efficiency of a calculation can severely diminish when oversubscribing processors.

8.1.5 Library interface to LAMMPS

As described on the *Build basics* doc page, LAMMPS can be built as a static or shared library, so that it can be called by another code, used in a *coupled manner* with other codes, or driven through a *Python interface*.

At the core of LAMMPS is the LAMMPS class, which encapsulates the state of the simulation program through the state of the various class instances that it is composed of. So a calculation using LAMMPS requires creating an instance of the LAMMPS class and then send it (text) commands, either individually or from a file, or perform other operations that modify the state stored inside that instance or drive simulations. This is essentially what the `src/main.cpp` file does as well for the standalone LAMMPS executable, reading commands either from an input file or the standard input.

Creating a LAMMPS instance can be done by using C++ code directly or through a C-style interface library to LAMMPS that is provided in the files `src/library.cpp` and `src/library.h`. This *C language API*, can be used from C and C++, and is also the basis for the *Python* and *Fortran* interfaces or the *SWIG based wrappers* included in the LAMMPS source code.

The `examples/COUPLE` and `python/examples` directories contain some example programs written in C++, C, Fortran, and Python, which show how a driver code can link to LAMMPS as a library, run LAMMPS on a subset of processors (so the others are available to run some other code concurrently), grab data from LAMMPS, change it, and send it back into LAMMPS.

A detailed documentation of the available APIs and examples of how to use them can be found in the *Programmer Guide* section of this manual.

8.1.6 Coupling LAMMPS to other codes

LAMMPS is designed to support being coupled to other codes. For example, a quantum mechanics code might compute forces on a subset of atoms and pass those forces to LAMMPS. Or a continuum finite element (FE) simulation might use atom positions as boundary conditions on FE nodal points, compute a FE solution, and return interpolated forces on MD atoms.

LAMMPS can be coupled to other codes in at least 4 different ways. Each has advantages and disadvantages, which you will have to think about in the context of your application.

1. Define a new *fix* or *compute* command that calls the other code. In this scenario, LAMMPS is the driver code. During timestepping, the fix or compute is invoked, and can make library calls to the other code, which has been linked to LAMMPS as a library. This is the way the *VORONOI* package, which computes Voronoi tessellations using the *Voro++ library*, is interfaced to LAMMPS. See the *compute voronoi* command for more details. Also see the *Modify* pages for information on how to add a new fix or compute to LAMMPS.
2. Define a new LAMMPS command that calls the other code. This is conceptually similar to method (1), but in this case LAMMPS and the other code are on a more equal footing. Note that now the other code is not called during the timestepping of a LAMMPS run, but between runs. The LAMMPS input script can be used to alternate LAMMPS runs with calls to the other code, invoked via the new command. The *run* command facilitates this with its *every* option, which makes it easy to run a few steps, invoke the command, run a few steps, invoke the command, etc.

In this scenario, the other code can be called as a library, as in 1., or it could be a stand-alone code, invoked by a `system()` call made by the command (assuming your parallel machine allows one or more processors to start up another program). In the latter case the stand-alone code could communicate with LAMMPS through files that the command writes and reads.

See the [Modify command](#) page for information on how to add a new command to LAMMPS.

3. Use LAMMPS as a library called by another code. In this case, the other code is the driver and calls LAMMPS as needed. Alternately, a wrapper code could link and call both LAMMPS and another code as libraries. Again, the `run` command has options that allow it to be invoked with minimal overhead (no setup or clean-up) if you wish to do multiple short runs, driven by another program. Details about using the library interface are given in the [library API](#) documentation.
4. Couple LAMMPS with another code in a client/server fashion, using the [MDI Library](#) developed by the [Molecular Sciences Software Institute \(MolSSI\)](#) to run LAMMPS as either an MDI driver (client) or an MDI engine (server). The MDI driver issues commands to the MDI server to exchange data between them. See the [Using LAMMPS with the MDI library for code coupling](#) page for more information about how LAMMPS can operate in either of these modes.

8.1.7 Using LAMMPS with the MDI library for code coupling

Client/server coupling of two (or more) codes is where one code is the “client” and sends request messages (data) to one (or more) “server” code(s). A server responds to each request with a reply message (data). This enables two (or more) codes to work in tandem to perform a simulation. In this context, LAMMPS can act as either a client or server code. It does this by using the [MolSSI Driver Interface \(MDI\) library](#), developed by the [Molecular Sciences Software Institute \(MolSSI\)](#), which is supported by the [MDI](#) package.

Alternate methods for coupling codes with LAMMPS are described on the [Coupling LAMMPS to other codes](#) page.

Some advantages of client/server coupling are that the codes can run as stand-alone executables; they need not be linked together. Thus, neither code needs to have a library interface. This also makes it easy to run the two codes on different numbers of processors. If a message protocol (format and content) is defined for a particular kind of simulation, then in principle any code which implements the client-side protocol can be used in tandem with any code which implements the server-side protocol. Neither code needs to know what specific other code it is working with.

In MDI nomenclature, a client code is the “driver”, and a server code is an “engine”. One driver code can communicate with one or more instances of one or more engine codes. Driver and engine codes can be written in any language: C, C++, Fortran, Python, etc.

In addition to allowing driver and engine(s) to run as stand-alone executables, MDI also enables an engine to be a *plugin* to the client code. In this scenario, server code(s) are compiled as shared libraries, and one (or more) instances of the server are instantiated by the driver code. If the driver code runs in parallel, it can split its MPI communicator into multiple sub-communicators, and launch each plugin engine instance on a sub-communicator. Driver processors within that sub-communicator exchange messages with the corresponding engine instance, and can also send MPI messages to other processors in the driver. The driver code can also destroy engine instances and re-instantiate them. LAMMPS can operate as either a stand-alone or plugin MDI engine. When it operates as a driver, it can use either stand-alone or plugin MDI engines.

The way in which an MDI driver communicates with an MDI engine is by making `MDI_Send()` and `MDI_Recv()` calls, which are conceptually similar to `MPI_Send()` and `MPI_Recv()` calls. Each send or receive operation uses a string to identify the command name, and optionally some data, which can be a single value or vector of values of any data type. Inside the MDI library, data is exchanged between the driver and engine via MPI calls or sockets. This is a run-time choice by the user.

The [MDI](#) package provides a [mdi engine](#) command, which enables LAMMPS to operate as an MDI engine. Its doc page explains the variety of standard and custom MDI commands which the LAMMPS engine recognizes and can

respond to.

The package also provides a *mdi plugin* command, which enables LAMMPS to operate as an MDI driver and load an MDI engine as a plugin library.

The package furthermore includes a *fix mdi/qm* command, in which LAMMPS operates as an MDI driver in conjunction with a quantum mechanics code as an MDI engine. The `post_force()` method of the `fix_mdi_qm.cpp` file shows how a driver issues MDI commands to another code. This command can be used to couple to an MDI engine, which is either a stand-alone code or a plugin library.

As explained in the *fix mdi/qm* command documentation, it can be used to perform *ab initio* MD simulations or energy minimizations, or to evaluate the quantum energy and forces for a series of independent systems. The `examples/mdi` directory has example input scripts for all of these use cases.

The package also has a *fix mdi/qmmm* command in which LAMMPS operates as an MDI driver in conjunction with a quantum mechanics code as an MDI engine to perform QM/MM simulations. The LAMMPS input script partitions the system into QM and MM (molecular mechanics) atoms. As described below the `examples/QUANTUM` directory has examples for coupling to 3 different quantum codes in this manner.

The `examples/mdi` directory contains Python scripts and LAMMPS input script which use LAMMPS as either an MDI driver or engine, or both. Currently, 5 example use cases are provided:

- Run *ab initio* MD (AIMD) using 2 instances of LAMMPS. As a driver, LAMMPS performs the timestepping in either NVE or NPT mode. As an engine, LAMMPS computes forces and is a surrogate for a quantum code.
- LAMMPS runs an MD simulation as a driver. Every N steps it passes the current snapshot to an MDI engine to evaluate the energy, virial, and peratom forces. As the engine, LAMMPS is a surrogate for a quantum code.
- LAMMPS loops over a series of data files and passes the configuration to an MDI engine to evaluate the energy, virial, and peratom forces and thus acts as a simulation driver. As the engine, LAMMPS is used as a surrogate for a quantum code.
- A Python script driver invokes a sequence of unrelated LAMMPS calculations. Calculations can be single-point energy/force evaluations, MD runs, or energy minimizations.
- Run AIMD with a Python driver code and 2 LAMMPS instances as engines. The first LAMMPS instance performs MD timestepping. The second LAMMPS instance acts as a surrogate QM code to compute forces.

Note

In any of these examples where LAMMPS is used as an engine, an actual QM code (provided it has support for MDI) could be used in its place, without modifying the input scripts or launch commands, except to specify the name of the QM code.

The `examples/mdi/Run.sh` file illustrates how to launch both driver and engine codes so that they communicate using the MDI library via either MPI or sockets, or using the engine as a stand-alone code, or as a plugin library.

As of March 2023, these are quantum codes with MDI support provided via Python wrapper scripts included in the LAMMPS distribution. These can be used with the *fix mdi/qm* and *fix mdi/qmmm* commands to perform QM calculations of an entire system (e.g. AIMD) or QM/MM simulations. See the `examples/QUANTUM` sub-directories for more details:

- LATTE - AIMD only
- PySCF - QM/MM only
- NWChem - AIMD or QM/MM

There are also at least two quantum codes which have direct MDI support, [Quantum ESPRESSO \(QE\)](#) and [INQ](#). There are also several QM codes which have indirect support through QCEngine or i-PI. The former means they require a wrapper program (QCEngine) with MDI support which writes/read files to pass data to the quantum code itself. The list of QCEngine-supported and i-PI-supported quantum codes is on the [MDI webpage](#).

These direct- and indirect-support codes should be usable for full system calculations (e.g. AIMD). Whether they support QM/MM models depends on the individual QM code.

8.1.8 Broken Bonds

Typically, molecular bond interactions persist for the duration of a simulation in LAMMPS. However, some commands break bonds dynamically, including the following:

- *bond_style quartic*
- *fix bond/break*
- *fix bond/react*
- *BPM package* bond styles

A bond can break if it is stretched beyond a user-defined threshold or more generally if other criteria are met.

For the quartic bond style, when a bond is broken its bond type is set to 0 to effectively break it and pairwise forces between the two atoms in the broken bond are “turned on”. Angles, dihedrals, etc cannot be defined for a system when *bond_style quartic* is used.

Similarly, bond styles in the BPM package are also incompatible with angles, dihedrals, etc. and when a bond breaks its type is set to zero. However, in the BPM package one can either turn off all pair interactions between bonded particles or leave them on, overlaying pair forces on top of bond forces. To remove pair forces, the special bond list is dynamically updated. More details can be found on the [Howto BPM](#) page.

The *fix bond/break* and *fix bond/react* commands allow breaking of bonds within a molecular topology with may also define angles, dihedrals, etc. These commands update internal topology data structures to remove broken bonds, as well as the appropriate angle, dihedral, etc interactions which include the bond. They also trigger a rebuild of the neighbor list when this occurs, to turn on the appropriate pairwise forces.

Note that when bonds are dumped to a file via the *dump local* command, bonds with type 0 are not included.

The *delete_bonds* command can be used to query the status of broken bonds with type = 0 or permanently delete them, e.g.:

```
delete_bonds all stats
delete_bonds all bond 0 remove
```

The compute *count/type* command tallies the current number of bonds (or angles, etc) for each bond (angle, etc) type. It also tallies broken bonds with type = 0.

The compute *nbond/atom* command tallies the current number of bonds each atom is part of, excluding broken bonds with type = 0.

8.2 Settings howto

8.2.1 2d simulations

You must use the *dimension* command to specify a 2d simulation. The default is 3d.

A 2d simulation box must be periodic in z as set by the *boundary* command. This is the default.

Simulation boxes in LAMMPS can be either orthogonal or triclinic in shape. Orthogonal boxes in 2d are a rectangle with 4 edges that are each perpendicular to either the x or y coordinate axes. Triclinic boxes in 2d are a parallelogram with opposite pairs of faces parallel to each other. LAMMPS supports two forms of triclinic boxes, restricted and general, which for 2d differ in how the box is oriented with respect to the xy coordinate axes. See the *Howto triclinic* for a detailed description of all 3 kinds of simulation boxes.

Here are examples of using the *create_box* command to define the simulation box for a 2d system.

```
# 2d orthogonal box using a block-style region
region mybox block -10 10 0 10 -0.5 0.5
create_box 1 mybox

# 2d restricted triclinic box using a prism-style region with only xy tilt
region mybox prism 0 10 0 10 -0.5 0.5 2.0 0.0 0.0
create_box 1 mybox

# 2d general triclinic box using a primitive cell for a 2d hex lattice
lattice      custom 1.0 a1 1.0 0.0 0.0 a2 0.5 0.86602540378 0.0 &
              a3 0.0 0.0 1.0 basis 0.0 0.0 0.0 triclinic/general
create_box   1 NULL 0 5 0 5 -0.5 0.5
```

Note that for 2d orthogonal or restricted triclinic boxes, the box has a 3rd dimension which must straddle $z = 0.0$ in the z dimension. Typically the width of box in the z dimension should be narrow, e.g. -0.5 to 0.5, but that is not required. For a 2d general triclinic box, the *a3* vector defined by the *lattice* command must be (0.0,0.0,1.0), which is its default value. Also the *clo* and *chi* arguments of the *create_box* command must be -0.5 and 0.5.

Here are examples of using the *read_data* command to define the simulation box for a 2d system via keywords in the header section of the data file. These are the same boxes as the examples for the *create_box* command

```
# 2d orthogonal box
-10 10    xlo xhi
0 10     ylo yhi
-0.5 0.5 zlo zhi      # this is the default, so no need to specify

# 2d restricted triclinic box with only xy tilt
-10 10    xlo xhi
0 10     ylo yhi
-0.5 0.5 zlo zhi      # this is the default, so no need to specify
2.0 0.0 0.0 xy xz yz

# 3d general triclinic box using a primitive cell for a 2d hex lattice
5 0 0          avec
2.5 4.3301270189 0 bvec
0 0 1          cvec      # this is the default, so no need to specify
0 0 -0.5       abc origin # this is the default for 2d, so no need to specify
```

Note that for 2d orthogonal or restricted triclinic boxes, the box has a 3rd dimension specified by the *zlo zhi* values,

which must straddle $z = 0.0$. Typically the width of box in the z dimension should be narrow, e.g. -0.5 to 0.5 , but that is not required. For a 2d general triclinic box, the z component of *avec* and *bvec* must be zero, and *cvec* must be $(0,0,1)$, which is the default. The z component of *abc origin* must also be -0.5 , which is the default.

If using the *create_atoms* command to create atoms in the 2d simulation box, all the z coordinates of created atoms will be zero.

If using the *read_data* command to read in a data file of atom coordinates for a 2d system, the z coordinates of all atoms should be zero. A value within epsilon of zero is also allowed in case the data file was generated by another program with finite numeric precision, in which case the z coord for the atom will be set to zero.

Use the *fix enforce2d* command as the last fix defined in the input script. It ensures that the z -components of velocities and forces are zeroed out every timestep. The reason to make it the last fix is so that any forces added by other fixes will also be zeroed out.

Many of the example input scripts included in the examples directory are for 2d models.

Note

Some models in LAMMPS treat particles as finite-size spheres, as opposed to point particles. See the *atom_style sphere* and *fix nve/sphere* commands for details. By default, for 2d simulations, such particles will still be modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be that of a sphere. If you wish to model them as 2d discs, see the *set density/disc* command and the *disc* option for the *fix nve/sphere*, *fix nvt/sphere*, *fix nph/sphere*, *fix npt/sphere* commands.

8.2.2 Type labels

Added in version 15Sep2022.

Each atom in LAMMPS has an associated numeric atom type. Similarly, each bond, angle, dihedral, and improper is assigned a bond type, angle type, and so on. The primary use of these types is to map potential (force field) parameters to the interactions of the atom, bond, angle, dihedral, and improper.

By default, type values are entered as integers from 1 to *Ntypes* wherever they appear in LAMMPS input or output files. The total number *Ntypes* for each interaction is “locked in” when the simulation box is created.

A recent addition to LAMMPS is the option to use strings - referred to as type labels - as an alternative. Using type labels instead of numeric types can be advantageous in various scenarios. For example, type labels can make inputs more readable and generic (i.e. usable through the *include command* for different systems with different numerical values assigned to types. This generality also applies to other inputs like data files read by *read_data* or molecule template files read by the *molecule* command. A discussion of the current type label support can be found in (*Gissing*). See below for a list of other commands that can use type labels in different ways.

LAMMPS will *internally* continue to use numeric types, which means that many previous restrictions still apply. For example, the total number of types is locked in when creating the simulation box, and potential parameters for each type must be provided even if not used by any interactions.

A collection of type labels for all type-kinds (atom types, bond types, etc.) is stored as a “label map” which is simply a list of numeric types and their associated type labels. Within a type-kind, each type label must be unique. It can be assigned to only one numeric type. To read and write type labels to data files for a given type-kind, *all* associated numeric types need have a type label assigned. Partial maps can be saved with the *labelmap write* command and read back with the *include* command.

Valid type labels can contain most ASCII characters, but cannot start with a number, a ‘#’, or a ‘*’. Also, labels must not contain whitespace characters. When using the *labelmap command* in the LAMMPS input, if certain characters appear in the type label, such as the single (‘) or double (”) quote or the ‘#’ character, the label must be put in either

double, single, or triple (""") quotes. Triple quotes allow for the most generic type label strings, but they require to have a leading and trailing blank space. When defining type labels the blanks will be ignored. Example:

```
labelmap angle 1 "" C1'-C2"-C3# ""
```

This command will map the string `C1'-C2"-C3#` to the angle type 1.

There are two ways to define label maps. One is via the `labelmap` command. The other is via the `read_data` command. A data file can have sections such as *Atom Type Labels*, *Bond Type Labels*, etc., which assign type labels to numeric types. The label map can be written out to data files by the `write_data` command. This map is also written to and read from restart files, by the `write_restart` and `read_restart` commands.

Use of type labels in LAMMPS input or output

Many LAMMPS input script commands that take a numeric type as an argument can use the associated type label instead. If a type label is not defined for a particular numeric type, only its numeric type can be used.

This example assigns labels to the atom types, and then uses the type labels to redefine the pair coefficients.

```
pair_coeff 1 2 1.0 1.0          # numeric types
labelmap atom 1 C 2 H
pair_coeff C H 1.0 1.0         # type labels
```

Adding support for type labels to various commands is an ongoing project. If an input script command (or a section in a file read by a command) allows substituting a type label for a numeric type argument, it will be explicitly mentioned in that command's documentation page.

As a temporary measure, input script commands can take advantage of variables and how they can be expanded during processing of the input. The variables can use functions that will translate type label strings to their respective number as defined in the current label map. See the `variable` command for details.

For example, here is how the `pair_coeff` command could be used with type labels if it did not yet support them, either with an explicit variable command or an implicit variable used in the `pair_coeff` command.

```
labelmap atom 1 C 2 H
variable atom1 equal label2type(atom,C)
variable atom2 equal label2type(atom,H)
pair_coeff ${atom1} ${atom2} 1.0 1.0
```

```
labelmap atom 1 C 2 H
pair_coeff $(label2type(atom,C)) $(label2type(atom,H)) 80.0 1.2
```

Commands that can use label types

Any workflow that involves reading multiple data files, molecule templates or a combination of the two can be streamlined by using type labels instead of numeric types, because types are automatically synced between the files. The creation of simulation-ready reaction templates for *fix bond/react* is much simpler when using type labels, and results in templates that can be used without modification in multiple simulations or different systems.

8.2.3 Triclinic (non-orthogonal) simulation boxes

By default, LAMMPS uses an orthogonal simulation box to encompass the particles. The orthogonal box has its “origin” at (xlo,ylo,zlo) and extends to (xhi,yhi,zhi). Conceptually it is defined by 3 edge vectors starting from the origin given by $\mathbf{A} = (xhi-xlo,0,0)$; $\mathbf{B} = (0,yhi-ylo,0)$; $\mathbf{C} = (0,0,zhi-zlo)$. The *boundary* command sets the boundary conditions for the 6 faces of the box (periodic, non-periodic, etc). The 6 parameters (xlo,xhi,ylo,yhi,zlo,zhi) are defined at the time the simulation box is created by one of these commands:

- *create_box*
- *read_data*
- *read_restart*
- *read_dump*

Internally, LAMMPS defines box size parameters lx,ly,lz where $lx = xhi-xlo$, and similarly in the y and z dimensions. The 6 parameters, as well as lx,ly,lz, can be output via the *thermo_style custom* command. See the *Howto 2d* doc page for info on how zlo and zhi are defined for 2d simulations.

Triclinic simulation boxes

LAMMPS also allows simulations to be performed using triclinic (non-orthogonal) simulation boxes shaped as a 3d parallelepiped with triclinic symmetry. For 2d simulations a triclinic simulation box is effectively a parallelogram; see the *Howto 2d* doc page for details.

One use of triclinic simulation boxes is to model solid-state crystals with triclinic symmetry. The *lattice* command can be used with non-orthogonal basis vectors to define a lattice that will tile a triclinic simulation box via the *create_atoms* command.

A second use is to run Parrinello-Rahman dynamics via the *fix npt* command, which will adjust the xy, xz, yz tilt factors to compensate for off-diagonal components of the pressure tensor. The analog for an *energy minimization* is the *fix box/relax* command.

A third use is to shear a bulk solid to study the response of the material. The *fix deform* command can be used for this purpose. It allows dynamic control of the xy, xz, yz tilt factors as a simulation runs. This is discussed in the *Howto NEMD* doc page on non-equilibrium MD (NEMD) simulations.

Conceptually, a triclinic parallelepiped is defined with an “origin” at (xlo,ylo,zlo) and 3 edge vectors $\mathbf{A} = (ax,ay,az)$, $\mathbf{B} = (bx,by,bz)$, $\mathbf{C} = (cx,cy,cz)$ which can be arbitrary vectors, so long as they are non-zero, distinct, and not co-planar. In addition, they must define a right-handed system, such that $(\mathbf{A} \text{ cross } \mathbf{B})$ points in the direction of \mathbf{C} . Note that a left-handed system can be converted to a right-handed system by simply swapping the order of any pair of the \mathbf{A} , \mathbf{B} , \mathbf{C} vectors.

The 4 commands listed above for defining orthogonal simulation boxes have triclinic options which allow for specification of the origin and edge vectors \mathbf{A} , \mathbf{B} , \mathbf{C} . For each command, this can be done in one of two ways, for what LAMMPS calls a *general* triclinic box or a *restricted* triclinic box.

A *general* triclinic box is specified by an origin (xlo, ylo, zlo) and arbitrary edge vectors $\mathbf{A} = (ax,ay,az)$, $\mathbf{B} = (bx,by,bz)$, and $\mathbf{C} = (cx,cy,cz)$. So there are 12 parameters in total.

A *restricted* triclinic box also has an origin (xlo,ylo,zlo), but its edge vectors are of the following restricted form: $\mathbf{A} = (xhi-xlo,0,0)$, $\mathbf{B} = (xy,yhi-ylo,0)$, $\mathbf{C} = (xz,yz,zhi-zlo)$. So there are 9 parameters in total. Note that the restricted form requires \mathbf{A} to be along the x-axis, \mathbf{B} to be in the xy plane with a y-component in the +y direction, and \mathbf{C} to have its z-component in the +z direction. Note that a restricted triclinic box is *right-handed* by construction since $(\mathbf{A} \text{ cross } \mathbf{B})$ points in the direction of \mathbf{C} .

The xy, xz, yz values can be zero or positive or negative. They are called “tilt factors” because they are the amount of displacement applied to edges of faces of an orthogonal box to change it into a restricted triclinic parallelepiped.

Note

Any right-handed general triclinic box (i.e. solid-state crystal basis vectors) can be rotated in 3d around its origin in order to conform to the LAMMPS definition of a restricted triclinic box. See the discussion in the next sub-section about general triclinic simulation boxes in LAMMPS.

Note that the *thermo_style custom* command has keywords for outputting the various parameters that define the size and shape of orthogonal, restricted triclinic, and general triclinic simulation boxes.

For orthogonal boxes there 6 thermo keywords (xlo, ylo, zlo) and (xhi, yhi, zhi).

For restricted triclinic boxes there are 9 thermo keywords for (xlo, ylo, zlo), (xhi, yhi, zhi), and the (xy, xz, yz) tilt factors.

For general triclinic boxes there are 12 thermo keywords for (xlo, ylo, zhi) and the components of the **A**, **B**, **C** edge vectors, namely ($avecx, avecy, avecz$), ($bvecx, bvecy, bvecz$), and ($cvecx, cvecy, cvecz$),

The remainder of this doc page explains (a) how LAMMPS operates with general triclinic simulation boxes, (b) mathematical transformations between general and restricted triclinic boxes which may be useful when creating LAMMPS inputs or interpreting outputs for triclinic simulations, and (c) how LAMMPS uses tilt factors for restricted triclinic simulation boxes.

General triclinic simulation boxes in LAMMPS

LAMMPS allows specification of general triclinic simulation boxes with their atoms as a convenience for users who may be converting data from solid-state crystallographic representations or from DFT codes for input to LAMMPS. Likewise it allows output of dump files, data files, and thermodynamic data (e.g. pressure tensor) in a general triclinic format.

However internally, LAMMPS only uses restricted triclinic simulation boxes. This is for parallel efficiency and to formulate partitioning of the simulation box across processors, neighbor list building, and inter-processor communication of per-atom data with methods similar to those used for orthogonal boxes.

This means 4 things which are important to understand:

- Input of a general triclinic system is immediately converted to a restricted triclinic system.
- If output of per-atom data for a general triclinic system is requested (e.g. for atom coordinates in a dump file), conversion from a restricted to general triclinic system is done at the time of output.
- The conversion of the simulation box and per-atom data from general triclinic to restricted triclinic (and vice versa) is a 3d rotation operation around an origin, which is the lower left corner of the simulation box. This means an input data file for a general triclinic system should specify all per-atom quantities consistent with the general triclinic box and its orientation relative to the standard x, y, z coordinate axes. For example, atom coordinates should be inside the general triclinic simulation box defined by the edge vectors **A**, **B**, **C** and its origin. Likewise per-atom velocities should be in directions consistent with the general triclinic box orientation. E.g. a velocity vector which will be in the $+x$ direction once LAMMPS converts from a general to restricted triclinic box, should be specified in the data file in the direction of the **A** edge vector. See the *read_data* doc page for info on all the per-atom vector quantities to which this rule applies when a data file for a general triclinic box is input.
- If commands such as *write_data* or *dump custom* are used to output general triclinic information, it is effectively the inverse of the operation described in the preceding bullet.

- Other LAMMPS commands such as *region* or *velocity* or *set*, operate on a restricted triclinic system even if a general triclinic system was defined initially.

This is the list of commands which have general triclinic options:

- *create_box* - define a general triclinic box
 - *create_atoms* - add atoms to a general triclinic box
 - *lattice* - define a custom lattice consistent with the **A**, **B**, **C** edge vectors of a general triclinic box
 - *read_data* - read a data file for a general triclinic system
 - *write_data* - write a data file for a general triclinic system
 - *dump_atom*, *dump_custom* - output dump snapshots in general triclinic format
 - *dump_modify triclinic/general* - select general triclinic format for dump output
 - *thermo_style* - output the pressure tensor in general triclinic format
 - *thermo_modify triclinic/general* - select general triclinic format for thermo output
 - *read_restart* - read a restart file for a general triclinic system
 - *write_restart* - write a restart file for a general triclinic system
-

Transformation from general to restricted triclinic boxes

Let **A**,**B**,**C** be the right-handed edge vectors of a general triclinic simulation box. The equivalent LAMMPS **a**,**b**,**c** for a restricted triclinic box are a 3d rotation of **A**, **B**, and **C** and can be computed as follows:

$$\begin{aligned}
 (\mathbf{a} \quad \mathbf{b} \quad \mathbf{c}) &= \begin{pmatrix} a_x & b_x & c_x \\ 0 & b_y & c_y \\ 0 & 0 & c_z \end{pmatrix} \\
 a_x &= A \\
 b_x &= \mathbf{B} \cdot \hat{\mathbf{A}} = B \cos \gamma \\
 b_y &= |\hat{\mathbf{A}} \times \mathbf{B}| = B \sin \gamma = \sqrt{B^2 - b_x^2} \\
 c_x &= \mathbf{C} \cdot \hat{\mathbf{A}} = C \cos \beta \\
 c_y &= \mathbf{C} \cdot (\widehat{\mathbf{A} \times \mathbf{B}}) \times \hat{\mathbf{A}} = \frac{\mathbf{B} \cdot \mathbf{C} - b_x c_x}{b_y} \\
 c_z &= |\mathbf{C} \cdot (\widehat{\mathbf{A} \times \mathbf{B}})| = \sqrt{C^2 - c_x^2 - c_y^2}
 \end{aligned}$$

where $A = |\mathbf{A}|$ indicates the scalar length of **A**. The hat symbol (^) indicates the corresponding unit vector. β and γ are angles between the **A**, **B**, **C** vectors as described below.

For consistency, the same rotation applied to the triclinic box edge vectors can also be applied to atom positions, velocities, and other vector quantities. This can be conveniently achieved by first converting to fractional coordinates in the general triclinic coordinates and then converting to coordinates in the restricted triclinic basis. The transformation is given by the following equation:

$$\mathbf{x} = (\mathbf{a} \quad \mathbf{b} \quad \mathbf{c}) \cdot \frac{1}{V} \begin{pmatrix} \mathbf{B} \times \mathbf{C} \\ \mathbf{C} \times \mathbf{A} \\ \mathbf{A} \times \mathbf{B} \end{pmatrix} \cdot \mathbf{X}$$

where V is the volume of the box (same in either basis), \mathbf{X} is the fractional vector in the general triclinic basis and \mathbf{x} is the resulting vector in the restricted triclinic basis.

Crystallographic general triclinic representation of a simulation box

General triclinic crystal structures are often defined using three lattice constants a , b , and c , and three angles α , β , and γ . Note that in this nomenclature, the a , b , and c lattice constants are the scalar lengths of the edge vectors \mathbf{a} , \mathbf{b} , and \mathbf{c} defined above. The relationship between these 6 quantities (a , b , c , α , β , γ) and the LAMMPS restricted triclinic box sizes (lx, ly, lz) = ($xhi-xlo, yhi-ylo, zhi-zlo$) and tilt factors (xy, xz, yz) is as follows:

$$\begin{aligned}a &= lx \\ b^2 &= ly^2 + xy^2 \\ c^2 &= lz^2 + xz^2 + yz^2 \\ \cos \alpha &= \frac{xy * xz + ly * yz}{b * c} \\ \cos \beta &= \frac{xz}{c} \\ \cos \gamma &= \frac{xy}{b}\end{aligned}$$

The inverse relationship can be written as follows:

$$\begin{aligned}lx &= a \\ xy &= b \cos \gamma \\ xz &= c \cos \beta \\ ly^2 &= b^2 - xy^2 \\ yz &= \frac{b * c \cos \alpha - xy * xz}{ly} \\ lz^2 &= c^2 - xz^2 - yz^2\end{aligned}$$

The values of a , b , c , α , β , and γ can be printed out or accessed by computes using the *thermo_style custom* keywords *cella*, *cellb*, *cellc*, *cellalpha*, *cellbeta*, *cellgamma*, respectively.

Output of restricted and general triclinic boxes in a dump file

As discussed on the *dump* command doc page, when the BOX BOUNDS for a snapshot is written to a dump file for a restricted triclinic box, an orthogonal bounding box which encloses the triclinic simulation box is output, along with the 3 tilt factors (xy , xz , yz) of the restricted triclinic box, formatted as follows:

```
ITEM: BOX BOUNDS xy xz yz
xlo_bound xhi_bound xy
ylo_bound yhi_bound xz
zlo_bound zhi_bound yz
```

This bounding box is convenient for many visualization programs and is calculated from the 9 restricted triclinic box parameters ($xlo, xhi, ylo, yhi, zlo, zhi, xy, xz, yz$) as follows:

```
xlo_bound = xlo + MIN(0.0,xy,xz,xy+xz)
xhi_bound = xhi + MAX(0.0,xy,xz,xy+xz)
ylo_bound = ylo + MIN(0.0,yz)
yhi_bound = yhi + MAX(0.0,yz)
zlo_bound = zlo
zhi_bound = zhi
```

These formulas can be inverted if you need to convert the bounding box back into the restricted triclinic box parameters, e.g. $xlo = xlo_bound - \text{MIN}(0.0, xy, xz, xy+xz)$.

Periodicity and tilt factors for triclinic simulation boxes

There is no requirement that a triclinic box be periodic in any dimension, though it typically should be in y or z if you wish to enforce a shift in coordinates due to periodic boundary conditions across the y or z boundaries. See the doc page for the *boundary* command for an explanation of shifted coordinates for restricted triclinic boxes which are periodic.

Some commands that work with triclinic boxes, e.g. the *fix deform* and *fix npt* commands, require periodicity or non-shrink-wrap boundary conditions in specific dimensions. See the command doc pages for details.

A restricted triclinic box can be defined with all 3 tilt factors = 0.0, so that it is initially orthogonal. This is necessary if the box will become non-orthogonal, e.g. due to use of the *fix npt* or *fix deform* commands. Alternatively, you can use the *change_box* command to convert a simulation box from orthogonal to restricted triclinic and vice versa.

Note

Highly tilted restricted triclinic simulation boxes can be computationally inefficient. This is due to the large volume of communication needed to acquire ghost atoms around a processor's irregular-shaped subdomain. For extreme values of tilt, LAMMPS may also lose atoms and generate an error.

LAMMPS will issue a warning if you define a restricted triclinic box with a tilt factor which skews the box more than half the distance of the parallel box length, which is the first dimension in the tilt factor (e.g. x for xz).

For example, if $xlo = 2$ and $xhi = 12$, then the x box length is 10 and the xy tilt factor should be between -5 and 5 to avoid the warning. Similarly, both xz and yz should be between $-(xhi-xlo)/2$ and $+(yhi-ylo)/2$. Note that these are not limitations, since if the maximum tilt factor is 5 (as in this example), then simulations boxes and atom configurations with tilt = ..., -15, -5, 5, 15, 25, ... are all geometrically equivalent.

If the box tilt exceeds this limit during a dynamics run (e.g. due to the *fix deform* command), then by default the box is “flipped” to an equivalent shape with a tilt factor within the warning bounds, and the run continues. See the *fix deform* page for further details. Box flips that would normally occur using the *fix deform* or *fix npt* commands can be suppressed using the *flip no* option with either of the commands.

One exception to box flipping is if the first dimension in the tilt factor (e.g. x for xy) is non-periodic. In that case, the limits on the tilt factor are not enforced, since flipping the box in that dimension would not change the atom positions due to non-periodicity. In this mode, if the system tilts to large angles, the simulation will simply become inefficient, due to the highly skewed simulation box.

8.2.4 Thermostats

Thermostatting means controlling the temperature of particles in an MD simulation. *Barostatting* means controlling the pressure. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Thermostatting in LAMMPS is performed by *fixes*, or in one case by a pair style. Several thermostatting fixes are available: Nose-Hoover (nvt), Berendsen, CSVr, Langevin, and direct rescaling (temp/rescale). Dissipative particle dynamics (DPD) thermostatting can be invoked via the *dpd/tstat* pair style:

- *fix nvt*
- *fix nvt/sphere*
- *fix nvt/asphere*
- *fix nvt/sllod*
- *fix temp/berendsen*
- *fix temp/csvr*
- *fix langevin*
- *fix temp/rescale*
- *pair_style dpd/tstat*

Fix nvt only thermostats the translational velocity of particles. *Fix nvt/sllod* also does this, except that it subtracts out a velocity bias due to a deforming box and integrates the SLLOD equations of motion. See the *Howto nemd* page for further details. *Fix nvt/sphere* and *fix nvt/asphere* thermostat not only translation velocities but also rotational velocities for spherical and aspherical particles.

Note

A recent (2017) book by (*Daivis and Todd*) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostatting generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

DPD thermostatting alters pairwise interactions in a manner analogous to the per-particle thermostatting of *fix langevin*.

Any of the thermostatting fixes can be instructed to use custom temperature computes that remove bias which has two effects: first, the current calculated temperature, which is compared to the requested target temperature, is calculated with the velocity bias removed; second, the thermostat adjusts only the thermal temperature component of the particle's velocities, which are the velocities with the bias removed. The removed bias is then added back to the adjusted velocities. See the doc pages for the individual fixes and for the *fix_modify* command for instructions on how to assign a temperature compute to a thermostatting fix.

For example, you can apply a thermostat only to atoms in a spatial region by using it in conjunction with *compute temp/region*. Or you can apply a thermostat to only the x and z components of velocity by using it with *compute temp/partial*. Of you could thermostat only the thermal temperature of a streaming flow of particles without affecting the streaming velocity, by using *compute temp/profile*.

Below is a list of custom temperature computes that can be used like that:

- *compute temp/asphere command*
- *compute temp/body command*
- *compute temp/chunk command*

- *compute temp/com command*
- *compute temp/deform command*
- *compute temp/partial command*
- *compute temp/profile command*
- *compute temp/ramp command*
- *compute temp/region command*
- *compute temp/rotate command*
- *compute temp/sphere command*

Note

Only the nvt fixes perform time integration, meaning they update the velocities and positions of particles due to forces and velocities respectively. The other thermostat fixes only adjust velocities; they do NOT perform time integration updates. Thus they should be used in conjunction with a constant NVE integration fix such as these:

- *fix nve*
- *fix nve/sphere*
- *fix nve/asphere*

Thermodynamic output, which can be setup via the *thermo_style* command, often includes temperature values. As explained on the page for the *thermo_style* command, the default temperature is setup by the thermo command itself. It is NOT the temperature associated with any thermostating fix you have defined or with any compute you have defined that calculates a temperature. The doc pages for the thermostating fixes explain the ID of the temperature compute they create. Thus if you want to view these temperatures, you need to specify them explicitly via the *thermo_style custom* command. Or you can use the *thermo_modify* command to re-define what temperature compute is used for default thermodynamic output.

(Daivis and Todd) Daivis and Todd, Nonequilibrium Molecular Dynamics (book), Cambridge University Press, <https://doi.org/10.1017/9781139017848>, (2017).

8.2.5 Barostats

Barostatting means controlling the pressure in an MD simulation. *Thermostatting* means controlling the temperature of the particles. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Barostatting in LAMMPS is performed by *fixes*. Two barostatting methods are currently available: Nose-Hoover (npt and nph) and Berendsen:

- *fix npt*
- *fix npt/sphere*
- *fix npt/asphere*
- *fix nph*
- *fix press/berendsen*

The *fix npt* commands include a Nose-Hoover thermostat and barostat. *Fix nph* is just a Nose/Hoover barostat; it does no thermostating. Both *fix nph* and *fix press/berendsen* can be used in conjunction with any of the thermostating fixes.

As with the *thermostats*, *fix npt* and *fix nph* only use translational motion of the particles in computing T and P and performing thermo/barostatting. *Fix npt/sphere* and *fix npt/asphere* thermo/barostat using not only translation velocities but also rotational velocities for spherical and aspherical particles.

All of the barostatting fixes use the *compute pressure* compute to calculate a current pressure. By default, this compute is created with a simple *compute temp* (see the last argument of the *compute pressure* command), which is used to calculate the kinetic component of the pressure. The barostatting fixes can also use temperature computes that remove bias for the purpose of computing the kinetic component which contributes to the current pressure. See the doc pages for the individual fixes and for the *fix_modify* command for instructions on how to assign a temperature or pressure compute to a barostatting fix.

Note

As with the thermostats, the Nose/Hoover methods (*fix npt* and *fix nph*) perform time integration. *Fix press/berendsen* does NOT, so it should be used with one of the constant NVE fixes or with one of the NVT fixes.

Thermodynamic output, which can be setup via the *thermo_style* command, often includes pressure values. As explained on the page for the *thermo_style* command, the default pressure is setup by the thermo command itself. It is NOT the pressure associated with any barostatting fix you have defined or with any compute you have defined that calculates a pressure. The doc pages for the barostatting fixes explain the ID of the pressure compute they create. Thus if you want to view these pressures, you need to specify them explicitly via the *thermo_style custom* command. Or you can use the *thermo_modify* command to re-define what pressure compute is used for default thermodynamic output.

8.2.6 Walls

Walls in an MD simulation are typically used to bound particle motion, i.e. to serve as a boundary condition.

Walls in LAMMPS can be of rough (made of particles) or idealized surfaces. Ideal walls can be smooth, generating forces only in the normal direction, or frictional, generating forces also in the tangential direction.

Rough walls, built of particles, can be created in various ways. The particles themselves can be generated like any other particle, via the *lattice* and *create_atoms* commands, or read in via the *read_data* command.

Their motion can be constrained by many different commands, so that they do not move at all, move together as a group at constant velocity or in response to a net force acting on them, move in a prescribed fashion (e.g. rotate around a point), etc. Note that if a time integration fix like *fix nve* or *fix nvt* is not used with the group that contains wall particles, their positions and velocities will not be updated.

- *fix aveforce* - set force on particles to average value, so they move together
- *fix setforce* - set force on particles to a value, e.g. 0.0
- *fix freeze* - freeze particles for use as granular walls
- *fix nve/noforce* - advect particles by their velocity, but without force
- *fix move* - prescribe motion of particles by a linear velocity, oscillation, rotation, variable

The *fix move* command offers the most generality, since the motion of individual particles can be specified with *variable* formula which depends on time and/or the particle position.

For rough walls, it may be useful to turn off pairwise interactions between wall particles via the *neigh_modify exclude* command.

Rough walls can also be created by specifying frozen particles that do not move and do not interact with mobile particles, and then tethering other particles to the fixed particles, via a *bond*. The bonded particles do interact with other mobile particles.

Idealized walls can be specified via several *fix* commands. *Fix wall/gran* creates frictional walls for use with granular particles; all the other commands create smooth walls.

- *fix wall/reflect* - reflective flat walls
- *fix wall/lj93* - flat walls, with Lennard-Jones 9/3 potential
- *fix wall/lj126* - flat walls, with Lennard-Jones 12/6 potential
- *fix wall/colloid* - flat walls, with *pair_style colloid* potential
- *fix wall/harmonic* - flat walls, with repulsive harmonic spring potential
- *fix wall/morse* - flat walls, with Morse potential
- *fix wall/region* - use region surface as wall
- *fix wall/gran* - flat or curved walls with *pair_style granular* potential

The *lj93*, *lj126*, *colloid*, *harmonic*, and *morse* styles all allow the flat walls to move with a constant velocity, or oscillate in time. The *fix wall/region* command offers the most generality, since the region surface is treated as a wall, and the geometry of the region can be a simple primitive volume (e.g. a sphere, or cube, or plane), or a complex volume made from the union and intersection of primitive volumes. *Regions* can also specify a volume “interior” or “exterior” to the specified primitive shape or *union* or *intersection*. *Regions* can also be “dynamic” meaning they move with constant velocity, oscillate, or rotate.

The only frictional idealized walls currently in LAMMPS are flat or curved surfaces specified by the *fix wall/gran* command. At some point we plan to allow region surfaces to be used as frictional walls, as well as triangulated surfaces.

8.2.7 NEMD simulations

Non-equilibrium molecular dynamics or NEMD simulations are typically used to measure a fluid’s rheological properties such as viscosity. In LAMMPS, such simulations can be performed by first setting up a non-orthogonal simulation box (see the preceding Howto section).

A shear strain can be applied to the simulation box at a desired strain rate by using the *fix deform* command. The *fix nvt/sllod* command can be used to thermostat the sheared fluid and integrate the SLLOD equations of motion for the system. *Fix nvt/sllod* uses *compute temp/deform* to compute a thermal temperature by subtracting out the streaming velocity of the shearing atoms. The velocity profile or other properties of the fluid can be monitored via the *fix ave/chunk* command.

Note

A recent (2017) book by (*Daivis and Todd*) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostating generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

As discussed in the previous section on non-orthogonal simulation boxes, the amount of tilt or skew that can be applied is limited by LAMMPS for computational efficiency to be 1/2 of the parallel box length. However, *fix deform* can continuously strain a box by an arbitrary amount. As discussed in the *fix deform* command, when the tilt value reaches a limit, the box is flipped to the opposite limit which is an equivalent tiling of periodic space. The strain rate can then continue to change as before. In a long NEMD simulation these box re-shaping events may occur many times.

In a NEMD simulation, the “remap” option of *fix deform* should be set to “remap v”, since that is what *fix nvt/sllod* assumes to generate a velocity profile consistent with the applied shear strain rate.

An alternative method for calculating viscosities is provided via the *fix viscosity* command.

NEMD simulations can also be used to measure transport properties of a fluid through a pore or channel. Simulations of steady-state flow can be performed using the *fix flow/gauss* command.

(Daivis and Todd) Daivis and Todd, Nonequilibrium Molecular Dynamics (book), Cambridge University Press, <https://doi.org/10.1017/9781139017848>, (2017).

8.2.8 Long-range dispersion settings

The PPPM method computes interactions by splitting the pair potential into two parts, one of which is computed in a normal pairwise fashion, the so-called real-space part, and one of which is computed using the Fourier transform, the so called reciprocal-space or kspace part. For both parts, the potential is not computed exactly but is approximated. Thus, there is an error in both parts of the computation, the real-space and the kspace error. The just mentioned facts are true both for the PPPM for Coulomb as well as dispersion interactions. The deciding difference - and also the reason why the parameters for *pppm/disp* have to be selected with more care - is the impact of the errors on the results: The kspace error of the PPPM for Coulomb and dispersion interaction and the real-space error of the PPPM for Coulomb interaction have the character of noise. In contrast, the real-space error of the PPPM for dispersion has a clear physical interpretation: the underprediction of cohesion. As a consequence, the real-space error has a much stronger effect than the kspace error on simulation results for *pppm/disp*. Parameters must thus be chosen in a way that this error is much smaller than the kspace error.

When using *pppm/disp* and not making any specifications on the PPPM parameters via the *kspace modify* command, parameters will be tuned such that the real-space error and the kspace error are equal. This will result in simulations that are either inaccurate or slow, both of which is not desirable. For selecting parameters for the *pppm/disp* that provide fast and accurate simulations, there are two approaches, which both have their up- and downsides.

The first approach is to set desired real-space and kspace accuracies via the *kspace_modify force/disp/real* and *kspace_modify force/disp/kspace* commands. Note that the accuracies have to be specified in force units and are thus dependent on the chosen unit settings. For real units, 0.0001 and 0.002 seem to provide reasonable accurate and efficient computations for the real-space and kspace accuracies. 0.002 and 0.05 work well for most systems using lj units. PPPM parameters will be generated based on the desired accuracies. The upside of this approach is that it usually provides a good set of parameters and will work for both the *kspace_modify diff ad* and *kspace_modify diff ik* options. The downside of the method is that setting the PPPM parameters will take some time during the initialization of the simulation.

The second approach is to set the parameters for the *pppm/disp* explicitly using the *kspace_modify mesh/disp*, *kspace_modify order/disp*, and *kspace_modify gewald/disp* commands. This approach requires a more experienced user who understands well the impact of the choice of parameters on the simulation accuracy and performance. This approach provides a fast initialization of the simulation. However, it is sensitive to errors: A combination of parameters that will perform well for one system might result in far-from-optimal conditions for other simulations. For example, parameters that provide accurate and fast computations for all-atomistic force fields can provide insufficient accuracy or united-atomistic force fields (which is related to that the latter typically have larger dispersion coefficients).

To avoid inaccurate or inefficient simulations, the *pppm/disp* stops simulations with an error message if no action is taken to control the PPPM parameters. If the automatic parameter generation is desired and real-space and kspace accuracies are desired to be equal, this error message can be suppressed using the *kspace_modify disp/auto yes* command.

A reasonable approach that combines the upsides of both methods is to make the first run using the *kspace_modify force/disp/real* and *kspace_modify force/disp/kspace* commands, write down the PPPM parameters from the output, and specify these parameters using the second approach in subsequent runs (which have the same composition, force field, and approximately the same volume).

Concerning the performance of the `pppm/disp` there are two more things to consider. The first is that when using the `pppm/disp`, the cutoff parameter does no longer affect the accuracy of the simulation (subject to that `gewald/disp` is adjusted when changing the cutoff). The performance can thus be increased by examining different values for the cutoff parameter. A lower bound for the cutoff is only set by the truncation error of the repulsive term of pair potentials.

The second is that the mixing rule of the pair style has an impact on the computation time when using the `pppm/disp`. Fastest computations are achieved when using the geometric mixing rule. Using the arithmetic mixing rule substantially increases the computational cost. The computational overhead can be reduced using the `kpace_modify mix/disp geom` and `kpace_modify splittol` commands. The first command simply enforces geometric mixing of the dispersion coefficients in `kpace` computations. This introduces some error in the computations but will also significantly speed-up the simulations. The second keyword sets the accuracy with which the dispersion coefficients are approximated using a matrix factorization approach. This may result in better accuracy than using the first command, but will usually also not provide an equally good increase of efficiency.

Finally, `pppm/disp` can also be used when no mixing rules apply. This can be achieved using the `kpace_modify mix/disp none` command. Note that the code does not check automatically whether any mixing rule is fulfilled. If mixing rules do not apply, the user will have to specify this command explicitly.

8.3 Analysis howto

8.3.1 Output from LAMMPS (thermo, dumps, computes, fixes, variables)

There are four basic forms of LAMMPS output:

- *Thermodynamic output*, which is a list of quantities printed every few timesteps to the screen and logfile.
- *Dump files*, which contain snapshots of atoms and various per-atom values and are written at a specified frequency.
- Certain fixes can output user-specified quantities to files: *fix ave/time* for time averaging, *fix ave/chunk* for spatial or other averaging, and *fix print* for single-line output of *variables*. Fix print can also output to the screen.
- *Restart files*.

A simulation prints one set of thermodynamic output and (optionally) restart files. It can generate any number of dump files and fix output files, depending on what *dump* and *fix* commands you specify.

As discussed below, LAMMPS gives you a variety of ways to determine what quantities are calculated and printed when the thermodynamics, dump, or fix commands listed above perform output. Throughout this discussion, note that users can also *add their own computes and fixes to LAMMPS* which can generate values that can then be output with these commands.

The following subsections discuss different LAMMPS commands related to output and the kind of data they operate on and produce:

- *Global/per-atom/local/per-grid data*
- *Scalar/vector/array data*
- *Disambiguation*
- *Thermodynamic output*
- *Dump file output*
- *Fixes that write output files*
- *Computes that process output quantities*
- *Fixes that process output quantities*

- *Computes that generate values to output*
- *Fixes that generate values to output*
- *Variables that generate values to output*
- *Summary table of output options and data flow between commands*

Global/per-atom/local/per-grid data

Various output-related commands work with four different “styles” of data: global, per-atom, local, and per-grid. A global datum is one or more system-wide values, e.g. the temperature of the system. A per-atom datum is one or more values per atom, e.g. the kinetic energy of each atom. Local datums are calculated by each processor based on the atoms it owns, and there may be zero or more per atom, e.g. a list of bond distances.

A per-grid datum is one or more values per grid cell, for a grid which overlays the simulation domain. Similar to atoms and per-atom data, the grid cells and the data they store are distributed across processors; each processor owns the grid cells whose center points fall within its subdomain.

Scalar/vector/array data

Global, per-atom, local, and per-grid datums can come in three “kinds”: a single scalar value, a vector of values, or a 2d array of values. More specifically these are the valid kinds for each style:

- global scalar
- global vector
- global array
- per-atom vector
- per-atom array
- local vector
- local array
- per-grid vector
- per-grid array

A per-atom vector means a single value per atom; the “vector” is the length of the number of atoms. A per-atom array means multiple values per atom. Similarly a local vector or array means one or multiple values per entity (e.g. per bond in the system). And a per-grid vector or array means one or multiple values per grid cell.

The doc page for a compute or fix or variable that generates data will specify both the styles and kinds of data it produces, e.g. a per-atom vector. Note that a compute or fix may generate multiple styles and kinds of output. However, for per-atom data only a vector or array is output, never both. Likewise for per-local and per-grid data. An example of a fix which generates multiple styles and kinds of data is the *fix mdi/qm* command. It outputs a global scalar, global vector, and per-atom array for the quantum mechanical energy and virial of the system and forces on each atom.

By contrast, different variable styles generate only a single kind of data: a global scalar for an equal-style variable, global vector for a vector-style variable, and a per-atom vector for an atom-style variable.

When data is accessed by another command, as in many of the output commands discussed below, it can be referenced via the following bracket notation, where ID in this case is the ID of a compute. The leading “c_” would be replaced by “f_” for a fix, or “v_” for a variable (and ID would be the name of the variable):

c_ID	entire scalar, vector, or array
c_ID[I]	one element of vector, one column of array
c_ID[I][J]	one element of array

Note that using one bracket reduces the dimension of the data once (vector -> scalar, array -> vector). Using two brackets reduces the dimension twice (array -> scalar). Thus a command that uses scalar values as input can also conceptually operate on an element of a vector or array.

Per-grid vectors or arrays are accessed similarly, except that the ID for the compute or fix includes a grid name and a data name. This is because a fix or compute can create multiple grids (of different sizes) and multiple sets of data (for each grid). The fix or compute defines names for each grid and for each data set, so that all of them can be accessed by other commands. See the [Howto grid](#) doc page for more details.

Disambiguation

When a compute or fix produces data in multiple styles, e.g. global and per-atom, a reference to the data can sometimes be ambiguous. Usually the context in which the input script references the data determines which style is meant.

For example, if a compute outputs a global vector and a per-atom array, an element of the global vector will be accessed by using c_ID[I] in *thermodynamic output*, while a column of the per-atom array will be accessed by using c_ID[I] in a *dump custom* command.

However, if a *atom-style variable* references c_ID[I], then it could be intended to refer to a single element of the global vector or a column of the per-atom array. The doc page for any command that has a potential ambiguity (variables are the most common) will explain how to resolve the ambiguity.

In this case, an atom-style variables references per-atom data if it exists. If access to an element of a global vector is needed (as in this example), an equal-style variable which references the value can be defined and used in the atom-style variable formula instead.

Similarly, *thermodynamic output* can only reference global data from a compute or fix. But you can indirectly access per-atom data as follows. The reference c_ID[245][2] for the ID of a *compute displace/atom* command, refers to the y-component of displacement for the atom with ID 245. While you cannot use that reference directly in the *thermo_style* command, you can use it in an equal-style variable formula, and then reference the variable in thermodynamic output.

Thermodynamic output

The frequency and format of thermodynamic output is set by the *thermo*, *thermo_style*, and *thermo_modify* commands. The *thermo_style* command also specifies what values are calculated and written out. Pre-defined keywords can be specified (e.g. press, etotal, etc). Three additional kinds of keywords can also be specified (c_ID, f_ID, v_name), where a *compute* or *fix* or *variable* provides the value to be output. In each case, the compute, fix, or variable must generate global values for input to the *thermo_style custom* command.

Note that thermodynamic output values can be “extensive” or “intensive”. The former scale with the number of atoms in the system (e.g. total energy), the latter do not (e.g. temperature). The setting for *thermo_modify norm* determines whether extensive quantities are normalized or not. Computes and fixes produce either extensive or intensive values; see their individual doc pages for details. *Equal-style variables* produce only intensive values; you can include a division by “natoms” in the formula if desired, to make an extensive calculation produce an intensive result.

Dump file output

Dump file output is specified by the *dump* and *dump_modify* commands. There are several pre-defined formats (*dump atom*, *dump xtc*, etc).

There is also a *dump custom* format where the user specifies what values are output with each atom. Pre-defined atom attributes can be specified (*id*, *x*, *fx*, etc). Three additional kinds of keywords can also be specified (*c_ID*, *f_ID*, *v_name*), where a *compute* or *fix* or *variable* provides the values to be output. In each case, the *compute*, *fix*, or *variable* must generate per-atom values for input to the *dump custom* command.

There is also a *dump local* format where the user specifies what local values to output. A pre-defined index keyword can be specified to enumerate the local values. Two additional kinds of keywords can also be specified (*c_ID*, *f_ID*), where a *compute* or *fix* or *variable* provides the values to be output. In each case, the *compute* or *fix* must generate local values for input to the *dump local* command.

There is also a *dump grid* format where the user specifies what per-grid values to output from *computes* or *fixes* that generate per-grid data.

Fixes that write output files

Several fixes take various quantities as input and can write output files: *fix ave/time*, *fix ave/chunk*, *fix ave/histo*, *fix ave/correlate*, and *fix print*.

The *fix ave/time* command enables direct output to a file and/or time-averaging of global scalars or vectors. The user specifies one or more quantities as input. These can be global *compute* values, global *fix* values, or *variables* of any style except the atom style which produces per-atom values. Since a variable can refer to keywords used by the *thermo_style custom* command (like *temp* or *press*) and individual per-atom values, a wide variety of quantities can be time averaged and/or output in this way. If the inputs are one or more scalar values, then the fix generate a global scalar or vector of output. If the inputs are one or more vector values, then the fix generates a global vector or array of output. The time-averaged output of this fix can also be used as input to other output commands.

The *fix ave/chunk* command enables direct output to a file of chunk-averaged per-atom quantities like those output in dump files. Chunks can represent spatial bins or other collections of atoms, e.g. individual molecules. The per-atom quantities can be atom density (mass or number) or atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The chunk-averaged output of this fix is global and can also be used as input to other output commands.

Note that the *fix ave/grid* command can also average the same per-atom quantities within spatial bins, but it does this for a distributed grid whose grid cells are owned by different processors. It outputs per-grid data, not global data, so it is more efficient for large numbers of averaging bins.

The *fix ave/histo* command enables direct output to a file of histogrammed quantities, which can be global or per-atom or local quantities. The histogram output of this fix can also be used as input to other output commands.

The *fix ave/correlate* command enables direct output to a file of time-correlated quantities, which can be global values. The correlation matrix output of this fix can also be used as input to other output commands.

The *fix print* command can generate a line of output written to the screen and log file or to a separate file, periodically during a running simulation. The line can contain one or more *variable* values for any style variable except the vector or atom styles). As explained above, variables themselves can contain references to global values generated by *thermodynamic* keywords, *computes*, *fixes*, or other *variables*, or to per-atom values for a specific atom. Thus the *fix print* command is a means to output a wide variety of quantities separate from normal thermodynamic or dump file output.

Computes that process output quantities

The *compute reduce* and *compute reduce/region* commands take one or more per-atom or local vector quantities as inputs and “reduce” them (sum, min, max, ave) to scalar quantities. These are produced as output values which can be used as input to other output commands.

The *compute slice* command take one or more global vector or array quantities as inputs and extracts a subset of their values to create a new vector or array. These are produced as output values which can be used as input to other output commands.

The *compute property/atom* command takes a list of one or more pre-defined atom attributes (id, x, fx, etc) and stores the values in a per-atom vector or array. These are produced as output values which can be used as input to other output commands. The list of atom attributes is the same as for the *dump custom* command.

The *compute property/local* command takes a list of one or more pre-defined local attributes (bond info, angle info, etc) and stores the values in a local vector or array. These are produced as output values which can be used as input to other output commands.

The *compute property/grid* command takes a list of one or more pre-defined per-grid attributes (id, grid cell coords, etc) and stores the values in a per-grid vector or array. These are produced as output values which can be used as input to the *dump grid* command.

The *compute property/chunk* command takes a list of one or more pre-defined chunk attributes (id, count, coords for spatial bins) and stores the values in a global vector or array. These are produced as output values which can be used as input to other output commands.

Fixes that process output quantities

The *fix vector* command can create global vectors as output from global scalars as input, accumulating them one element at a time.

The *fix ave/atom* command performs time-averaging of per-atom vectors. The per-atom quantities can be atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The time-averaged per-atom output of this fix can be used as input to other output commands.

The *fix store/state* command can archive one or more per-atom attributes at a particular time, so that the old values can be used in a future calculation or output. The list of atom attributes is the same as for the *dump custom* command, including per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The output of this fix can be used as input to other output commands.

The *fix ave/grid* command performs time-averaging of either per-atom or per-grid data.

For per-atom data it performs averaging for the atoms within each grid cell, similar to the *fix ave/chunk* command when its chunks are defined as regular 2d or 3d bins. The per-atom quantities can be atom density (mass or number) or atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*.

The chief difference between the *fix ave/grid* and *fix ave/chunk* commands when used in this context is that the former uses a distributed grid, while the latter uses a global grid. Distributed means that each processor owns the subset of grid cells within its subdomain. Global means that each processor owns a copy of the entire grid. The *fix ave/grid* command is thus more efficient for large grids.

For per-grid data, the *fix ave/grid* command takes inputs for grid data produced by other computes or fixes and averages the values for each grid point over time.

Computes that generate values to output

Every *compute* in LAMMPS produces either global or per-atom or local or per-grid values. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The page for each compute command describes what it produces. Computes that produce per-atom or local or per-grid values have the word “atom” or “local” or “grid” as the last word in their style name. Computes without the word “atom” or “local” or “grid” produce global values.

Fixes that generate values to output

Some *fixes* in LAMMPS produces either global or per-atom or local or per-grid values which can be accessed by other commands. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The page for each fix command tells whether it produces any output quantities and describes them.

Variables that generate values to output

Variables defined in an input script can store one or more strings. But equal-style, vector-style, and atom-style or atomfile-style variables generate a global scalar value, global vector or values, or a per-atom vector, respectively, when accessed. The formulas used to define these variables can contain references to the thermodynamic keywords and to global and per-atom data generated by computes, fixes, and other variables. The values generated by variables can be used as input to and thus output by the other commands described in this section.

Per-grid variables have not (yet) been implemented.

Summary table of output options and data flow between commands

This table summarizes the various commands that can be used for generating output from LAMMPS. Each command produces output data of some kind and/or writes data to a file. Most of the commands can take data from other commands as input. Thus you can link many of these commands together in pipeline form, where data produced by one command is used as input to another command and eventually written to the screen or to a file. Note that to hook two commands together the output and input data types must match, e.g. global/per-atom/local data and scalar/vector/array data.

Also note that, as described above, when a command takes a scalar as input, that could also be an element of a vector or array. Likewise a vector input could be a column of an array.

Command	Input	Output
<i>thermo_style custom</i>	global scalars	screen, log file
<i>dump custom</i>	per-atom vectors	dump file
<i>dump local</i>	local vectors	dump file
<i>dump grid</i>	per-grid vectors	dump file
<i>fix print</i>	global scalar from variable	screen, file
<i>print</i>	global scalar from variable	screen
<i>computes</i>	N/A	global/per-atom/local/per-grid scalar/vector/array
<i>fixes</i>	N/A	global/per-atom/local/per-grid scalar/vector/array
<i>variables</i>	global scalars and vectors, per-atom vectors	global scalar and vector, per-atom vector
<i>compute reduce</i>	per-atom/local vectors	global scalar/vector
<i>compute slice</i>	global vectors/arrays	global vector/array
<i>compute property/atom</i>	N/A	per-atom vector/array
<i>compute property/local</i>	N/A	local vector/array
<i>compute property/grid</i>	N/A	per-grid vector/array
<i>compute property/chunk</i>	N/A	global vector/array
<i>fix vector</i>	global scalars	global vector
<i>fix ave/atom</i>	per-atom vectors	per-atom vector/array
<i>fix ave/time</i>	global scalars/vectors	global scalar/vector/array, file
<i>fix ave/chunk</i>	per-atom vectors	global array, file
<i>fix ave/grid</i>	per-atom vectors or per-grid vectors	per-grid vector/array
<i>fix ave/histo</i>	global/per-atom/local scalars and vectors	global array, file
<i>fix ave/correlate</i>	global scalars	global array, file
<i>fix store/state</i>	per-atom vectors	per-atom vector/array

8.3.2 Use chunks to calculate system properties

In LAMMPS, “chunks” are collections of atoms, as defined by the *compute chunk/atom* command, which assigns each atom to a chunk ID (or to no chunk at all). The number of chunks and the assignment of chunk IDs to atoms can be static or change over time. Examples of “chunks” are molecules or spatial bins or atoms with similar values (e.g. coordination number or potential energy).

The per-atom chunk IDs can be used as input to two other kinds of commands, to calculate various properties of a system:

- *fix ave/chunk*
- any of the *compute */chunk* commands

Here a brief overview for each of the 4 kinds of chunk-related commands is provided. Then some examples are given of how to compute different properties with chunk commands.

Compute chunk/atom command:

This compute can assign atoms to chunks of various styles. Only atoms in the specified group and optional specified region are assigned to a chunk. Here are some possible chunk definitions:

atoms in same molecule	chunk ID = molecule ID
atoms of same atom type	chunk ID = atom type
all atoms with same atom property (charge, radius, etc)	chunk ID = output of compute property/atom
atoms in same cluster	chunk ID = output of <i>compute cluster/atom</i> command
atoms in same spatial bin	chunk ID = bin ID
atoms in same rigid body	chunk ID = molecule ID used to define rigid bodies
atoms with similar potential energy	chunk ID = output of <i>compute pe/atom</i>
atoms with same local defect structure	chunk ID = output of <i>compute centro/atom</i> or <i>compute coord/atom</i> command

Note that chunk IDs are integer values, so for atom properties or computes that produce a floating point value, they will be truncated to an integer. You could also use the compute in a variable that scales the floating point value to spread it across multiple integers.

Spatial bins can be of various kinds, e.g. 1d bins = slabs, 2d bins = pencils, 3d bins = boxes, spherical bins, cylindrical bins.

This compute also calculates the number of chunks *Nchunk*, which is used by other commands to tally per-chunk data. *Nchunk* can be a static value or change over time (e.g. the number of clusters). The chunk ID for an individual atom can also be static (e.g. a molecule ID), or dynamic (e.g. what spatial bin an atom is in as it moves).

Note that this compute allows the per-atom output of other *computes*, *fixes*, and *variables* to be used to define chunk IDs for each atom. This means you can write your own compute or fix to output a per-atom quantity to use as chunk ID. See the *Modify* doc pages for info on how to do this. You can also define a *per-atom variable* in the input script that uses a formula to generate a chunk ID for each atom.

Fix ave/chunk command:

This fix takes the ID of a *compute chunk/atom* command as input. For each chunk, it then sums one or more specified per-atom values over the atoms in each chunk. The per-atom values can be any atom property, such as velocity, force, charge, potential energy, kinetic energy, stress, etc. Additional keywords are defined for per-chunk properties like density and temperature. More generally any per-atom value generated by other *computes*, *fixes*, and *per-atom variables*, can be summed over atoms in each chunk.

Similar to other averaging fixes, this fix allows the summed per-chunk values to be time-averaged in various ways, and output to a file. The fix produces a global array as output with one row of values per chunk.

Compute */chunk commands:

The following computes operate on chunks of atoms to produce per-chunk values. Any compute whose style name ends in “/chunk” is in this category:

- *compute com/chunk*
- *compute gyration/chunk*
- *compute inertia/chunk*
- *compute msd/chunk*

- *compute property/chunk*
- *compute temp/chunk*
- *compute torque/chunk*
- *compute vcm/chunk*

They each take the ID of a *compute chunk/atom* command as input. As their names indicate, they calculate the center-of-mass, radius of gyration, moments of inertia, mean-squared displacement, temperature, torque, and velocity of center-of-mass for each chunk of atoms. The *compute property/chunk* command can tally the count of atoms in each chunk and extract other per-chunk properties.

The reason these various calculations are not part of the *fix ave/chunk command*, is that each requires a more complicated operation than simply summing and averaging over per-atom values in each chunk. For example, many of them require calculation of a center of mass, which requires summing mass*position over the atoms and then dividing by summed mass.

All of these computes produce a global vector or global array as output, with one or more values per chunk. The output can be used in various ways:

- As input to the *fix ave/time* command, which can write the values to a file and optionally time average them.
- As input to the *fix ave/histo* command to histogram values across chunks. E.g. a histogram of cluster sizes or molecule diffusion rates.
- As input to special functions of *equal-style variables*, like `sum()` and `max()` and `ave()`. E.g. to find the largest cluster or fastest diffusing molecule or average radius-of-gyration of a set of molecules (chunks).

Other chunk commands:

- *compute chunk/spread/atom*
- *compute reduce/chunk*

The *compute chunk/spread/atom* command spreads per-chunk values to each atom in the chunk, producing per-atom values as its output. This can be useful for outputting per-chunk values to a per-atom *dump file*. Or for using an atom's associated chunk value in an *atom-style variable*. Or as input to the *fix ave/chunk* command to spatially average per-chunk values calculated by a per-chunk compute.

The *compute reduce/chunk* command reduces a peratom value across the atoms in each chunk to produce a value per chunk. When used with the *compute chunk/spread/atom* command it can create peratom values that induce a new set of chunks with a second *compute chunk/atom* command.

Example calculations with chunks

Here are examples using chunk commands to calculate various properties:

1. Average velocity in each of 1000 2d spatial bins:

```
compute cc1 all chunk/atom bin/2d x 0.0 0.1 y lower 0.01 units reduced
fix 1 all ave/chunk 100 10 1000 cc1 vx vy file tmp.out
```

2. Temperature in each spatial bin, after subtracting a flow velocity:

```
compute cc1 all chunk/atom bin/2d x 0.0 0.1 y lower 0.1 units reduced
compute vbias all temp/profile 1 0 0 y 10
fix 1 all ave/chunk 100 10 1000 cc1 temp bias vbias file tmp.out
```

3. Center of mass of each molecule:

```
compute cc1 all chunk/atom molecule
compute myChunk all com/chunk cc1
fix 1 all ave/time 100 1 100 c_myChunk[*] file tmp.out mode vector
```

4. Total force on each molecule and ave/max across all molecules:

```
compute cc1 all chunk/atom molecule
fix 1 all ave/chunk 1000 1 1000 cc1 fx fy fz file tmp.out
variable xave equal ave(f_1[2])
variable xmax equal max(f_1[2])
thermo 1000
thermo_style custom step temp v_xave v_xmax
```

5. Histogram of cluster sizes:

```
compute cluster all cluster/atom 1.0
compute cc1 all chunk/atom c_cluster compress yes
compute size all property/chunk cc1 count
fix 1 all ave/histo 100 1 100 0 20 20 c_size mode vector ave running beyond ignore file_
→tmp.histo
```

6. An example for using a per-chunk value to apply per-atom forces to compress individual polymer chains (molecules) in a mixture, is explained on the [compute chunk/spread/atom](#) command doc page.

7. An example for using one set of per-chunk values for molecule chunks, to create a second set of micelle-scale chunks (clustered molecules, due to hydrophobicity), is explained on the [compute reduce/chunk](#) command doc page.

8. An example for using one set of per-chunk values (dipole moment vectors) for molecule chunks, spreading the values to each atom in each chunk, then defining a second set of chunks as spatial bins, and using the [fix ave/chunk](#) command to calculate an average dipole moment vector for each bin. This example is explained on the [compute chunk/spread/atom](#) command doc page.

8.3.3 Using distributed grids

Added in version 22Dec2022.

LAMMPS has internal capabilities to create uniformly spaced grids which overlay the simulation domain. For 2d and 3d simulations these are 2d and 3d grids respectively. Conceptually a grid can be thought of as a collection of grid cells. Each grid cell can store one or more values (data).

The grid cells and data they store are distributed across processors. Each processor owns the grid cells (and data) whose center points lie within the spatial subdomain of the processor. If needed for its computations, a processor may also store ghost grid cells with their data.

Distributed grids can overlay orthogonal or triclinic simulation boxes; see the [Howto triclinic](#) doc page for an explanation of the latter. For a triclinic box, the grid cell shape conforms to the shape of the simulation domain, e.g. parallelograms instead of rectangles in 2d.

If the box size or shape changes during a simulation, the grid changes with it, so that it always overlays the entire simulation domain. For non-periodic dimensions, the grid size in that dimension matches the box size, as set by the [boundary](#) command for fixed or shrink-wrapped boundaries.

If load-balancing is invoked by the [balance](#) or [fix balance](#) commands, then the subdomain owned by a processor can change which may also change which grid cells they own.

Post-processing and visualization of grid cell data can be enabled by the *dump grid*, *dump grid/vtk*, and *dump image* commands. The latter has an optional *grid* keyword. The [OVITO visualization tool](#) also plans (as of Nov 2022) to add support for visualizing grid cell data (along with atoms) using *dump grid* output files as input.

Note

For developers, distributed grids are implemented within the code via two classes: `Grid2d` and `Grid3d`. These partition the grid across processors and have methods which allow forward and reverse communication of ghost grid data as well as load balancing. If you write a new compute or fix which needs a distributed grid, these are the classes to look at. A new pair style could use a distributed grid by having a fix define it. Please see the section on [using distributed grids within style classes](#) for a detailed description.

These are the commands which currently define or use distributed grids:

- *fix ttm/grid* - store electron temperature on grid
- *fix ave/grid* - time average per-atom or per-grid values
- *compute property/grid* - generate grid IDs and coords
- *dump grid* - output per-grid values in LAMMPS format
- *dump grid/vtk* - output per-grid values in VTK format
- *dump image grid* - include colored grid in output images
- *pair_style amoeba* - FFT grids
- *kpace_style ppm* (and variants) - FFT grids
- *kpace_style msm* (and variants) - MSM grids

The grids used by the *kpace_style* can not be referenced by an input script. However the grids and data created and used by the other commands can be.

A compute or fix command may create one or more grids (of different sizes). Each grid can store one or more data fields. A data field can be a single value per grid point (per-grid vector) or multiple values per grid point (per-grid array). See the [Howto output](#) doc page for an explanation of how per-grid data can be generated by some commands and used by other commands.

A command accesses grid data from a compute or fix using a *grid reference* with the following syntax:

- `c_ID:gname:dname`
- `c_ID:gname:dname[I]`
- `f_ID:gname:dname`
- `f_ID:gname:dname[I]`

The prefix “c_” or “f_” refers to the ID of the compute or fix; gname is the name of the grid, which is assigned by the compute or fix; dname is the name of the data field, which is also assigned by the compute or fix.

If the data field is a per-grid vector (one value per grid point), then no brackets are used to access the values. If the data field is a per-grid array (multiple values per grid point), then brackets are used to specify the column I of the array. I ranges from 1 to Ncol inclusive, where Ncol is the number of columns in the array and is defined by the compute or fix.

Currently, there are no per-grid variables implemented in LAMMPS. We may add this feature at some point.

8.3.4 Calculate temperature

Temperature is computed as kinetic energy divided by some number of degrees of freedom (and the Boltzmann constant). Since kinetic energy is a function of particle velocity, there is often a need to distinguish between a particle's advection velocity (due to some aggregate motion of particles) and its thermal velocity. The sum of the two is the particle's total velocity, but the latter is often what is wanted to compute a temperature.

LAMMPS has several options for computing temperatures, any of which can be used in *thermostatting* and *barostatting*. These *compute commands* calculate temperature:

- *compute temp*
- *compute temp/sphere*
- *compute temp/asphere*
- *compute temp/com*
- *compute temp/deform*
- *compute temp/partial*
- *compute temp/profile*
- *compute temp/ramp*
- *compute temp/region*

All but the first 3 calculate velocity biases directly (e.g. advection velocities) that are removed when computing the thermal temperature. *Compute temp/sphere* and *compute temp/asphere* compute kinetic energy for finite-size particles that includes rotational degrees of freedom. They both allow for velocity biases indirectly, via an optional extra argument which is another temperature compute that subtracts a velocity bias. This allows the translational velocity of spherical or aspherical particles to be adjusted in prescribed ways.

8.3.5 Calculate elastic constants

Elastic constants characterize the stiffness of a material. The formal definition is provided by the linear relation that holds between the stress and strain tensors in the limit of infinitesimal deformation. In tensor notation, this is expressed as $s_{ij} = C_{ijkl} * e_{kl}$, where the repeated indices imply summation. s_{ij} are the elements of the symmetric stress tensor. e_{kl} are the elements of the symmetric strain tensor. C_{ijkl} are the elements of the fourth rank tensor of elastic constants. In three dimensions, this tensor has $3^4=81$ elements. Using Voigt notation, the tensor can be written as a 6×6 matrix, where C_{ij} is now the derivative of s_i w.r.t. e_j . Because s_i is itself a derivative w.r.t. e_i , it follows that C_{ij} is also symmetric, with at most $7*6/2 = 21$ distinct elements.

At zero temperature, it is easy to estimate these derivatives by deforming the simulation box in one of the six directions using the *change_box* command and measuring the change in the stress tensor. A general-purpose script that does this is given in the examples/ELASTIC directory described on the *Examples* doc page.

Calculating elastic constants at finite temperature is more challenging, because it is necessary to run a simulation that performs time averages of differential properties. There are at least 3 ways to do this in LAMMPS. The most reliable way to do this is by exploiting the relationship between elastic constants, stress fluctuations, and the Born matrix, the second derivatives of energy w.r.t. strain (*Ray*). The Born matrix calculation has been enabled by the *compute born/matrix* command, which works for any bonded or non-bonded potential in LAMMPS. The most expensive part of the calculation is the sampling of the stress fluctuations. Several examples of this method are provided in the examples/ELASTIC_T/BORN_MATRIX directory described on the *Examples* doc page.

A second way is to measure the change in average stress tensor in an NVT simulations when the cell volume undergoes a finite deformation. In order to balance the systematic and statistical errors in this method, the magnitude of the deformation must be chosen judiciously, and care must be taken to fully equilibrate the deformed cell before sampling

the stress tensor. An example of this method is provided in the `examples/ELASTIC_T/DEFORMATION` directory described on the [Examples](#) doc page.

Another approach is to sample the triclinic cell fluctuations that occur in an NPT simulation. This method can also be slow to converge and requires careful post-processing ([Shinoda](#)). We do not provide an example of this method.

A nice review of the advantages and disadvantages of all of these methods is provided in the paper by Clavier et al. ([Clavier](#)).

8.3.6 Calculate thermal conductivity

The thermal conductivity κ of a material can be measured in at least 4 ways using various options in LAMMPS. See the `examples/KAPPA` directory for scripts that implement the 4 methods discussed here for a simple Lennard-Jones fluid model. Also, see the [Howto viscosity](#) page for an analogous discussion for viscosity.

The thermal conductivity tensor κ is a measure of the propensity of a material to transmit heat energy in a diffusive manner as given by Fourier's law

$$\mathbf{J} = -\kappa \text{grad}(\mathbf{T})$$

where \mathbf{J} is the heat flux in units of energy per area per time and $\text{grad}(\mathbf{T})$ is the spatial gradient of temperature. The thermal conductivity thus has units of energy per distance per time per degree K and is often approximated as an isotropic quantity, i.e. as a scalar.

The first method is to setup two thermostatted regions at opposite ends of a simulation box, or one in the middle and one at the end of a periodic box. By holding the two regions at different temperatures with a [thermostatting fix](#), the energy added to the hot region should equal the energy subtracted from the cold region and be proportional to the heat flux moving between the regions. See the papers by [Ikeshoji and Hafskjold](#) and [Wirnsberger et al](#) for details of this idea. Note that thermostatting fixes such as [fix nvt](#), [fix langevin](#), and [fix temp/rescale](#) store the cumulative energy they add/subtract.

Alternatively, as a second method, the [fix heat](#) or [fix ehex](#) commands can be used in place of thermostats on each of two regions to add/subtract specified amounts of energy to both regions. In both cases, the resulting temperatures of the two regions can be monitored with the “compute temp/region” command and the temperature profile of the intermediate region can be monitored with the [fix ave/chunk](#) and [compute ke/atom](#) commands.

The third method is to perform a reverse non-equilibrium MD simulation using the [fix thermal/conductivity](#) command which implements the rNEMD algorithm of Muller-Plathe. Kinetic energy is swapped between atoms in two different layers of the simulation box. This induces a temperature gradient between the two layers which can be monitored with the [fix ave/chunk](#) and [compute ke/atom](#) commands. The fix tallies the cumulative energy transfer that it performs. See the [fix thermal/conductivity](#) command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the heat flux to κ . The heat flux can be calculated from the fluctuations of per-atom potential and kinetic energies and per-atom stress tensor in a steady-state equilibrated simulation. This is in contrast to the two preceding non-equilibrium methods, where energy flows continuously between hot and cold regions of the simulation box.

The [compute heat/flux](#) command can calculate the needed heat flux and describes how to implement the Green_Kubo formalism using additional LAMMPS commands, such as the [fix ave/correlate](#) command to calculate the needed auto-correlation. See the page for the [compute heat/flux](#) command for an example input script that calculates the thermal conductivity of solid Ar via the GK formalism.

(Ikeshoji) Ikeshoji and Hafskjold, Molecular Physics, 81, 251-261 (1994).

(Wirnsberger) Wirnsberger, Frenkel, and Dellago, J Chem Phys, 143, 124104 (2015).

8.3.7 Calculate viscosity

The shear viscosity η of a fluid can be measured in at least 6 ways using various options in LAMMPS. See the examples/VISCOSITY directory for scripts that implement the 5 methods discussed here for a simple Lennard-Jones fluid model and 1 method for SPC/E water model. Also, see the [page on calculating thermal conductivity](#) for an analogous discussion for thermal conductivity.

Eta is a measure of the propensity of a fluid to transmit momentum in a direction perpendicular to the direction of velocity or momentum flow. Alternatively it is the resistance the fluid has to being sheared. It is given by

$$J = -\eta \text{grad}(V_{\text{stream}})$$

where J is the momentum flux in units of momentum per area per time. and $\text{grad}(V_{\text{stream}})$ is the spatial gradient of the velocity of the fluid moving in another direction, normal to the area through which the momentum flows. Viscosity thus has units of pressure-time.

The first method is to perform a non-equilibrium MD (NEMD) simulation by shearing the simulation box via the [fix deform](#) command, and using the [fix nvt/sllod](#) command to thermostat the fluid via the SLLOD equations of motion. Alternatively, as a second method, one or more moving walls can be used to shear the fluid in between them, again with some kind of thermostat that modifies only the thermal (non-shearing) components of velocity to prevent the fluid from heating up.

Note

A recent (2017) book by ([Daivis and Todd](#)) discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostating generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

In both cases, the velocity profile setup in the fluid by this procedure can be monitored by the [fix ave/chunk](#) command, which determines $\text{grad}(V_{\text{stream}})$ in the equation above. E.g. the derivative in the y-direction of the V_x component of fluid motion or $\text{grad}(V_{\text{stream}}) = dV_x/dy$. The P_{xy} off-diagonal component of the pressure or stress tensor, as calculated by the [compute pressure](#) command, can also be monitored, which is the J term in the equation above. See the [Howto nemd](#) page for details on NEMD simulations.

The third method is to perform a reverse non-equilibrium MD simulation using the [fix viscosity](#) command which implements the rNEMD algorithm of Muller-Plathe. Momentum in one dimension is swapped between atoms in two different layers of the simulation box in a different dimension. This induces a velocity gradient which can be monitored with the [fix ave/chunk](#) command. The [fix](#) tallies the cumulative momentum transfer that it performs. See the [fix viscosity](#) command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the stress/pressure tensor to η . This can be done in a fully equilibrated simulation which is in contrast to the two preceding non-equilibrium methods, where momentum flows continuously through the simulation box.

Here is an example input script that calculates the viscosity of liquid Ar via the GK formalism:

```
# Sample LAMMPS input script for viscosity of liquid Ar

```

The fifth method is related to the above Green-Kubo method, but uses the Einstein formulation, analogous to the Einstein mean-square-displacement formulation for self-diffusivity. The time-integrated momentum fluxes play the role of Cartesian coordinates, whose mean-square displacement increases linearly with time at sufficiently long times.

The sixth is the periodic perturbation method, which is also a non-equilibrium MD method. However, instead of measuring the momentum flux in response to an applied velocity gradient, it measures the velocity profile in response to applied stress. A cosine-shaped periodic acceleration is added to the system via the *fix accelerate/cos* command, and the *compute viscosity/cos* command is used to monitor the generated velocity profile and remove the velocity bias before thermostating.

Note

An article by (*Hess*) discussed the accuracy and efficiency of these methods.

8.3.8 Calculate diffusion coefficients

The diffusion coefficient D of a material can be measured in at least 2 ways using various options in LAMMPS. See the examples/DIFFUSE directory for scripts that implement the 2 methods discussed here for a simple Lennard-Jones fluid model.

The first method is to measure the mean-squared displacement (MSD) of the system, via the *compute msd* command. The slope of the MSD versus time is proportional to the diffusion coefficient. The instantaneous MSD values can be accumulated in a vector via the *fix vector* command, and a line fit to the vector to compute its slope via the *variable slope* function, and thus extract D .

The second method is to measure the velocity auto-correlation function (VACF) of the system, via the *compute vacf* command. The time-integral of the VACF is proportional to the diffusion coefficient. The instantaneous VACF values can be accumulated in a vector via the *fix vector* command, and time integrated via the *variable trap* function, and thus extract D .

8.3.9 Output structured data from LAMMPS

LAMMPS can output structured data with the *print* and *fix print* command. This gives you flexibility since you can build custom data formats that contain system properties, thermo data, and variables values. This output can be directed to the screen and/or to a file for post processing.

Writing the current system state, thermo data, variable values

Use the *print* command to output the current system state, which can include system properties, thermo data and variable values.

YAML

```
print """"---
timestep: $(step)
pe: $(pe)
ke: $(ke)
..."""" file current_state.yaml screen no
```

Listing 1: current_state.yaml

```
---
timestep: 250
pe: -4.7774327356321810711
ke: 2.4962152903997174569
```

JSON

```
print """"{
  "timestep": $(step),
  "pe": $(pe),
  "ke": $(ke)
}"""" file current_state.json screen no
```

Listing 2: current_state.json

```
{
  "timestep": 250,
  "pe": -4.7774327356321810711,
  "ke": 2.4962152903997174569
}
```

YAML format thermo_style or dump_style output

Extracting data from log file

Added in version 24Mar2022.

LAMMPS supports the thermo style “yaml” and for “custom” style thermodynamic output the format can be changed to YAML with *thermo_modify line yaml*. This will produce a block of output in a compact YAML format - one “document” per run - of the following style:

```
---
keywords: ['Step', 'Temp', 'E_pair', 'E_mol', 'TotEng', 'Press', ]
data:
  - [100, 0.757453103239935, -5.7585054860159, 0, -4.62236133677021, 0.207261053624721, ]
  - [110, 0.759322359337036, -5.7614668389562, 0, -4.62251889318624, 0.194314975399602, ]
  - [120, 0.759372342462676, -5.76149365656489, 0, -4.62247073844943, 0.191600048851267, ]
  - [130, 0.756833027516501, -5.75777334823494, 0, -4.62255928350835, 0.208792327853067, ]
  ...
```

This data can be extracted and parsed from a log file using python with:

```
import re, yaml
try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

docs = ""
with open("log.lammps") as f:
    for line in f:
        m = re.search(r"^(keywords:.*$|data:$|---$|\\.|\\.\\.\\.\\.| - \\[.*\\]$)", line)
        if m: docs += m.group(0) + '\n'

thermo = list(yaml.load_all(docs, Loader=Loader))

print("Number of runs: ", len(thermo))
print(thermo[1]['keywords'][4], ' = ', thermo[1]['data'][2][4])
```

After loading the YAML data, *thermo* is a list containing a dictionary for each “run” where the tag “keywords” maps to the list of thermo header strings and the tag “data” has a list of lists where the outer list represents the lines of output and the inner list the values of the columns matching the header keywords for that step. The second print() command for example will print the header string for the fifth keyword of the second run and the corresponding value for the third output line of that run:

```
Number of runs: 2
TotEng = -4.62140097780047
```

Extracting data from dump file

Added in version 4May2022.

YAML format output has been added to multiple commands in LAMMPS, for example *dump yaml* or *fix ave/time*. Depending on the kind of data being written, organization of the data or the specific syntax used may change, but the principles are very similar and all files should be readable with a suitable YAML parser. A simple example for this is given below:

```
import yaml
try:
    from yaml import CSafeLoader as YamlLoader
except ImportError:
    from yaml import SafeLoader as YamlLoader

timesteps = []
with open("dump.yaml", "r") as f:
    data = yaml.load_all(f, Loader=YamlLoader)

    for d in data:
        print('Processing timestep %d' % d['timestep'])
        timesteps.append(d)

print('Read %d timesteps from yaml dump' % len(timesteps))
print('Second timestep: ', timesteps[1]['timestep'])
print('Box info: x: ', timesteps[1]['box'][0], ' y:', timesteps[1]['box'][1], ' z:',
      →timesteps[1]['box'][2])
print('First 5 per-atom columns: ', timesteps[1]['keywords'][0:5])
print('Corresponding 10th atom data: ', timesteps[1]['data'][9][0:5])
```

The corresponding output for a YAML dump command added to the “melt” example is:

```
Processing timestep 0
Processing timestep 50
Processing timestep 100
Processing timestep 150
Processing timestep 200
Processing timestep 250
Read 6 timesteps from yaml dump
Second timestep: 50
Box info: x: [0, 16.795961913825074] y: [0, 16.795961913825074] z: [0, 16.
→795961913825074]
First 5 per-atom columns: ['id', 'type', 'x', 'y', 'z']
Corresponding 10th atom data: [10, 1, 4.43828, 0.968481, 0.108555]
```

Processing scalar data with Python

After reading and parsing the YAML format data, it can be easily imported for further processing and visualization with the `pandas` and `matplotlib` Python modules. Because of the organization of the data in the YAML format thermo output, it needs to be told to process only the ‘data’ part of the imported data to create a pandas data frame, and one needs to set the column names from the ‘keywords’ entry. The following Python script code example demonstrates this, and creates the image shown on the right of a simple plot of various bonded energy contributions versus the timestep from a run of the ‘peptide’ example input after changing the *thermo style* to ‘yaml’. The properties to be used for x and y values can be conveniently selected through the keywords. Please note that those keywords can be changed to custom strings with the *thermo_modify colname* command.

```
import re, yaml
import pandas as pd
import matplotlib.pyplot as plt

try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

docs = ""
with open("log.lammps") as f:
    for line in f:
        m = re.search(r"^(keywords:.*$|data:$|---$|\\.\\.\\.\\.| - \\[.*\\]$)", line)
        if m: docs += m.group(0) + '\n'

thermo = list(yaml.load_all(docs, Loader=Loader))

df = pd.DataFrame(data=thermo[0]['data'], columns=thermo[0]['keywords'])
fig = df.plot(x='Step', y=['E_bond', 'E_angle', 'E_dihed', 'E_impro'], ylabel='Energy in_
→kcal/mol')
plt.savefig('thermo_bondeng.png')
```

Processing vector data with Python

Global *vector* data as produced by *fix ave/time* uses a slightly different organization of the data. You still have the dictionary keys ‘keywords’ and ‘data’ for the column headers and the data. But the data is a dictionary indexed by the time step and for each step there are multiple rows of values each with a list of the averaged properties. This requires a slightly different processing, since the entire data cannot be directly imported into a single pandas DataFrame class instance. The following Python script example demonstrates how to read such data. The result will combine the data for the different steps into one large “multi-index” table. The pandas IndexSlice class can then be used to select data from this combined data frame.

```
import yaml
import pandas as pd

try:
    from yaml import CSafeLoader as Loader
```

(continues on next page)

(continued from previous page)

```

except ImportError:
    from yaml import SafeLoader as Loader

with open("ave.yaml") as f:
    ave = yaml.load(f, Loader=Loader)

keys = ave['keywords']
df = {}
for k in ave['data'].keys():
    df[k] = pd.DataFrame(data=ave['data'][k], columns=keys)

# create multi-index data frame
df = pd.concat(df)

# output only the first 3 value for steps 200 to 300 of the column Pressure
idx = pd.IndexSlice
print(df['Pressure'].loc[idx[200:300, 0:2]])

```

Processing scalar data with Perl

The ease of processing YAML data is not limited to Python. Here is an example for extracting and processing a LAMMPS log file with Perl instead.

```

use YAML::XS;

open(LOG, "log.lammps") or die("could not open log.lammps: $!");
my $file = "";
while(my $line = <LOG>) {
    if ($line =~ /^(keywords:.*$|data:$|---$|\.\.\. $| - \[.*\]$)/) {
        $file .= $line;
    }
}
close(LOG);

# convert YAML to perl as nested hash and array references
my $thermo = Load $file;

# convert references to real arrays
my @keywords = @{$thermo->{'keywords'}};
my @data = @{$thermo->{'data'}};

# print first two columns
print("$keywords[0] $keywords[1]\n");
foreach (@data) {
    print("${$_}[0] ${$_}[1]\n");
}

```

Writing continuous data during a simulation

The *fix print* command allows you to output an arbitrary string at defined times during a simulation run.

YAML

```
fix extra all print 50 ""
- timestep: $(step)
  pe: $(pe)
  ke: $(ke)"" file output.yaml screen no
```

Listing 3: output.yaml

```
# Fix print output for fix extra
- timestep: 0
  pe: -6.77336805325924729
  ke: 4.49887500000000026219

- timestep: 50
  pe: -4.8082494418323200591
  ke: 2.5257981827119797558

- timestep: 100
  pe: -4.7875608875581505686
  ke: 2.5062598821985102582

- timestep: 150
  pe: -4.7471033686005483787
  ke: 2.466095925545450207

- timestep: 200
  pe: -4.7509052858544134068
  ke: 2.4701136792591693592

- timestep: 250
  pe: -4.7774327356321810711
  ke: 2.4962152903997174569
```

Post-processing of YAML files can be easily be done with Python and other scripting languages. In case of Python the *yaml* package allows you to load the data files and obtain a list of dictionaries.

```
import yaml

with open("output.yaml") as f:
    data = yaml.load(f, Loader=yaml.FullLoader)

print(data)
```

```
[{'timestep': 0, 'pe': -6.773368053259247, 'ke': 4.4988750000000003}, {'timestep': 50, 'pe': -4.80824944183232, 'ke': 2.5257981827119798}, {'timestep': 100, 'pe': -4.787560887558151, 'ke': 2.5062598821985103}, {'timestep': 150, 'pe': -4.747103368600548, 'ke': 2.46609592554545}, {'timestep': 200, 'pe': -4.750905285854413, 'ke': 2.4701136792591693}, {'timestep': 250, 'pe': -4.777432735632181, 'ke': 2.4962152903997175}]
```

(continues on next page)

(continued from previous page)

```
→4701136792591694}, {'timestep': 250, 'pe': -4.777432735632181, 'ke': 2.
→4962152903997175}]
```

Line Delimited JSON (LD-JSON)

The JSON format itself is very strict when it comes to delimiters. For continuous output/streaming data it is beneficial use the *line delimited JSON* format. Each line represents one JSON object.

```
fix extra all print 50 ""{"timestep": $(step), "pe": $(pe), "ke": $(ke)}"" title ""_
→file output.json screen no
```

Listing 4: output.json

```
{"timestep": 0, "pe": -6.77336805325924729, "ke": 4.49887500000000026219}
{"timestep": 50, "pe": -4.8082494418323200591, "ke": 2.5257981827119797558}
{"timestep": 100, "pe": -4.7875608875581505686, "ke": 2.5062598821985102582}
{"timestep": 150, "pe": -4.7471033686005483787, "ke": 2.466095925545450207}
{"timestep": 200, "pe": -4.7509052858544134068, "ke": 2.4701136792591693592}
{"timestep": 250, "pe": -4.7774327356321810711, "ke": 2.4962152903997174569}
```

One simple way to load this data into a Python script is to use the *pandas* package. It can directly load these files into a data frame:

```
import pandas as pd

data = pd.read_json('output.json', lines=True)
print(data)
```

	timestep	pe	ke
0	0	-6.773368	4.498875
1	50	-4.808249	2.525798
2	100	-4.787561	2.506260
3	150	-4.747103	2.466096
4	200	-4.750905	2.470114
5	250	-4.777433	2.496215

8.4 Force fields howto

8.4.1 CHARMM, AMBER, COMPASS, and DREIDING force fields

A compact summary of the concepts, definitions, and properties of force fields with explicit bonded interactions (like the ones discussed in this HowTo) is given in (*Gissinger*).

A force field has 2 parts: the formulas that define it and the coefficients used for a particular system. Here we only discuss formulas implemented in LAMMPS that correspond to formulas commonly used in the CHARMM, AMBER, COMPASS, and DREIDING force fields. Setting coefficients is done either from special sections in an input data file via the *read_data* command or in the input script with commands like *pair_coeff* or *bond_coeff* and so on. See the *Tools* doc page for additional tools that can use CHARMM, AMBER, or Materials Studio generated files to assign force field coefficients and convert their output into LAMMPS input. LAMMPS input scripts can also be generated by charmm-gui.org.

CHARMM and AMBER

The CHARMM force field (*MacKerell*) and AMBER force field (*Cornell*) have potential energy function of the form

$$V = \sum_{bonds} E_b + \sum_{angles} E_a + \overbrace{\sum_{dihedral} E_d}^{charmm \text{ charmmfsw}} + \sum_{impropers} E_i$$

$$+ \underbrace{\sum_{pairs} (E_{LJ} + E_{coul})}_{\substack{lj/charmm/coul/charmm \\ lj/charmm/coul/charmm/implicit \\ lj/charmm/coul/long \\ lj/charmm/coul/msm \\ lj/charmmfsw/coul/charmmfsh \\ lj/charmmfsw/coul/long}} + \sum_{special} E_s + \sum_{residues} CMAP(\phi, \psi)$$

The terms are computed by bond styles (relationship between 2 atoms), angle styles (between 3 atoms), dihedral/improper styles (between 4 atoms), pair styles (non-covalently bonded pair interactions) and special bonds. The CMAP term (see *fix cmap* command for details) corrects for pairs of dihedral angles (“Correction MAP”) to significantly improve the structural and dynamic properties of proteins in crystalline and solution environments (*Brooks*). The AMBER force field does not include the CMAP term.

The interaction styles listed below compute force field formulas that are consistent with common options in CHARMM or AMBER. See each command’s documentation for the formula it computes.

- *bond_style* harmonic
- *angle_style* charmm
- *dihedral_style* charmmfsh
- *dihedral_style* charmm
- *pair_style* lj/charmmfsw/coul/charmmfsh
- *pair_style* lj/charmmfsw/coul/long
- *pair_style* lj/charmm/coul/charmm
- *pair_style* lj/charmm/coul/charmm/implicit
- *pair_style* lj/charmm/coul/long
- *special_bonds* charmm
- *special_bonds* amber

The pair styles compute Lennard Jones (LJ) and Coulombic interactions with additional switching or shifting functions that ramp the energy and/or force smoothly to zero between an inner (*a*) and outer (*b*) cutoff. The older styles with *charmm* (not *charmmfsw* or *charmmfsh*) in their name compute the LJ and Coulombic interactions with an energy switching function (esw) $S(r)$ which ramps the energy smoothly to zero between the inner and outer cutoff. This can cause irregularities in pairwise forces (due to the discontinuous second derivative of energy at the boundaries of the switching region), which in some cases can result in complications in energy minimization and detectable artifacts in MD simulations.

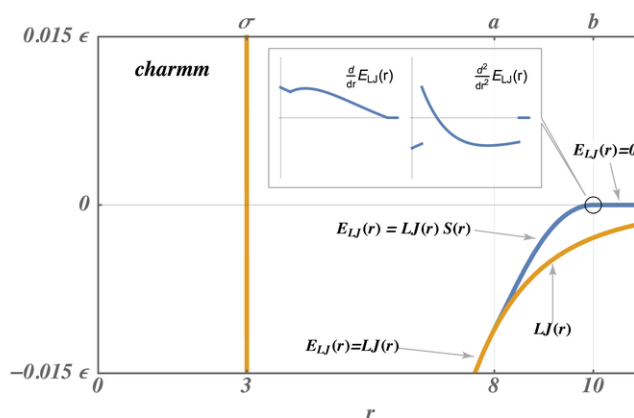

$$LJ(r) = 4\epsilon \left[\left(\frac{\sigma}{r} \right)^{12} - \left(\frac{\sigma}{r} \right)^6 \right]$$

$$C(r) = \frac{Cq_i q_j}{\epsilon r}$$

$$S(r) = \frac{(b^2 - r^2)^2 (b^2 + 2r^2 - 3a^2)}{(b^2 - a^2)^3}$$

$$E_{LJ}(r) = \begin{cases} LJ(r), & r \leq a \\ LJ(r)S(r), & a < r \leq b \\ 0, & r > b \end{cases}$$

$$E_{coul}(r) = \begin{cases} C(r), & r \leq a \\ C(r)S(r), & a < r \leq b \\ 0, & r > b \end{cases}$$

The newer styles with *charmmfsw* or *charmmfsh* in their name replace energy switching with force switching (fsw) for LJ interactions and force shifting (fsh) functions for Coulombic interactions ([Steinbach](#))

$$E_{LJ}(r) = \begin{cases} 4\epsilon\sigma^6 \left(\frac{\sigma^6 - r^6}{r^{12}} - \frac{\sigma^6}{a^6 b^6} + \frac{1}{a^3 b^3} \right) & r \leq a \\ \frac{4\epsilon\sigma^6 \left(\sigma^6 (b^6 - r^6)^2 - b^3 r^6 (a^3 + b^3) (b^3 - r^3)^2 \right)}{b^6 r^{12} (b^6 - a^6)} & a < r \leq b \\ 0, & r > b \end{cases}$$

$$E_{coul}(r) = \begin{cases} C(r) \frac{(b-r)^2}{rb^2}, & r \leq b \\ 0, & r > b \end{cases}$$

These styles are used by LAMMPS input scripts generated by <https://charmm-gui.org/> (Brooks).

Note

For CHARMM, newer *charmmfsw* or *charmmfsh* styles were released in March 2017. We recommend they be used instead of the older *charmm* styles. See discussion of the differences on the *pair charmm* and *dihedral charmm* doc pages.

Note

The TIP3P water model is strongly recommended for use with the CHARMM force field. In fact, “using the SPC model with CHARMM parameters is a bad idea” and “to enable TIP4P style water in CHARMM, you would have to write a new pair style”. LAMMPS input scripts generated by Solution Builder on <https://charmm-gui.org> use TIP3P molecules for solvation. Any other water model can and probably will lead to false conclusions.

COMPASS

COMPASS is a general force field for atomistic simulation of common organic molecules, inorganic small molecules, and polymers which was developed using ab initio and empirical parameterization techniques (Sun). See the *Tools* page for the msi2lmp tool for creating LAMMPS template input and data files from BIOVIA’s Materials Studio files. Please note that the msi2lmp tool is very old and largely unmaintained, so it does not support all features of Materials Studio provided force field files, especially additions during the last decade. You should watch the output carefully and compare results, where possible. See (Sun) for a description of the COMPASS force field.

These interaction styles listed below compute force field formulas that are consistent with the COMPASS force field. See each command’s documentation for the formula it computes.

- *bond_style* class2
- *angle_style* class2
- *dihedral_style* class2
- *improper_style* class2
- *pair_style* lj/class2
- *pair_style* lj/class2/coul/cut
- *pair_style* lj/class2/coul/long

- *special_bonds* lj/coul 0 0 1

DREIDING

DREIDING is a generic force field developed by the [Goddard group](#) at Caltech and is useful for predicting structures and dynamics of organic, biological and main-group inorganic molecules. The philosophy in DREIDING is to use general force constants and geometry parameters based on simple hybridization considerations, rather than individual force constants and geometric parameters that depend on the particular combinations of atoms involved in the bond, angle, or torsion terms. DREIDING has an *explicit hydrogen bond term* to describe interactions involving a hydrogen atom on very electronegative atoms (N, O, F). Unlike CHARMM or AMBER, the DREIDING force field has not been parameterized for considering solvents (like water).

See ([Mayo](#)) for a description of the DREIDING force field

The interaction styles listed below compute force field formulas that are consistent with the DREIDING force field. See each command's documentation for the formula it computes.

8.4.2 AMOEBA and HIPPO force fields

The AMOEBA and HIPPO polarizable force fields were developed by Jay Ponder’s group at the U Washington at St Louis. The LAMMPS implementation is based on Fortran 90 code provided by the Ponder group in their [Tinker MD software](#).

The current implementation (July 2022) of AMOEBA in LAMMPS matches the version discussed in ([Ponder](#)), ([Ren](#)), and ([Shi](#)). Likewise the current implementation of HIPPO in LAMMPS matches the version discussed in ([Rackers](#)).

These force fields can be used when polarization effects are desired in simulations of water, organic molecules, and biomolecules including proteins, provided that parameterizations (Tinker PRM force field files) are available for the systems you are interested in. Files in the LAMMPS potentials directory with a “amoeba” or “hippo” suffix can be used. The Tinker distribution and website have additional force field files as well: <https://github.com/TinkerTools/tinker/tree/release/params>.

Note that currently, HIPPO can only be used for water systems, but HIPPO files for a variety of small organic and biomolecules are in preparation by the Ponder group. Those force field files will be included in the LAMMPS distribution when available.

To use the AMOEBA or HIPPO force fields, a simulation must be 3d, and fully periodic or fully non-periodic, and use an orthogonal (not triclinic) simulation box.

The AMOEBA and HIPPO force fields contain the following terms in their energy (U) computation. Further details for AMOEBA equations are in ([Ponder](#)), further details for the HIPPO equations are in ([Rackers](#)).

$$\begin{aligned}
 U &= U_{\text{intermolecular}} + U_{\text{intramolecular}} \\
 U_{\text{intermolecular}} &= U_{\text{hal}} + U_{\text{repulsion}} + U_{\text{dispersion}} + U_{\text{multipole}} + U_{\text{polar}} + U_{\text{qxfer}} \\
 U_{\text{intramolecular}} &= U_{\text{bond}} + U_{\text{angle}} + U_{\text{torsion}} + U_{\text{oop}} + U_{b\theta} + U_{UB} + U_{\text{pitorsion}} + U_{\text{bitorsion}}
 \end{aligned}$$

For intermolecular terms, the AMOEBA force field includes only the U_{hal} , $U_{\text{multipole}}$, U_{polar} terms. The HIPPO force field includes all but the U_{hal} term. In LAMMPS, these are all computed by the `pair_style amoeba or hippo` command. Note that the $U_{\text{multipole}}$ and U_{polar} terms in this formula are not the same for the AMOEBA and HIPPO force fields.

For intramolecular terms, the U_{bond} , U_{angle} , U_{torsion} , U_{oop} terms are computed by the `bond_style class2` `angle_style amoeba`, `dihedral_style fourier`, and `improper_style amoeba` commands respectively. The `angle_style amoeba` command includes the $U_{b\theta}$ bond-angle cross term, and the U_{UB} term for a Urey-Bradley bond contribution between the I,K atoms in the IJK angle.

The $U_{\text{pitorsion}}$ term is computed by the `fix amoeba/pitorsion` command. It computes 6-body interaction between a pair of bonded atoms which each have 2 additional bond partners.

The $U_{\text{bitorsion}}$ term is computed by the `fix amoeba/bitorsion` command. It computes 5-body interaction between two 4-body torsions (dihedrals) which overlap, having 3 atoms in common.

These command doc pages have additional details on the terms they compute:

- `pair_style amoeba or hippo`
- `bond_style class2`
- `angle_style amoeba`
- `dihedral_style fourier`
- `improper_style amoeba`

- *fix amoeba/pitortion*
- *fix amoeba/bitortion*

To use the AMOEBA or HIPPO force fields in LAMMPS, use commands like the following appropriately in your input script. The only change needed for AMOEBA vs HIPPO simulation is for the *pair_style* and *pair_coeff* commands, as shown below. See examples/amoeba for example input scripts for both AMOEBA and HIPPO.

```
units                real                                # required
atom_style           amoeba
bond_style           class2                            # CLASS2 package
angle_style          amoeba
dihedral_style       fourier                            # EXTRA-MOLECULE package
improper_style       amoeba
# required per-atom data
fix                 amtype all property/atom i_amtype ghost yes
fix                 extra all property/atom &
                    i_amgroup i_ired i_xaxis i_yaxis i_zaxis d_pval ghost yes
fix                 polaxe all property/atom i_polaxe

fix                 pit all amoeba/pitortion            # PiTorsion terms in FF
fix_modify          pit energy yes
# Bitorsion terms in FF
fix                 bit all amoeba/bitorsion bitorsion.ubiquitin.data
fix_modify          bit energy yes

read_data           data.ubiquitin fix amtype NULL "Tinker Types" &
                    fix pit "pitortion types" "PiTorsion Coeffs" &
                    fix pit pitortions PiTortions &
                    fix bit bitortions BiTortions

pair_style           amoeba                            # AMOEBA FF
pair_coeff           * * amoeba_ubiquitin.prm amoeba_ubiquitin.key

pair_style           hippo                             # HIPPO FF
pair_coeff           * * hippo_water.prm hippo_water.key

special_bonds       lj/coul 0.5 0.5 0.5 one/five yes    # 1-5 neighbors
```

The data file read by the *read_data* command should be created by the tools/tinker/tinker2lmp.py conversion program described below. It will create a section in the data file with the header “Tinker Types”. A *fix property/atom* command for the data must be specified before the *read_data* command. In the example above the fix ID is *amtype*.

Similarly, if the system you are simulating defines AMOEBA/HIPPO pitortion or bitorsion interactions, there will be entries in the data file for those interactions. They require a *fix amoeba/pitortion* and *fix amoeba/bitorsion* command be defined. In the example above, the IDs for these two fixes are *pit* and *bit*.

Of course, if the system being modeled does not have one or more of the following – bond, angle, dihedral, improper, pitortion, bitorsion interactions – then the corresponding style and fix commands above do not need to be used. See the example scripts in examples/amoeba for water systems as examples; they are simpler than what is listed above.

The two *fix property/atom* commands with IDs (in the example above) *extra* and *polaxe* are also needed to define internal per-atom quantities used by the AMOEBA and HIPPO force fields.

The *pair_coeff* command used for either the AMOEBA or HIPPO force field takes two arguments for Tinker force field files, namely a PRM and KEY file. The keyfile can be specified as NULL and default values for a various settings will

be used. Note that these 2 files are meant to allow use of native Tinker files as-is. However LAMMPS does not support all the options which can be included in a Tinker PRM or KEY file. See specifics below.

A *special_bonds* command with the *one/five* option is required, since the AMOEBA/HIPPO force fields define weighting factors for not only 1-2, 1-3, 1-4 interactions, but also 1-5 interactions. This command will trigger a per-atom list of 1-5 neighbors to be generated. The AMOEBA and HIPPO force fields define their own custom weighting factors for all the 1-2, 1-3, 1-4, 1-5 terms which in the Tinker PRM and KEY files; they can be different for different terms in the force field.

In addition to the list above, these command doc pages have additional details:

- *atom_style amoeba*
 - *fix property/atom*
 - *special_bonds*
-

Tinker PRM and KEY files

A Tinker PRM file is composed of sections, each of which has multiple lines. This is the list of PRM sections LAMMPS knows how to parse and use. Any other sections are skipped:

- Angle Bending Parameters
- Atom Type Definitions
- Atomic Multipole Parameters
- Bond Stretching Parameters
- Charge Penetration Parameters
- Charge Transfer Parameters
- Dipole Polarizability Parameters
- Dispersion Parameters
- Force Field Definition
- Literature References
- Out-of-Plane Bend Parameters
- Pauli Repulsion Parameters
- Pi-Torsion Parameters
- Stretch-Bend Parameters
- Torsion-Torsion Parameters
- Torsional Parameters
- Urey-Bradley Parameters
- Van der Waals Pair Parameters
- Van der Waals Parameters

A Tinker KEY file is composed of lines, each of which has a keyword followed by zero or more parameters. This is the list of keywords LAMMPS knows how to parse and use in the same manner Tinker does. Any other keywords are skipped. The value in parenthesis is the default value for the keyword if it is not specified, or if the keyfile in the *pair_coeff* command is specified as NULL:

- a-axis (0.0)

- b-axis (0.0)
- c-axis (0.0)
- ctrn-cutoff (6.0)
- ctrn-taper (0.9 * ctrn-cutoff)
- cutoff
- delta-halgren (0.07)
- dewald (no long-range dispersion unless specified)
- dewald-alpha (0.4)
- dewald-cutoff (7.0)
- dispersion-cutoff (9.0)
- dispersion-taper (9.0 * dispersion-cutoff)
- dpme-grid
- dpme-order (4)
- ewald (no long-range electrostatics unless specified)
- ewald-alpha (0.4)
- ewald-cutoff (7.0)
- gamma-halgren (0.12)
- mpole-cutoff (9.0)
- mpole-taper (0.65 * mpole-cutoff)
- pcg-guess (enabled by default)
- pcg-noguess (disable pcg-guess if specified)
- pcg-noprecond (disable pcg-precond if specified)
- pcg-peek (1.0)
- pcg-precond (enabled by default)
- pewald-alpha (0.4)
- pme-grid
- pme-order (5)
- polar-eps (1.0e-6)
- polar-iter (100)
- polar-predict (no prediction operation unless specified)
- ppme-order (5)
- repulsion-cutoff (6.0)
- repulsion-taper (0.9 * repulsion-cutoff)
- taper
- usolve-cutoff (4.5)
- usolve-diag (2.0)

- vdw-cutoff (9.0)
- vdw-taper (0.9 * vdw-cutoff)

Tinker2lmp.py tool

This conversion tool is found in the tools/tinker directory. As shown in examples/amoeba/README, these commands produce the data files found in examples/amoeba, and also illustrate all the options available to use with the tinker2lmp.py script:

```
python tinker2lmp.py -xyz water_dimer.xyz -amoeba amoeba_water.prm -data data.water_
→dimer.amoeba                # AMOEBA non-periodic system
python tinker2lmp.py -xyz water_dimer.xyz -hippo hippo_water.prm -data data.water_dimer.
→hippo                        # HIPPO non-periodic system
python tinker2lmp.py -xyz water_box.xyz -amoeba amoeba_water.prm -data data.water_box.
→amoeba -pbc 18.643 18.643 18.643 # AMOEBA periodic system
python tinker2lmp.py -xyz water_box.xyz -hippo hippo_water.prm -data data.water_box.
→hippo -pbc 18.643 18.643 18.643 # HIPPO periodic system
python tinker2lmp.py -xyz ubiquitin.xyz -amoeba amoeba_ubiquitin.prm -data data.
→ubiquitin.new -pbc 54.99 41.91 41.91 -bitorsion bitorsion.ubiquitin.data.new #
→system with bitorsions
```

Switches and their arguments may be specified in any order.

The -xyz switch is required and specifies an input XYZ file as an argument. The format of this file is an extended XYZ format defined and used by Tinker for its input. Example *.xyz files are in the examples/amoeba directory. The file lists the atoms in the system. Each atom has the following information: Tinker species name (ignored by LAMMPS), xyz coordinates, Tinker numeric type, and a list of atom IDs the atom is bonded to.

Here is more information about the extended XYZ format defined and used by Tinker, and links to programs that convert standard PDB files to the extended XYZ format:

- https://openbabel.org/docs/current/FileFormats/Tinker_XYZ_format.html
- <https://github.com/emleddin/pdbxyz-xyzpdb>
- <https://github.com/TinkerTools/tinker/blob/release/source/pdbxyz.f>

The -amoeba or -hippo switch is required. It specifies an input AMOEBA or HIPPO PRM force field file as an argument. This should be the same file used by the *pair_style* command in the input script.

The -data switch is required. It specifies an output file name for the LAMMPS data file that will be produced.

For periodic systems, the -pbc switch is required. It specifies the periodic box size for each dimension (x,y,z). For a Tinker simulation these are specified in the KEY file.

The -bitorsion switch is only needed if the system contains Tinker bitorsion interactions. The data for each type of bitorsion interaction will be written to the specified file, and read by the *fix amoeba/bitorsion* command. The data includes 2d arrays of values to which splines are fit, and thus is not compatible with the LAMMPS data file format.

8.4.3 TIP3P water model

The TIP3P water model as implemented in CHARMM (*MacKerell*) specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the 3 atoms.

A suitable pair style with cutoff Coulomb would be:

- `pair_style lj/cut/coul/cut`

or these commands for a long-range Coulomb model:

- `pair_style lj/cut/coul/long`
- `pair_style lj/cut/coul/long/soft`
- `kspace_style pppm`
- `kspace_style pppm/disp`

In LAMMPS the *fix shake* or *fix rattle* command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used. In case of rigid bonds also bond style *zero* and angle style *zero* can be used.

The table below lists the force field parameters (in real *units*) to for the water molecule atoms to run a rigid or flexible TIP3P-CHARMM model with a cutoff, the original 1983 TIP3P model (*Jorgensen*), or a TIP3P model with parameters optimized for a long-range Coulomb solver (e.g. Ewald or PPPM in LAMMPS) (*Price*). The K values can be used if a flexible TIP3P model (without fix shake) is desired, for rigid bonds/angles they are ignored.

Parameter	TIP3P-CHARMM	TIP3P (original)	TIP3P (Ewald)
O mass (amu)	15.9994	15.9994	15.9994
H mass (amu)	1.008	1.008	1.008
O charge (<i>e</i>)	-0.834	-0.834	-0.834
H charge (<i>e</i>)	0.417	0.417	0.417
LJ ϵ of OO (kcal/mole)	0.1521	0.1521	0.1020
LJ σ of OO (\AA)	3.1507	3.1507	3.188
LJ ϵ of HH (kcal/mole)	0.0460	0.0	0.0
LJ σ of HH (\AA)	0.4	1.0	1.0
LJ ϵ of OH (kcal/mole)	0.0836	0.0	0.0
LJ σ of OH (\AA)	1.7753	1.0	1.0
K of OH bond (kcal/mole/ \AA^2)	450	450	450
r_0 of OH bond (\AA)	0.9572	0.9572	0.9572
K of HOH angle (kcal/mole)	55.0	55.0	55.0
θ_0 of HOH angle	104.52°	104.52°	104.52°

Below is the code for a LAMMPS input file and a molecule file (`tip3p.mol`) of TIP3P water for use with the *molecule* command demonstrating how to set up a small bulk water system for TIP3P with rigid bonds.

8.4.4 TIP4P water model

The four-point TIP4P rigid water model extends the traditional *three-point TIP3P* model by adding an additional site M, usually massless, where the charge associated with the oxygen atom is placed. This site M is located at a fixed distance away from the oxygen along the bisector of the HOH bond angle. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used. In case of rigid bonds also bond style *zero* and angle style *zero* can be used.

There are two ways to implement TIP4P water in LAMMPS:

1. Use a specially written pair style that uses the *TIP3P geometry* without the point M. The point M location is then implicitly derived from the other atoms or each water molecule and used during the force computation. The forces on M are then projected on the oxygen and the two hydrogen atoms. This is computationally very efficient, but the charge distribution in space is only correct within the tip4p labeled styles. So all other computations using charges will “see” the negative charge incorrectly on the oxygen atom.

This can be done with the following pair styles for Coulomb with a cutoff:

- *pair_style tip4p/cut*
- *pair_style lj/cut/tip4p/cut*

or these commands for a long-range Coulomb treatment:

- *pair_style tip4p/long*
- *pair_style lj/cut/tip4p/long*
- *pair_style lj/long/tip4p/long*
- *pair_style tip4p/long/soft*
- *pair_style lj/cut/tip4p/long/soft*
- *kpspace_style pppm/tip4p*
- *kpspace_style pppm/disp/tip4p*

The bond lengths and bond angles should be held fixed using the *fix shake* or *fix rattle* command, unless a parameterization for a flexible TIP4P model is used. The parameter sets listed below are all for rigid TIP4P model variants and thus the bond and angle force constants are not used and can be set to any legal value; only equilibrium length and angle are used.

2. Use an *explicit 4 point TIP4P geometry* where the oxygen atom carries no charge and the M point no Lennard-Jones interactions. Since *fix shake* or *fix rattle* may not be applied to this kind of geometry, *fix rigid* or *fix rigid/small* or its thermostatted variants are required to maintain a rigid geometry. This avoids some of the issues with respect to analysis and non-tip4p styles, but it is a more costly force computation (more atoms in the same volume and thus more neighbors in the neighbor lists) and requires a much shorter timestep for stable integration of the rigid body motion. Since no bonds or angles are required, they do not need to be defined and atom style charge would be sufficient for a bulk TIP4P water system. In order to avoid that LAMMPS produces an error due to the massless M site a tiny non-zero mass needs to be assigned.

The table below lists the force field parameters (in real *units*) to for a selection of popular variants of the TIP4P model. There is the rigid TIP4P model with a cutoff (*Jorgensen*), the TIP4P/Ice model (*Abascal1*), the TIP4P/2005 model (*Abascal2*) and a version of TIP4P parameters adjusted for use with a long-range Coulombic solver (e.g. Ewald or PPPM in LAMMPS). Note that for implicit TIP4P models the OM distance is specified in the *pair_style* command, not as part of the pair coefficients.

Parameter	TIP4P (original)	TIP4P/Ice	TIP4P/2005	TIP4P (Ewald)
O mass (amu)	15.9994	15.9994	15.9994	15.9994
H mass (amu)	1.008	1.008	1.008	1.008
O or M charge (<i>e</i>)	-1.040	-1.1794	-1.1128	-1.04844
H charge (<i>e</i>)	0.520	0.5897	0.5564	0.52422
LJ ϵ of OO (kcal/mole)	0.1550	0.21084	0.1852	0.16275
LJ σ of OO (Å)	3.1536	3.1668	3.1589	3.16435
LJ ϵ of HH, MM, OH, OM, HM (kcal/mole)	0.0	0.0	0.0	0.0
LJ σ of HH, MM, OH, OM, HM (Å)	1.0	1.0	1.0	1.0
r_0 of OH bond (Å)	0.9572	0.9572	0.9572	0.9572
θ_0 of HOH angle	104.52°	104.52°	104.52°	104.52°
OM distance (Å)	0.15	0.1577	0.1546	0.1250

Note that when using the TIP4P pair style, the neighbor list cutoff for Coulomb interactions is effectively extended by a distance 2 * (OM distance), to account for the offset distance of the fictitious charges on O atoms in water molecules. Thus it is typically best in an efficiency sense to use a LJ cutoff \geq Coulomb cutoff + 2*(OM distance), to shrink the size of the neighbor list. This leads to slightly larger cost for the long-range calculation, so you can test the trade-off for your model. The OM distance and the LJ and Coulombic cutoffs are set in the *pair_style lj/cut/tip4p/long* command.

Below is the code for a LAMMPS input file using the implicit method and the *TIP3P molecule file*. Because the TIP4P charges are different from TIP3P they need to be reset (or the molecule file changed):

```

units real
atom_style full
region box block -5 5 -5 5 -5 5
create_box 2 box bond/types 1 angle/types 1 &
           extra/bond/per/atom 2 extra/angle/per/atom 1 extra/special/per/atom 2

mass 1 15.9994
mass 2 1.008

pair_style lj/cut/tip4p/cut 1 2 1 1 0.15 8.0
pair_coeff 1 1 0.1550 3.1536
pair_coeff 2 2 0.0 1.0

bond_style zero

8.4.5 TIP5P water model

The five-point TIP5P rigid water model extends the *three-point TIP3P model* by adding two additional sites L, usually massless, where the charge associated with the oxygen atom is placed. These sites L are located at a fixed distance away from the oxygen atom, forming a tetrahedral angle that is rotated by 90 degrees from the HOH plane. Those sites thus somewhat approximate lone pairs of the oxygen and consequently improve the water structure to become even more “tetrahedral” in comparison to the *four-point TIP4P model*.

A suitable pair style with cutoff Coulomb would be:

- *pair_style lj/cut/coul/cut*

or these commands for a long-range model:

- *pair_style lj/cut/coul/long*
- *pair_style lj/cut/coul/long/soft*
- *kpace_style ppm*
- *kpace_style ppm/disp*

A TIP5P model *must* be run using a *rigid fix* since there is no other option to keep this kind of structure rigid in LAMMPS. In order to avoid that LAMMPS produces an error due to the massless L sites, those need to be assigned a tiny non-zero mass.

The table below lists the force field parameters (in real *units*) to for a the TIP5P model with a cutoff (*Mahoney*) and the TIP5P-E model (*Rick*) for use with a long-range Coulombic solver (e.g. Ewald or PPPM in LAMMPS).

Parameter	TIP5P	TIP5P-E
O mass (amu)	15.9994	15.9994
H mass (amu)	1.008	1.008
O charge (<i>e</i>)	0.0	0.0
L charge (<i>e</i>)	-0.241	-0.241
H charge (<i>e</i>)	0.241	0.241
LJ ϵ of OO (kcal/mole)	0.1600	0.1780
LJ σ of OO (Å)	3.1200	3.0970
LJ ϵ of HH, LL, OH, OL, HL (kcal/mole)	0.0	0.0
LJ σ of HH, LL, OH, OL, HL (Å)	1.0	1.0
r_0 of OH bond (Å)	0.9572	0.9572
θ_0 of HOH angle	104.52°	104.52°
OL distance (Å)	0.70	0.70
θ_0 of LOL angle	109.47°	109.47°

Below is the code for a LAMMPS input file for setting up a simulation of TIP5P water with a molecule file. Because of using *fix rigid/small* no bonds need to be defined and thus no extra storage needs to be reserved for them, but we need to either switch to atom style full or use *fix property/atom mol* so that fix rigid/small can identify rigid bodies by their molecule ID. Also a *neigh_modify exclude* command is added to exclude computing intramolecular non-bonded interactions, since those are removed by the rigid fix anyway:

```

8.4.6 SPC water model

The SPC water model specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the 3 atoms. In LAMMPS the *fix shake* command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used.

These are the additional parameters (in real units) to set for O and H atoms and the water molecule to run a rigid SPC model.

O mass = 15.9994

H mass = 1.008

O charge = -0.820

H charge = 0.410

LJ ϵ of OO = 0.1553

LJ σ of OO = 3.166

LJ ϵ , σ of OH, HH = 0.0

r_0 of OH bond = 1.0

θ_0 of HOH angle = 109.47°

Note that as originally proposed, the SPC model was run with a 9 Angstrom cutoff for both LJ and Coulomb terms. It can also be used with long-range electrostatic solvers (e.g. Ewald or PPPM in LAMMPS) without changing any of the parameters above, although it becomes a different model in that mode of usage.

The SPC/E (extended) water model is the same, except the partial charge assignments change:

O charge = -0.8476

H charge = 0.4238

See the ([Berendsen](#)) reference for more details on both the SPC and SPC/E models.

Below is the code for a LAMMPS input file and a molecule file (spce.mol) of SPC/E water for use with the *molecule* command demonstrating how to set up a small bulk water system for SPC/E with rigid bonds.

8.5 Packages howto

8.5.1 Finite-size spherical and aspherical particles

Typical MD models treat atoms or particles as point masses. Sometimes it is desirable to have a model with finite-size particles such as spheroids or ellipsoids or generalized aspherical bodies. The difference is that such particles have a moment of inertia, rotational energy, and angular momentum. Rotation is induced by torque coming from interactions with other particles.

LAMMPS has several options for running simulations with these kinds of particles. The following aspects are discussed in turn:

- atom styles
- pair potentials
- time integration
- computes, thermodynamics, and dump output
- rigid bodies composed of finite-size particles

Example input scripts for these kinds of models are in the body, colloid, dipole, ellipse, line, peri, pour, and tri directories of the [examples directory](#) in the LAMMPS distribution.

Atom styles

There are several [atom styles](#) that allow for definition of finite-size particles: sphere, dipole, ellipsoid, line, tri, peri, and body.

The sphere style defines particles that are spheroids and each particle can have a unique diameter and mass (or density). These particles store an angular velocity (omega) and can be acted upon by torque. The “set” command can be used to modify the diameter and mass of individual particles, after then are created.

The dipole style does not actually define finite-size particles, but is often used in conjunction with spherical particles, via a command like

```
atom_style hybrid sphere dipole
```

This is because when dipoles interact with each other, they induce torques, and a particle must be finite-size (i.e. have a moment of inertia) in order to respond and rotate. See the [atom_style dipole](#) command for details. The “set” command can be used to modify the orientation and length of the dipole moment of individual particles, after then are created.

The ellipsoid style defines particles that are ellipsoids and thus can be aspherical. Each particle has a shape, specified by 3 diameters, and mass (or density). These particles store an angular momentum and their orientation (quaternion), and can be acted upon by torque. They do not store an angular velocity (ω), which can be in a different direction than angular momentum, rather they compute it as needed. The “set” command can be used to modify the diameter, orientation, and mass of individual particles, after then are created. It also has a brief explanation of what quaternions are.

The line style defines line segment particles with two end points and a mass (or density). They can be used in 2d simulations, and they can be joined together to form rigid bodies which represent arbitrary polygons.

The tri style defines triangular particles with three corner points and a mass (or density). They can be used in 3d simulations, and they can be joined together to form rigid bodies which represent arbitrary particles with a triangulated surface.

The peri style is used with [Peridynamic models](#) and defines particles as having a volume, that is used internally in the [pair_style peri](#) potentials.

The body style allows for definition of particles which can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. The body style is discussed in more detail on the [Howto body](#) doc page.

Note that if one of these atom styles is used (or multiple styles via the [atom_style hybrid](#) command), not all particles in the system are required to be finite-size or aspherical.

For example, in the ellipsoid style, if the 3 shape parameters are set to the same value, the particle will be a sphere rather than an ellipsoid. If the 3 shape parameters are all set to 0.0 or if the diameter is set to 0.0, it will be a point particle. In the line or tri style, if the lineflag or triflag is specified as 0, then it will be a point particle.

Some of the pair styles used to compute pairwise interactions between finite-size particles also compute the correct interaction with point particles as well, e.g. the interaction between a point particle and a finite-size particle or between two point particles. If necessary, [pair_style hybrid](#) can be used to ensure the correct interactions are computed for the appropriate style of interactions. Likewise, using groups to partition particles (ellipsoids versus spheres versus point particles) will allow you to use the appropriate time integrators and temperature computations for each class of particles. See the doc pages for various commands for details.

Also note that for [2d simulations](#), atom styles sphere and ellipsoid still use 3d particles, rather than as circular disks or ellipses. This means they have the same moment of inertia as the 3d object. When temperature is computed, the correct degrees of freedom are used for rotation in a 2d versus 3d system.

Pair potentials

When a system with finite-size particles is defined, the particles will only rotate and experience torque if the force field computes such interactions. These are the various [pair styles](#) that generate torque:

- [pair_style gran/history](#)
- [pair_style gran/hertz](#)
- [pair_style gran/no_history](#)
- [pair_style dipole/cut](#)
- [pair_style gayberne](#)
- [pair_style resquared](#)
- [pair_style brownian](#)

- *pair_style lubricate*
- *pair_style line/lj*
- *pair_style tri/lj*
- *pair_style body/nparticle*

The granular pair styles are used with spherical particles. The dipole pair style is used with the dipole atom style, which could be applied to spherical or ellipsoidal particles. The GayBerne and REsquared potentials require ellipsoidal particles, though they will also work if the 3 shape parameters are the same (a sphere). The Brownian and lubrication potentials are used with spherical particles. The line, tri, and body potentials are used with line segment, triangular, and body particles respectively.

Time integration

There are several fixes that perform time integration on finite-size spherical particles, meaning the integrators update the rotational orientation and angular velocity or angular momentum of the particles:

- *fix nve/sphere*
- *fix nvt/sphere*
- *fix npt/sphere*

Likewise, there are 3 fixes that perform time integration on ellipsoidal particles:

- *fix nve/asphere*
- *fix nvt/asphere*
- *fix npt/asphere*

The advantage of these fixes is that those which thermostat the particles include the rotational degrees of freedom in the temperature calculation and thermostating. The *fix langevin* command can also be used with its *omega* or *angmom* options to thermostat the rotational degrees of freedom for spherical or ellipsoidal particles. Other thermostating fixes only operate on the translational kinetic energy of finite-size particles.

These fixes perform constant NVE time integration on line segment, triangular, and body particles:

- *fix nve/line*
- *fix nve/tri*
- *fix nve/body*

Note that for mixtures of point and finite-size particles, these integration fixes can only be used with *groups* which contain finite-size particles.

Computes, thermodynamics, and dump output

There are several computes that calculate the temperature or rotational energy of spherical or ellipsoidal particles:

- *compute temp/sphere*
- *compute temp/asphere*
- *compute erotate/sphere*
- *compute erotate/asphere*

These include rotational degrees of freedom in their computation. If you wish the thermodynamic output of temperature or pressure to use one of these computes (e.g. for a system entirely composed of finite-size particles), then the compute can be defined and the *thermo_modify* command used. Note that by default thermodynamic quantities will be calculated with a temperature that only includes translational degrees of freedom. See the *thermo_style* command for details.

These commands can be used to output various attributes of finite-size particles:

- *dump custom*
- *compute property/atom*
- *dump local*
- *compute body/local*

Attributes include the dipole moment, the angular velocity, the angular momentum, the quaternion, the torque, the end-point and corner-point coordinates (for line and tri particles), and sub-particle attributes of body particles.

Rigid bodies composed of finite-size particles

The *fix rigid* command treats a collection of particles as a rigid body, computes its inertia tensor, sums the total force and torque on the rigid body each timestep due to forces on its constituent particles, and integrates the motion of the rigid body.

If any of the constituent particles of a rigid body are finite-size particles (spheres or ellipsoids or line segments or triangles), then their contribution to the inertia tensor of the body is different than if they were point particles. This means the rotational dynamics of the rigid body will be different. Thus a model of a dimer is different if the dimer consists of two point masses versus two spheroids, even if the two particles have the same mass. Finite-size particles that experience torque due to their interaction with other particles will also impart that torque to a rigid body they are part of.

See the “fix rigid” command for example of complex rigid-body models it is possible to define in LAMMPS.

Note that the *fix shake* command can also be used to treat 2, 3, or 4 particles as a rigid body, but it always assumes the particles are point masses.

Also note that body particles cannot be modeled with the *fix rigid* command. Body particles are treated by LAMMPS as single particles, though they can store internal state, such as a list of sub-particles. Individual body particles are typically treated as rigid bodies, and their motion integrated with a command like *fix nve/body*. Interactions between pairs of body particles are computed via a command like *pair_style body/nparticle*.

8.5.2 Granular models

Granular system are composed of spherical particles with a diameter, as opposed to point particles. This means they have an angular velocity and torque can be imparted to them to cause them to rotate.

To run a simulation of a granular model, you will want to use the following commands:

- *atom_style sphere*
- *fix nve/sphere*
- *fix gravity*

This compute

- *compute erotate/sphere*

calculates rotational kinetic energy which can be *output with thermodynamic info*. The compute

- *compute fabric*

calculates various versions of the fabric tensor for granular and non-granular pair styles.

Use one of these 4 pair potentials, which compute forces and torques between interacting pairs of particles:

- *pair_style gran/history*
- *pair_style gran/no_history*
- *pair_style gran/hertzian*
- *pair_style granular*

These commands implement fix options specific to granular systems:

- *fix freeze*
- *fix pour*
- *fix viscous*
- *fix wall/gran*
- *fix wall/gran/region*

The fix style *freeze* zeroes both the force and torque of frozen atoms, and should be used for granular system instead of the fix style *setforce*.

To model heat conduction, one must add the temperature and heatflow atom variables with:

- *fix property/atom*

a temperature integration fix

- *fix heat/flow*

and a heat conduction option defined in both

- *pair_style granular*
- *fix wall/gran*

For computational efficiency, you can eliminate needless pairwise computations between frozen atoms by using this command:

- *neigh_modify exclude*

Note

By default, for 2d systems, granular particles are still modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be the same as in 3d. If you wish to model granular particles in 2d as 2d discs, see the note on this topic on the [Howto 2d](#) doc page, where 2d simulations are discussed.

To add custom granular contact models, see the [modifying granular sub-models page](#).

8.5.3 Body particles

Overview:

In LAMMPS, body particles are generalized finite-size particles. Individual body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. Note that other kinds of finite-size spherical and aspherical particles are also supported by LAMMPS, such as spheres, ellipsoids, line segments, and triangles, but they are simpler entities than body particles. See the [Howto spherical](#) page for a general overview of all these particle types.

Body particles are used via the `atom_style body` command. It takes a body style as an argument. The current body styles supported by LAMMPS are as follows. The name in the first column is used as the `bstyle` argument for the `atom_style body` command.

<i>nparticle</i>	rigid body with N sub-particles
<i>rounded/polygon</i>	2d polygons with N vertices
<i>rounded/polyhedron</i>	3d polyhedra with N vertices, E edges and F faces

The body style determines what attributes are stored for each body and thus how they can be used to compute pairwise body/body or bond/non-body (point particle) interactions. More details of each style are described below.

More styles may be added in the future. See the [page on creating new body styles](#) for details on how to add a new body style to the code.

When to use body particles:

You should not use body particles to model a rigid body made of simpler particles (e.g. point, sphere, ellipsoid, line segment, triangular particles), if the interaction between pairs of rigid bodies is just the summation of pairwise interactions between the simpler particles. LAMMPS already supports this kind of model via the `fix rigid` command. Any of the numerous pair styles that compute interactions between simpler particles can be used. The `fix rigid` command time integrates the motion of the rigid bodies. All of the standard LAMMPS commands for thermostating, adding constraints, performing output, etc will operate as expected on the simple particles.

By contrast, when body particles are used, LAMMPS treats an entire body as a single particle for purposes of computing pairwise interactions, building neighbor lists, migrating particles between processors, output of particles to a dump file, etc. This means that interactions between pairs of bodies or between a body and non-body (point) particle need to be encoded in an appropriate pair style. If such a pair style were to mimic the `fix rigid` model, it would need to loop over the entire collection of interactions between pairs of simple particles within the two bodies, each time a single body/body interaction was computed.

Thus it only makes sense to use body particles and develop such a pair style, when particle/particle interactions are more complex than what the `fix rigid` command can already calculate. For example, consider particles with one or more of the following attributes:

- represented by a surface mesh
- represented by a collection of geometric entities (e.g. planes + spheres)
- deformable
- internal stress that induces fragmentation

For these models, the interaction between pairs of particles is likely to be more complex than the summation of simple pairwise interactions. An example is contact or frictional forces between particles with planar surfaces that interpenetrate. Likewise, the body particle may store internal state, such as a stress tensor used to compute a fracture criterion.

These are additional LAMMPS commands that can be used with body particles of different styles

<i>fix nve/body</i>	integrate motion of a body particle in NVE ensemble
<i>fix nvt/body</i>	ditto for NVT ensemble
<i>fix npt/body</i>	ditto for NPT ensemble
<i>fix nph/body</i>	ditto for NPH ensemble
<i>compute body/local</i>	store sub-particle attributes of a body particle
<i>compute temp/body</i>	compute temperature of body particles
<i>dump local</i>	output sub-particle attributes of a body particle
<i>dump image</i>	output body particle attributes as an image

The pair styles currently defined for use with specific body styles are listed in the sections below.

Note that for all the body styles, if the data file defines a general triclinic box, then the orientation of the body particle and its corresponding 6 moments of inertia and other orientation-dependent values should reflect the fact the body is defined withing a general triclinic box with edge vectors **A,**B**,**C****. LAMMPS will rotate the box to convert it to a restricted triclinic box. This operation will also rotate the orientation of the body particles. See the [Howto triclinic](#) doc page for more details. The sections below highlight the orientation-dependent values specific to each body style.

Specifics of body style *nparticle*:

The *nparticle* body style represents body particles as a rigid body with a variable number N of sub-particles. It is provided as a vanilla, prototypical example of a body particle, although as mentioned above, the *fix rigid* command already duplicates its functionality.

The `atom_style` body command for this body style takes two additional arguments:

```
atom_style body nparticle Nmin Nmax
Nmin = minimum # of sub-particles in any body in the system
Nmax = maximum # of sub-particles in any body in the system
```

The Nmin and Nmax arguments are used to bound the size of data structures used internally by each particle.

When the *read_data* command reads a data file for this body style, the following information must be provided for each entry in the *Bodies* section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
```

where $M = 6 + 3*N$, and N is the number of sub-particles in the body particle.

The integer line has a single value N. The floating point line(s) list 6 moments of inertia followed by the coordinates of the N sub-particles (x1 to zN) as 3N values. These values can be listed on as many lines as you wish; see the *read_data* command for more details.

The 6 moments of inertia (ixx,iyy,izz,ixy,ixz,iyz) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

The coordinates of each sub-particle are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the *Atoms* section of the data file, as is the total mass of the body particle.

Note that if the data file defines a general triclinic simulation box, these sub-particle displacements are orientation-dependent and, as mentioned above, should reflect the body particle's orientation within the general triclinic box.

The *pair_style body/nparticle* command can be used with this body style to compute body/body and body/non-body interactions.

Specifics of body style rounded/polygon:

The *rounded/polygon* body style represents body particles as a 2d polygon with a variable number of N vertices. This style can only be used for 2d models; see the *boundary* command. See the *pair_style body/rounded/polygon* page for a diagram of two squares with rounded circles at the vertices. Special cases for $N = 1$ (circle) and $N = 2$ (rod with rounded ends) can also be specified.

One use of this body style is for 2d discrete element models, as described in *Fraige*.

Similar to body style *nparticle*, the *atom_style* body command for this body style takes two additional arguments:

```
atom_style body rounded/polygon Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system
```

The *Nmin* and *Nmax* arguments are used to bound the size of data structures used internally by each particle.

When the *read_data* command reads a data file for this body style, the following information must be provided for each body in the *Bodies* section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
diameter
```

where $M = 6 + 3*N + 1$, and N is the number of vertices in the body particle.

The integer line has a single value N . The floating point line(s) list 6 moments of inertia, followed by the coordinates of the N vertices ($x1$ to zN) as $3N$ values (with $z = 0.0$ for each), followed by a diameter value = the rounded diameter of the circle that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the *read_data* command for more details.

Note

It is important that the vertices for each polygonal body particle be listed in order around its perimeter, so that edges can be inferred. LAMMPS does not check that this is the case.

The 6 moments of inertia (*ixx,iyy,izz,ixy,ixz,iyz*) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

The coordinates of each vertex are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the *Atoms* section of the data file.

For example, the following information would specify a square particle whose edge length is $\sqrt{2}$ and rounded diameter is 1.0. The orientation of the square is aligned with the xy coordinate axes which is consistent with the 6 moments of inertia: *ixx iyy izz ixy ixz iyz = 1 1 4 0 0 0*. Note that only *izz* matters in 2D simulations.

```

3 1 19
4
1 1 4 0 0 0
-0.7071 -0.7071 0
-0.7071 0.7071 0
0.7071 0.7071 0
0.7071 -0.7071 0
1.0

```

A rod in 2D, whose length is 4.0, mass 1.0, rounded at two ends by circles of diameter 0.5, is specified as follows:

```

1 1 13
2
1 1 1.33333 0 0 0
-2 0 0
2 0 0
0.5

```

A disk, whose diameter is 3.0, mass 1.0, is specified as follows:

```

1 1 10
1
1 1 4.5 0 0 0
0 0 0
3.0

```

Note that if the data file defines a general triclinic simulation box, these polygon vertex displacements are orientation-dependent and, as mentioned above, should reflect the body particle's orientation within the general triclinic box.

The `pair_style body/rounded/polygon` command can be used with this body style to compute body/body interactions. The `fix wall/body/polygon` command can be used with this body style to compute the interaction of body particles with a wall.

Specifics of body style rounded/polyhedron:

The `rounded/polyhedron` body style represents body particles as a 3d polyhedron with a variable number of N vertices, E edges and F faces. This style can only be used for 3d models; see the `boundary` command. See the “`pair_style body/rounded/polygon`” page for a diagram of a two 2d squares with rounded circles at the vertices. A 3d cube with rounded spheres at the 8 vertices and 12 rounded edges would be similar. Special cases for $N = 1$ (sphere) and $N = 2$ (rod with rounded ends) can also be specified.

This body style is for 3d discrete element models, as described in [Wang](#).

Similar to body style `rounded/polygon`, the `atom_style body` command for this body style takes two additional arguments:

```

atom_style body rounded/polyhedron Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system

```

The `Nmin` and `Nmax` arguments are used to bound the size of data structures used internally by each particle.

When the `read_data` command reads a data file for this body style, the following information must be provided for each entry in the `Bodies` section of the data file:

```

atom-ID 3 M
N E F
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
0 1
1 2
2 3
...
0 1 2 -1
0 2 3 -1
...
1 2 3 4
diameter

```

where $M = 6 + 3*N + 2*E + 4*F + 1$, and N is the number of vertices in the body particle, E = number of edges, F = number of faces. For $N = 1$ or 2 , the format is simpler. E and F are ignored and no edges or faces are listed, so that $M = 6 + 3*N + 1$.

The integer line has three values: number of vertices (N), number of edges (E) and number of faces (F). The floating point line(s) list 6 moments of inertia followed by the coordinates of the N vertices ($x1$ to zN) as $3N$ values, followed by $2E$ vertex indices corresponding to the end points of the E edges, then $4*F$ vertex indices defining F faces. The last value is the diameter value = the rounded diameter of the sphere that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the [read_data](#) command for more details.

Note that vertices are numbered from 0 to $N-1$ inclusive. The order of the 2 vertices in each edge does not matter. Faces can be triangles or quadrilaterals. In both cases 4 vertices must be specified. For a triangle the 4th vertex is -1. The 4 vertices within each triangle or quadrilateral face should be ordered by the right-hand rule so that the normal vector of the face points outwards from the center of mass. For polyhedron with faces with more than 4 vertices, you should split the complex face into multiple simple faces, each of which is a triangle or quadrilateral.

Note

If a face is a quadrilateral then its 4 vertices must be co-planar. LAMMPS does not check that this is the case. If you have a quad-face of a polyhedron that is not planar (e.g. a cube whose vertices have been randomly displaced), then you should represent the single quad face as two triangle faces instead.

The 6 moments of inertia (ixx,iyy,izz,ixy,ixz,iyz) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

The coordinates of each vertex are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the *Atoms* section of the data file.

For example, the following information would specify a cubic particle whose edge length is 2.0 and rounded diameter is 0.5. The orientation of the cube is aligned with the xyz coordinate axes which is consistent with the 6 moments of inertia: $ixx iyy izz ixy ixz iyz = 0.667\ 0.667\ 0.667\ 0\ 0\ 0$.

```

1 3 79
8 12 6
0.667 0.667 0.667 0 0 0
1 1 1

```

(continues on next page)

0.5

```

A rod in 3D, whose length is 4.0, mass 1.0 and rounded at two ends by circles of diameter 0.5, is specified as follows:

```

1 3 13
2 1 1
0 1.33333 1.33333 0 0 0
-2 0 0
2 0 0
0.5

```

A sphere whose diameter is 3.0 and mass 1.0, is specified as follows:

```

1 3 10
1 1 1
0.9 0.9 0.9 0 0 0
0 0 0
3.0

```

The number of edges and faces for a rod or sphere must be listed, but is ignored.

Note that if the data file defines a general triclinic simulation box, these polyhedron vertex displacements are orientation-dependent and, as mentioned above, should reflect the body particle's orientation within the general triclinic box.

The *pair_style body/rounded/polyhedron* command can be used with this body style to compute body/body interactions. The *fix wall/body/polyhedron* command can be used with this body style to compute the interaction of body particles with a wall.

Output specifics for all body styles:

For the *compute body/local* and *dump local* commands, all 3 of the body styles described on this page produces one datum for each of the N vertices (of sub-particles) in a body particle. The datum has 3 values:

```
1 = x position of vertex (or sub-particle)
2 = y position of vertex
3 = z position of vertex
```

These values are the current position of the vertex within the simulation domain, not a displacement from the center-of-mass (COM) of the body particle itself. These values are calculated using the current COM and orientation of the body particle.

The *dump image* command and its *body* keyword can be used to render body particles.

For the *nparticle* body style, each body is drawn as a collection of spheres, one for each sub-particle. The size of each sphere is determined by the *bflag1* parameter for the *body* keyword. The *bflag2* argument is ignored.

For the *rounded/polygon* body style, each body is drawn as a polygon with N line segments. For the *rounded/polyhedron* body style, each face of each body is drawn as a polygon with N line segments. The drawn diameter of each line segment is determined by the *bflag1* parameter for the *body* keyword. The *bflag2* argument is ignored.

Note that for both the *rounded/polygon* and *rounded/polyhedron* styles, line segments are drawn between the pairs of vertices. Depending on the diameters of the line segments this may be slightly different than the physical extent of the body as calculated by the *pair_style rounded/polygon* or *pair_style rounded/polyhedron* commands. Conceptually, the pair styles define the surface of a 2d or 3d body by lines or planes that are tangent to the finite-size spheres of specified diameter which are placed on each vertex position.

8.5.4 Bonded particle models

The BPM package implements bonded particle models which can be used to simulate mesoscale solids. Solids are constructed as a collection of particles, which each represent a coarse-grained region of space much larger than the atomistic scale. Particles within a solid region are then connected by a network of bonds to provide solid elasticity.

Unlike traditional bonds in molecular dynamics, the equilibrium bond length can vary between bonds. Bonds store the reference state. This includes setting the equilibrium length equal to the initial distance between the two particles, but can also include data on the bond orientation for rotational models. This produces a stress-free initial state. Furthermore, bonds are allowed to break under large strains, producing fracture. The *examples/bpm* directory has sample input scripts for simulations of the fragmentation of an impacted plate and the pouring of extended, elastic bodies. See (Clemmer) for more general information on the approach and the LAMMPS implementation.

Bonds can be created using a *read data* or *create bonds* command. Alternatively, a *molecule* template with bonds can be used with *fix deposit* or *fix pour* to create solid grains.

In this implementation, bonds store their reference state when they are first computed in the setup of the first simulation run. Data is then preserved across run commands and is written to *binary restart files* such that restarting the system will not reset the reference state of a bond. Bonds that are created midway into a run, such as those created by pouring grains using *fix pour*, are initialized on that timestep.

Currently, there are two types of bonds included in the BPM package. The first bond style, *bond bpm/spring*, only applies pairwise, central body forces. Point particles must have *bond atom style* and may be thought of as nodes in

a spring network. Alternatively, the second bond style, *bond bpm/rotational*, resolves tangential forces and torques arising with the shearing, bending, and twisting of the bond due to rotation or displacement of particles. Particles are similar to those used in the *granular package*, *atom style sphere*. However, they must also track the current orientation of particles and store bonds, and therefore use a *bpm/sphere atom style*. This also requires a unique integrator *fix nve/bpm/sphere* which numerically integrates orientation similar to *fix nve/asphere*.

In addition to bond styles, a new pair style *pair bpm/spring* was added to accompany the bpm/spring bond style. This pair style is simply a hookean repulsion with similar velocity damping as its sister bond style.

Bond data can be output using a combination of standard LAMMPS commands. A list of IDs for bonded atoms can be generated using the *compute property/local* command. Various properties of bonds can be computed using the *compute bond/local* command. This command allows one to access data saved to the bond's history, such as the reference length of the bond. More information on bond history data can be found on the documentation pages for the specific BPM bond styles. Finally, this data can be output using a *dump local* command. As one may output many columns from the same compute, the *dump modify colname* option may be used to provide more helpful column names. An example of this procedure is found in */examples/bpm/pour/*. External software, such as OVITO, can read these dump files to render bond data.

As bonds can be broken between neighbor list builds, the *special_bonds* command works differently for BPM bond styles. There are two possible settings which determine how pair interactions work between bonded particles. First, one can overlay pair forces with bond forces such that all bonded particles also feel pair interactions. This can be accomplished by setting the *overlay/pair* keyword present in all bpm bond styles to *yes* and requires using the following special bond settings

```
special_bonds lj/coul 1 1 1
```

Alternatively, one can turn off all pair interactions between bonded particles. Unlike *bond quartic*, this is not done by subtracting pair forces during the bond computation, but rather by dynamically updating the special bond list. This is the default behavior of BPM bond styles and is done by updating the 1-2 special bond list as bonds break. To do this, LAMMPS requires *newton* bond off such that all processors containing an atom know when a bond breaks. Additionally, one must use the following special bond settings

```
special_bonds lj 0 1 1 coul 1 1 1
```

These settings accomplish two goals. First, they turn off 1-3 and 1-4 special bond lists, which are not currently supported for BPMs. As BPMs often have dense bond networks, generating 1-3 and 1-4 special bond lists is expensive. By setting the lj weight for 1-2 bonds to zero, this turns off pairwise interactions. Even though there are no charges in BPM models, setting a nonzero coul weight for 1-2 bonds ensures all bonded neighbors are still included in the neighbor list in case bonds break between neighbor list builds. If bond breakage is disabled during a simulation run by setting the *break* keyword to *no*, a zero coul weight for 1-2 bonds can be used to exclude bonded atoms from the neighbor list builds

```
special_bonds lj 0 1 1 coul 0 1 1
```

This can be useful for post-processing, or to determine pair interaction properties between distinct bonded particles.

To monitor the fracture of bonds in the system, all BPM bond styles have the ability to record instances of bond breakage to output using the *dump local* command. Since one may frequently output a list of broken bonds and the time they broke, the *dump modify* option *header no* may be useful to avoid repeatedly printing the header of the dump file. An example of this procedure is found in */examples/bpm/impact/*. Additionally, one can use *compute nbond/atom* to tally the current number of bonds per atom.

See the *Howto* page on broken bonds for more information.

While LAMMPS has many utilities to create and delete bonds, *only* the following are currently compatible with BPM bond styles:

- *create_bonds*
- *delete_bonds*
- *fix bond/create*
- *fix bond/break*
- *fix bond/swap*

Note

The *create_bonds* command requires certain *special_bonds* settings. To subtract pair interactions, one will need to switch between different *special_bonds* settings in the input script. An example is found in `examples/bpm/impact`.

(Clemmer) Clemmer, Monti, Lechman, Soft Matter, 20, 1702 (2024).

8.5.5 Polarizable models

In polarizable force fields the charge distributions in molecules and materials respond to their electrostatic environments. Polarizable systems can be simulated in LAMMPS using three methods:

- the fluctuating charge method, implemented in the *QEQ* package,
- the adiabatic core-shell method, implemented in the *CORESHELL* package,
- the thermalized Drude dipole method, implemented in the *DRUDE* package.

The fluctuating charge method calculates instantaneous charges on interacting atoms based on the electronegativity equalization principle. It is implemented in the *fix qeq* which is available in several variants. It is a relatively efficient technique since no additional particles are introduced. This method allows for charge transfer between molecules or atom groups. However, because the charges are located at the interaction sites, off-plane components of polarization cannot be represented in planar molecules or atom groups.

The two other methods share the same basic idea: polarizable atoms are split into one core atom and one satellite particle (called shell or Drude particle) attached to it by a harmonic spring. Both atoms bear a charge and they represent collectively an induced electric dipole. These techniques are computationally more expensive than the QEq method because of additional particles and bonds. These two charge-on-spring methods differ in certain features, with the core-shell model being normally used for ionic/crystalline materials, whereas the so-called Drude model is normally used for molecular systems and fluid states.

The core-shell model is applicable to crystalline materials where the high symmetry around each site leads to stable trajectories of the core-shell pairs. However, bonded atoms in molecules can be so close that a core would interact too strongly or even capture the Drude particle of a neighbor. The Drude dipole model is relatively more complex in order to remedy this and other issues. Specifically, the Drude model includes specific thermostating of the core-Drude pairs and short-range damping of the induced dipoles.

The three polarization methods can be implemented through a self-consistent calculation of charges or induced dipoles at each timestep. In the fluctuating charge scheme this is done by the matrix inversion method in *fix qeq/point*, but for core-shell or Drude-dipoles the relaxed-dipoles technique would require an slow iterative procedure. These self-consistent solutions yield accurate trajectories since the additional degrees of freedom representing polarization are massless. An alternative is to attribute a mass to the additional degrees of freedom and perform time integration using an extended Lagrangian technique. For the fluctuating charge scheme this is done by *fix qeq/dynamic*, and for the

charge-on-spring models by the methods outlined in the next two sections. The assignment of masses to the additional degrees of freedom can lead to unphysical trajectories if care is not exerted in choosing the parameters of the polarizable models and the simulation conditions.

In the core-shell model the vibration of the shells is kept faster than the ionic vibrations to mimic the fast response of the polarizable electrons. But in molecular systems thermalizing the core-Drude pairs at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, too short a timestep, etc.) In order to avoid these problems the relative motion of the Drude particles with respect to their cores is kept “cold” so the vibration of the core-Drude pairs is very slow, approaching the self-consistent regime. In both models the temperature is regulated using the velocities of the center of mass of core+shell (or Drude) pairs, but in the Drude model the actual relative core-Drude particle motion is thermostatted separately as well.

8.5.6 Adiabatic core/shell model

The adiabatic core-shell model by *Mitchell and Fincham* is a simple method for adding polarizability to a system. In order to mimic the electron shell of an ion, a satellite particle is attached to it. This way the ions are split into a core and a shell where the latter is meant to react to the electrostatic environment inducing polarizability. See the *Howto polarizable* page for a discussion of all the polarizable models available in LAMMPS.

Technically, shells are attached to the cores by a spring force $f = k \cdot r$ where k is a parameterized spring constant and r is the distance between the core and the shell. The charges of the core and the shell add up to the ion charge, thus $q(\text{ion}) = q(\text{core}) + q(\text{shell})$. This setup introduces the ion polarizability (α) given by $\alpha = q(\text{shell})^2 / k$. In a similar fashion the mass of the ion is distributed on the core and the shell with the core having the larger mass.

To run this model in LAMMPS, *atom_style full* can be used since atom charge and bonds are needed. Each kind of core/shell pair requires two atom types and a bond type. The core and shell of a core/shell pair should be bonded to each other with a harmonic bond that provides the spring force. For example, a data file for NaCl, as found in *examples/coreshell*, has this format:

```
432 atoms # core and shell atoms
216 bonds # number of core/shell springs

4 atom types # 2 cores and 2 shells for Na and Cl
2 bond types

0.0 24.09597 xlo xhi
0.0 24.09597 ylo yhi
0.0 24.09597 zlo zhi

Masses # core/shell mass ratio = 0.1

1 20.690784 # Na core
2 31.90500 # Cl core
3 2.298976 # Na shell
4 3.54500 # Cl shell

(...)

```

Non-Coulombic (e.g. Lennard-Jones) pairwise interactions are only defined between the shells. Coulombic interactions are defined between all cores and shells. If desired, additional bonds can be specified between cores.

The *special_bonds* command should be used to turn-off the Coulombic interaction within core/shell pairs, since that interaction is set by the bond spring. This is done using the *special_bonds* command with a 1-2 weight = 0.0, which is the default value. It needs to be considered whether one has to adjust the *special_bonds* weighting according to the molecular topology since the interactions of the shells are bypassed over an extra bond.

Note that this core/shell implementation does not require all ions to be polarized. One can mix core/shell pairs and ions without a satellite particle if desired.

Since the core/shell model permits distances of $r = 0.0$ between the core and shell, a pair style with a “cs” suffix needs to be used to implement a valid long-range Coulombic correction. Several such pair styles are provided in the CORESHELL package. See [this page](#) for details. All of the core/shell enabled pair styles require the use of a long-range Coulombic solver, as specified by the *kspace_style* command. Either the PPPM or Ewald solvers can be used.

For the NaCl example problem, these pair style and bond style settings are used:

```

pair_style      born/coul/long/cs 20.0 20.0
pair_coeff       * *          0.0 1.0000  0.00 0.00  0.00
pair_coeff       3 3          487.0 0.23768 0.00 1.05  0.50 #Na-Na
pair_coeff       3 4          145134.0 0.23768 0.00 6.99  8.70 #Na-Cl
pair_coeff       4 4          405774.0 0.23768 0.00 72.40 145.40 #Cl-Cl

bond_style      harmonic
bond_coeff       1 63.014 0.0
bond_coeff       2 25.724 0.0

```

When running dynamics with the adiabatic core/shell model, the following issues should be considered. The relative motion of the core and shell particles corresponds to the polarization, hereby an instantaneous relaxation of the shells is approximated and a fast core/shell spring frequency ensures a nearly constant internal kinetic energy during the simulation. Thermostats can alter this polarization behavior, by scaling the internal kinetic energy, meaning the shell will not react freely to its electrostatic environment. Therefore it is typically desirable to decouple the relative motion of the core/shell pair, which is an imaginary degree of freedom, from the real physical system. To do that, the *compute temp/cs* command can be used, in conjunction with any of the thermostat fixes, such as *fix nvt* or *fix langevin*. This compute uses the center-of-mass velocity of the core/shell pairs to calculate a temperature, and ensures that velocity is what is rescaled for thermostatting purposes. This compute also works for a system with both core/shell pairs and non-polarized ions (ions without an attached satellite particle). The *compute temp/cs* command requires input of two groups, one for the core atoms, another for the shell atoms. Non-polarized ions which might also be included in the treated system should not be included into either of these groups, they are taken into account by the *group-ID* (second argument) of the compute. The groups can be defined using the *group *type** command. Note that to perform thermostatting using this definition of temperature, the *fix modify temp* command should be used to assign the compute to the thermostat fix. Likewise the *thermo_modify temp* command can be used to make this temperature be output for the overall system.

For the NaCl example, this can be done as follows:

```

group cores type 1 2
group shells type 3 4

```

(continues on next page)

(continued from previous page)

```

compute CSequ all temp/cs cores shells
fix thermoberendsen all temp/berendsen 1427 1427 0.4      # thermostat for the true_
→physical system
fix thermostatequ all nve                                  # integrator as needed for the_
→berendsen thermostat
fix_modify thermoberendsen temp CSequ
thermo_modify temp CSequ                                  # output of center-of-mass_
→derived temperature

```

The pressure for the core/shell system is computed via the regular LAMMPS convention by *treating the cores and shells as individual particles*. For the thermo output of the pressure as well as for the application of a barostat, it is necessary to use an additional *pressure* compute based on the default *temperature* and specifying it as a second argument in *fix modify* and *thermo_modify* resulting in:

```

(...)
compute CSequ all temp/cs cores shells
compute thermo_press_lmp all pressure thermo_temp          # pressure for individual_
→particles
thermo_modify temp CSequ press thermo_press_lmp          # modify thermo to regular_
→pressure
fix press_bar all npt temp 300 300 0.04 iso 0 0 0.4
fix_modify press_bar temp CSequ press thermo_press_lmp    # pressure modification for_
→correct kinetic scalar

```

If *compute temp/cs* is used, the decoupled relative motion of the core and the shell should in theory be stable. However numerical fluctuation can introduce a small momentum to the system, which is noticeable over long trajectories. Therefore it is recommendable to use the *fix momentum* command in combination with *compute temp/cs* when equilibrating the system to prevent any drift.

When initializing the velocities of a system with core/shell pairs, it is also desirable to not introduce energy into the relative motion of the core/shell particles, but only assign a center-of-mass velocity to the pairs. This can be done by using the *bias* keyword of the *velocity create* command and assigning the *compute temp/cs* command to the *temp* keyword of the *velocity* command, e.g.

```

velocity all create 1427 134 bias yes temp CSequ
velocity all scale 1427 temp CSequ

```

To maintain the correct polarizability of the core/shell pairs, the kinetic energy of the internal motion shall remain nearly constant. Therefore the choice of spring force and mass ratio need to ensure much faster relative motion of the 2 atoms within the core/shell pair than their center-of-mass velocity. This allows the shells to effectively react instantaneously to the electrostatic environment and limits energy transfer to or from the core/shell oscillators. This fast movement also dictates the timestep that can be used.

The primary literature of the adiabatic core/shell model suggests that the fast relative motion of the core/shell pairs only allows negligible energy transfer to the environment. The mentioned energy transfer will typically lead to a small drift in total energy over time. This internal energy can be monitored using the *compute chunk/atom* and *compute temp/chunk* commands. The internal kinetic energies of each core/shell pair can then be summed using the *sum()* special function of the *variable* command. Or they can be time/averaged and output using the *fix ave/time* command. To use these commands, each core/shell pair must be defined as a “chunk”. If each core/shell pair is defined as its own molecule, the molecule ID can be used to define the chunks. If cores are bonded to each other to form larger molecules, the chunks can be identified by the *fix property/atom* via assigning a core/shell ID to each atom using a special field in the data file read by the *read_data* command. This field can then be accessed by the *compute property/atom* command, to use as input to the *compute chunk/atom* command to define the core/shell pairs as chunks.

For example if core/shell pairs are the only molecules:

```
read_data NaCl_CS_x0.1_prop.data
compute prop all property/atom molecule
compute cs_chunk all chunk/atom c_prop
compute csthern all temp/chunk cs_chunk temp internal com yes cdof 3.0      # note the
→chosen degrees of freedom for the core/shell pairs
fix ave_chunk all ave/time 10 1 10 c_csthern file chunk.dump mode vector
```

For example if core/shell pairs and other molecules are present:

```
fix csinfo all property/atom i_CSID      # property/atom command
read_data NaCl_CS_x0.1_prop.data fix csinfo NULL CS-Info # atom property added in the
→data-file
compute prop all property/atom i_CSID
(...)
```

The additional section in the data file would be formatted like this:

```
CS-Info      # header of additional section

1  1          # column 1 = atom ID, column 2 = core/shell ID
2  1
3  2
4  2
5  3
6  3
7  4
8  4
(...)
```

8.5.7 Drude induced dipoles

The thermalized Drude model represents induced dipoles by a pair of charges (the core atom and the Drude particle) connected by a harmonic spring. See the *Howto polarizable* doc page for a discussion of all the polarizable models available in LAMMPS.

The Drude model has a number of features aimed at its use in molecular systems (*Lamoureux and Roux*):

- Thermostatting of the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.
- Consistent definition of 1-2 to 1-4 neighbors. A core-Drude particle pair represents a single (polarizable) atom, so the special screening factors in a covalent structure should be the same for the core and the Drude particle. Drude particles have to inherit the 1-2, 1-3, 1-4 special neighbor relations from their respective cores.
- Stabilization of the interactions between induced dipoles. Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short range can be done by Thole functions (for which there are physical grounds). This Thole damping is applied to the point charges composing

the induced dipole (the charge of the Drude particle and the opposite charge on the core, not to the total charge of the core atom).

A detailed tutorial covering the usage of Drude induced dipoles in LAMMPS is on the [here](#).

As with the core-shell model, the cores and Drude particles should appear in the data file as standard atoms. The same holds for the springs between them, which are described by standard harmonic bonds. The nature of the atoms (core, Drude particle or non-polarizable) is specified via the `fix drude` command. The special list of neighbors is automatically refactored to account for the equivalence of core and Drude particles as regards special 1-2 to 1-4 screening. It may be necessary to use the `extra/special/per/atom` keyword of the `read_data` command. If using `fix shake`, make sure no Drude particle is in this fix group.

There are three ways to thermostat the Drude particles at a low temperature: use either `fix langevin/drude` for a Langevin thermostat, or `fix drude/transform/*` for a Nose-Hoover thermostat, or `fix tgnvt/drude` for a temperature-grouped Nose-Hoover thermostat. The first and third require use of the command `comm_modify vel yes`. The second requires two separate integration fixes like `nvt` or `npt`. The correct temperatures of the reduced degrees of freedom can be calculated using the `compute temp/drude`. This requires also to use the command `comm_modify vel yes`.

Short-range damping of the induced dipole interactions can be achieved using Thole functions through the `pair style thole` in `pair_style hybrid/overlay` with a Coulomb pair style. It may be useful to use `coul/long/cs` or similar from the CORESHELL package if the core and Drude particle come too close, which can cause numerical issues.

8.5.8 Tutorial for Thermalized Drude oscillators in LAMMPS

This tutorial explains how to use Drude oscillators in LAMMPS to simulate polarizable systems using the DRUDE package. As an illustration, the input files for a simulation of 250 phenol molecules are documented. First of all, LAMMPS has to be compiled with the DRUDE package activated. Then, the data file and input scripts have to be modified to include the Drude dipoles and how to handle them.

Example input scripts available: `examples/PACKAGES/drude`

Overview of Drude induced dipoles

Polarizable atoms acquire an induced electric dipole moment under the action of an external electric field, for example the electric field created by the surrounding particles. Drude oscillators represent these dipoles by two fixed charges: the core (DC) and the Drude particle (DP) bound by a harmonic potential. The Drude particle can be thought of as the electron cloud whose center can be displaced from the position of the corresponding nucleus.

The sum of the masses of a core-Drude pair should be the mass of the initial (unsplit) atom, $m_C + m_D = m$. The sum of their charges should be the charge of the initial (unsplit) atom, $q_C + q_D = q$. A harmonic potential between the core and Drude partners should be present, with force constant k_D and an equilibrium distance of zero. The (half-)stiffness of the [harmonic bond](#) $K_D = k_D/2$ and the Drude charge q_D are related to the atom polarizability α by

$$K_D = \frac{1}{2} \frac{q_D^2}{\alpha}$$

Ideally, the mass of the Drude particle should be small, and the stiffness of the harmonic bond should be large, so that the Drude particle remains close to the core. The values of Drude mass, Drude charge, and force constant can be chosen following different strategies, as in the following examples of polarizable force fields:

- [Lamoureux and Roux](#) suggest adopting a global half-stiffness, $K_D = 500 \text{ kcal}/(\text{mol Ang}^2)$ - which corresponds to a force constant $k_D = 4184 \text{ kJ}/(\text{mol Ang}^2)$ - for all types of core-Drude bond, a global mass $m_D = 0.4 \text{ g/mol}$ (or u) for all types of Drude particles, and to calculate the Drude charges for individual atom types from the atom polarizabilities using equation (1). This choice is followed in the polarizable CHARMM force field.

- Alternately *Schroeder and Steinhauser* suggest adopting a global charge $q_D = -1.0e$ and a global mass $m_D = 0.1$ g/mol (or u) for all Drude particles, and to calculate the force constant for each type of core-Drude bond from equation (1). The timesteps used by these authors are between 0.5 and 2 fs, with the degrees of freedom of the Drude oscillators kept cold at 1 K.
- In both these force fields hydrogen atoms are treated as non-polarizable.

The motion of the Drude particles can be calculated by minimizing the energy of the induced dipoles at each timestep, by an iterative, self-consistent procedure. The Drude particles can be massless and therefore do not contribute to the kinetic energy. However, the relaxed method is computational slow. An extended-lagrangian method can be used to calculate the positions of the Drude particles, but this requires them to have mass. It is important in this case to decouple the degrees of freedom associated with the Drude oscillators from those of the normal atoms. Thermalizing the Drude dipoles at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, very short timestep, etc.), which can be remedied by the “cold Drude” technique (*Lamoureux and Roux*).

Two closely related models are used to represent polarization through “charges on a spring”: the core-shell model and the Drude model. Although the basic idea is the same, the core-shell model is normally used for ionic/crystalline materials, whereas the Drude model is normally used for molecular systems and fluid states. In ionic crystals the symmetry around each ion and the distance between them are such that the core-shell model is sufficiently stable. But to be applicable to molecular/covalent systems the Drude model includes two important features:

1. The possibility to thermostat the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.
2. The Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle (shell) of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short of the interactions between the point charges composing the induced dipole can be done by *Thole* functions.

Preparation of the data file

The data file is similar to a standard LAMMPS data file for *atom_style full*. The DPs and the *harmonic bonds* connecting them to their DC should appear in the data file as normal atoms and bonds.

You can use the *polarizer* tool (Python script distributed with the DRUDE package) to convert a non-polarizable data file (here *data.102494.lmp*) to a polarizable data file (*data-p.lmp*)

```
polarizer -q -f phenol.dff data.102494.lmp data-p.lmp
```

This will automatically insert the new atoms and bonds. The masses and charges of DCs and DPs are computed from *phenol.dff*, as well as the DC-DP bond constants. The file *phenol.dff* contains the polarizabilities of the atom types and the mass of the Drude particles, for instance:

```
# units: kJ/mol, A, deg
# kforce is in the form k/2 r_D^2
# type m_D/u q_D/e k_D alpha/A3 thole
OH      0.4   -1.0   4184.0   0.63   0.67
CA      0.4   -1.0   4184.0   1.36   2.51
CAI     0.4   -1.0   4184.0   1.09   2.51
```

The hydrogen atoms are absent from this file, so they will be treated as non-polarizable atoms. In the non-polarizable data file *data.102494.lmp*, atom names corresponding to the atom type numbers have to be specified as comments at the end of lines of the *Masses* section. You probably need to edit it to add these names. It should look like

```
Masses
```

(continues on next page)

(continued from previous page)

```

1 12.011 # CAI
2 12.011 # CA
3 15.999 # OH
4 1.008 # HA
5 1.008 # HO

```

Basic input file

The atom style should be set to (or derive from) *full*, so that you can define atomic charges and molecular bonds, angles, dihedrals...

The *polarizer* tool also outputs certain lines related to the input script (the use of these lines will be explained below). In order for LAMMPS to recognize that you are using Drude oscillators, you should use the fix *drude*. The command is

```
fix DRUDE all drude C C C N N D D D
```

The N, C, D following the *drude* keyword have the following meaning: There is one tag for each atom type. This tag is C for DCs, D for DPs and N for non-polarizable atoms. Here the atom types 1 to 3 (C and O atoms) are DC, atom types 4 and 5 (H atoms) are non-polarizable and the atom types 6 to 8 are the newly created DPs.

By recognizing the fix *drude*, LAMMPS will find and store matching DC-DP pairs and will treat DP as equivalent to their DC in the *special bonds* relations. It may be necessary to extend the space for storing such special relations. In this case extra space should be reserved by using the *extra/special/per/atom* keyword of either the *read_data* or *create_box* command. With our phenol, there is 1 more special neighbor for which space is required. Otherwise LAMMPS crashes and gives the required value.

```
read_data data-p.lmp extra/special/per/atom 1
```

Let us assume we want to run a simple NVT simulation at 300 K. Note that Drude oscillators need to be thermalized at a low temperature in order to approximate a self-consistent field (SCF), therefore it is not possible to simulate an NVE ensemble with this package. Since dipoles are approximated by a charged DC-DP pair, the *pair_style* must include Coulomb interactions, for instance *lj/cut/coul/long* with *kspace_style pppm*. For example, with a cutoff of 10. and a precision 1.e-4:

```
pair_style lj/cut/coul/long 10.0
kspace_style pppm 1.0e-4
```

As compared to the non-polarizable input file, *pair_coeff* lines need to be added for the DPs. Since the DPs have no Lennard-Jones interactions, their ϵ is 0. so the only *pair_coeff* line that needs to be added is

```
pair_coeff * 6* 0.0 0.0 # All-DPs
```

Now for the thermalization, the simplest choice is to use the fix *langevin/drude*.

```
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
```

This applies a Langevin thermostat at temperature 300. to the centers of mass of the DC-DP pairs, with relaxation time 100 and with random seed 12435. This fix applies also a Langevin thermostat at temperature 1. to the relative motion of the DPs around their DCs, with relaxation time 20 and random seed 13977. Only the DCs and non-polarizable atoms need to be in this fix's group. LAMMPS will thermostat the DPs together with their DC. For this, ghost atoms need to know their velocities. Thus you need to add the following command:

```
comm_modify vel yes
```

In order to avoid that the center of mass of the whole system drifts due to the random forces of the Langevin thermostat on DCs, you can add the *zero yes* option at the end of the fix line.

If the fix *shake* is used to constrain the C-H bonds, it should be invoked after the fix *langevin/drude* for more accuracy.

```
fix SHAKE ATOMS shake 0.0001 20 0 t 4 5
```

Note

The group of the fix *shake* must not include the DPs. If the group *ATOMS* is defined by non-DPs atom types, you could use

Since the fix *langevin/drude* does not perform time integration (just modification of forces but no position/velocity updates), the fix *nve* should be used in conjunction.

```
fix NVE all nve
```

To avoid the flying ice cube artifact, where the atoms progressively freeze and the center of mass of the whole system drifts faster and faster, the fix *momentum* can be used. For instance:

```
fix MOMENTUM all momentum 100 linear 1 1 1
```

Finally, do not forget to update the atom type elements if you use them in a *dump_modify ... element ...* command, by adding the element type of the DPs. Here for instance

```
dump DUMP all custom 10 dump.lammpstrj id mol type element x y z ix iy iz
dump_modify DUMP element C C O H H D D D
```

The input file should now be ready for use!

You will notice that the global temperature *thermo_temp* computed by LAMMPS is not 300. K as wanted. This is because LAMMPS treats DPs as standard atoms in his default compute. If you want to output the temperatures of the DC-DP pair centers of mass and of the DPs relative to their DCs, you should use the *compute temp_drude*

```
compute TDRUDE all temp/drude
```

And then output the correct temperatures of the Drude oscillators using *thermo_style custom* with respectively *c_TDRUDE[1]* and *c_TDRUDE[2]*. These should be close to 300.0 and 1.0 on average.

```
thermo_style custom step temp c_TDRUDE[1] c_TDRUDE[2]
```

Thole screening

Dipolar interactions represented by point charges on springs may not be stable, for example if the atomic polarizability is too high for instance, a DP can escape from its DC and be captured by another DC, which makes the force and energy diverge and the simulation crash. Even without reaching this extreme case, the correlation between nearby dipoles on the same molecule may be exaggerated. Often, special bond relations prevent bonded neighboring atoms to see the charge of each other's DP, so that the problem does not always appear. It is possible to use screened dipole-dipole interactions by using the **pair_style thole**. This is implemented as a correction to the Coulomb pair_styles, which dampens at short distance the interactions between the charges representing the induced dipoles. It is to be used as *hybrid/overlay* with any standard *coul* pair style. In our example, we would use

```
pair_style hybrid/overlay lj/cut/coul/long 10.0 thole 2.6 10.0
```

This tells LAMMPS that we are using two pair_styles. The first one is as above (*lj/cut/coul/long 10.0*). The second one is a *thole* pair_style with default screening factor 2.6 (*Noskov*) and cutoff 10.0.

Since *hybrid/overlay* does not support mixing rules, the interaction coefficients of all the pairs of atom types with $i < j$ should be explicitly defined. The output of the *polarizer* script can be used to complete the *pair_coeff* section of the input file. In our example, this will look like:

```
pair_coeff 1 1 lj/cut/coul/long 0.0700 3.550
pair_coeff 1 2 lj/cut/coul/long 0.0700 3.550
pair_coeff 1 3 lj/cut/coul/long 0.1091 3.310
pair_coeff 1 4 lj/cut/coul/long 0.0458 2.985
pair_coeff 2 2 lj/cut/coul/long 0.0700 3.550
pair_coeff 2 3 lj/cut/coul/long 0.1091 3.310
pair_coeff 2 4 lj/cut/coul/long 0.0458 2.985
pair_coeff 3 3 lj/cut/coul/long 0.1700 3.070
pair_coeff 3 4 lj/cut/coul/long 0.0714 2.745
pair_coeff 4 4 lj/cut/coul/long 0.0300 2.420
pair_coeff * 5 lj/cut/coul/long 0.0000 0.000
pair_coeff * 6* lj/cut/coul/long 0.0000 0.000
pair_coeff 1 1 thole 1.090 2.510
pair_coeff 1 2 thole 1.218 2.510
pair_coeff 1 3 thole 0.829 1.590
pair_coeff 1 6 thole 1.090 2.510
pair_coeff 1 7 thole 1.218 2.510
pair_coeff 1 8 thole 0.829 1.590
pair_coeff 2 2 thole 1.360 2.510
pair_coeff 2 3 thole 0.926 1.590
pair_coeff 2 6 thole 1.218 2.510
pair_coeff 2 7 thole 1.360 2.510
pair_coeff 2 8 thole 0.926 1.590
pair_coeff 3 3 thole 0.630 0.670
pair_coeff 3 6 thole 0.829 1.590
pair_coeff 3 7 thole 0.926 1.590
pair_coeff 3 8 thole 0.630 0.670
pair_coeff 6 6 thole 1.090 2.510
pair_coeff 6 7 thole 1.218 2.510
pair_coeff 6 8 thole 0.829 1.590
pair_coeff 7 7 thole 1.360 2.510
pair_coeff 7 8 thole 0.926 1.590
pair_coeff 8 8 thole 0.630 0.670
```

For the *thole* pair style the coefficients are

1. the atom polarizability in units of cubic length
2. the screening factor of the Thole function (optional, default value specified by the pair_style command)
3. the cutoff (optional, default value defined by the pair_style command)

The special neighbors have charge-charge and charge-dipole interactions screened by the *coul* factors of the *special_bonds* command (0.0, 0.0, and 0.5 in the example above). Without using the pair_style *thole*, dipole-dipole interactions are screened by the same factor. By using the pair_style *thole*, dipole-dipole interactions are screened by Thole's function, whatever their special relationship (except within each DC-DP pair of course). Consider for example 1-2 neighbors: using the pair_style *thole*, their dipoles will see each other (despite the *coul* factor being 0.) and the

interactions between these dipoles will be damped by Thole's function.

Thermostats and barostats

Using a Nose-Hoover barostat with the *langevin/drude* thermostat is straightforward using *fix nph* instead of *nve*. For example:

```
fix NPH all nph iso 1. 1. 500
```

It is also possible to use a Nose-Hoover instead of a Langevin thermostat. This requires to use **fix drude/transform** just before and after the time integration fixes. The *fix drude/transform/direct* converts the atomic masses, positions, velocities and forces into a reduced representation, where the DCs transform into the centers of mass of the DC-DP pairs and the DPs transform into their relative position with respect to their DC. The *fix drude/transform/inverse* performs the reverse transformation. For a NVT simulation, with the DCs and atoms at 300 K and the DPs at 1 K relative to their DC one would use

```
fix DIRECT all drude/transform/direct
fix NVT1 ATOMS nvt temp 300. 300. 100
fix NVT2 DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

For our phenol example, the groups would be defined as

```
group ATOMS type 1 2 3 4 5 # DCs and non-polarizable atoms
group CORES type 1 2 3      # DCs
group DRUDES type 6 7 8     # DPs
```

Note that with the fixes *drude/transform*, it is not required to specify *comm_modify vel yes* because the fixes do it anyway (several times and for the forces also).

It is a bit more tricky to run a NPT simulation with Nose-Hoover barostat and thermostat. First, the volume should be integrated only once. So the fix for DCs and atoms should be *npt* while the fix for DPs should be *nvt* (or vice versa). Second, the *fix npt* computes a global pressure and thus a global temperature whatever the fix group. We do want the pressure to correspond to the whole system, but we want the temperature to correspond to the fix group only. We must then use the *fix_modify* command for this. In the end, the block of instructions for thermostating and barostatting will look like

```
compute TATOMS ATOMS temp
fix DIRECT all drude/transform/direct
fix NPT ATOMS npt temp 300. 300. 100 iso 1. 1. 500
fix_modify NPT temp TATOMS press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

Another option for thermalizing the Drude model is to use the temperature-grouped Nose-Hoover (TGNH) thermostat proposed by (Son). This is implemented as *fix tgnvt/drude* and *fix tgnpt/drude*. It separates the kinetic energy into three contributions: the molecular center of mass (COM) motion, the motion of atoms or atom-Drude pairs relative to molecular COMs, and the relative motion of atom-Drude pairs. An independent Nose-Hoover chain is applied to each type of motion. When TGNH is used, the temperatures of molecular, atomic and Drude motion can be printed out with *thermo_style command* command.

NVT simulation with TGNH thermostat

```
comm_modify vel yes
fix TGNVT all tgnvt/drude temp 300. 300. 100 1. 20
thermo_style custom f_TGNVT[1] f_TGNVT[2] f_TGNVT[3]
```

NPT simulation with TGNH thermostat

```
comm_modify vel yes
fix TGNPT all tgnpt/drude temp 300. 300. 100 1. 20 iso 1. 1. 500
thermo_style custom f_TGNPT[1] f_TGNPT[2] f_TGNPT[3]
```

Rigid bodies

You may want to simulate molecules as rigid bodies (but polarizable). Common cases are water models such as *SWM4-NDP*, which is a kind of polarizable TIP4P water. The rigid bodies and the DPs should be integrated separately, even with the Langevin thermostat. Let us review the different thermostats and ensemble combinations.

NVT ensemble using Langevin thermostat:

```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nve/small molecule
fix NVE DRUDES nve
```

NVT ensemble using Nose-Hoover thermostat:

```
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/nvt/small molecule temp 300. 300. 100
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

NPT ensemble with Langevin thermostat:

```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nph/small molecule iso 1. 1. 500
fix NVE DRUDES nve
```

NPT ensemble using Nose-Hoover thermostat:

```
compute TATOM ATOMS temp
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/npt/small molecule temp 300. 300. 100 iso 1. 1. 500
fix_modify RIGID temp TATOM press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

8.5.9 Peridynamics with LAMMPS

This Howto is based on the Sandia report 2010-5549 by Michael L. Parks, Pablo Seleson, Steven J. Plimpton, Richard B. Lehoucq, and Stewart A. Silling.

Overview

Peridynamics is a nonlocal extension of classical continuum mechanics. The discrete peridynamic model has the same computational structure as a molecular dynamics model. This Howto provides a brief overview of the peridynamic model of a continuum, then discusses how the peridynamic model is discretized within LAMMPS as described in the original article (*Parks*). An example problem with comments is also included.

Quick Start

The peridynamics styles are included in the optional *PERI* package. If your LAMMPS executable does not already include the PERI package, you can see the *build instructions for packages* for how to enable the package when compiling a custom version of LAMMPS from source.

Here is a minimal example for setting up a peridynamics simulation.

```
units          si
boundary       s s s
lattice        sc 0.0005
atom_style     peri
atom_modify    map array
neighbor       0.0010 bin
region         target cylinder y 0.0 0.0 0.0050 -0.0050 0.0 units box
create_box     1 target
create_atoms   1 region target

pair_style     peri/pmb
pair_coeff      * * 1.6863e22 0.0015001 0.0005 0.25
set            group all density 2200
set            group all volume 1.25e-10
velocity       all set 0.0 0.0 0.0 sum no units box
fix            1 all nve
compute        1 all damage/atom
timestep       1.0e-7
```

Some notes on this input example:

- peridynamics simulations typically use SI *units*
- particles must be created on a *simple cubic lattice*
- using the *atom style peri* is required
- an *atom map* is required for indexing particles
- The *skin distance* used when computing neighbor lists should be defined appropriately for your choice of simulation parameters. The *skin* should be set to a value such that the peridynamic horizon plus the skin distance is larger than the maximum possible distance between two bonded particles (before their bond breaks). Here it is set to 0.001 meters.

- a *peridynamics pair style* is required. Available choices are currently: *peri/eps*, *peri/lps*, *peri/pmb*, and *peri/ves*. The model parameters are set with a *pair_coeff* command.
- the mass density and volume fraction for each particle must be defined. This is done with the two *set* commands for *density* and *volume*. For a simple cubic lattice, the volume of a particle should be equal to the cube of the lattice constant, here $V_i = \Delta x^3$.
- with the *velocity* command all particles are initially at rest
- a plain *velocity-Verlet time integrator* is used, which is algebraically equivalent to a centered difference in time, but numerically more stable
- you can compute the damage at the location of each particle with *compute damage/atom*
- finally, the timestep is set to 0.1 microseconds with the *timestep* command.

Peridynamic Model of a Continuum

The following is not a complete overview of peridynamics, but a discussion of only those details specific to the model we have implemented within LAMMPS. For more on the peridynamic theory, the reader is referred to (Silling 2007). To begin, we define the notation we will use.

Basic Notation

Within the peridynamic literature, the following notational conventions are generally used. The position of a given point in the reference configuration is \mathbf{x} . Let $\mathbf{u}(\mathbf{x}, t)$ and $\mathbf{y}(\mathbf{x}, t)$ denote the displacement and position, respectively, of the point \mathbf{x} at time t . Define the relative position and displacement vectors of two bonded points \mathbf{x} and \mathbf{x}' as $\xi = \mathbf{x}' - \mathbf{x}$ and $\eta = \mathbf{u}(\mathbf{x}', t) - \mathbf{u}(\mathbf{x}, t)$, respectively. We note here that η is time-dependent, and that ξ is not. It follows that the relative position of the two bonded points in the current configuration can be written as $\xi + \eta = \mathbf{y}(\mathbf{x}', t) - \mathbf{y}(\mathbf{x}, t)$.

Peridynamic models are frequently written using *states*, which we briefly describe here. For the purposes of our discussion, all states are operators that act on vectors in \mathbb{R}^3 . For a more complete discussion of states, see (Silling 2007). A *vector state* is an operator whose image is a vector, and may be viewed as a generalization of a second-rank tensor. Similarly, a *scalar state* is an operator whose image is a scalar. Of particular interest is the vector force state $\underline{\mathbf{T}}[\mathbf{x}, t] \langle \mathbf{x}' - \mathbf{x} \rangle$, which is a mapping, having units of force per volume squared, of the vector $\mathbf{x}' - \mathbf{x}$ to the force vector state field. The vector state operator $\underline{\mathbf{T}}$ may itself be a function of \mathbf{x} and t . The constitutive model is completely contained within $\underline{\mathbf{T}}$.

In the peridynamic theory, the deformation at a point depends collectively on all points interacting with that point. Using the notation of (Silling 2007), we write the peridynamic equation of motion as

$$\rho(\mathbf{x})\ddot{\mathbf{u}}(\mathbf{x}, t) = \int_{\mathcal{H}_{\mathbf{x}}} \{ \underline{\mathbf{T}}[\mathbf{x}, t] \langle \mathbf{x}' - \mathbf{x} \rangle - \underline{\mathbf{T}}[\mathbf{x}', t] \langle \mathbf{x} - \mathbf{x}' \rangle \} dV_{\mathbf{x}'} + \mathbf{b}(\mathbf{x}, t), \quad (1)$$

where ρ represents the mass density, $\underline{\mathbf{T}}$ the force vector state, and \mathbf{b} an external body force density. A point \mathbf{x} interacts with all the points \mathbf{x}' within the neighborhood $\mathcal{H}_{\mathbf{x}}$, assumed to be a spherical region of radius $\delta > 0$ centered at \mathbf{x} . δ is called the *horizon*, and is analogous to the cutoff radius used in molecular dynamics. Conditions on $\underline{\mathbf{T}}$ for which (1) satisfies the balance of linear and angular momentum are given in (Silling 2007).

We consider only force vector states that can be written as

$$\underline{\mathbf{T}} = \underline{t} \underline{\mathbf{M}},$$

with \underline{t} a *scalar force state* and $\underline{\mathbf{M}}$ the *deformed direction vector state*, defined by

$$\underline{\mathbf{M}} \langle \xi \rangle = \begin{cases} \frac{\xi + \eta}{\|\xi + \eta\|} & \|\xi + \eta\| \neq 0 \\ 0 & \text{otherwise} \end{cases}. \quad (2)$$

Such force states correspond to so-called *ordinary* materials ([Silling 2007](#)). These are the materials for which the force between any two interacting points \mathbf{x} and \mathbf{x}' acts along the line between the points.

Linear Peridynamic Solid (LPS) Model

We summarize the linear peridynamic solid (LPS) material model. For more on this model, the reader is referred to ([Silling 2007](#)). This model is a nonlocal analogue to a classical linear elastic isotropic material. The elastic properties of a classical linear elastic isotropic material are determined by (for example) the bulk and shear moduli. For the LPS model, the elastic properties are analogously determined by the bulk and shear moduli, along with the horizon δ .

The LPS model has a force scalar state

$$\underline{t} = \frac{3K\theta}{m} \underline{\omega} \underline{x} + \alpha \underline{\omega} \underline{e}^d, \quad (3)$$

with K the bulk modulus and α related to the shear modulus G as

$$\alpha = \frac{15G}{m}.$$

The remaining components of the model are described as follows. Define the reference position scalar state \underline{x} so that $\underline{x} \langle \xi \rangle = \|\xi\|$. Then, the weighted volume m is defined as

$$m[\mathbf{x}] = \int_{\mathcal{H}_x} \underline{\omega} \langle \xi \rangle \underline{x} \langle \xi \rangle \underline{x} \langle \xi \rangle dV_\xi. \quad (4)$$

Let

$$\underline{e}[\mathbf{x}, t] \langle \xi \rangle = \|\xi + \eta\| - \|\xi\|$$

be the extension scalar state, and

$$\theta[\mathbf{x}, t] = \frac{3}{m[\mathbf{x}]} \int_{\mathcal{H}_x} \underline{\omega} \langle \xi \rangle \underline{x} \langle \xi \rangle \underline{e}[\mathbf{x}, t] \langle \xi \rangle dV_\xi$$

be the dilatation. The isotropic and deviatoric parts of the extension scalar state are defined, respectively, as

$$\underline{e}^i = \frac{\theta \underline{x}}{3}, \quad \underline{e}^d = \underline{e} - \underline{e}^i,$$

where the arguments of the state functions and the vectors on which they operate are omitted for simplicity. We note that the LPS model is linear in the dilatation θ , and in the deviatoric part of the extension \underline{e}^d .

Note

The weighted volume m is time-independent, and does not change as bonds break. It is computed with respect to the bond family defined at the reference (initial) configuration.

The non-negative scalar state $\underline{\omega}$ is an *influence function* ([Silling 2007](#)). For more on influence functions, see ([Seleson 2010](#)). If an influence function $\underline{\omega}$ depends only upon the scalar $\|\xi\|$, (i.e., $\underline{\omega} \langle \xi \rangle = \underline{\omega} \langle \|\xi\| \rangle$), then $\underline{\omega}$ is a spherical influence function. For a spherical influence function, the LPS model is isotropic ([Silling 2007](#)).

Note

In the LAMMPS implementation of the LPS model, the influence function $\underline{\omega} \langle \|\xi\| \rangle = 1/\|\xi\|$ is used. However, the user can define their own influence function by altering the method “influence_function” in the file `pair_peri_lps.cpp`. The LAMMPS peridynamics code permits both spherical and non-spherical influence functions (e.g., isotropic and non-isotropic materials).

Prototype Microelastic Brittle (PMB) Model

We summarize the prototype microelastic brittle (PMB) material model. For more on this model, the reader is referred to (Silling 2000) and (Silling 2005). This model is a special case of the LPS model; see (Seleson 2010) for the derivation. The elastic properties of the PMB model are determined by the bulk modulus K and the horizon δ .

The PMB model is expressed using the scalar force state field

$$\underline{t}[\mathbf{x}, t](\xi) = \frac{1}{2}f(\eta, \xi), \quad (5)$$

with f a scalar-valued function. We assume that f takes the form

$$f = cs,$$

where

$$c = \frac{18K}{\pi\delta^4}, \quad (6)$$

with K the bulk modulus and δ the horizon, and s the bond stretch, defined as

$$s(t, \eta, \xi) = \frac{\|\eta + \xi\| - \|\xi\|}{\|\xi\|}.$$

Bond stretch is a unitless quantity, and identical to a one-dimensional definition of strain. As such, we see that a bond at its equilibrium length has stretch $s = 0$, and a bond at twice its equilibrium length has stretch $s = 1$. The constant c given above is appropriate for 3D models only. For more on the origins of the constant c , see (Silling 2005). For the derivation of c for 1D and 2D models, see (Emmrich).

Given (5), (1) reduces to

$$\rho(\mathbf{x})\ddot{\mathbf{u}}(\mathbf{x}, t) = \int_{\mathcal{H}_{\mathbf{x}}} \mathbf{f}(\eta, \xi) dV_{\xi} + \mathbf{b}(\mathbf{x}, t), \quad (7)$$

with

$$\mathbf{f}(\eta, \xi) = f(\eta, \xi) \frac{\xi + \eta}{\|\xi + \eta\|}.$$

Unlike the LPS model, the PMB model has a Poisson ratio of $\nu = 1/4$ in 3D, and $\nu = 1/3$ in 2D. This is reflected in the input for the PMB model, which requires only the bulk modulus of the material, whereas the LPS model requires both the bulk and shear moduli.

Damage

Bonds are made to break when they are stretched beyond a given limit. Once a bond fails, it is failed forever (Silling). Further, new bonds are never created during the course of a simulation. We discuss only one criterion for bond breaking, called the *critical stretch* criterion.

Define μ to be the history-dependent scalar boolean function

$$\mu(t, \eta, \xi) = \begin{cases} 1 & \text{if } s(t', \eta, \xi) < \min(s_0(t', \eta, \xi), s_0(t', \eta', \xi')) \text{ for all } 0 \leq t' \leq t \\ 0 & \text{otherwise} \end{cases}. \quad (8)$$

where $\eta' = \mathbf{u}(\mathbf{x}'', t) - \mathbf{u}(\mathbf{x}', t)$ and $\xi' = \mathbf{x}'' - \mathbf{x}'$. Here, $s_0(t, \eta, \xi)$ is a critical stretch defined as

$$s_0(t, \eta, \xi) = s_{00} - \alpha s_{\min}(t, \eta, \xi), \quad s_{\min}(t) = \min_{\xi} s(t, \eta, \xi), \quad (9)$$

where s_{00} and α are material-dependent constants. The history function μ breaks bonds when the stretch s exceeds the critical stretch s_0 .

Although $s_0(t, \eta, \xi)$ is expressed as a property of a particle, bond breaking must be a symmetric operation for all particle pairs sharing a bond. That is, particles \mathbf{x} and \mathbf{x}' must utilize the same test when deciding to break their common bond. This can be done by any method that treats the particles symmetrically. In the definition of μ above, we have chosen to take the minimum of the two s_0 values for particles \mathbf{x} and \mathbf{x}' when determining if the \mathbf{x} - \mathbf{x}' bond should be broken.

Following (*Silling*), we can define the damage at a point \mathbf{x} as

$$\phi(\mathbf{x}, t) = 1 - \frac{\int_{\mathcal{H}_{\mathbf{x}}} \mu(t, \eta, \xi) dV_{\mathbf{x}'}}{\int_{\mathcal{H}_{\mathbf{x}}} dV_{\mathbf{x}'}}. \quad (10)$$

Discrete Peridynamic Model and LAMMPS Implementation

In LAMMPS, instead of (1), we model this equation of motion:

$$\rho(\mathbf{x})\ddot{\mathbf{y}}(\mathbf{x}, t) = \int_{\mathcal{H}_{\mathbf{x}}} \{ \mathbf{T}[\mathbf{x}, t] \langle \mathbf{x}' - \mathbf{x} \rangle - \mathbf{T}[\mathbf{x}', t] \langle \mathbf{x} - \mathbf{x}' \rangle \} dV_{\mathbf{x}'} + \mathbf{b}(\mathbf{x}, t),$$

where we explicitly track and store at each timestep the positions and not the displacements of the particles. We observe that $\ddot{\mathbf{y}}(\mathbf{x}, t) = \ddot{\mathbf{x}} + \ddot{\mathbf{u}}(\mathbf{x}, t) = \ddot{\mathbf{u}}(\mathbf{x}, t)$, so that this is equivalent to (1).

Spatial Discretization

The region defining a peridynamic material is discretized into particles forming a simple cubic lattice with lattice constant Δx , where each particle i is associated with some volume fraction V_i . For any particle i , let \mathcal{F}_i denote the family of particles for which particle i shares a bond in the reference configuration. That is,

$$\mathcal{F}_i = \{p \mid \|\mathbf{x}_p - \mathbf{x}_i\| \leq \delta\}. \quad (11)$$

The discretized equation of motion replaces (1) with

$$\rho \ddot{\mathbf{y}}_i^n = \sum_{p \in \mathcal{F}_i} \{ \mathbf{T}[\mathbf{x}_i, t] \langle \mathbf{x}'_p - \mathbf{x}_i \rangle - \mathbf{T}[\mathbf{x}_p, t] \langle \mathbf{x}_i - \mathbf{x}_p \rangle \} V_p + \mathbf{b}_i^n, \quad (12)$$

where n is the timestep number and subscripts denote the particle number.

Short-Range Forces

In the model discussed so far, particles interact only through their bond forces. A particle with no bonds becomes a free non-interacting particle. To account for contact forces, short-range forces are introduced (*Silling 2007*). We add to the force in (12) the following force

$$\mathbf{f}_s(\mathbf{y}_p, \mathbf{y}_i) = \min \left\{ 0, \frac{c_s}{\delta} (\|\mathbf{y}_p - \mathbf{y}_i\| - d_{pi}) \right\} \frac{\mathbf{y}_p - \mathbf{y}_i}{\|\mathbf{y}_p - \mathbf{y}_i\|}, \quad (13)$$

where d_{pi} is the short-range interaction distance between particles p and i , and c_S is a multiple of the constant c from (6). Note that the short-range force is always repulsive, never attractive. In practice, we choose

$$c_S = 15 \frac{18K}{\pi \delta^4}. \quad (14)$$

For the short-range interaction distance, we choose (Silling 2007)

$$d_{pi} = \min \{0.9 \|\mathbf{x}_p - \mathbf{x}_i\|, 1.35(r_p + r_i)\}, \quad (15)$$

where r_i is called the *node radius* of particle i . Given a discrete lattice, we choose r_i to be half the lattice constant.

Note

For a simple cubic lattice, $\Delta x = \Delta y = \Delta z$.

Given this definition of d_{pi} , contact forces appear only when particles are under compression.

When accounting for short-range forces, it is convenient to define the short-range family of particles

$$\mathcal{F}_i^S = \{p \mid \|\mathbf{y}_p - \mathbf{y}_i\| \leq d_{pi}\}.$$

Modification to the Particle Volume

The right-hand side of (12) may be thought of as a midpoint quadrature of (1). To slightly improve the accuracy of this quadrature, we discuss a modification to the particle volume used in (12). In a situation where two particles share a bond with $\|\mathbf{x}_p - \mathbf{x}_i\| = \delta$, for example, we suppose that only approximately half the volume of each particle is “seen” by the other (Silling 2007). When computing the force of each particle on the other we use $V_p/2$ rather than V_p in (12). As such, we introduce a nodal volume scaling function for all bonded particles where $\delta - r_i \leq \|\mathbf{x}_p - \mathbf{x}_i\| \leq \delta$ (see the Figure below).

We choose to use a linear unitless nodal volume scaling function

$$v(\mathbf{x}_p - \mathbf{x}_i) = \begin{cases} -\frac{1}{2r_i} \|\mathbf{x}_p - \mathbf{x}_i\| + \left(\frac{\delta}{2r_i} + \frac{1}{2}\right) & \text{if } \delta - r_i \leq \|\mathbf{x}_p - \mathbf{x}_i\| \leq \delta \\ 1 & \text{if } \|\mathbf{x}_p - \mathbf{x}_i\| \leq \delta - r_i \\ 0 & \text{otherwise} \end{cases}$$

If $\|\mathbf{x}_p - \mathbf{x}_i\| = \delta$, $v = 0.5$, and if $\|\mathbf{x}_p - \mathbf{x}_i\| = \delta - r_i$, $v = 1.0$, for example.

Temporal Discretization

When discretizing time in LAMMPS, we use a velocity-Verlet scheme, where both the position and velocity of the particle are stored explicitly. The velocity-Verlet scheme is generally expressed in three steps. In *Algorithm 1*, ρ_i denotes the mass density of a particle and $\tilde{\mathbf{f}}_i^n$ denotes the the net force density on particle i at timestep n . The LAMMPS command *fix nve* performs a velocity-Verlet integration.

Algorithm 1: Velocity Verlet

$$1: \mathbf{v}_i^{n+1/2} = \mathbf{v}_i^n + \frac{\Delta t}{2\rho_i} \tilde{\mathbf{f}}_i^n$$

(a) Two-dimensional diagram showing particle on mesh (solid lines) with neighborhood \mathcal{H}_x as grey circular region. Dual mesh (dotted lines) shows boundaries of each particle.

(b) Plot of $\nu(\mathbf{x}_p - \mathbf{x}_i)$ vs. $\|\mathbf{x}_p - \mathbf{x}_i\|$.

Fig. 1: Diagram showing horizon of a particular particle, demonstrating that the volume associated with particles near the boundary of the horizon is not completely contained within the horizon.

$$\begin{aligned} 2: \mathbf{y}_i^{n+1} &= \mathbf{y}_i^n + \Delta t \mathbf{v}_i^{n+1/2} \\ 3: \mathbf{v}_i^{n+1} &= \mathbf{v}_i^{n+1/2} + \frac{\Delta t}{2\rho_i} \tilde{\mathbf{f}}_i^{n+1} \end{aligned}$$

Breaking Bonds

During the course of simulation, it may be necessary to break bonds, as described in the [Damage section](#). Bonds are recorded as broken in a simulation by removing them from the bond family \mathcal{F}_i (see (11)).

A naive implementation would have us first loop over all bonds and compute s_{min} in (9), then loop over all bonds again and break bonds with a stretch $s > s_0$ as in (8), and finally loop over all particles and compute forces for the next step of [Algorithm 1](#). For reasons of computational efficiency, we will utilize the values of s_0 from the *previous* timestep when deciding to break a bond.

Note

For the first timestep, s_0 is initialized to ∞ for all nodes. This means that no bonds may be broken until the second timestep. As such, it is recommended that the first few timesteps of the peridynamic simulation not involve any actions that might result in the breaking of bonds. As a practical example, the projectile in the [commented example below](#) is placed such that it does not impact the target brittle plate until several timesteps into the simulation.

LPS Pseudocode

A sketch of the LPS model implementation in the PERI package appears in [Algorithm 2](#). This algorithm makes use of the routines in [Algorithm 3](#) and [Algorithm 4](#).

Algorithm 2: LPS Peridynamic Model Pseudocode

```

Fix  $s_{00}$ ,  $\alpha$ , horizon  $\delta$ , bulk modulus  $K$ , shear modulus  $G$ , timestep  $\Delta t$ , and generate initial lattice of
particles with lattice constant  $\Delta x$ . Let there be  $N$  particles. Define constant  $c_S$  for repulsive
short-range forces.
Initialize bonds between all particles  $i \neq j$  where  $\|\mathbf{x}_j - \mathbf{x}_i\| \leq \delta$ 
Initialize weighted volume  $m$  for all particles using Algorithm 3
Initialize  $s_0 = \infty$  {Initialize each entry to MAX_DOUBLE}
while not done do
  Perform step 1 of Algorithm 1, updating velocities of all particles
  Perform step 2 of Algorithm 1, updating positions of all particles

Perform step 3 of Algorithm 1, updating velocities of all particles
end while

```

Damage

The damage associated with every particle (see [\(10\)](#)) can optionally be computed and output with a LAMMPS data dump. To do this, your input script must contain the command `compute damage/atom`. This enables a LAMMPS per-atom compute to calculate the damage associated with each particle every time a LAMMPS `data dump` frame is written.

Visualizing Simulation Results

There are multiple ways to visualize the simulation results. Typically, you want to display the particles and color code them by the value computed with the `compute damage/atom` command.

This can be done, for example, by using the built-in visualizer of the `dump image or dump movie` command to create snapshot images or a movie. Below are example command lines for using `dump image` with the [example listed below](#) and a set of images created for steps 300, 600, and 2000 this way.

```

dump          D2 all image 100 dump.peri.*.png c_C1 type box no 0.0 view 30 60 zoom 1.
→5 up 0 0 -1 ssao yes 4539 0.6
dump_modify   D2 pad 5 adiam * 0.001 amap 0.0 1.0 ca 0.1 3 min blue 0.5 yellow max red

```

For interactive visualization, the [Ovito](#) is very convenient to use. Below are steps to create a visualization of the *same example from below* now using the generated trajectory in the `dump.peri` file.

- Launch Ovito
- File -> Load File -> `dump.peri`
- Select “-> Particle types” and under “Appearance” set “Display radius:” to 0.0005
- From the “Add modification:” drop down list select “Color coding”
- Under “Color coding” select from the “Color gradient” drop down list “Jet”
- Also under “Color coding” set “Start value:” to 0 and “End value:” to 1
- You can improve the image quality by adding the “Ambient occlusion” modification

Pitfalls

Parallel Scalability

LAMMPS operates in parallel in a *spatial-decomposition mode*, where each processor owns a spatial subdomain of the overall simulation domain and communicates with its neighboring processors via distributed-memory message passing (MPI) to acquire ghost atom information to allow forces on the atoms it owns to be computed. LAMMPS also uses Verlet neighbor lists which are recomputed every few timesteps as particles move. On these timesteps, particles also migrate to new processors as needed. LAMMPS decomposes the overall simulation domain so that spatial subdomains of nearly equal volume are assigned to each processor. When each subdomain contains nearly the same number of particles, this results in a reasonable load balance among all processors. As is more typical with some peridynamic simulations, some subdomains may contain many particles while other subdomains contain few particles, resulting in a load imbalance that impacts parallel scalability.

Setting the “skin” distance

The *neighbor* command with LAMMPS is used to set the so-called “skin” distance used when building neighbor lists. All atom pairs within a cutoff distance equal to the horizon δ plus the skin distance are stored in the list. Unexpected crashes in LAMMPS may be due to too small a skin distance. The skin should be set to a value such that δ plus the skin distance is larger than the maximum possible distance between two bonded particles. For example, if s_{00} is increased, the skin distance may also need to be increased.

“Lost” particles

All particles are contained within the “simulation box” of LAMMPS. The boundaries of this box may change with time, or not, depending on how the LAMMPS *boundary* command has been set. If a particle drifts outside the simulation box during the course of a simulation, it is called *lost*.

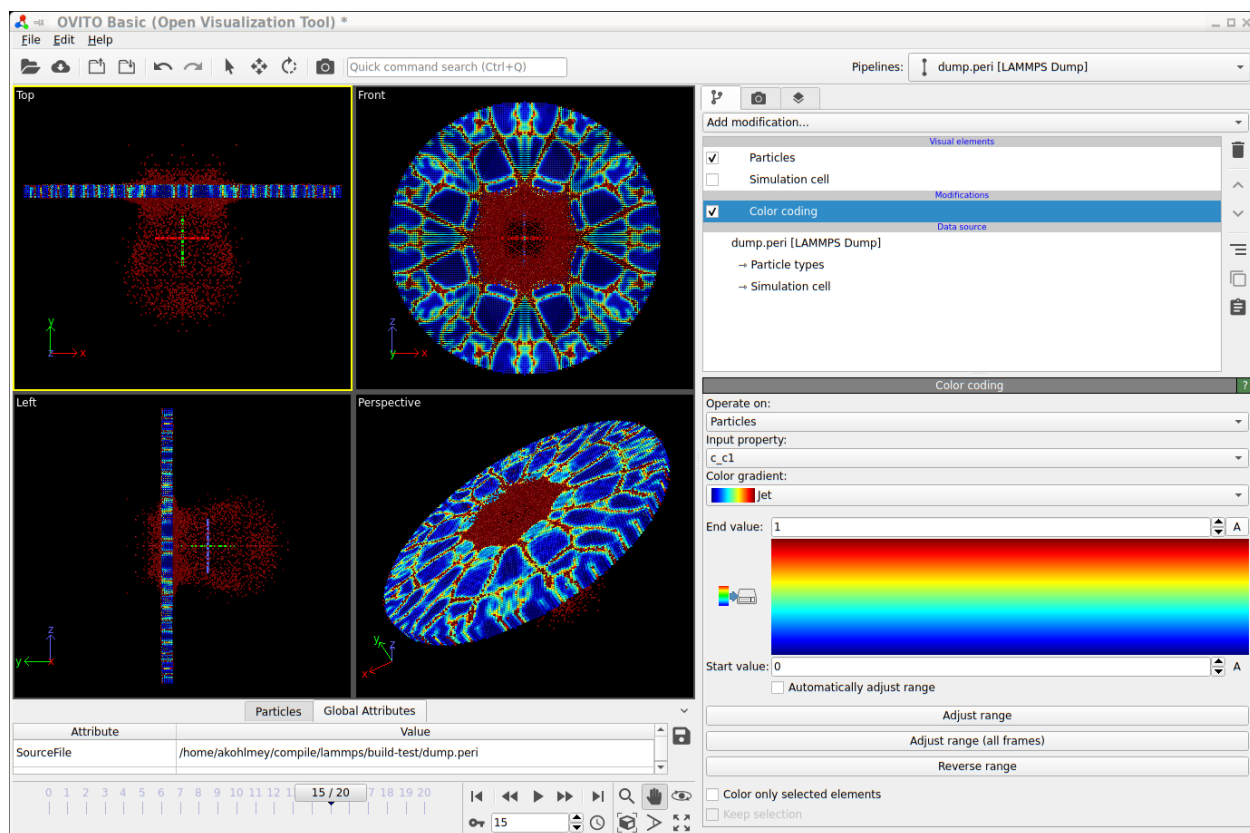

Fig. 2: Screenshot of visualizing a trajectory with Ovito

As an option of the *themo_modify* command of LAMMPS, the *lost* keyword determines whether LAMMPS checks for lost atoms each time it computes thermodynamics and what it does if atoms are lost. If the value is *ignore*, LAMMPS does not check for lost atoms. If the value is *error* or *warn*, LAMMPS checks and either issues an error or warning. The code will exit with an error and continue with a warning. This can be a useful debugging option. The default behavior of LAMMPS is to exit with an error if a particle is lost.

The peridynamic module within LAMMPS does not check for lost atoms. If a particle with unbroken bonds is lost, those bonds are marked as broken by the remaining particles.

Defining the peridynamic horizon δ

In the *pair_coeff* command, the user must specify the horizon δ . This argument determines which particles are bonded when the simulation is initialized. It is recommended that δ be set to a small fraction of a lattice constant larger than desired.

For example, if the lattice constant is 0.0005 and you wish to set the horizon to three times the lattice constant, then set δ to be 0.0015001, a value slightly larger than three times the lattice constant. This guarantees that particles three lattice constants away from each other are still bonded. If δ is set to 0.0015, for example, floating point error may result in some pairs of particles three lattice constants apart not being bonded.

Breaking bonds too early

For technical reasons, the bonds in the simulation are not created until the end of the first timestep of the simulation. Therefore, one should not attempt to break bonds until at least the second step of the simulation.

Bugs

The user is cautioned that this code is a beta release. If you are confident that you have found a bug in the peridynamic module, please report it in a *GitHub Issue* <<https://github.com/lammps/lammps/issues>> or send an email to the LAMMPS developers. First, check the [New features and bug fixes](#) section of the LAMMPS website site to see if the bug has already been reported or fixed. If not, the most useful thing you can do for us is to isolate the problem. Run it on the smallest number of atoms and fewest number of processors and with the simplest input script that reproduces the bug. In your message, describe the problem and any ideas you have as to what is causing it or where in the code the problem might be. We'll request your input script and data files if necessary.

Modifying and Extending the Peridynamic Module

To add new features or peridynamic potentials to the peridynamic module, the user is referred to the [Modifying & extending LAMMPS](#) section. To develop a new bond-based material, start with the *peri/pmb* pair style as a template. To develop a new state-based material, start with the *peri/lps* pair style as a template.

A Numerical Example

To introduce the peridynamic implementation within LAMMPS, we replicate a numerical experiment taken from section 6 of ([Silling 2005](#)).

Problem Description and Setup

We consider the impact of a rigid sphere on a homogeneous disk of brittle material. The sphere has diameter 0.01 m and velocity 100 m/s directed normal to the surface of the target. The target material has density $\rho = 2200 \text{ kg/m}^3$. A PMB material model is used with $K = 14.9 \text{ GPa}$ and critical bond stretch parameters given by $s_{00} = 0.0005$ and $\alpha = 0.25$. A three-dimensional simple cubic lattice is constructed with lattice constant 0.0005 m and horizon 0.0015 m. (The horizon is three times the lattice constant.) The target is a cylinder of diameter 0.074 m and thickness 0.0025 m, and the associated lattice contains 103,110 particles. Each particle i has volume fraction $V_i = 1.25 \times 10^{-10} \text{ m}^3$.

The spring constant in the PMB material model is (see (6))

$$c = \frac{18k}{\pi\delta^4} = \frac{18(14.9 \times 10^9)}{\pi(1.5 \times 10^{-3})^4} \approx 1.6863 \times 10^{22}.$$

The CFL analysis from (Silling2005) shows that a timestep of 1.0×10^{-7} is safe.

We observe here that in IEEE double-precision floating point arithmetic when computing the bond stretch $s(t, \eta, \xi)$ at each iteration where $\|\eta + \xi\|$ is computed during the iteration and $\|\xi\|$ was computed and stored for the initial lattice, it may be that $fl(s) = \varepsilon$ with $|\varepsilon| \leq \varepsilon_{\text{machine}}$ for an unstretched bond. Taking $\varepsilon = 2.220446049250313 \times 10^{-16}$, we see that the value $csV_i \approx 4.68 \times 10^{-4}$, computed when determining f , is perhaps larger than we would like, especially when the true force should be zero. One simple way to avoid this issue is to insert the following instructions in Algorithm 5 after instruction 21 (and similarly for Algorithm 2):

```

if  $|dr| < \varepsilon_{\text{machine}}$  then
     $dr = 0$ 
end if

```

Qualitatively, this says that displacements from equilibrium on the order of 10^{-16} m are taken to be exactly zero, a seemingly reasonable assumption.

The Projectile

The projectile used in the following experiments is not the one used in (Silling 2005). The projectile used here exerts a force

$$F(r) = -k_s(r - R)^2$$

on each atom where k_s is a specified force constant, r is the distance from the atom to the center of the indenter, and R is the radius of the projectile. The force is repulsive and $F(r) = 0$ for $r > R$. For our problem, the projectile radius $R = 0.05 \text{ m}$, and we have chosen $k_s = 1.0 \times 10^{17}$ (compare with (6) above).

Writing the LAMMPS Input File

We discuss the example input script *listed below*. In line 2 we specify that SI units are to be used. We specify the dimension (3) and boundary conditions (“shrink-wrapped”) for the computational domain in lines 3 and 4. In line 5 we specify that peridynamic particles are to be used for this simulation. In line 7, we set the “skin” distance used in building the LAMMPS neighbor list. In line 8 we set the lattice constant (in meters) and in line 10 we define the spatial region where the target will be placed. In line 12 we specify a rectangular box enclosing the target region that defines the simulation domain. Line 14 fills the target region with atoms. Lines 15 and 17 define the peridynamic material model, and lines 19 and 21 set the particle density and particle volume, respectively. The particle volume should be set to the cube of the lattice constant for a simple cubic lattice. Line 23 sets the initial velocity of all particles to zero. Line 25 instructs LAMMPS to integrate time with velocity-Verlet, and lines 27-30 create the spherical projectile, sending it with a velocity of 100 m/s towards the target. Line 32 declares a compute style for the damage (percentage of broken bonds) associated with each particle. Line 33 sets the timestep, line 34 instructs LAMMPS to provide a screen dump of

thermodynamic quantities every 200 timesteps, and line 35 instructs LAMMPS to create a data file (`dump.peri`) with a complete snapshot of the system every 100 timesteps. This file can be used to create still images or movies. Finally, line 36 instructs LAMMPS to run for 2000 timesteps.

Note

To use the LPS model, replace line 15 with `pair_style peri/lps` and modify line 16 accordingly.

Numerical Results and Discussion

We ran the *input script from above*. Images of the disk (projectile not shown) appear in Figure below. The plot of damage on the top monolayer was created by coloring each particle according to its damage.

The symmetry in the computed solution arises because a “perfect” lattice was used, and a because a perfectly spherical projectile impacted the lattice at its geometric center. To break the symmetry in the solution, the nodes in the peridynamic body may be perturbed slightly from the lattice sites. To do this, the lattice of points can be slightly perturbed using the *displace_atoms* command.

8.5.10 Manifolds (surfaces)

Overview:

This page is not about a LAMMPS input script command, but about manifolds, which are generalized surfaces, as defined and used by the MANIFOLD package, to track particle motion on the manifolds. See the src/MANIFOLD/README file for more details about the package and its commands.

Below is a list of currently supported manifolds by the MANIFOLD package, their parameters and a short description of them. The parameters listed here are in the same order as they should be passed to the relevant fixes.

<i>manifold</i>	<i>parameters</i>	<i>equation</i>	<i>description</i>
cylinder	R	$x^2 + y^2 - R^2 = 0$	Cylinder along z-axis, axis going through (0,0,0)
cylinder_dent	R l a	$x^2 + y^2 - r(z)^2 = 0$, $r(x) = R$ if $ z > l$, $r(z) = R - a*(1 + \cos(z/l))/2$ otherwise	A cylinder with a dent around $z = 0$
dumbbell	a A B c	$-(x^2 + y^2) + (a^2 - z^2/c^2) * (1 + (A*\sin(B*z^2))^4) = 0$	A dumbbell
ellipsoid	a b c	$(x/a)^2 + (y/b)^2 + (z/c)^2 = 0$	An ellipsoid
gaussian_bump	A l rc1 rc2	if($x < rc1$) $-z + A * \exp(-x^2 / (2 l^2))$; else if($x < rc2$) $-z + a + b*x + c*x^2 + d*x^3$; else z	A Gaussian bump at $x = y = 0$, smoothly tapered to a flat plane $z = 0$.
plane	a b c x0 y0 z0	$a*(x-x0) + b*(y-y0) + c*(z-z0) = 0$	A plane with normal (a,b,c) going through point (x0,y0,z0)
plane_w	a w	$z - a*\sin(w*x) = 0$	A plane with a sinusoidal modulation on z along x.
sphere	R	$x^2 + y^2 + z^2 - R^2 = 0$	A sphere of radius R
supersphere	R q	$ x ^q + y ^q + z ^q - R^q = 0$	A supersphere of hyperradius R
spine	a, A, B, B2, c	$-(x^2 + y^2) + (a^2 - z^2/f(z)^2)*(1 + (A*\sin(g(z)*z^2))^4)$, $f(z) = c$ if $z > 0$, 1 otherwise; $g(z) = B$ if $z > 0$, B2 otherwise	An approximation to a dendritic spine
spine_t	a, A, B, B2, c	$-(x^2 + y^2) + (a^2 - z^2/f(z)^2)*(1 + (A*\sin(g(z)*z^2))^2)$, $f(z) = c$ if $z > 0$, 1 otherwise; $g(z) = B$ if $z > 0$, B2 otherwise	Another approximation to a dendritic spine
thylakoid	wB LB IB	Various, see (Paquay)	A model grana thylakoid consisting of two block-like compartments connected by a bridge of width wB, length LB and taper length IB
torus	R r	$(R - \sqrt{x^2 + y^2})^2 + z^2 - r^2 = 0$	A torus with large radius R and small radius r, centered on (0,0,0)

(**Paquay**) Paquay and Kusters, Biophys. J., 110, 6, (2016). preprint available at [arXiv:1411.3019](https://arxiv.org/abs/1411.3019).

8.5.11 Reproducing hydrodynamics and elastic objects (RHEO)

The RHEO package is a hybrid implementation of smoothed particle hydrodynamics (SPH) for fluid flow, which can couple to the *BPM package* to model solid elements. RHEO combines these methods to enable mesh-free modeling of multi-phase material systems. Its SPH solver supports many advanced options including reproducing kernels, particle shifting, free surface identification, and solid surface reconstruction. To model fluid-solid systems, the status of particles can dynamically change between a fluid and solid state, e.g. during melting/solidification, which determines how they interact and their physical behavior. The package is designed with modularity in mind, so one can easily turn various features on/off, adjust physical details of the system, or develop new capabilities. For instance, the numerics associated with calculating gradients, reproducing kernels, etc. are separated into distinct classes to simplify the development of new integration schemes which can call these calculations. Additional numerical details can be found in (*Palermo*) and (*Clemmer*).

Note, if you simply want to run a traditional SPH simulation, the *SPH package* package is likely better suited for your application. It has fewer advanced features and therefore benefits from improved performance. The *MACHDYN* package for solids may also be relevant for fluid-solid problems.

At the core of the package is *fix rheo* which integrates particle trajectories and controls many optional features (e.g. the use of reproducing kernels). In conjunction to *fix rheo*, one must specify an instance of *fix rheo/pressure* and *fix rheo/viscosity* to define a pressure equation of state and viscosity model, respectively. Optionally, one can model a heat equation with *fix rheo/thermal*, which also allows the user to specify equations for a particle's thermal conductivity, specific heat, latent heat, and melting temperature. The ordering of these fixes in an input script matters. *fix rheo* must be defined prior to all other RHEO fixes.

Typically, RHEO requires atom style rheo. In addition to typical atom properties like positions and forces, particles store a local density, viscosity, pressure, and status. If thermal evolution is modeled, one must use atom style *rheo/thermal* which also includes a local energy, temperature, and conductivity. Note that the temperature is always derived from the energy. This implies the *temperature* attribute of *the set command* does not affect particles. Instead, one should use the *sph/e* attribute.

The status variable uses bit-masking to track various properties of a particle such as its current state of matter (fluid or solid) and its location relative to a surface. Some of these properties (and others) can be accessed using *compute rheo/property/atom*. The *status* attribute in *the set command* only allows control over the first bit which sets the state of matter, 0 is fluid and 1 is solid.

Fluid interactions, including pressure forces, viscous forces, and heat exchange, are calculated using *pair rheo*. Unlike typical pair styles, *pair rheo* ignores the *special bond* settings. Instead, it determines whether to calculate forces based on the status of particles: e.g., hydrodynamic forces are only calculated if a fluid particle is involved.

To model elastic objects, there are currently two mechanisms in RHEO, one designed for bulk solid bodies and the other for thin shells. Both mechanisms rely on introducing bonded forces between particles and therefore require a hybrid of atom style bond and rheo (or rheo/thermal).

To create an elastic solid body, one has to (a) change the status of constituent particles to solid (e.g. with the *set* command), (b) create bpm bonds between the particles (see the *bpm howto* page for more details), and (c) use *pair rheo/solid* to apply repulsive contact forces between distinct solid bodies. Akin to *pair rheo*, *pair rheo/solid* considers a particles fluid/solid phase to determine whether to apply forces. However, unlike *pair rheo*, *pair rheo/solid* does obey special bond settings such that contact forces do not have to be calculated between two bonded solid particles in the same elastic body.

In systems with thermal evolution, *fix rheo/thermal* can optionally set a melting/solidification temperature allowing particles to dynamically swap their state between fluid and solid when the temperature exceeds or drops below the critical temperature, respectively. Using the *react* option, one can specify a maximum bond length and a bond type. Then, when solidifying, particles will search their local neighbors and automatically create bonds with any neighboring solid particles in range. For BPM bond styles, bonds will then use the immediate position of the two particles to calculate

a reference state. When melting, particles will delete any bonds of the specified type when reverting to a fluid state. Special bonds are updated as bonds are created/broken.

The other option for elastic objects is an elastic shell that is nominally much thinner than a particle diameter, e.g. a oxide skin which gradually forms over time on the surface of a fluid. Currently, this is implemented using *fix rheo/oxidation* and bond style *rheo/shell*. Essentially, *fix rheo/oxidation* creates candidate bonds of a specified type between surface fluid particles within a specified distance. a newly created *rheo/shell* bond will then start a timer. While the timer is counting down, the bond will delete itself if particles move too far apart or move away from the surface. However, if the timer reaches a user-defined threshold, then the bond will activate and apply additional forces to the fluid particles. Bond style *rheo/shell* then operates very similarly to a BPM bond style, storing a reference length and breaking if stretched too far. Unlike the above method, this option does not remove the underlying fluid interactions (although particle shifting is turned off) and does not modify special bond settings of particles.

While these two options are not expected to be appropriate for every system, either framework can be modified to create more suitable models (e.g. by changing the criteria for creating/deleting a bond or altering force calculations).

8.5.12 Magnetic spins

The magnetic spin simulations are enabled by the SPIN package, whose implementation is detailed in *Tranchida*.

The model represents the simulation of atomic magnetic spins coupled to lattice vibrations. The dynamics of those magnetic spins can be used to simulate a broad range a phenomena related to magneto-elasticity, or or to study the influence of defects on the magnetic properties of materials.

The magnetic spins are interacting with each others and with the lattice via pair interactions. Typically, the magnetic exchange interaction can be defined using the *pair/spin/exchange* command. This exchange applies a magnetic torque to a given spin, considering the orientation of its neighboring spins and their relative distances. It also applies a force on the atoms as a function of the spin orientations and their associated inter-atomic distances.

The command *fix precession/spin* allows to apply a constant magnetic torque on all the spins in the system. This torque can be an external magnetic field (Zeeman interaction), and an uniaxial or cubic magnetic anisotropy.

A Langevin thermostat can be applied to those magnetic spins using *fix langevin/spin*. Typically, this thermostat can be coupled to another Langevin thermostat applied to the atoms using *fix langevin* in order to simulate thermostatted spin-lattice systems.

The magnetic damping can also be applied using *fix langevin/spin*. It allows to either dissipate the thermal energy of the Langevin thermostat, or to perform a relaxation of the magnetic configuration toward an equilibrium state.

The command *fix setforce/spin* allows to set the components of the magnetic precession vectors (while erasing and replacing the previously computed magnetic precession vectors on the atom). This command can be used to freeze the magnetic moment of certain atoms in the simulation by zeroing their precession vector.

The command *fix nve/spin* can be used to perform a symplectic integration of the combined dynamics of spins and atomic motions.

The minimization style *min/spin* can be applied to the spins to perform a minimization of the spin configuration.

All the computed magnetic properties can be output by two main commands. The first one is *compute spin*, that enables to evaluate magnetic averaged quantities, such as the total magnetization of the system along x, y, or z, the spin temperature, or the magnetic energy. The second command is *compute property/atom*. It enables to output all the per atom magnetic quantities. Typically, the orientation of a given magnetic spin, or the magnetic force acting on this spin.

8.6 Tutorials howto

8.6.1 Using CMake with LAMMPS

The support for building LAMMPS with CMake is a recent addition to LAMMPS thanks to the efforts of Christoph Junghans (LANL) and Richard Berger (LANL). One of the key strengths of CMake is that it is not tied to a specific platform or build system. Instead it generates the files necessary to build and develop for different build systems and on different platforms. Note, that this applies to the build system itself not the LAMMPS code. In other words, without additional porting effort, it is not possible - for example - to compile LAMMPS with Visual C++ on Windows. The build system output can also include support files necessary to program LAMMPS as a project in integrated development environments (IDE) like Eclipse, Visual Studio, QtCreator, Xcode, CodeBlocks, Kate and others.

A second important feature of CMake is that it can detect and validate available libraries, optimal settings, available support tools and so on, so that by default LAMMPS will take advantage of available tools without requiring to provide the details about how to enable/integrate them.

The downside of this approach is, that there is some complexity associated with running CMake itself and how to customize the building of LAMMPS. This tutorial will show how to manage this through some selected examples. Please see the chapter about *building LAMMPS* for descriptions of specific flags and options for LAMMPS in general and for specific packages.

CMake can be used through either the command-line interface (CLI) program `cmake` (or `cmake3`), a text mode interactive user interface (TUI) program `ccmake` (or `ccmake3`), or a graphical user interface (GUI) program `cmake-gui`. All of them are portable software available on all supported platforms and can be used interchangeably. As of LAMMPS version 2 August 2023, the minimum required CMake version is 3.16.

All details about features and settings for CMake are in the [CMake online documentation](#). We focus below on the most important aspects with respect to compiling LAMMPS.

Prerequisites

This tutorial assumes that you are operating in a command-line environment using a shell like Bash or Zsh.

- Linux: any Terminal window will work or text console
- macOS: launch the Terminal application
- Windows 10 or 11: install and run the *Windows Subsystem for Linux*
- other Unix-like operating systems like FreeBSD

Note

It is also possible to use CMake on Windows 10 or 11 through either the Microsoft Visual Studio IDE with the bundled CMake or from the Windows command prompt using a separately installed CMake package, both using the native Microsoft Visual C++ compilers and (optionally) the Microsoft MPI SDK. This tutorial, however, only covers unix-like command line interfaces.

We also assume that you have downloaded and unpacked a recent LAMMPS source code package or used Git to create a clone of the LAMMPS sources on your compilation machine.

You should change into the top level directory of the LAMMPS source tree all paths mentioned in the tutorial are relative to that. Immediately after downloading it should look like this:

```
$ ls
bench  doc      lib      potentials  README  tools
cmake  examples  LICENSE  python     src
```

Build versus source directory

When using CMake the build procedure is separated into multiple distinct phases:

1. **Configuration:** detect or define which features and settings should be enable and used and how LAMMPS should be compiled
2. **Compilation:** generate and compile all necessary source files and build libraries and executables.
3. **Installation:** copy selected files from the compilation into your file system, so they can be used without having to keep the source and build tree around.

The configuration and compilation of LAMMPS has to happen in a dedicated *build directory* which must be different from the source directory. Also the source directory (`src`) must remain pristine, so it is not allowed to “install” packages using the traditional make process and after an compilation attempt all created source files must be removed. This can be achieved with `make no-all purge`.

You can pick **any** folder outside the source tree. We recommend to create a folder `build` in the top-level directory, or multiple folders in case you want to have separate builds of LAMMPS with different options (`build-parallel`, `build-serial`) or with different compilers (`build-gnu`, `build-clang`, `build-intel`) and so on. All the auxiliary files created by one build process (executable, object files, log files, etc) are stored in this directory or subdirectories within it that CMake creates.

Running CMake

CLI version

In the (empty) build directory, we now run the command `cmake ../cmake`, which will start the configuration phase and you will see the progress of the configuration printed to the screen followed by a summary of the enabled features, options and compiler settings. A typical summary screen will look like this:

```
$ cmake ../cmake/
-- The CXX compiler identification is GNU 8.2.0
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++ - works
-- Detecting CXX compiler ABI info
-- Detecting CXX compiler ABI info - done
-- Detecting CXX compile features
-- Detecting CXX compile features - done
-- Found Git: /usr/bin/git (found version "2.25.2")

```

The `cmake` command has one mandatory argument, and that is a folder with either the file `CMakeLists.txt` or `CMakeCache.txt`. The `CMakeCache.txt` file is created during the CMake configuration run and contains all active settings, thus after a first run of CMake all future runs in the build folder can use the folder `.` and CMake will know where to find the CMake scripts and reload the settings from the previous step. This means, that one can modify an existing configuration by re-running CMake, but only needs to provide flags indicating the desired change, everything else will be retained. One can also mix compilation and configuration, i.e. start with a minimal configuration and then, if needed, enable additional features and recompile.

The steps above **will NOT compile the code**. The compilation can be started in a portable fashion with `cmake --build`

.., or you use the selected built tool, e.g. make.

TUI version

For the text mode UI CMake program the basic principle is the same. You start the command `ccmake ../cmake` in the build folder.

Fig. 4: Initial ccmake screen

Fig. 5: Configure output of ccmake

Fig. 6: Options screen of ccmake

This will show you the initial screen (left image) with the empty configuration cache. Now you type the ‘c’ key to run the configuration step. That will do a first configuration run and show the summary (center image). You exit the summary screen with ‘e’ and see now the main screen with detected options and settings. You can now make changes by moving and down with the arrow keys of the keyboard and modify entries. For on/off settings, the enter key will toggle the state. For others, hitting enter will allow you to modify the value and you commit the change by hitting the enter key again or cancel using the escape key. All “new” settings will be marked with a star ‘*’ and for as long as one setting is marked like this, you have to re-run the configuration by hitting the ‘c’ key again, sometimes multiple times unless the TUI shows the word “generate” next to the letter ‘g’ and by hitting the ‘g’ key the build files will be written to the folder and the TUI exits. You can quit without generating build files by hitting ‘q’.

GUI version

For the graphical CMake program the steps are similar to the TUI version. You can type the command `cmake-gui ../cmake` in the build folder. In this case the path to the CMake script folder is not required, it can also be entered from the GUI.

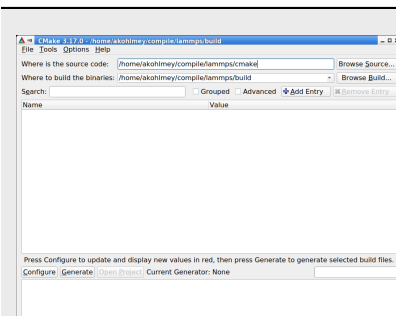

Fig. 7: Initial cmake-gui screen

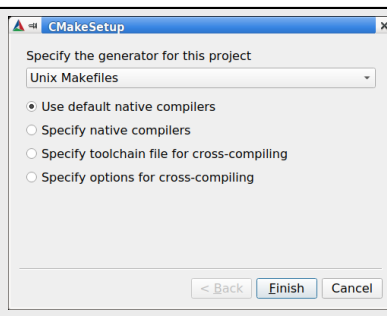

Fig. 8: Generator selection in cmake-gui

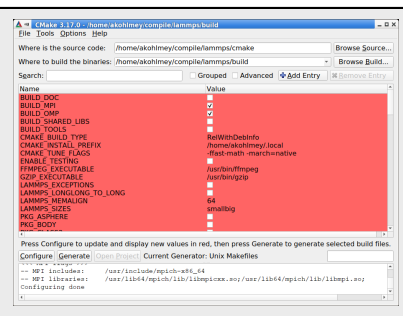

Fig. 9: Options screen of cmake-gui

Again, you start with an empty configuration cache (left image) and need to start the configuration step. For the very first configuration in a folder, you will have a pop-up dialog (center image) asking to select the desired build tool and some configuration settings (stick with the default) and then you get the option screen with all new settings highlighted

in red. You can modify them (or not) and click on the “configure” button again until satisfied and click on the “generate” button to write out the build files. You can exit the GUI from the “File” menu or hit “ctrl-q”.

Setting options

Options that enable, disable or modify settings are modified by setting the value of CMake variables. This is done on the command line with the `-D` flag in the format `-D VARIABLE=value`, e.g. `-D CMAKE_BUILD_TYPE=Release` or `-D BUILD_MPI=on`. There is one quirk: when used before the CMake directory, there may be a space between the `-D` flag and the variable, after it must not be. Such CMake variables can have boolean values (on/off, yes/no, or 1/0 are all valid) or are strings representing a choice, or a path, or are free format. If the string would contain whitespace, it must be put in quotes, for example `-D CMAKE_TUNE_FLAGS="-ftree-vectorize -ffast-math"`.

CMake variables fall into two categories: 1) common CMake variables that are used by default for any CMake configuration setup and 2) project specific variables, i.e. settings that are specific for LAMMPS. Also CMake variables can be flagged as *advanced*, which means they are not shown in the text mode or graphical CMake program in the overview of all settings by default, but only when explicitly requested (by hitting the ‘t’ key or clicking on the ‘Advanced’ check-box).

Some common CMake variables

Variable	Description
CMAKE_INSTALL_PREFIX	root directory of install location for <code>make install</code> (default: <code>\$HOME/.local</code>)
LAMMPS_INSTALL_RPATH	set or remove runtime path setting from binaries for <code>make install</code> (default: <code>off</code>)
CMAKE_BUILD_TYPE	controls compilation options: one of <code>RelWithDebInfo</code> (default), <code>Release</code> , <code>Debug</code> , <code>MinSizeRel</code>
BUILD_SHARED_LIBS	if set to <code>on</code> build the LAMMPS library as shared library (default: <code>off</code>)
CMAKE_MAKE_PROGRAM	name/path of the compilation command (default depends on <code>-G</code> option, usually <code>make</code>)
CMAKE_VERBOSE_MAKEFILE	if set to <code>on</code> echo commands while executing during build (default: <code>off</code>)
CMAKE_C_COMPILER	C compiler to be used for compilation (default: system specific, <code>gcc</code> on Linux)
CMAKE_CXX_COMPILER	C++ compiler to be used for compilation (default: system specific, <code>g++</code> on Linux)
CMAKE_Fortran_COMPILER	Fortran compiler to be used for compilation (default: system specific, <code>gfortran</code> on Linux)
CXX_COMPILER_LAUNCHER	tool to launch the C++ compiler, e.g. <code>ccache</code> or <code>distcc</code> for faster compilation (default: empty)

Some common LAMMPS specific variables

Variable	Description
BUILD_MPI	build LAMMPS with MPI support (default: on if a working MPI available, else off)
BUILD_OMP	build LAMMPS with OpenMP support (default: on if compiler supports OpenMP fully, else off)
BUILD_TOOLS	compile some additional executables from the tools folder (default: off)
BUILD_DOC	include building the HTML format documentation for packaging/installing (default: off)
CMAKE_TUNE_FLAG	common compiler flags, for optimization or instrumentation (default:)
LAMMPS_MACHINE	when set to name the LAMMPS executable and library will be called <code>lmp_name</code> and <code>liblammps_name.a</code>
FFT	select which FFT library to use: FFTW3, MKL, KISS (default, unless FFTW3 is found)
FFT_KOKKOS	select which FFT library to use in Kokkos-enabled styles: FFTW3, MKL, HIPFFT, CUFFT, KISS (default)
FFT_SINGLE	select whether to use single precision FFTs (default: off)
WITH_JPEG	whether to support JPEG format in <i>dump image</i> (default: on if found)
WITH_PNG	whether to support PNG format in <i>dump image</i> (default: on if found)
WITH_GZIP	whether to support reading and writing compressed files (default: on if found)
WITH_FFMPEG	whether to support generating movies with <i>dump movie</i> (default: on if found)

Enabling or disabling LAMMPS packages

The LAMMPS software is organized into a common core that is always included and a large number of *add-on packages* that have to be enabled to be included into a LAMMPS executable. Packages are enabled through setting variables of the kind `PKG_<NAME>` to on and disabled by setting them to off (or using yes, no, 1, 0 correspondingly). `<NAME>` has to be replaced by the name of the package, e.g. MOLECULE or EXTRA-PAIR.

Using presets

Since LAMMPS has a lot of optional features and packages, specifying them all on the command line can be tedious. Or when selecting a different compiler toolchain, multiple options have to be changed consistently and that is rather error prone. Or when enabling certain packages, they require consistent settings to be operated in a particular mode. For this purpose, we are providing a selection of “preset files” for CMake in the folder `cmake/presets`. They represent a way to pre-load or override the CMake configuration cache by setting or changing CMake variables. Preset files are loaded using the `-C` command line flag. You can combine loading multiple preset files or change some variables later with additional `-D` flags. A few examples:

```
cmake -C ../cmake/presets/basic.cmake -D PKG_MISC=on ../cmake
cmake -C ../cmake/presets/clang.cmake -C ../cmake/presets/most.cmake ../cmake
cmake -C ../cmake/presets/basic.cmake -D BUILD_MPI=off ../cmake
```

The first command will install the packages KSPACE, MANYBODY, MOLECULE, RIGID and MISC; the first four from the preset file and the fifth from the explicit variable definition. The second command will first switch the compiler toolchain to use the Clang compilers and install a large number of packages that are not depending on any special external libraries or tools and are not very unusual. The third command will enable the first four packages like above and then enforce compiling LAMMPS as a serial program (using the MPI STUBS library).

It is also possible to do this incrementally.

```
cmake -C ../cmake/presets/basic.cmake ../cmake
cmake -D PKG_MISC=on .
```

will achieve the same final configuration as in the first example above. In this scenario it is particularly convenient to do the second configuration step using either the text mode or graphical user interface (`ccmake` or `cmake-gui`).

Note

Using a preset to select a compiler package (`clang.cmake`, `gcc.cmake`, `intel.cmake`, `oneapi.cmake`, or `pgi.cmake`) are an exception to the mechanism of updating the configuration incrementally, as they will trigger a reset of cached internal CMake settings and thus reset settings to their default values.

Compilation and build targets

The actual compilation will be started by running the selected build command (on Linux this is by default `make`, see below how to select alternatives). You can also use the portable command `cmake --build .` which will adapt to whatever the selected build command is. This is particularly convenient, if you have set a custom build command via the `CMAKE_MAKE_PROGRAM` variable.

When calling the build program, you can also select which “target” is to be build through appending the `--target` flag and the name of the target to the build command. When using `make` as build tool, you can just append the target name to the command. Example: `cmake --build . --target all` or `make all`. The following abstract targets are available:

Target	Description
<code>all</code>	build “everything” (default)
<code>lammps</code>	build the LAMMPS library and executable
<code>doc</code>	build the HTML documentation (if configured)
<code>install</code>	install all target files into folders in <code>CMAKE_INSTALL_PREFIX</code>
<code>test</code>	run some tests (if configured with <code>-D ENABLE_TESTING=on</code>)
<code>clean</code>	remove all generated files

Choosing generators

While CMake usually defaults to creating makefiles to compile software with the `make` program, it supports multiple alternate build tools (e.g. `ninja-build` which tends to be faster and more efficient in parallelizing builds than `make`) and can generate project files for integrated development environments (IDEs) like VisualStudio, Eclipse or CodeBlocks. This is specific to how the local CMake version was configured and compiled. The list of available options can be seen at the end of the output of `cmake --help`. Example on Fedora 31 this is:

Generators

The following generators are available on this platform (* marks default):

```
* Unix Makefiles           = Generates standard UNIX makefiles.
  Green Hills MULTI       = Generates Green Hills MULTI files
                           (experimental, work-in-progress).
  Ninja                   = Generates build.ninja files.
  Ninja Multi-Config      = Generates build-<Config>.ninja files.
  Watcom WMake            = Generates Watcom WMake makefiles.
  CodeBlocks - Ninja      = Generates CodeBlocks project files.
  CodeBlocks - Unix Makefiles = Generates CodeBlocks project files.
  CodeLite - Ninja        = Generates CodeLite project files.
  CodeLite - Unix Makefiles = Generates CodeLite project files.
```

(continues on next page)

(continued from previous page)

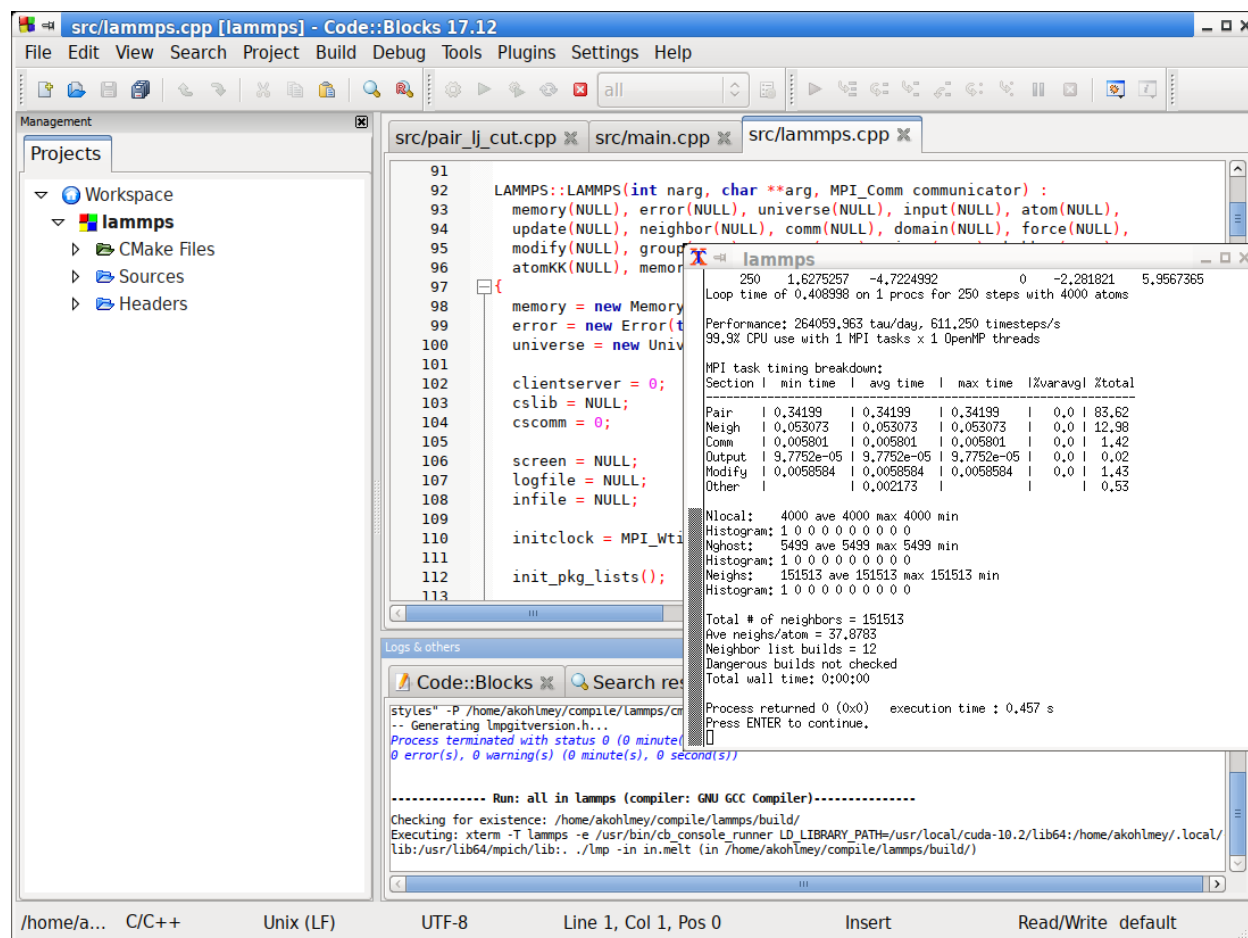

```

Sublime Text 2 - Ninja          = Generates Sublime Text 2 project files.
Sublime Text 2 - Unix Makefiles
                                = Generates Sublime Text 2 project files.
Kate - Ninja                    = Generates Kate project files.
Kate - Unix Makefiles          = Generates Kate project files.
Eclipse CDT4 - Ninja           = Generates Eclipse CDT 4.0 project files.
Eclipse CDT4 - Unix Makefiles = Generates Eclipse CDT 4.0 project files.

```

Below is a screenshot of using the CodeBlocks IDE with the ninja build tool after running CMake as follows:

```
cmake -G 'CodeBlocks - Ninja' ../cmake/presets/most.cmake ../cmake/
```

8.6.2 LAMMPS GitHub tutorial

written by Stefan Paquay

This document describes the process of how to use GitHub to integrate changes or additions you have made to LAMMPS into the official LAMMPS distribution. It uses the process of updating this very tutorial as an example to describe the individual steps and options. You need to be familiar with git and you may want to have a look at the [git book](#) to familiarize yourself with some of the more advanced git features used below.

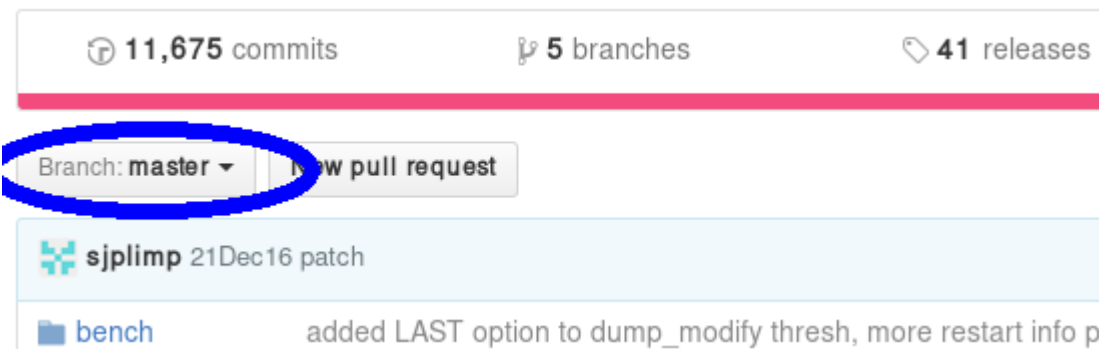

As of fall 2016, submitting contributions to LAMMPS via pull requests on GitHub is the preferred option for integrating contributed features or improvements to LAMMPS, as it significantly reduces the amount of work required by the LAMMPS developers. Consequently, creating a pull request will increase your chances to have your contribution included and will reduce the time until the integration is complete. For more information on the requirements to have your code included into LAMMPS please see [this page](#).

Making an account

First of all, you need a GitHub account. This is fairly simple, just go to [GitHub](#) and create an account by clicking the “Sign up for GitHub” button. Once your account is created, you can sign in by clicking the button in the top left and filling in your username or e-mail address and password.

Forking the repository

To get changes into LAMMPS, you need to first fork the *lammps/lammps* repository on GitHub. At the time of writing, *develop* is the preferred target branch. Thus go to [LAMMPS on GitHub](#) and make sure branch is set to “develop”, as shown in the figure below.

If it is not, use the button to change it to *develop*. Once it is, use the fork button to create a fork.

This will create a fork (which is essentially a copy, but uses less resources) of the LAMMPS repository under your own GitHub account. You can make changes in this fork and later file *pull requests* to allow the upstream repository to merge changes from your own fork into the one we just forked from (or others that were forked from the same repository). At the same time, you can set things up, so you can include changes from upstream into your repository and thus keep it in sync with the ongoing LAMMPS development.

Adding changes to your own fork

Additions to the upstream version of LAMMPS are handled using *feature branches*. For every new feature, a so-called feature branch is created, which contains only those modification relevant to one specific feature. For example, adding a single fix would consist of creating a branch with only the fix header and source file and nothing else. It is explained in more detail here: [feature branch workflow](#).

Feature branches

First of all, create a clone of your version on GitHub on your local machine via HTTPS:

```
git clone https://github.com/<your user name>/lammps.git <some name>
```

or, if you have set up your GitHub account for using SSH keys, via SSH:

```
git clone git@github.com:<your user name>/lammps.git
```

You can find the proper URL by clicking the “Clone or download”-button:

The above command copies (“clones”) the git repository to your local machine to a directory with the name you chose. If none is given, it will default to “lammps”. Typical names are “mylammps” or something similar.

You can use this local clone to make changes and test them without interfering with the repository on GitHub.

To pull changes from upstream into this copy, you can go to the directory and use git pull:

```
cd mylammps
git checkout develop
git pull https://github.com/lammps/lammps develop
```

You can also add this URL as a remote:

```
git remote add upstream https://www.github.com/lammps/lammps
```

From then on you can update your upstream branches with:

```
git fetch upstream
```

and then refer to the upstream repository branches with *upstream/develop* or *upstream/release* and so on.

At this point, you typically make a feature branch from the updated branch for the feature you want to work on. This tutorial contains the workflow that updated this tutorial, and hence we will call the branch “github-tutorial-update”:

```
git fetch upstream
git checkout -b github-tutorial-update upstream/develop
```

Now that we have changed branches, we can make our changes to our local repository. Just remember that if you want to start working on another, unrelated feature, you should switch branches!

Note

Committing changes to the *develop*, *release*, or *stable* branches is strongly discouraged. While it may be convenient initially, it will create more work in the long run. Various texts and tutorials on using git effectively discuss the motivation for using feature branches instead.

After changes are made

After everything is done, add the files to the branch and commit them:

```
git add doc/src/Howto_github.txt
git add doc/src/JPG/tutorial*.png
```

Warning

Do not use *git commit -a* (or *git add -A*). The *-a* flag (or *-A* flag) will automatically include **all** modified **and** new files and that is rarely the behavior you want. It can easily lead to accidentally adding unrelated and unwanted changes into the repository. Instead it is preferable to explicitly use *git add*, *git rm*, *git mv* for adding, removing, renaming individual files, respectively, and then *git commit* to finalize the commit. Carefully check all pending changes with *git status* before committing them. If you find doing this on the command line too tedious, consider using a GUI, for example the one included in git distributions written in Tk, i.e. use *git gui* (on some Linux distributions it may be required to install an additional package to use it).

After adding all files, the change set can be committed with some useful message that explains the change.

```
git commit -m 'Finally updated the GitHub tutorial'
```

After the commit, the changes can be pushed to the same branch on GitHub:

```
git push
```

Git will ask you for your user name and password on GitHub if you have not configured anything. If your local branch is not present on GitHub yet, it will ask you to add it by running

```
git push --set-upstream origin github-tutorial-update
```

If you correctly type your user name and password, the feature branch should be added to your fork on GitHub.

If you want to make really sure you push to the right repository (which is good practice), you can provide it explicitly:

```
git push origin
```

or using an explicit URL:

```
git push git@github.com:Pakketeretet2/lammps.git
```

Filing a pull request

Up to this point in the tutorial, all changes were to *your* clones of LAMMPS. Eventually, however, you want this feature to be included into the official LAMMPS version. To do this, you will want to file a pull request by clicking on the “New pull request” button:

Your recently pushed branches:

 **github-tutorial-update** (less than a minute ago)

Branch: **github-tutoria...**

New pull request

This branch is 1 commit ahead of lammps:master.

 **Pakketeret2** Finally updated the github tutorial.

Make sure that the current branch is set to the correct one, which, in this case, is “github-tutorial-update”. If done correctly, the only changes you will see are those that were made on this branch.

This will open up a new window that lists changes made to the repository. If you are just adding new files, there is not much to do, but I suppose merge conflicts are to be resolved here if there are changes in existing files. If all changes can automatically be merged, green text at the top will say so and you can click the “Create pull request” button, see image.

Open a pull request

Create a new pull request by comparing changes across two branches. If you need to, you can also [compare across forks](#).

base fork: lammps:lammps | base: master | head fork: Pakketeret2/lammps | compare: github-tutorial-update

✓ **Able to merge.** These branches can be automatically merged.

GitHub tutorial update

Write | Preview | AA | B | i | “ < > | : | : | ✓ | ↶ | @ |

Leave a comment

Attach files by dragging & dropping or [selecting them](#).

✓ **Allow edits from maintainers.** [Learn more](#)

Create pull request

Before creating the pull request, make sure the short title is accurate and add a comment with details about your pull request. Here you write what your modifications do and why they should be incorporated upstream.

Note the checkbox that says “Allow edits from maintainers”. This is checked by default checkbox (although in my version of Firefox, only the checkmark is visible):

Attach files by dragging & dropping or [selecting them](#).

☒ **Allow edits from maintainers.** [Learn more](#)

Create pull request

If it is checked, maintainers can immediately add their own edits to the pull request. This helps the inclusion of your branch significantly, as simple/trivial changes can be added directly to your pull request branch by the LAMMPS maintainers. The alternative would be that they make changes on their own version of the branch and file a reverse pull request to you. Just leave this box checked unless you have a very good reason not to.

Now just write some nice comments and click on “Create pull request”.

 GitHub tutorial update

Update to the Github tutorial with proper branch names etc.
Some images are currently broken, they will be added in a second push, but are dependent on this first pull.

Attach files by dragging & dropping or [selecting them](#).

☒ **Allow edits from maintainers.** [Learn more](#)

Create pull request

After filing a pull request

Note

When you submit a pull request (or ask for a pull request) for the first time, you will receive an invitation to become a LAMMPS project collaborator. Please accept this invite as being a collaborator will simplify certain administrative tasks and will probably speed up the merging of your feature, too.

You will notice that after filing the pull request, some checks are performed automatically:

GitHub tutorial update #315

 **Open** Pakketeret2 wants to merge 2 commits into `lammps:master` from `Pakketeret2:github-tutorial-updat`

 Conversation **0**  Commits **2**  Files changed **5**

 **Pakketeret2** commented a minute ago Collaborator + 🗨️ ✎️

Update to the Github tutorial with proper branch names etc.
Some images are currently broken, they will be added in a second push, but are dependent on this first pull.

 **Pakketeret2** added some commits 18 minutes ago

-   Finally updated the github tutorial. 391ab76
-   Almost done with the tutorial now. 4d98bbd

If all is fine, you will see this:

Add more commits by pushing to the `github-tutorial-update` branch on `Pakketeret2/lammps`.

All checks have passed [Show all checks](#)
3 successful checks

This pull request can be automatically merged by project collaborators
Only those with [write access](#) to this repository can merge pull requests.

[Merge pull request](#) You're not [authorized](#) to merge this pull request.

If any of the checks are failing, your pull request will not be processed, as your changes may break compilation for certain configurations or may not merge cleanly. It is your responsibility to remove the reason(s) for the failed test(s). If you need help with this, please contact the LAMMPS developers by adding a comment explaining your problems with resolving the failed tests.

A few further interesting things (can) happen to pull requests before they are included.

Additional changes

First of all, any additional changes you push into your branch in your repository will automatically become part of the pull request:

Pakketeret2 added some commits 2 days ago

- Finally updated the github tutorial. 391ab76
- Almost done with the tutorial now ✓ 4d98bbd
- Second update round to text and images, a third will follow after ✓ 2c7feal
- Small changes to tutorial text. 18b12ef

This means you can add changes that should be part of the feature after filing the pull request, which is useful in case you have forgotten them, or if a developer has requested that something needs to be changed before the feature can be accepted into the official LAMMPS version. After each push, the automated checks are run again.

Labels

LAMMPS developers may add labels to your pull request to assign it to categories (mostly for bookkeeping purposes), but a few of them are important: *needs_work*, *work_in_progress*, *run_tests*, *test_for_regression*, and *ready_for_merge*. The first two indicate, that your pull request is not considered to be complete. With “needs_work” the burden is on exclusively on you; while “work_in_progress” can also mean, that a LAMMPS developer may want to add changes. Please watch the comments to the pull requests. The two “test” labels are used to trigger extended tests before the code is merged. This is sometimes done by LAMMPS developers, if they suspect that there may be some subtle side effects from your changes. It is not done by default, because those tests are very time-consuming. The *ready_for_merge* label is usually attached when the LAMMPS developer assigned to the pull request considers this request complete and to trigger a final full test evaluation.

Reviews

As of Fall 2021, a pull request needs to pass all automatic tests and at least 1 approving review from a LAMMPS developer with write access to the repository before it is eligible for merging. In case your changes touch code that certain developers are associated with, they are auto-requested by the GitHub software. Those associations are set in the file `.github/CODEOWNERS`. Thus if you want to be automatically notified to review when anybody changes files or

packages, that **you** have contributed to LAMMPS, you can add suitable patterns to that file, or a LAMMPS developer may add you.

Otherwise, you can also manually request reviews from specific developers, or LAMMPS developers - in their assessment of your pull request - may determine who else should be reviewing your contribution and add that person. Through reviews, LAMMPS developers also may request specific changes from you. If those are not addressed, your pull requests cannot be merged.

Assignees

There is an assignee property for pull requests. If the request has not been reviewed by any developer yet, it is not assigned to anyone. After revision, a developer can choose to assign it to either a) you, b) a LAMMPS developer (including him/herself) or c) Axel Kohlmeyer (akohlmey).

- Case a) happens if changes are required on your part
- Case b) means that at the moment, it is being tested and reviewed by a LAMMPS developer with the expectation that some changes would be required. After the review, the developer can choose to implement changes directly or suggest them to you.
- Case c) means that the pull request has been assigned to the developer overseeing the merging of pull requests into the *develop* branch.

In this case, Axel assigned the tutorial to Steve:

Update to the LAMMPS tutorial with proper branch names etc.
Some images are currently broken, they will be added in a second push, but are dependent on this first pull.

Reverse pull requests

Sometimes, however, you might not feel comfortable having other people push changes into your own branch, or maybe the maintainers are not sure their idea was the right one. In such a case, they can make changes, reassign you as the assignee, and file a “reverse pull request”, i.e. file a pull request in **your** forked GitHub repository to include changes in the branch, that you have submitted as a pull request yourself. In that case, you can choose to merge their changes

back into your branch, possibly make additional changes or corrections and proceed from there. It looks something like this:

For some reason, the highlighted button did not work in my case, but I can go to my own repository and merge the pull request from there:

Be sure to check the changes to see if you agree with them by clicking on the tab button:

some formatting updates and text rewrites for your pull request #1

---	---

Because the changes are OK with us, we are going to merge by clicking on "Merge pull request". After a merge it looks like this:

Pakketeret2 commented 3 minutes ago

Thanks Axel, will merge after a review.

Pakketeret2 merged commit 1310438 into Pakketeret2:github-tutorial-update a minute ago

Avoid bugs by automatically running your tests.
Continuous integration can help catch bugs by running your tests automatically.
Merge your code with confidence using one of our continuous integration providers.

Now, since in the meantime our local text for the tutorial also changed, we need to pull Axel's change back into our branch, and merge them:

```
git add Howto_github.txt
git add JPG/tutorial_reverse_pull_request*.png
git commit -m "Updated text and images on reverse pull requests"
git pull
```

In this case, the merge was painless because git could auto-merge:

```
[ stefan@phys8250 src ] % git pull
Auto-merging doc/src/tutorial_github.txt
Waiting for Emacs...
Merge made by the 'recursive' strategy.
 doc/src/tutorial_github.txt | 68 ++++++-----
 1 file changed, 37 insertions(+), 31 deletions(-)
[ stefan@phys8250 src ] %
```

With Axel's changes merged in and some final text updates, our feature branch is now perfect as far as we are concerned, so we are going to commit and push again:

```
git add Howto_github.txt
git add JPG/tutorial_reverse_pull_request6.png
git commit -m "Merged Axel's suggestions and updated text"
git push git@github.com:Pakketeret2/lammps
```

This merge also shows up on the lammps GitHub page:

polish the introduction, some more clarifications, corrections and fo... 6af56e6

akohlmei referenced this pull request in Pakketeret2/lammps 2 hours ago
A few more suggested edits to the tutorial from me #2

akohlmei assigned sjplimp and unassigned Pakketeret2 2 hours ago

After a merge

When everything is fine, the feature branch is merged into the *develop* branch:

Now one question remains: What to do with the feature branch that got merged into upstream?

It is in principle safe to delete them from your own fork. This helps keep it a bit more tidy. Note that you first have to switch to another branch!

```
git checkout develop
git pull https://github.com/lammps/lammps develop
git branch -d github-tutorial-update
```

If you do not pull first, it is not really a problem but git will warn you at the next statement that you are deleting a local branch that was not yet fully merged into HEAD. This is because git does not yet know your branch just got merged into LAMMPS upstream. If you first delete and then pull, everything should still be fine. You can display all branches that are fully merged by:

Finally, if you delete the branch locally, you might want to push this to your remote(s) as well:

```
git push origin :github-tutorial-update
```

Recent changes in the workflow

Some recent changes to the workflow are not captured in this tutorial. For example, in addition to the *develop* branch, to which all new features should be submitted, there is also a *release*, a *stable*, and a *maintenance* branch; the *release* branch is updated from the *develop* branch as part of a “feature release”, and *stable* (together with *release*) are updated from *develop* when a “stable release” is made. In between stable releases, selected bug fixes and infrastructure updates are back-ported from the *develop* branch to the *maintenance* branch and occasionally merged to *stable* as an update release.

Furthermore, the naming of the release tags now follow the pattern “patch_<Day><Month><Year>” to simplify comparisons between releases. For stable releases additional “stable_<Day><Month><Year>” tags are applied and update releases are tagged with “stable_<Day><Month><Year>_update<Number>”. Finally, all releases and submissions are subject to automatic testing and code checks to make sure they compile with a variety of compilers and popular operating systems. Some unit and regression testing is applied as well.

A detailed discussion of the LAMMPS developer GitHub workflow can be found in the file [doc/github-development-workflow.md](#)

8.6.3 Using the LAMMPS-GUI

This document describes **LAMMPS-GUI version 1.6**.

LAMMPS-GUI is a graphical text editor customized for editing LAMMPS input files that is linked to the [LAMMPS library](#) and thus can run LAMMPS directly using the contents of the editor's text buffer as input. It can retrieve and display information from LAMMPS while it is running, display visualizations created with the [dump image command](#), and is adapted specifically for editing LAMMPS input files through text completion and reformatting, and linking to the online LAMMPS documentation for known LAMMPS commands and styles.

Note

Pre-compiled, ready-to-use LAMMPS-GUI executables for Linux (Ubuntu 20.04LTS or later and compatible), macOS (version 11 aka Big Sur or later), and Windows (version 10 or later) [are available](#) for download. None-MPI LAMMPS executables of the same LAMMPS version are included in these packages as well. The source code for the LAMMPS-GUI is included in the LAMMPS source code distribution and can be found in the `tools/lammps-gui` folder. It can be compiled alongside LAMMPS when [compiling with CMake](#).

LAMMPS-GUI tries to provide an experience similar to what people traditionally would do to run LAMMPS using a command line window but just rolled into a single executable:

- editing LAMMPS input files with a text editor
- run LAMMPS on those input file with selected command line flags
- use or extract data from the created files and visualize it with either a molecular visualization program or a plotting program

That procedure is quite effective for people proficient in using the command line, as that allows them to use tools for the individual steps that they are most comfortable with. It is often *required* to adopt this workflow when running LAMMPS simulations on high-performance computing facilities.

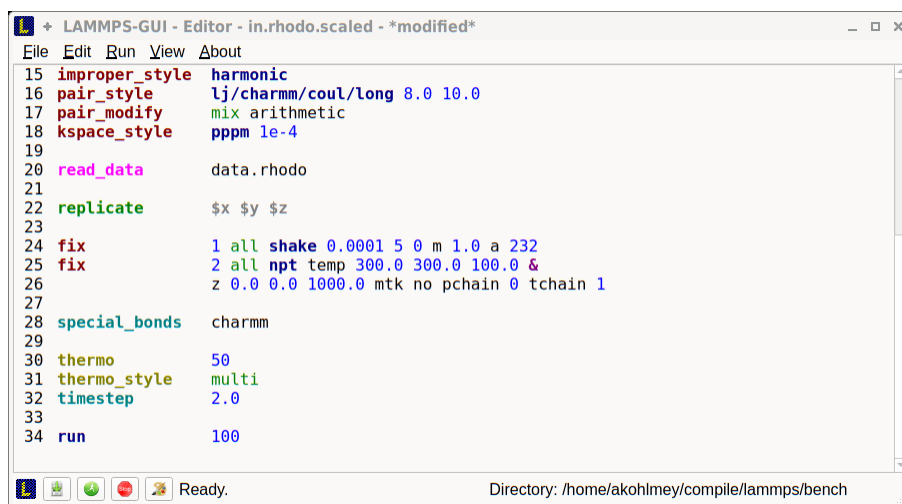

The main benefit of using the LAMMPS-GUI application instead is that many basic tasks can be done directly from the GUI without switching to a text console window or using external programs, let alone writing scripts to extract data from the generated output. It also integrates well with graphical desktop environments.

LAMMPS-GUI thus makes it easier for beginners to get started running simple LAMMPS simulations. It is very suitable for tutorials on LAMMPS since you only need to learn how to use a single program for most tasks and thus time can be saved and people can focus on learning LAMMPS. It is also designed to keep the barrier low when you decide to switch to a full featured, standalone programming editor and more sophisticated visualization and analysis tools, and run LAMMPS from the command line or a batch script.

The following text provides a detailed tour of the features and functionality of the LAMMPS-GUI. Suggestions for new features and reports of bugs are always welcome. You can use the [the same channels as for LAMMPS itself](#) for that purpose.

Starting LAMMPS-GUI

When LAMMPS-GUI starts, it shows the main window, labeled *Editor*, with either an empty buffer or the contents of the file used as argument. In the latter case it may look like the following:

There is the typical menu bar at the top, then the main editor buffer, and a status bar at the bottom. The input file contents are shown with line numbers on the left and the input is colored according to the LAMMPS input file syntax. The status bar shows the status of LAMMPS execution on the left (e.g. “Ready.” when idle) and the current working directory on the right. The name of the current file in the buffer is shown in the window title; the word **modified** is added if the buffer edits have not yet saved to a file. The geometry of the main window is stored when exiting and restored when starting again.

Opening Files

The LAMMPS-GUI application tries to open the first command line argument as a LAMMPS input script, further arguments are ignored. When no argument is given, LAMMPS-GUI starts with an empty buffer. Files can also be opened via the **File** menu or by drag-and-drop of a file from a graphical file manager into the editor window. Only one file can be edited at a time, so opening a new file with a filled buffer closes that buffer. If the buffer has unsaved modifications, you are asked to either cancel the operation, discard the changes, or save them. A buffer with modifications can be saved any time from the “File” menu, by the keyboard shortcut *Ctrl-S* (*Command-S* on macOS), or by clicking on the “Save” button at the very left in the status bar.

Running LAMMPS

From within the LAMMPS-GUI main window LAMMPS can be started either from the Run menu using the Run LAMMPS from Editor Buffer entry, by the keyboard shortcut *Ctrl-Enter* (*Command-Enter* on macOS), or by clicking on the green “Run” button in the status bar. All of these operations causes LAMMPS to process the entire input script in the editor buffer, which may contain multiple *run* or *minimize* commands.

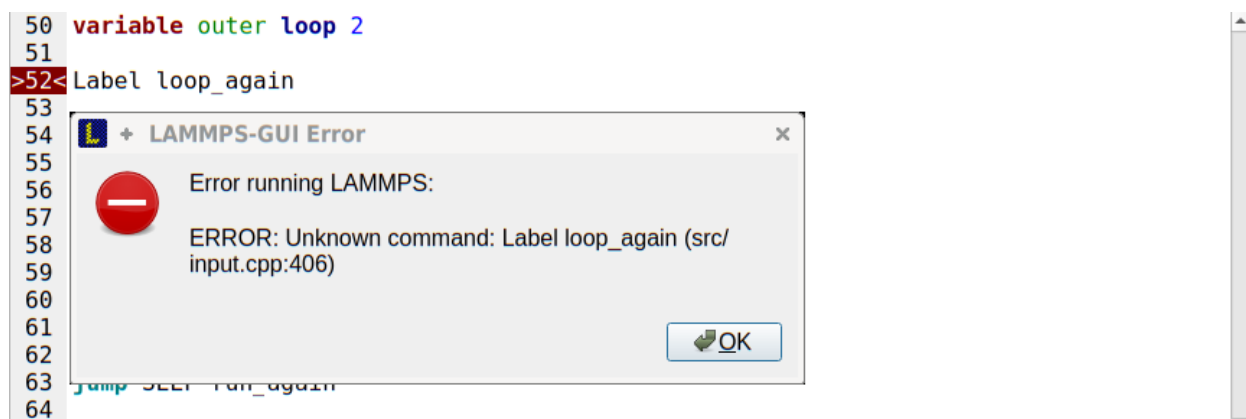

LAMMPS runs in a separate thread, so the GUI stays responsive and is able to interact with the running calculation and access data it produces. It is important to note that running LAMMPS this way is using the contents of the input buffer for the run (via the `lammps_commands_string()` function of the LAMMPS C-library interface), and **not** the original file it was read from. Thus, if there are unsaved changes in the buffer, they *will* be used. As an alternative, it is also possible to run LAMMPS by reading the contents of a file from the Run LAMMPS from File menu entry or with *Ctrl-Shift-Enter*. This option may be required in some rare cases where the input uses some functionality that is not compatible with running LAMMPS from a string buffer. For consistency, any unsaved changes in the buffer must be either saved to the file or undone before LAMMPS can be run from a file.

While LAMMPS is running, the contents of the status bar change. On the left side there is a text indicating that LAMMPS is running, which also indicates the number of active threads, when thread-parallel acceleration was selected in the Preferences dialog. On the right side, a progress bar is shown that displays the estimated progress for the current *run* or *minimize* command.

Also, the line number of the currently executed command is highlighted in green.

If an error occurs (in the example below the command *label* was incorrectly capitalized as “Label”), an error message dialog is shown and the line of the input which triggered the error is highlighted. The state of LAMMPS in the status bar is set to “Failed.” instead of “Ready.”

Up to three additional windows may open during a run:

- an *Output* window with the captured screen output from LAMMPS
- a *Charts* window with a line graph created from thermodynamic output of the run
- a *Slide Show* window with images created by a *dump image command* in the input

More information on those windows and how to adjust their behavior and contents is given below.

An active LAMMPS run can be stopped cleanly by using either the **Stop LAMMPS** entry in the Run menu, the keyboard shortcut *Ctrl-/* (*Command-/* on macOS), or by clicking on the red button in the status bar. This will cause the running LAMMPS process to complete the current timestep (or iteration for energy minimization) and then complete the processing of the buffer while skipping all run or minimize commands. This is equivalent to the input script command *timer timeout 0* and is implemented by calling the *lammps_force_timeout()* function of the LAMMPS C-library interface. Please see the corresponding documentation pages to understand the implications of this operation.

Output Window

By default, when starting a run, an *Output* window opens that displays the screen output of the running LAMMPS calculation, as shown below. This text would normally be seen in the command line window.

```

+ LAMMPS-GUI - Output - in.peptide - Run 2
SHAKE stats (type/ave/delta/count) on step 300
Bond:  4  1.111  3.79044e-06  9

Bond:  8  1.08  2.09369e-06  7
Bond: 10  1.111  5.64841e-06  8
Bond: 12  1.08  2.10677e-06  9
Bond: 14  0.96  0  1
Bond: 18  0.957202  7.72573e-06  1280
Angle: 31  104.52  0.000806204  640
----- Step 300 ----- CPU = 1.502605 (sec) -----
TotEng = -5251.3661 KinEng = 1123.7713 Temp = 279.3297
PotEng = -6375.1373 E_bond = 14.2206 E_angle = 38.4275
E_dihed = 18.1674 E_impro = 2.3734 E_vdwl = 715.3478
E_coul = 26745.4050 E_long = -33909.0790 Press = -471.5843
Loop time of 1.50263 on 4 procs for 300 steps with 2004 atoms

```

LAMMPS-GUI captures the screen output from LAMMPS as it is generated and updates the *Output* window regularly during a run.

By default, the *Output* window is replaced each time a run is started. The runs are counted and the run number for the current run is displayed in the window title. It is possible to change the behavior of LAMMPS-GUI in the preferences dialog to create a *new Output* window for every run or to not show the current *Output* window. It is also possible to show or hide the *current Output* window from the View menu.

The text in the *Output* window is read-only and cannot be modified, but keyboard shortcuts to select and copy all or parts of the text can be used to transfer text to another program. Also, the keyboard shortcut *Ctrl-S* (*Command-S* on macOS) is available to save the *Output* buffer to a file. The “Select All” and “Copy” functions, as well as a “Save Log to File” option are also available from a context menu by clicking with the right mouse button into the *Output* window text area.

```

...
Loop time of 1.51507 on 4 procs for 300 steps with 2004 atoms

```

Added in version 1.6.

Should the *Output* window contain embedded YAML format text (see above for a demonstration), for example from using *thermo_style yaml* or *thermo_modify line yaml*, the keyboard shortcut *Ctrl-Y* (*Command-Y* on macOS) is available to save only the YAML parts to a file. This option is also available from a context menu by clicking with the right mouse button into the *Output* window text area.

Charts Window

By default, when starting a run, a *Charts* window opens that displays a plot of thermodynamic output of the LAMMPS calculation as shown below.

The drop down menu on the top right allows selection of different properties that are computed and written to thermo output. Only one property can be shown at a time. The plots are updated with new data as the run progresses, so they can be used to visually monitor the evolution of available properties. The window title shows the current run number that this chart window corresponds to. Same as for the *Output* window, the chart window is replaced on each new run, but the behavior can be changed in the preferences dialog.

From the **File** menu on the top left, it is possible to save an image of the currently displayed plot or export the data in either plain text columns (for use by plotting tools like *gnuplot* or *grace*), or as CSV data which can be imported for further processing with Microsoft Excel or *pandas*

Thermo output data from successive run commands in the input script is combined into a single data set unless the format, number, or names of output columns are changed with a *thermo_style* or a *thermo_modify* command, or the current time step is reset with *reset_timestep*, or if a *clear* command is issued.

Image Slide Show

By default, if the LAMMPS input contains a *dump image* command, a “Slide Show” window opens which loads and displays the images created by LAMMPS as they are written. This is a convenient way to visually monitor the progress of the simulation.

The various buttons at the bottom right of the window allow single stepping through the sequence of images or playing an animation (as a continuous loop or once from first to last). It is also possible to zoom in or zoom out of the displayed images. The button on the very left triggers an export of the slide show animation to a movie file, provided the [FFmpeg](#) program is installed.

Added in version 1.6.

When clicking on the “garbage can” icon, all image files of the slide show will be deleted. Since their number can be large for long simulations, this option enables to safely and quickly clean up the clutter caused in the working directory by those image files without risk of deleting other files by accident when using wildcards.

Variable Info

During a run, it may be of interest to monitor the value of input script variables, for example to monitor the progress of loops. This can be done by enabling the “Variables Window” in the View menu or by using the *Ctrl-Shift-W* keyboard shortcut. This shows info similar to the [info variables](#) command in a separate window as shown below.

Like for the *Output* and *Charts* windows, its content is continuously updated during a run. It will show “(none)” if there are no variables defined. Note that it is also possible to *set index style variables*, that would normally be set via command line flags, via the “Set Variables...” dialog from the Run menu. LAMMPS-GUI automatically defines the variable “gui_run” to the current value of the run counter. That way it is possible to automatically record a separate log for each run attempt by using the command

```
log logfile-${gui_run}.txt
```

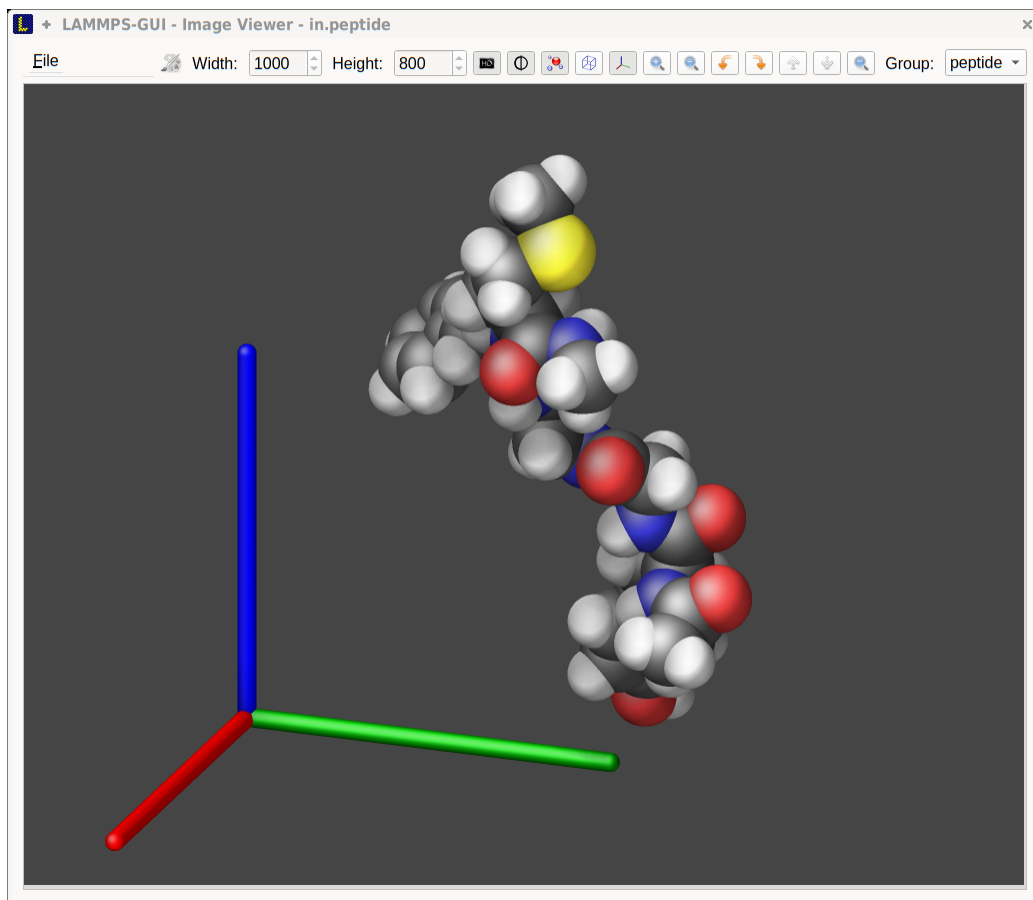

at the beginning of an input file. That would record logs to files `logfile-1.txt`, `logfile-2.txt`, and so on for successive runs.

Snapshot Image Viewer

By selecting the Create Image entry in the Run menu, or by hitting the *Ctrl-I* (*Command-I* on macOS) keyboard shortcut, or by clicking on the “palette” button in the status bar of the *Editor* window, LAMMPS-GUI sends a custom *write_dump image* command to LAMMPS and reads back the resulting snapshot image with the current state of the system into an image viewer. This functionality is *not* available *during* an ongoing run. In case LAMMPS is not yet initialized, LAMMPS-GUI tries to identify the line with the first run or minimize command and execute all commands from the input buffer up to that line, and then executes a “run 0” command. This initializes the system so an image of the initial state of the system can be rendered. If there was an error in that process, the snapshot image viewer does not appear.

When possible, LAMMPS-GUI tries to detect which elements the atoms correspond to (via their mass) and then colorize them in the image and set their atom diameters accordingly. If this is not possible, for instance when using reduced (= ‘lj’) *units*, then LAMMPS-GUI will check the current pair style and if it is a Lennard-Jones type potential, it will extract the *sigma* parameter for each atom type and assign atom diameters from those numbers.

Otherwise the default sequence of colors of the *dump image* command is assigned to the different atom types and the diameters are all the same.

The default image size, some default image quality settings, the view style and some colors can be changed in the Preferences dialog window. From the image viewer window further adjustments can be made: actual image size, high-quality (SSAO) rendering, anti-aliasing, view style, display of box or axes, zoom factor. The view of the system can be rotated horizontally and vertically. It is also possible to only display the atoms within a group defined in the input script (default is “all”). After each change, the image is rendered again and the display updated. The small palette icon on the top left is colored while LAMMPS is running to render the new image; it is grayed out when LAMMPS is finished. When there are many atoms to render and high quality images with anti-aliasing are requested, re-rendering may take several seconds. From the File menu of the image window, the current image can be saved to a file (keyboard

shortcut *Ctrl-S*) or copied to the clipboard (keyboard shortcut *Ctrl-C*) for pasting the image into another application.

Added in version 1.6.

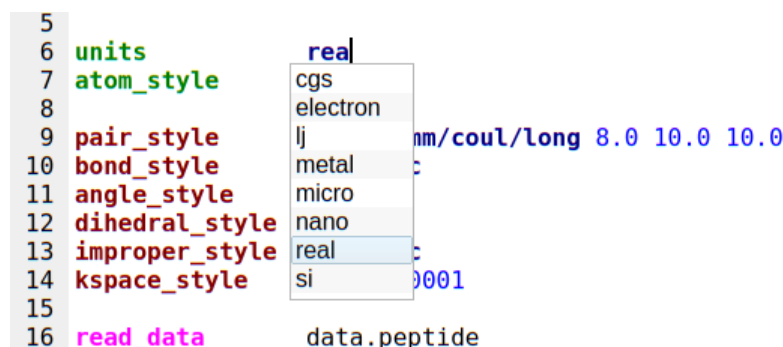

From the File menu it is also possible to copy the current *dump image* and *dump_modify* commands to the clipboard so they can be pasted into a LAMMPS input file so that the visualization settings of the snapshot image can be repeated for the entire simulation (and thus be repeated in the slide show viewer). This feature has the keyboard shortcut *Ctrl-D*.

Editor Window

The *Editor* window of LAMMPS-GUI has most of the usual functionality that similar programs have: text selection via mouse or with cursor moves while holding the Shift key, Cut (*Ctrl-X*), Copy (*Ctrl-C*), Paste (*Ctrl-V*), Undo (*Ctrl-Z*), Redo (*Ctrl-Shift-Z*), Select All (*Ctrl-A*). When trying to exit the editor with a modified buffer, a dialog will pop up asking whether to cancel the exit operation, or to save or not save the buffer contents to a file.

Context Specific Word Completion

By default, LAMMPS-GUI displays a small pop-up frame with possible choices for LAMMPS input script commands or styles after 2 characters of a word have been typed.

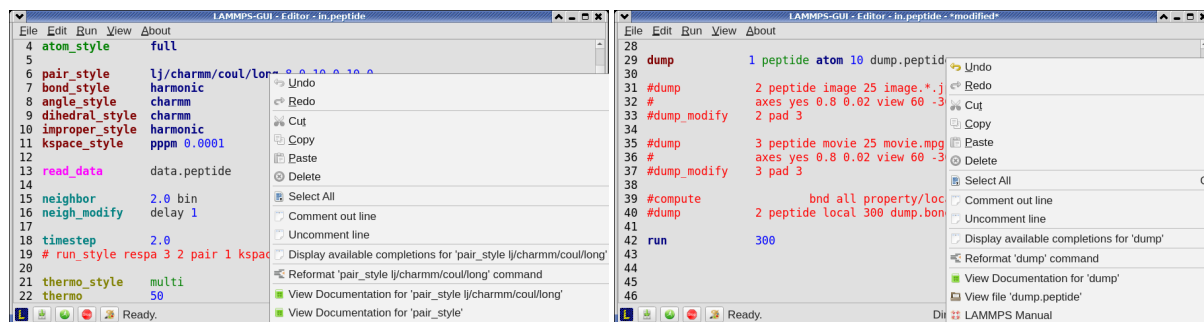

The word can then be completed through selecting an entry by scrolling up and down with the cursor keys and selecting with the 'Enter' key or by clicking on the entry with the mouse. The automatic completion pop-up can be disabled in the Preferences dialog, but the completion can still be requested manually by either hitting the 'Shift-TAB' key or by right-clicking with the mouse and selecting the option from the context menu. Most of the completion information is retrieved from the active LAMMPS instance and thus it shows only available options that have been enabled when compiling LAMMPS. That list, however, excludes accelerated styles and commands; for improved clarity, only the non-suffix version of styles are shown.

Line Reformatting

The editor supports reformatting lines according to the syntax in order to have consistently aligned lines. This primarily means adding whitespace padding to commands, type specifiers, IDs and names. This reformatting is performed by default when hitting the 'Enter' key to start a new line. This feature can be turned on or off in the Preferences dialog, but it can still be manually performed by hitting the 'TAB' key. The amount of padding can be adjusted in the Preferences dialog for the *Editor*.

Internally this functionality is achieved by splitting the line into "words" and then putting it back together with padding added where the context can be detected; otherwise a single space is used between words.

Context Specific Help

A unique feature of the LAMMPS-GUI is the option to look up the documentation for the command in the current line. This can be done by either clicking the right mouse button or by using the *Ctrl-?* keyboard shortcut. When using the mouse, there are additional entries in the context menu that open the corresponding documentation page in the online LAMMPS documentation in a web browser window. When using the keyboard, the first of those entries is chosen.

If the word under the cursor is a file, then additionally the context menu has an entry to open the file in a read-only text viewer window. This is a convenient way to view the contents of files that are referenced in the input.

Menu

The menu bar has entries **File**, **Edit**, **Run**, **View**, and **About**. Instead of using the mouse to click on them, the individual menus can also be activated by hitting the *Alt* key together with the corresponding underlined letter, that is *Alt-F* activates the **File** menu. For the corresponding activated sub-menus, the key corresponding the underlined letters can be used to select entries instead of using the mouse.

File

The **File** menu offers the usual options:

- **New** clears the current buffer and resets the file name to **unknown**
- **Open** opens a dialog to select a new file for editing in the *Editor*
- **View** opens a dialog to select a file for viewing in a *separate* window (read-only)
- **Save** saves the current file; if the file name is **unknown** a dialog will open to select a new file name
- **Save As** opens a dialog to select and new file name (and folder, if desired) and saves the buffer to it. Writing the buffer to a different folder will also switch the current working directory to that folder.
- **Quit** exits LAMMPS-GUI. If there are unsaved changes, a dialog will appear to either cancel the operation, or to save, or to not save the modified buffer.

In addition, up to 5 recent file names will be listed after the **Open** entry that allows re-opening recently opened files. This list is stored when quitting and recovered when starting again.

Edit

The Edit menu offers the usual editor functions like Undo, Redo, Cut, Copy, Paste. It can also open a Preferences dialog (keyboard shortcut *Ctrl-P*) and allows deletion of all stored preferences and settings, so they are reset to their default values.

Run

The Run menu has options to start and stop a LAMMPS process. Rather than calling the LAMMPS executable as a separate executable, the LAMMPS-GUI is linked to the LAMMPS library and thus can run LAMMPS internally through the *LAMMPS C-library interface* in a separate thread.

Specifically, a LAMMPS instance will be created by calling *lammps_open_no_mpi()*. The buffer contents are then executed by calling *lammps_commands_string()*. Certain commands and features are only available after a LAMMPS instance is created. Its presence is indicated by a small LAMMPS L logo in the status bar at the bottom left of the main window. As an alternative, it is also possible to run LAMMPS using the contents of the edited file by reading the file. This is mainly provided as a fallback option in case the input uses some feature that is not available when running from a string buffer.

The LAMMPS calculations are run in a concurrent thread so that the GUI can stay responsive and be updated during the run. The GUI can retrieve data from the running LAMMPS instance and tell it to stop at the next timestep. The Stop LAMMPS entry will do this by calling the *lammps_force_timeout()* library function, which is equivalent to a *timer timeout 0* command.

The Set Variables... entry opens a dialog box where *index style variables* can be set. Those variables are passed to the LAMMPS instance when it is created and are thus set *before* a run is started.

The Set Variables dialog will be pre-populated with entries that are set as index variables in the input and any variables that are used but not defined, if the built-in parser can detect them. New rows for additional variables can be added through the Add Row button and existing rows can be deleted by clicking on the X icons on the right.

The Create Image entry will send a *dump image* command to the LAMMPS instance, read the resulting file, and show it in an Image Viewer window.

The View in OVITO entry will launch OVITO with a *data file* containing the current state of the system. This option is only available if the LAMMPS-GUI can find the OVITO executable in the system path.

The View in VMD entry will launch VMD with a *data file* containing the current state of the system. This option is only available if the LAMMPS-GUI can find the VMD executable in the system path.

View

The **View** menu offers to show or hide additional windows with log output, charts, slide show, variables, or snapshot images. The default settings for their visibility can be changed in the **Preferences** dialog.

About

The **About** menu finally offers a couple of dialog windows and an option to launch the LAMMPS online documentation in a web browser. The **About LAMMPS-GUI** entry displays a dialog with a summary of the configuration settings of the LAMMPS library in use and the version number of LAMMPS-GUI itself. The **Quick Help** displays a dialog with a minimal description of LAMMPS-GUI. The **LAMMPS-GUI Howto** entry will open this documentation page from the online documentation in a web browser window. The **LAMMPS Manual** entry will open the main page of the LAMMPS online documentation in a web browser window.

Preferences

The **Preferences** dialog allows customization of the behavior and look of the LAMMPS-GUI application. The settings are grouped and each group is displayed within a tab.

General Settings:

- *Echo input to log:* when checked, all input commands, including variable expansions, are echoed to the *Output* window. This is equivalent to using *-echo screen* at the command line. There is no log file produced by default, since LAMMPS-GUI uses *-log none*.
- *Include citation details:* when checked full citation info will be included to the log window. This is equivalent to using *-cite screen* on the command line.
- *Show log window by default:* when checked, the screen output of a LAMMPS run will be collected in a log window during the run
- *Show chart window by default:* when checked, the thermodynamic output of a LAMMPS run will be collected and displayed in a chart window as line graphs.
- *Show slide show window by default:* when checked, a slide show window will be shown with images from a dump image command, if present, in the LAMMPS input.
- *Replace log window on new run:* when checked, an existing log window will be replaced on a new LAMMPS run, otherwise each run will create a new log window.
- *Replace chart window on new run:* when checked, an existing chart window will be replaced on a new LAMMPS run, otherwise each run will create a new chart window.

- *Replace image window on new render:* when checked, an existing chart window will be replaced when a new snapshot image is requested, otherwise each command will create a new image window.
- *Path to LAMMPS Shared Library File:* this option is only visible when LAMMPS-GUI was compiled to load the LAMMPS library at run time instead of being linked to it directly. With the `Browse . .` button or by changing the text, a different shared library file with a different compilation of LAMMPS with different settings or from a different version can be loaded. After this setting was changed, LAMMPS-GUI needs to be re-launched.
- *Select Default Font:* Opens a font selection dialog where the type and size for the default font (used for everything but the editor and log) of the application can be set.
- *Select Text Font:* Opens a font selection dialog where the type and size for the text editor and log font of the application can be set.
- *GUI update interval:* Allows to set the time interval between GUI and data updates during a LAMMPS run in milliseconds. The default is to update the GUI every 10 milliseconds. This is good for most cases. For LAMMPS runs that run *very* fast, however, data may be missed and through lowering this interval, this can be corrected. However, this will make the GUI use more resources, which may be a problem on some computers with slower CPUs and a small number of CPU cores. This setting may be changed to a value between 1 and 1000 milliseconds.

Accelerators:

This tab enables selection of an accelerator package for LAMMPS to use and is equivalent to using the *-suffix* and *-package* flags on the command line. Only settings supported by the LAMMPS library and local hardware are available. The *Number of threads* field allows setting the maximum number of threads for the accelerator packages that use threads.

Snapshot Image:

This tab allows setting defaults for the snapshot images displayed in the `Image Viewer` window, such as its dimensions and the zoom factor applied. The *Antialias* switch will render images with twice the number of pixels for width and height and then smoothly scale the image back to the requested size. This produces higher quality images with smoother edges at the expense of requiring more CPU time to render the image. The *HQ Image mode* option turns on screen space ambient occlusion (SSAO) mode when rendering images. This is also more time consuming, but produces a more ‘spatial’ representation of the system shading of atoms by their depth. The *VDW Style* checkbox selects whether atoms are represented by space filling spheres when checked or by smaller spheres and sticks. Finally there are a couple of drop down lists to select the background and box colors.

Editor Settings:

This tab allows tweaking settings of the editor window. Specifically the amount of padding to be added to LAMMPS commands, types or type ranges, IDs (e.g. for fixes), and names (e.g. for groups). The value set is the minimum width for the text element and it can be chosen in the range between 1 and 32.

The two settings which follow enable or disable the automatic reformatting when hitting the ‘Enter’ key and the automatic display of the completion pop-up window.

Keyboard Shortcuts

Almost all functionality is accessible from the menu of the editor window or through keyboard shortcuts. The following shortcuts are available (On macOS use the Command key instead of Ctrl/Control).

Shortcut	Function	Shortcut	Function	Shortcut	Function
Ctrl+N	New File	Ctrl+Z	Undo edit	Ctrl+Enter	Run Input
Ctrl+O	Open File	Ctrl+Shift+Z	Redo edit	Ctrl+/	Stop Active Run
Ctrl+Shift+F	View File	Ctrl+C	Copy text	Ctrl+Shift+V	Set Variables
Ctrl+S	Save File	Ctrl+X	Cut text	Ctrl+I	Snapshot Image
Ctrl+Shift+S	Save File As	Ctrl+V	Paste text	Ctrl+L	Slide Show
Ctrl+Q	Quit Application	Ctrl+A	Select All	Ctrl+P	Preferences
Ctrl+W	Close Window	Ctrl+Shift+H	Quick Help	Ctrl+Shift+G	LAMMPS-GUI Howto
Ctrl+Shift+A	About LAMMPS	Ctrl+?	Context Help	Ctrl+Shift+W	Show Variables
Ctrl+Shift+M	LAMMPS Manual	TAB	Reformat line	Shift+TAB	Show Completions
Ctrl+Shift+Enter	Run File				

Further editing keybindings are documented with the [Qt documentation](#). In case of conflicts the list above takes precedence.

All other windows only support a subset of keyboard shortcuts listed above. Typically, the shortcuts *Ctrl-/-* (Stop Run), *Ctrl-W* (Close Window), and *Ctrl-Q* (Quit Application) are supported.

8.6.4 Moltemplate Tutorial

In this tutorial, we are going to use the tool *Moltemplate* to set up a classical molecular dynamic simulation using the *OPLS-AA force field*. The first task is to describe an organic compound and create a complete input deck for LAMMPS. The second task is to map the OPLS-AA force field to a molecular sample created with an external tool, e.g. PACKMOL, and exported as a PDB file. The files used in this tutorial can be found in the `tools/moltemplate/tutorial-files` folder of the LAMMPS source code distribution.

Simulating an organic solvent

This example aims to create a cubic box of the organic solvent formamide.

The first step is to create a molecular topology in the LAMMPS-template (LT) file format representing a single molecule, which will be stored in a Moltemplate object called `_FAM inherits OPLSAA {}`. This command states that the object `_FAM` is based on an existing object called `OPLSAA`, which contains OPLS-AA parameters, atom type definitions, partial charges, masses and bond-angle rules for many organic and biological compounds.

The atomic structure is the starting point to populate the command `write('Data Atoms') {}`, which will write the `Atoms` section in the LAMMPS data file. The OPLS-AA force field uses the `atom_style full`, therefore, this column format is used: `# atomID molID atomType charge coordX coordY coordZ`. The `atomIDs` are replaced with Moltemplate `$`-type variables, which are then substituted with unique numerical IDs. The same logic is applied to the `molID`, except that the same variable is used for the whole molecule. The atom types are assigned using `@`-type variables. The assignment of atom types (e.g. `@atom:177`, `@atom:178`) is done using the OPLS-AA atom types defined in the “In Charges” section of the file `oplsaa.lt`, looking for a reasonable match with the description of the atom. The resulting file (`formamide.lt`) follows:

```
_FAM inherits OPLSAA {
  # atomID  molID  atomType  charge  coordX  coordY  coordZ
```

(continues on next page)

(continued from previous page)

```

write('Data Atoms') {
  $atom:C00 $mol @atom:177 0.00 0.100 0.490 0.0
  $atom:O01 $mol @atom:178 0.00 1.091 -0.250 0.0
  $atom:N02 $mol @atom:179 0.00 -1.121 -0.181 0.0
  $atom:H03 $mol @atom:182 0.00 -2.013 0.272 0.0
  $atom:H04 $mol @atom:182 0.00 -1.056 -1.190 0.0
  $atom:H05 $mol @atom:221 0.00 0.144 1.570 0.0
}

# A list of the bonds in the molecule:
# BondID AtomID1 AtomID2
write('Data Bond List') {
  $bond:C1 $atom:C00 $atom:O01
  $bond:C2 $atom:C00 $atom:H05
  $bond:C3 $atom:C00 $atom:N02
  $bond:C4 $atom:N02 $atom:H03
  $bond:C5 $atom:N02 $atom:H04
}
}

```

You don't have to specify the charge in this example because they will be assigned according to the atom type. Analogously, only a "Data Bond List" section is needed as the atom type will determine the bond type. The other bonded interactions (e.g. angles, dihedrals, and impropers) will be automatically generated by Moltemplate.

If the simulation is non-neutral, or Moltemplate complains that you have missing bond, angle, or dihedral types, this means at least one of your atom types is incorrect.

The second step is to create a master file with instructions to build a starting structure and the LAMMPS commands to run an NPT simulation. The master file (solv_01.lt) follows:

```

# Import the force field.
import /usr/local/moltemplate/moltemplate/force_fields/oplsaa.lt
import formamide.lt # after oplsaa.lt, as it depends on it.

# Create the input sample.
solv = new _FAM [5].move( 4.6, 0, 0)
           [5].move( 0, 4.6, 0)
           [5].move( 0, 0, 4.6)
solv[*][*][*].move(-11.5, -11.5, -11.5)

# Set the simulation box.
write_once("Data Boundary") {
  -11.5 11.5 xlo xhi
  -11.5 11.5 ylo yhi
  -11.5 11.5 zlo zhi
}

# Create an input deck for LAMMPS.
write_once("In Init"){
  # Input variables.
  variable run      string solv_01  # output name
  variable ts       equal 1         # timestep
  variable temp     equal 300       # equilibrium temperature

```

(continues on next page)

(continued from previous page)

```

variable p      equal 1.      # equilibrium pressure
variable d      equal 1000    # output frequency
variable equi   equal 5000    # Equilibration steps
variable prod   equal 30000   # Production steps

# PBC (set them before the creation of the box).
boundary p p p
}

# Run an NPT simulation.
write_once("In Run"){
  # Derived variables.
  variable tcouple equal \${ts}*100
  variable pcouple equal \${ts}*1000

  # Output.
  thermo          \$d
  thermo_style custom step etotal evdwl ecoul elong ebond eangle &
  edihed eimp ke pe temp press vol density cpu
  thermo_modify flush yes

  # Trajectory.
  dump TRJ all dcd \$d \${run}.dcd
  dump_modify TRJ unwrap yes

  # Thermalisation and relaxation, NPT ensemble.
  timestep        \${ts}
  fix              NPT all npt temp \${temp} \${temp} \${tcouple} iso \$p \$p \$\
→{pcouple}
  velocity all create \${temp} 858096 dist gaussian
  # Short runs to update the PPPM settings as the box shrinks.
  run \${equi} post no
  run \${equi} post no
  run \${equi} post no
  run \${equi}
  # From now on, the density shouldn't change too much.
  run \${prod}
  unfix NPT
}

```

The first two commands insert the content of files `oplsaa.lt` and `formamide.lt` into the master file. At this point, we can use the command `solv = new _FAM [N]` to create N copies of a molecule of type `_FAM`. In this case, we create an array of 5*5*5 molecules on a cubic grid using the coordinate transformation command `.move(4.6, 0, 0)`. See the Moltemplate documentation to learn more about the syntax. As the sample was created from scratch, we also specify the simulation box size in the “Data Boundary” section.

The LAMMPS setting for the force field are specified in the file `oplsaa.lt` and are written automatically in the input deck. We also specify the boundary conditions and a set of variables in the “In Init” section. The remaining commands to run an NPT simulation are written in the “In Run” section. Note that in this script, LAMMPS variables are protected with the escape character `\` to distinguish them from Moltemplate variables, e.g. `\${run}` is a LAMMPS variable that is written in the input deck as `${run}`.

Compile the master file with:

```
moltemplate.sh -overlay-all solv_01.lt
```

And execute the simulation with the following:

```
mpirun -np 4 lmp -in solv_01.in -l solv_01.log
```

Fig. 10: Snapshot of the sample at the beginning and end of the simulation. Rendered with Ovito.

Mapping an existing structure

Another helpful way to use Moltemplate is mapping an existing molecular sample to a force field. This is useful when a complex sample is assembled from different simulations or created with specialized software (e.g. PACKMOL). As in the previous example, all molecular species in the sample must be defined using single-molecule Moltemplate objects. For this example, we use a short polymer in a box containing water molecules and ions in the PDB file `model.pdb`.

It is essential to understand that the order of atoms in the PDB file and in the Moltemplate master script must match, as we are using the coordinates from the PDB file in the order they appear. The order of atoms and molecules in the PDB file provided is as follows:

- 500 water molecules, with atoms ordered in this sequence:

ATOM	1	O	MOL	D	1	5.901	7.384	1.103	0.00	0.00	DUM
ATOM	2	H	MOL	D	1	6.047	8.238	0.581	0.00	0.00	DUM
ATOM	3	H	MOL	D	1	6.188	7.533	2.057	0.00	0.00	DUM

- 1 polymer molecule.
- 1 Ca^{2+} ion.
- 2 Cl^- ions.

In the master LT file, this sequence of molecules is matched with the following commands:

```
# Create the sample.
wat=new SPC[500]
pol=new PolyNIPAM[1]
cat=new Ca[1]
ani=new Cl[2]
```

Note that the first command would create 500 water molecules in the same position in space, and the other commands will use the coordinates specified in the corresponding molecular topology block. However, the coordinates will be overwritten by rendering an external atomic structure file. Note that if the same molecule species are scattered in the input structure, it is recommended to reorder and group together for molecule types to facilitate the creation of the input sample.

The molecular topology for the polymer is created as in the previous example, with the atom types assigned as in the following schema:

Fig. 11: Atom types assigned to the polymer's repeating unit.

The molecular topology of the water and ions is stated directly into the master file for the sake of space, but they could also be written in a separate file(s) and imported before the sample is created.

The resulting master LT file defining short annealing at a fixed volume (NVT) follows:

```
# Use the OPLS-AA force field for all species.
import /usr/local/moltemplate/moltemplate/force_fields/oplsaa.lt
import PolyNIPAM.lt

# Define the SPC water and ions as in the OPLS-AA

  minimize .01 .001 1000 100000
  write_data \${run\}.min

  # Set the constraints.
  group watergroup type @atom:76 @atom:77
  fix 0 watergroup shake 0.0001 10 0 b @bond:042_043 a @angle:043_042_043

```

(continues on next page)

(continued from previous page)

```
# Short annealing.
timestep      \${ts\}
fix           1 all nvt temp \${temp\} \${temp\} \$(100*dt)
velocity      all create \${temp\} 315443
run           \${equi\}
unfix 1
}
```

In this example, the water model is SPC and it is defined in the `oplsaa.lt` file with atom types `@atom:76` and `@atom:77`. For water we also use the `group` and `fix shake` commands with Moltemplate @-type variables, to ensure consistency with the numerical values assigned during compilation. To identify the bond and angle types, look for the extended @atom IDs, which in this case are:

```
replace{ @atom:76 @atom:76_b042_a042_d042_i042 }
replace{ @atom:77 @atom:77_b043_a043_d043_i043 }
```

From which we can identify the following “Data Bonds By Type”: `@bond:042_043 @atom:*_b042*_a*_d*_i*` `@atom:*_b043*_a*_d*_i*` and “Data Angles By Type”: `@angle:043_042_043 @atom:*_b*_a043*_d*_i*` `@atom:*_b*_a042*_d*_i*` `@atom:*_b*_a043*_d*_i*`

Compile the master file with:

```
moltemplate.sh -overlay-all -pdb model.pdb sample01.lt
```

And execute the simulation with the following:

```
mpirun -np 4 lmp -in sample01.in -l sample01.log
```

Overview

PyLammps is a Python wrapper class for LAMMPS which can be created on its own or use an existing lammps Python object. It creates a simpler, more “pythonic” interface to common LAMMPS functionality, in contrast to the lammps wrapper for the C-style LAMMPS library interface which is written using [Python ctypes](#). The lammps wrapper is discussed on the [Use Python with LAMMPS](#) doc page.

Unlike the flat ctypes interface, PyLammps exposes a discoverable API. It no longer requires knowledge of the underlying C++ code implementation. Finally, the IPyLammps wrapper builds on top of PyLammps and adds some additional features for [IPython integration](#) into [Jupyter notebooks](#), e.g. for embedded visualization output from [dump style image](#).

Comparison of lammps and PyLammps interfaces

lammps.lammps

- uses ctypes
- direct memory access to native C++ data
- provides functions to send and receive data to LAMMPS
- requires knowledge of how LAMMPS internally works (C pointers, etc)

lammps.PyLammps

- higher-level abstraction built on top of original ctypes interface
- manipulation of Python objects
- communication with LAMMPS is hidden from API user
- shorter, more concise Python
- better IPython integration, designed for quick prototyping

Quick Start

System-wide Installation

Step 1: Building LAMMPS as a shared library

To use LAMMPS inside of Python it has to be compiled as shared library. This library is then loaded by the Python interface. In this example we enable the MOLECULE package and compile LAMMPS with PNG, JPEG and FFMPEG output support enabled.

Step 1a: For the CMake based build system, the steps are:

```
mkdir $LAMMPS_DIR/build-shared
cd $LAMMPS_DIR/build-shared

# MPI, PNG, jpeg, FFMPEG are auto-detected
cmake ../cmake -DPKG_MOLECULE=yes -DBUILD_LIB=yes -DBUILD_SHARED_LIBS=yes
make
```

Step 1b: For the legacy, make based build system, the steps are:

```
cd $LAMMPS_DIR/src

# add packages if necessary
make yes-MOLECULE

# compile shared library using Makefile
make mpi mode=shlib LMP_INC="-DLAMMPS_PNG -DLAMMPS_JPEG -DLAMMPS_FFMPEG" JPG_LIB="-lpng -
-ljpeg"
```

Step 2: Installing the LAMMPS Python package

PyLammps is part of the lammps Python package. To install it simply install that package into your current Python installation with:

```
make install-python
```

Note

Recompiling the shared library requires re-installing the Python package

Installation inside of a virtualenv

You can use virtualenv to create a custom Python environment specifically tuned for your workflow.

Benefits of using a virtualenv

- isolation of your system Python installation from your development installation
- installation can happen in your user directory without root access (useful for HPC clusters)
- installing packages through pip allows you to get newer versions of packages than e.g., through apt-get or yum package managers (and without root access)
- you can even install specific old versions of a package if necessary

Prerequisite (e.g. on Ubuntu)

```
apt-get install python-virtualenv
```

Creating a virtualenv with lammps installed

```
# create virtualenv named 'testing'
virtualenv $HOME/python/testing

# activate 'testing' environment
source $HOME/python/testing/bin/activate
```

Now configure and compile the LAMMPS shared library as outlined above. When using CMake and the shared library has already been build, you need to re-run CMake to update the location of the python executable to the location in the virtual environment with:

```
cmake . -DPython_EXECUTABLE=$(which python)

# install LAMMPS package in virtualenv
(testing) make install-python

# install other useful packages
(testing) pip install matplotlib jupyter mpi4py

...

# return to original shell
(testing) deactivate
```

Creating a new instance of PyLammps

To create a PyLammps object you need to first import the class from the lammps module. By using the default constructor, a new *lammps* instance is created.

```
from lammps import PyLammps
L = PyLammps()
```

You can also initialize PyLammps on top of this existing *lammps* object:

```
from lammps import lammps, PyLammps
lmp = lammps()
L = PyLammps(ptr=lmp)
```

Commands

Sending a LAMMPS command with the existing library interfaces is done using the command method of the lammps object instance.

For instance, let's take the following LAMMPS command:

```
region box block 0 10 0 5 -0.5 0.5
```

In the original interface this command can be executed with the following Python code if *L* was a lammps instance:

```
L.command("region box block 0 10 0 5 -0.5 0.5")
```

With the PyLammps interface, any command can be split up into arbitrary parts separated by white-space, passed as individual arguments to a region method.

```
L.region("box block", 0, 10, 0, 5, -0.5, 0.5)
```

Note that each parameter is set as Python literal floating-point number. In the PyLammps interface, each command takes an arbitrary parameter list and transparently merges it to a single command string, separating individual parameters by white-space.

The benefit of this approach is avoiding redundant command calls and easier parameterization. In the original interface parameterization needed to be done manually by creating formatted strings.

```
L.command("region box block %f %f %f %f %f %f" % (xlo, xhi, ylo, yhi, zlo, zhi))
```

In contrast, methods of PyLammps accept parameters directly and will convert them automatically to a final command string.

```
L.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```

System state

In addition to dispatching commands directly through the PyLammps object, it also provides several properties which allow you to query the system state.

L.system

Is a dictionary describing the system such as the bounding box or number of atoms

L.system.xlo, L.system.xhi

bounding box limits along x-axis

L.system.ylo, L.system.yhi

bounding box limits along y-axis

L.system.zlo, L.system.zhi

bounding box limits along z-axis

L.communication

configuration of communication subsystem, such as the number of threads or processors

L.communication.nthreads

number of threads used by each LAMMPS process

L.communication.nprocs

number of MPI processes used by LAMMPS

L.fixes

List of fixes in the current system

L.computes

List of active computes in the current system

L.dump

List of active dumps in the current system

L.groups

List of groups present in the current system

Working with LAMMPS variables

LAMMPS variables can be both defined and accessed via the PyLammps interface.

To define a variable you can use the *variable* command:

```
L.variable("a index 2")
```

A dictionary of all variables is returned by `L.variables`

you can access an individual variable by retrieving a variable object from the `L.variables` dictionary by name

```
a = L.variables['a']
```

The variable value can then be easily read and written by accessing the `value` property of this object.

```
print(a.value)
a.value = 4
```

Retrieving the value of an arbitrary LAMMPS expressions

LAMMPS expressions can be immediately evaluated by using the eval method. The passed string parameter can be any expression containing global thermo values, variables, compute or fix data.

```
result = L.eval("ke") # kinetic energy
result = L.eval("pe") # potential energy

result = L.eval("v_t/2.0")
```

Accessing atom data

All atoms in the current simulation can be accessed by using the L.atoms list. Each element of this list is an object which exposes its properties (id, type, position, velocity, force, etc.).

```
# access first atom
L.atoms[0].id
L.atoms[0].type

# access second atom
L.atoms[1].position
L.atoms[1].velocity
L.atoms[1].force
```

Some properties can also be used to set:

```
# set position in 2D simulation
L.atoms[0].position = (1.0, 0.0)

# set position in 3D simulation
L.atoms[0].position = (1.0, 0.0, 1.)
```

Evaluating thermo data

Each simulation run usually produces thermo output based on system state, computes, fixes or variables. The trajectories of these values can be queried after a run via the L.runs list. This list contains a growing list of run data. The first element is the output of the first run, the second element that of the second run.

```
L.run(1000)
L.runs[0] # data of first 1000 time steps

L.run(1000)
L.runs[1] # data of second 1000 time steps
```

Each run contains a dictionary of all trajectories. Each trajectory is accessible through its thermo name:

```
L.runs[0].thermo.Step # list of time steps in first run
L.runs[0].thermo.Ke   # list of kinetic energy values in first run
```

Together with matplotlib plotting data out of LAMMPS becomes simple:

```
import matplotlib.pyplot as plt
steps = L.runs[0].thermo.Step
ke     = L.runs[0].thermo.Ke
plt.plot(steps, ke)
```

Error handling with PyLammps

Using C++ exceptions in LAMMPS for errors allows capturing them on the C++ side and rethrowing them on the Python side. This way you can handle LAMMPS errors through the Python exception handling mechanism.

Warning

Capturing a LAMMPS exception in Python can still mean that the current LAMMPS process is in an illegal state and must be terminated. It is advised to save your data and terminate the Python instance as quickly as possible.

Using PyLammps in IPython notebooks and Jupyter

If the LAMMPS Python package is installed for the same Python interpreter as IPython, you can use PyLammps directly inside of an IPython notebook inside of Jupyter. Jupyter is a powerful integrated development environment (IDE) for many dynamic languages like Python, Julia and others, which operates inside of any web browser. Besides auto-completion and syntax highlighting it allows you to create formatted documents using Markup, mathematical formulas, graphics and animations intermixed with executable Python code. It is a great format for tutorials and showcasing your latest research.

To launch an instance of Jupyter simply run the following command inside your Python environment (this assumes you followed the Quick Start instructions):

```
jupyter notebook
```

IPyLammps Examples

Examples of IPython notebooks can be found in the `python/examples/pylammps` subdirectory. To open these notebooks launch *jupyter notebook* inside this directory and navigate to one of them. If you compiled and installed a LAMMPS shared library with exceptions, PNG, JPEG and FFMPEG support you should be able to rerun all of these notebooks.

Validating a dihedral potential

This example showcases how an IPython Notebook can be used to compare a simple LAMMPS simulation of a harmonic dihedral potential to its analytical solution. Four atoms are placed in the simulation and the dihedral potential is applied on them using a datafile. Then one of the atoms is rotated along the central axis by setting its position from Python, which changes the dihedral angle.

```
phi = [d * math.pi / 180 for d in range(360)]

pos = [(1.0, math.cos(p), math.sin(p)) for p in phi]

pe = []
for p in pos:
```

(continues on next page)

(continued from previous page)

```
L.atoms[3].position = p
L.run(0)
pe.append(L.eval("pe"))
```

By evaluating the potential energy for each position we can verify that trajectory with the analytical formula. To compare both solutions, we plot both trajectories over each other using matplotlib, which embeds the generated plot inside the IPython notebook.

```
In [11]: L.image(zoom=1.0)
Out[11]:
```

```
In [14]: L.image(zoom=1.0)
Out[14]:
```

```
In [27]: plt.plot(range(360), pe, range(360), E_analytical)
plt.xlabel('angle')
plt.ylabel('E')
```

Running a Monte Carlo relaxation

This second example shows how to use PyLammps to create a 2D Monte Carlo Relaxation simulation, computing and plotting energy terms and even embedding video output.

Initially, a 2D system is created in a state with minimal energy.

It is then disordered by moving each atom by a random delta.

```
random.seed(27848)
deltaperturb = 0.2

for i in range(L.system.natoms):
    x, y = L.atoms[i].position
    dx = deltaperturb * random.uniform(-1, 1)
    dy = deltaperturb * random.uniform(-1, 1)
    L.atoms[i].position = (x+dx, y+dy)

L.run(0)
```

Finally, the Monte Carlo algorithm is implemented in Python. It continuously moves random atoms by a random delta and only accepts certain moves.

```
estart = L.eval("pe")
elast = estart

naccept = 0
energies = [estart]

niterations = 3000
deltamove = 0.1
kT = 0.05

natoms = L.system.natoms

for i in range(niterations):
    iatom = random.randrange(0, natoms)
    current_atom = L.atoms[iatom]
```

(continues on next page)

(continued from previous page)

```
x0, y0 = current_atom.position

dx = deltamove \* random.uniform(-1, 1)
dy = deltamove \* random.uniform(-1, 1)

current_atom.position = (x0+dx, y0+dy)

L.run(1, "pre no post no")

e = L.eval("pe")
energies.append(e)

if e <= elast:
    naccept += 1
    elast = e
elif random.random() <= math.exp(natoms\*(elast-e)/kT):
    naccept += 1
    elast = e
else:
    current_atom.position = (x0, y0)
```

The energies of each iteration are collected in a Python list and finally plotted using matplotlib.

```
In [20]: plt.xlabel('iteration')
plt.ylabel('potential energy')
plt.plot(energies)
```

Figure 1

```
Out[20]: [<matplotlib.lines.Line2D at 0x7f26a40123c8>]
```

The IPython notebook also shows how to use dump commands and embed video files inside of the IPython notebook.

Using PyLammps and mpi4py (Experimental)

PyLammps can be run in parallel using mpi4py. This python package can be installed using

```
pip install mpi4py
```

The following is a short example which reads in an existing LAMMPS input file and executes it in parallel. You can find `in.melt` in the `examples/melt` folder.

```
from mpi4py import MPI
from lammps import PyLammps

L = PyLammps()
L.file("in.melt")

if MPI.COMM_WORLD.rank == 0:
    print("Potential energy: ", L.eval("pe"))
```

(continues on next page)

(continued from previous page)

```
MPI.Finalize()
```

To run this script (melt.py) in parallel using 4 MPI processes we invoke the following mpirun command:

```
mpirun -np 4 python melt.py
```

Warning

Any command must be executed by all MPI processes. However, evaluations and querying the system state is only available on rank 0.

Feedback and Contributing

If you find this Python interface useful, please feel free to provide feedback and ideas on how to improve it to Richard Berger (richard.berger@outlook.com). We also want to encourage people to write tutorial style IPython notebooks showcasing LAMMPS usage and maybe their latest research results.

8.6.6 Using LAMMPS on Windows 10 with WSL

written by Richard Berger

It's always been tricky for us to have LAMMPS users and developers work on Windows. We primarily develop LAMMPS to run on Linux clusters. To teach LAMMPS in workshop settings, we had to redirect Windows users to Linux Virtual Machines such as VirtualBox or Unix-like compilation with Cygwin.

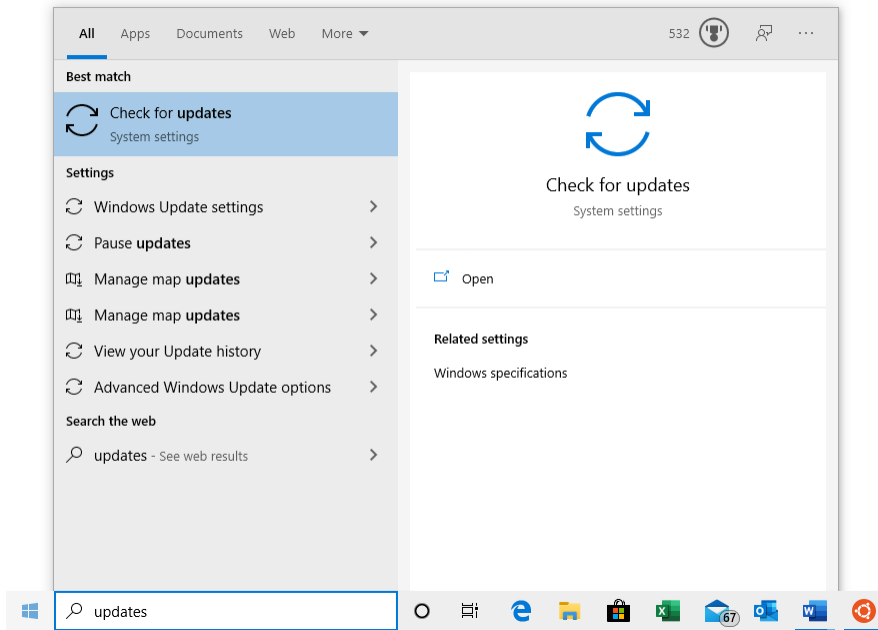

With the latest updates in Windows 10 (Version 2004, Build 19041 or higher), Microsoft has added a new way to work on Linux-based code. The [Windows Subsystem for Linux \(WSL\)](#). With WSL Version 2, you now get a Linux Virtual Machine that transparently integrates into Windows. All you need is to ensure you have the latest Windows updates installed and enable this new feature. Linux VMs are then easily installed using the Microsoft Store.

In this tutorial, I'll show you how to set up and compile LAMMPS for both serial and MPI usage in WSL2.

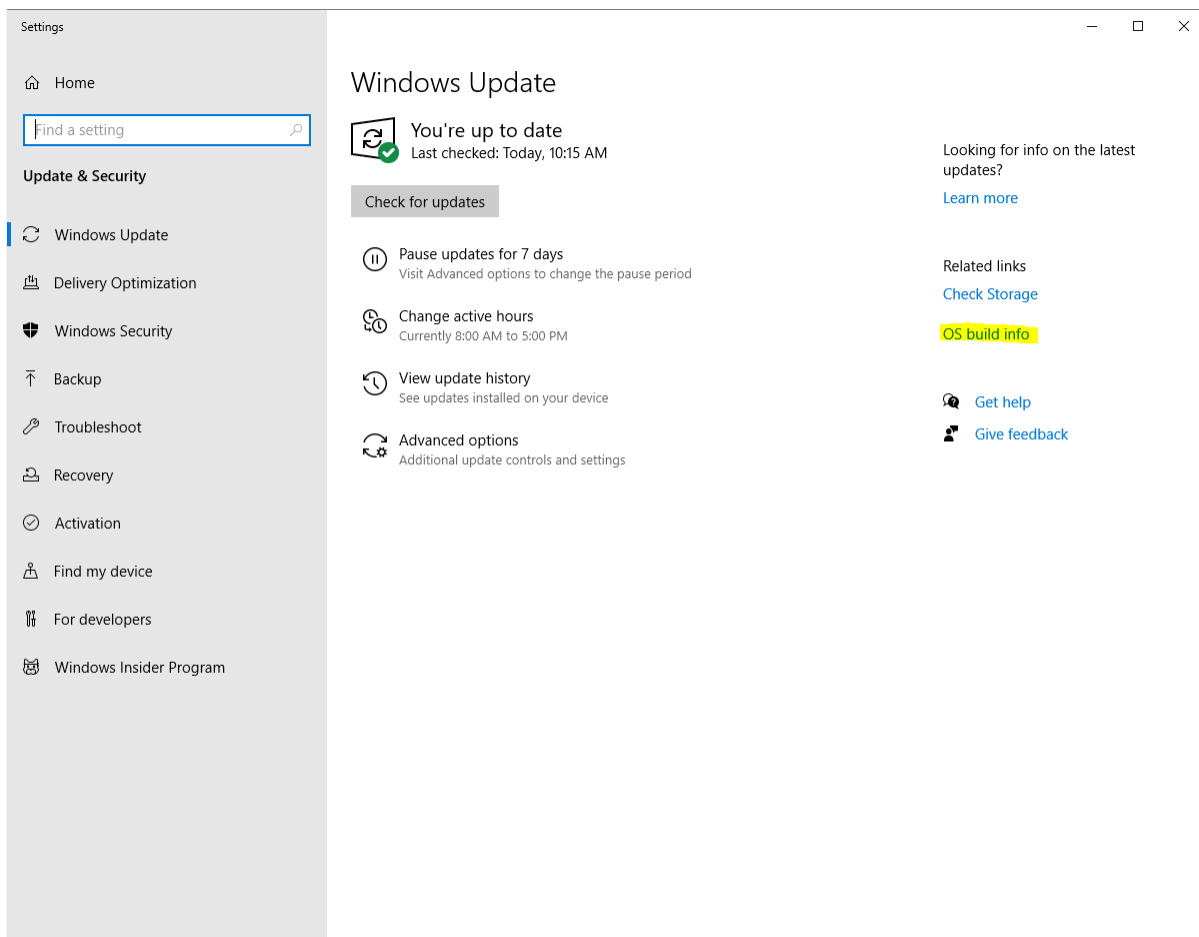

Installation

Upgrade to the latest Windows 10

Type "Updates" in Windows Start and select "Check for Updates".

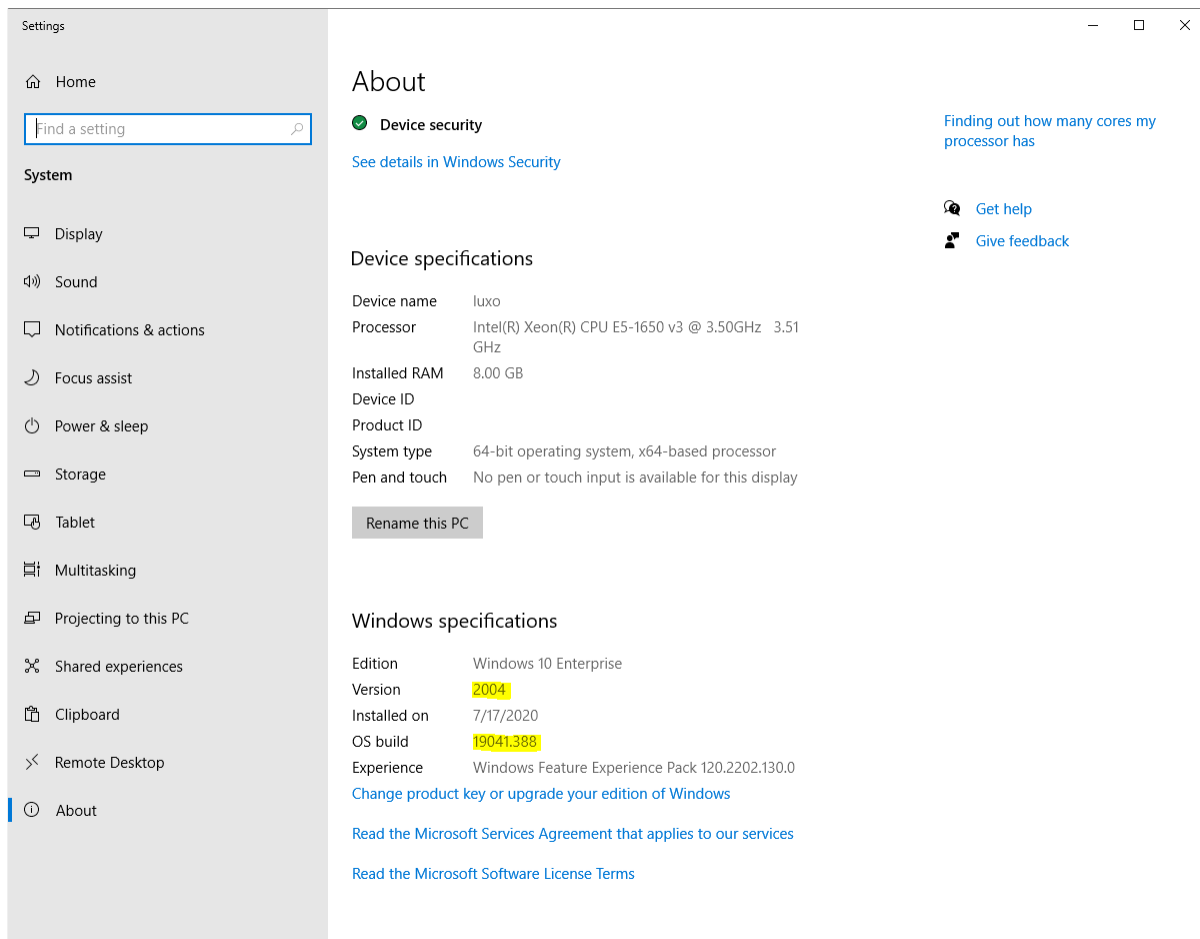

Install all pending updates and reboot your system as many times as necessary. Continue until your Windows installation is updated.

Verify your system has at least **version 2004 and build 19041 or later**. You can find this information by clicking on

“OS build info”.

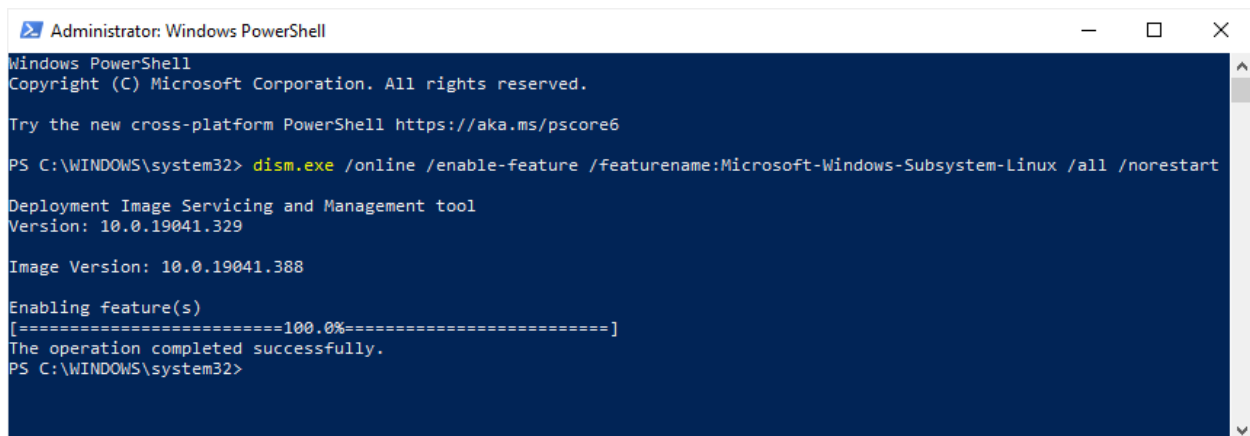

Enable WSL

Next, we must install two additional Windows features to enable WSL support. Open a PowerShell window as an administrator. Type “PowerShell” in Windows Start and select “Run as Administrator”.

Windows will ask you for administrator access. After you accept a new command line window will appear. Type in the following command to install WSL:

```
dism.exe /online /enable-feature /featurename:Microsoft-Windows-Subsystem-Linux /all /
↪norestart
```

Next, enable the VirtualMachinePlatform feature using the following command:

```
dism.exe /online /enable-feature /featurename:VirtualMachinePlatform /all /norestart
```

```
Administrator: Windows PowerShell
PS C:\WINDOWS\system32> dism.exe /online /enable-feature /featurename:VirtualMachinePlatform /all /norestart

Deployment Image Servicing and Management tool
Version: 10.0.19041.329

Image Version: 10.0.19041.388

Enabling feature(s)
[=====100.0%=====]
The operation completed successfully.
PS C:\WINDOWS\system32>
```

Finally, reboot your system.

Update WSL kernel component

Download and install the WSL Kernel Component Update. Afterwards, reboot your system.

Set WSL2 as default

Again, open PowerShell as administrator and run the following command:

```
wsl --set-default-version 2
```

This command ensures that all future Linux installations will use WSL version 2.

```
Administrator: Windows PowerShell
Windows PowerShell
Copyright (C) Microsoft Corporation. All rights reserved.

Try the new cross-platform PowerShell https://aka.ms/pscore6

PS C:\WINDOWS\system32> wsl --set-default-version 2
For information on key differences with WSL 2 please visit https://aka.ms/wsl2
PS C:\WINDOWS\system32>
```

Install a Linux Distribution

Next, we need to install a Linux distribution via the Microsoft Store. Install [Ubuntu 20.04 LTS](#). Once installed, you can launch it like any other application from the Start Menu.

Initial Setup

The first time you launch the Ubuntu Linux console, it will prompt you for a UNIX username and password. You will need this password to perform sudo commands later. Once completed, your Linux shell is ready for use. All your actions and commands will run as the Linux user you specified.

```
richard@luxo: ~
Retype new password:
passwd: password updated successfully
Installation successful!
To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.

Welcome to Ubuntu 20.04 LTS (GNU/Linux 4.4.0-19041-Microsoft x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/advantage

System information as of Fri Jul 17 13:51:44 EDT 2020

System load:  0.52   Processes:      7
Usage of /home: unknown   Users logged in:  0
Memory usage: 53%    IPv4 address for eth0: 10.0.2.15
Swap usage:   0%

0 updates can be installed immediately.
0 of these updates are security updates.

The list of available updates is more than a week old.
To check for new updates run: sudo apt update

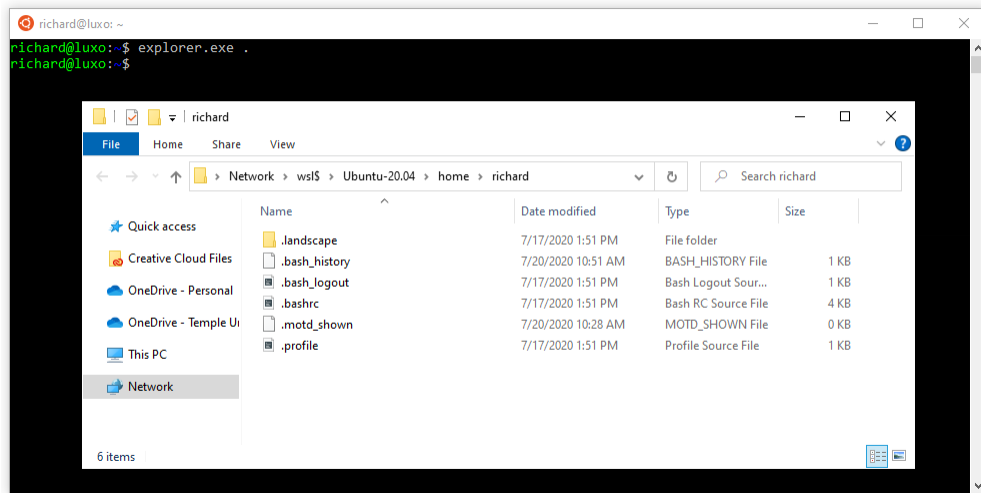

This message is shown once once a day. To disable it please create the
/home/richard/.hushlogin file.
richard@luxo: ~$
```

Windows Explorer / WSL integration

Your Linux installation will have its own Linux filesystem, which contains the Ubuntu files. Your Linux user will have a regular Linux home directory in `/home/<USERNAME>`. This directory is different from your Windows User directory. Windows and Linux filesystems are connected through WSL.

All hard drives in Windows are accessible in the `/mnt` directory in Linux. E.g., WSL maps the C hard drive to the `/mnt/c` directory. That means you can access your Windows User directory in `/mnt/c/Users/<WINDOWS_USERNAME>`.

The Windows Explorer can also access the Linux filesystem. To illustrate this integration, open an Ubuntu console and navigate to a directory of your choice. To view this location in Windows Explorer, use the `explorer.exe .` command (do not forget the final dot!).

Compiling LAMMPS

You now have a fully functioning Ubuntu installation and can follow most guides to install LAMMPS on a Linux system. Here are some of the essential steps to follow:

Install prerequisite packages

Before we can begin, we need to download the necessary compiler toolchain and libraries to compile LAMMPS. In our Ubuntu-based Linux installation, we will use the `apt` package manager to install additional packages.

First, upgrade all existing packages using `apt update` and `apt upgrade`.

```
sudo apt update
sudo apt upgrade -y
```

Next, install the following packages with `apt install`:

```
sudo apt install -y cmake build-essential ccache gfortran openmpi-bin libopenmpi-dev \
    libfftw3-dev libjpeg-dev libpng-dev python3-dev python3-pip \
    python3-virtualenv libblas-dev liblapack-dev libhdf5-serial-dev \
    hdf5-tools
```

Download LAMMPS

Obtain a copy of the LAMMPS source code and go into it using the `cd` command.

Option 1: Download a LAMMPS tarball using `wget`

```
wget https://github.com/lammps/lammps/archive/stable_3Mar2020.tar.gz
tar xvzf stable_3Mar2020.tar.gz
cd lammps
```

Option 2: Download a LAMMPS development version from GitHub

```
git clone --depth=1 https://github.com/lammps/lammps.git
cd lammps
```

Configure and Compile LAMMPS with CMake

A beginner-friendly way to compile LAMMPS is to use CMake. Create a build directory to compile LAMMPS and move into it. This directory will store the build configuration and any binaries generated during compilation.

```
mkdir build
cd build
```

There are countless ways to compile LAMMPS. It is beyond the scope of this tutorial. If you want to find out more about what can be enabled, please consult the extensive [documentation](#).

To compile a minimal version of LAMMPS, we're going to use a preset. Presets are a way to specify a collection of CMake options using a file.

```
cmake ../cmake/presets/basic.cmake ../cmake
```

This command configures the build and generates the necessary Makefiles. To compile the binary, run the `make` command.

```
make -j 4
```

The `-j` option specifies how many parallel processes will perform the compilation. This option can significantly speed up compilation times. Use a number that corresponds to the number of processors in your system.

After the compilation completes successfully, you will have an executable called `lmp` in the `build` directory.

```
richard@luxo: ~/lammps/build
richard@luxo:~/lammps/build$ ls
CMakeCache.txt  LAMMPSConfig.cmake  Makefile  etc  liblammps.a  lmp
CMakeFiles     LAMMPSConfigVersion.cmake  cmake_install.cmake  includes  liblammps.pc  styles
richard@luxo:~/lammps/build$
```

Please take note of the absolute path of your build directory. You will need to know the location to execute the LAMMPS binary later.

One way of getting the absolute path of the current directory is through the \$PWD variable:

```
# prints out the current value of the PWD variable
echo $PWD
```

Let us save this value in a temporary variable LAMMPS_BUILD_DIR for future use:

```
LAMMPS_BUILD_DIR=$PWD
```

The full path of the LAMMPS binary then is \$LAMMPS_BUILD_DIR/lmp.

Running an example script

Now that we have a LAMMPS binary, we will run a script from the examples folder.

Switch into the examples/melt folder:

```
cd ../examples/melt
```

To run this example in serial, use the following command line:

```
$LAMMPS_BUILD_DIR/lmp -in in.melt
```

To run the same script in parallel using MPI with 4 processes, do the following:

```
mpirun -np 4 $LAMMPS_BUILD_DIR/lmp -in in.melt
```

If you run LAMMPS for the first time, the Windows Firewall might prompt you to confirm access. LAMMPS is accessing the network stack to enable parallel computation. Allow the access.

In either serial or MPI case, LAMMPS executes and will output something similar to this:

```
LAMMPS (30 Jun 2020)
```

```
...
...
...
```

(continues on next page)

(continued from previous page)

```
Total # of neighbors = 151513
Ave neighs/atom = 37.878250
Neighbor list builds = 12
Dangerous builds not checked
Total wall time: 0:00:00
```

Congratulations! You’ve successfully compiled and executed LAMMPS on WSL!

Final steps

It is cumbersome to always specify the path of your LAMMPS binary. You can avoid this by adding the absolute path of your build directory to your PATH environment variable.

```
export PATH=$LAMMPS_BUILD_DIR:$PATH
```

You can then run LAMMPS input scripts like this:

```
lmp -in in.melt
```

or

```
mpirun -np 4 lmp -in in.melt
```

Note

The value of this PATH variable will disappear once you close your console window. To persist this setting edit the \$HOME/.bashrc file using your favorite text editor and add this line:

```
export PATH=/full/path/to/your/lammps/build:$PATH
```

Example: If the LAMMPS executable *lmp* has the following absolute path:

```
/home/<USERNAME>/lammps/build/lmp
```

the PATH variable should be:

```
export PATH=/home/<USERNAME>/lammps/build:$PATH
```

Once set up, all your Ubuntu consoles will always have access to your *lmp* binary without having to specify its location.

Conclusion

I hope this gives you good overview on how to start compiling and running LAMMPS on Windows. WSL makes preparing and running scripts on Windows a much better experience.

If you are completely new to Linux, I highly recommend investing some time in studying Linux online tutorials. E.g., tutorials about Bash Shell and Basic Unix commands (e.g., [Linux Journey](#)). Acquiring these skills will make you much more productive in this environment.

EXAMPLE SCRIPTS

The LAMMPS distribution includes an examples subdirectory with many sample problems. Many are 2d models that run quickly and are straightforward to visualize, requiring at most a couple of minutes to run on a desktop machine. Each problem has an input script (in.*) and produces a log file (log.*) when it runs. Some use a data file (data.*) of initial coordinates as additional input. A few sample log file run on different machines and different numbers of processors are included in the directories to compare your answers to. E.g. a log file like log.date.crack.foo.P means the “crack” example was run on P processors of machine “foo” on that date (i.e. with that version of LAMMPS).

Many of the input files have commented-out lines for creating dump files and image files.

If you uncomment the *dump* command in the input script, a text dump file will be produced, which can be animated by various *visualization programs*.

If you uncomment the *dump image* command in the input script, and assuming you have built LAMMPS with a JPG library, JPG snapshot images will be produced when the simulation runs. They can be quickly post-processed into a movie using commands described on the *dump image* doc page.

Animations of many of the examples can be viewed on the Movies section of the *LAMMPS website*.

There are two kinds of subdirectories in the examples folder. Lower case named directories contain one or a few simple, quick-to-run problems. Upper case named directories contain up to several complex scripts that illustrate a particular kind of simulation method or model. Some of these run for longer times, e.g. to measure a particular quantity.

Lists of both kinds of directories are given below.

9.1 Lowercase directories

accelerate	run with various acceleration options (OpenMP, GPU, Phi)
airebo	polyethylene with AIREBO potential
atm	Axilrod-Teller-Muto potential example
balance	dynamic load balancing, 2d system
body	body particles, 2d system
bpm	BPM simulations of pouring elastic grains and plate impact
cmap	CMAF 5-body contributions to CHARMM force field
colloid	big colloid particles in a small particle solvent, 2d system
comb	models using the COMB potential
controller	use of fix controller as a thermostat
coreshell	core/shell model using CORESHELL package
crack	crack propagation in a 2d solid
deposit	deposit atoms and molecules on a surface

continues on next page

Table 1 – continued from previous page

dipole	point dipolar particles, 2d system
dreiding	methanol via Dreiding FF
eim	NaCl using the EIM potential
ellipse	ellipsoidal particles in spherical solvent, 2d system
flow	Couette and Poiseuille flow in a 2d channel
friction	frictional contact of spherical asperities between 2d surfaces
mc	Monte Carlo features via fix gcmc, widom and other commands
granregion	use of fix wall/region/gran as boundary on granular particles
hugoniostat	Hugoniostat shock dynamics
hyper	global and local hyperdynamics of diffusion on Pt surface
indent	spherical indenter into a 2d solid
kim	use of potentials from the OpenKIM Repository
mdi	use of the MDI package and MolSSI MDI code coupling library
meam	MEAM test for SiC and shear (same as shear examples)
melt	rapid melt of 3d LJ system
micelle	self-assembly of small lipid-like molecules into 2d bilayers
min	energy minimization of 2d LJ melt
msst	MSST shock dynamics
multi	multi neighboring for systems with large interaction disparities
nb3b	use of non-bonded 3-body harmonic pair style
neb	nudged elastic band (NEB) calculation for barrier finding
nemd	non-equilibrium MD of 2d sheared system
obstacle	flow around two voids in a 2d channel
peptide	dynamics of a small solvated peptide chain (5-mer)
peri	Peridynamic model of cylinder impacted by indenter
pour	pouring of granular particles into a 3d box, then chute flow
prd	parallel replica dynamics of vacancy diffusion in bulk Si
python	using embedded Python in a LAMMPS input script
qeq	use of the QEQ package for charge equilibration
rdf-adf	computing radial and angle distribution functions for water
reax	RDX and TATB models using the ReaxFF
rerun	use of rerun and read_dump commands
rheo	RHEO simulations of fluid flows and phase transitions
rigid	rigid bodies modeled as independent or coupled
shear	sideways shear applied to 2d solid, with and without a void
snap	NVE dynamics for BCC tantalum crystal using SNAP potential
srd	stochastic rotation dynamics (SRD) particles as solvent
streitz	use of Streitz/Mintmire potential with charge equilibration
tad	temperature-accelerated dynamics of vacancy diffusion in bulk Si
threebody	regression test input for a variety of manybody potentials
tracker	track interactions in LJ melt
vashishta	use of the Vashishta potential
voronoi	Voronoi tessellation via compute voronoi/atom command

Here is how you can run and visualize one of the sample problems:

```
cd indent
cp ../../src/lmp_linux .           # copy LAMMPS executable to this dir
lmp_linux -in in.indent            # run the problem
```

Running the simulation produces the files *dump.indent* and *log.lammps*. You can visualize the dump file of snapshots with a variety of third-party tools highlighted on the [Visualization](#) page of the LAMMPS website.

If you uncomment the *dump image* line(s) in the input script a series of JPG images will be produced by the run (assuming you built LAMMPS with JPG support; see the *Build_settings* page for details). These can be viewed individually or turned into a movie or animated by tools like ImageMagick or QuickTime or various Windows-based tools. See the *dump image* page for more details. E.g. this Imagemagick command would create a GIF file suitable for viewing in a browser.

```
% convert -loop 1 *.jpg foo.gif
```

9.2 Uppercase directories

ASPHERE	various aspherical particle models, using ellipsoids, rigid bodies, line/triangle particles, etc
COUPLE	examples of how to use LAMMPS as a library
DIFFUSE	compute diffusion coefficients via several methods
ELASTIC	compute elastic constants at zero temperature
ELASTIC_T	compute elastic constants at finite temperature
HEAT	compute thermal conductivity for LJ and water via fix ehex
KAPPA	compute thermal conductivity via several methods
MC-LOOP	using LAMMPS in a Monte Carlo mode to relax the energy of a system in a input script loop
PACKAGES	examples for specific packages and contributed commands
SPIN	examples for features of the SPIN package
UNITS	examples that run the same simulation in lj, real, metal units
VISCOSITY	compute viscosity via several methods

Nearly all of these directories have README files which give more details on how to understand and use their contents.

The PACKAGES directory has a large number of subdirectories which correspond by name to specific packages. They contain scripts that illustrate how to use the command(s) provided in those packages. Many of the subdirectories have their own README files which give further instructions. See the *Packages_details* doc page for more info on specific packages.

AUXILIARY TOOLS

LAMMPS is designed to be a computational kernel for performing molecular dynamics computations. Additional pre- and post-processing steps are often necessary to setup and analyze a simulation. A list of such tools can be found on the [LAMMPS webpage](#) at these links:

- [Pre/Post processing](#)
- [External LAMMPS packages & tools](#)
- [Pizza.py toolkit](#)

The last link for [Pizza.py](#) is a Python-based tool developed at Sandia which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations.

Additional tools included in the LAMMPS distribution are described on this page.

Note that many users write their own setup or analysis tools or use other existing codes and convert their output to a LAMMPS input format or vice versa. The tools listed here are included in the LAMMPS distribution as examples of auxiliary tools. Some of them are not actively supported by the LAMMPS developers, as they were contributed by LAMMPS users. If you have problems using them, we can direct you to the authors.

The source code for each of these codes is in the tools subdirectory of the LAMMPS distribution. There is a Makefile (which you may need to edit for your platform) which will build several of the tools which reside in that directory. Most of them are larger packages in their own subdirectories with their own Makefiles and/or README files.

10.4 Tool descriptions

10.4.1 amber2lmp tool

The `amber2lmp` subdirectory contains two Python scripts for converting files back-and-forth between the AMBER MD code and LAMMPS. See the README file in `amber2lmp` for more information.

These tools were written by Keir Novik while he was at Queen Mary University of London. Keir is no longer there and cannot support these tools which are out-of-date with respect to the current LAMMPS version (and maybe with respect to AMBER as well). Since we don't use these tools at Sandia, you will need to experiment with them and make necessary modifications yourself.

10.4.2 binary2txt tool

The file `binary2txt.cpp` converts one or more binary LAMMPS dump file into ASCII text files. The syntax for running the tool is

```
binary2txt file1 file2 ...
```

which creates `file1.txt`, `file2.txt`, etc. This tool must be compiled on a platform that can read the binary file created by a LAMMPS run, since binary files are not compatible across all platforms.

10.4.3 ch2Imp tool

The ch2Imp subdirectory contains tools for converting files back-and-forth between the CHARMM MD code and LAMMPS.

They are intended to make it easy to use CHARMM as a builder and as a post-processor for LAMMPS. Using charmm2lammpls.pl, you can convert a PDB file with associated CHARMM info, including CHARMM force field data, into its LAMMPS equivalent. Support for the CMAP correction of CHARMM22 and later is available as an option. This tool can also add solvent water molecules and Na+ or Cl- ions to the system. Using lammpls2pdb.pl you can convert LAMMPS atom dumps into PDB files.

See the README file in the ch2Imp subdirectory for more information.

These tools were created by Pieter in't Veld (pjintve at sandia.gov) and Paul Crozier (pscrozi at sandia.gov) at Sandia.

CMAP support added and tested by Xiaohu Hu (hux2 at ornl.gov) and Robert A. Latour (latourr at clemson.edu), David Hyde-Volpe, and Tigran Abramyan, (Clemson University) and Chris Lorenz (chris.lorenz at kcl.ac.uk), King's College London.

10.4.4 chain tool

The file chain.f90 creates a LAMMPS data file containing bead-spring polymer chains and/or monomer solvent atoms. It uses a text file containing chain definition parameters as an input. The created chains and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a “soft” pair potential to un-overlap it. The syntax for running the tool is

```
chain < def.chain > data.file
```

See the def.chain or def.chain.ab files in the tools directory for examples of definition files. This tool was used to create the system for the [chain benchmark](#).

10.4.5 LAMMPS coding standard

The coding_standard folder contains multiple python scripts to check for and apply some LAMMPS coding conventions. The following scripts are available:

```
permissions.py # detects if sources have executable permissions and scripts have not
whitespace.py  # detects TAB characters and trailing whitespace
homepage.py    # detects outdated LAMMPS homepage URLs (pointing to sandia.gov instead
→of lammpls.org)
errordocs.py   # detects deprecated error docs in header files
versiontags.py # detects .. versionadded:: or .. versionchanged:: with pending version
→date
```

The tools need to be given the main folder of the LAMMPS distribution or individual file names as argument and will by default check them and report any non-compliance. With the optional -f argument the corresponding script will try to change the non-compliant file(s) to match the conventions.

For convenience this scripts can also be invoked by the make file in the src folder with, *make check-whitespace* or *make fix-whitespace* to either detect or edit the files. Correspondingly for the other python scripts. *make check* will run all checks.

10.4.6 colvars tools

The colvars directory contains a collection of tools for post-processing data produced by the colvars collective variable library. To compile the tools, edit the makefile for your system and run “make”.

Please report problems and issues the colvars library and its tools at: <https://github.com/colvars/colvars/issues>

abf_integrate:

MC-based integration of multidimensional free energy gradient Version 20110511

```
./abf_integrate < filename > [-n < nsteps >] [-t < temp >] [-m [0|1] (metadynamics)] [-h  
->< hill_height >] [-f < variable_hill_factor >]
```

The LAMMPS interface to the colvars collective variable library, as well as these tools, were created by Axel Kohlmeyer (akohlmey at gmail.com) while at ICTP, Italy.

10.4.7 createatoms tool

The tools/createatoms directory contains a Fortran program called createAtoms.f which can generate a variety of interesting crystal structures and geometries and output the resulting list of atom coordinates in LAMMPS or other formats.

See the included Manual.pdf for details.

The tool is authored by Xiaowang Zhou (Sandia), xzhou at sandia.gov.

10.4.8 drude tool

The tools/drude directory contains a Python script called polarizer.py which can add Drude oscillators to a LAMMPS data file in the required format.

See the header of the polarizer.py file for details.

The tool is authored by Agilio Padua and Alain Dequidt: agilio.padua at ens-lyon.fr, alain.dequidt at uca.fr

10.4.9 eam database tool

The tools/eam_database directory contains a Fortran and a Python program that will generate EAM alloy setfl potential files for any combination of the 17 elements: Cu, Ag, Au, Ni, Pd, Pt, Al, Pb, Fe, Mo, Ta, W, Mg, Co, Ti, Zr, Cr. The files can then be used with the *pair_style eam/alloy* command.

The Fortran version of the tool was authored by Xiaowang Zhou (Sandia), xzhou at sandia.gov, with updates from Lucas Hale (NIST) lucas.hale at nist.gov and is based on his paper:

X. W. Zhou, R. A. Johnson, and H. N. G. Wadley, Phys. Rev. B, 69, 144113 (2004).

The parameters for Cr were taken from:

Lin Z B, Johnson R A and Zhigilei L V, Phys. Rev. B 77 214108 (2008).

The Python version of the tool was authored by Germain Clavier (TU Eindhoven) g.m.g.c.clavier at tue.nl or germain.clavier at gmail.com

Note

The parameters in the database are only optimized for individual elements. The mixed parameters for interactions between different elements generated by this tool are derived from simple mixing rules and are thus inferior to parameterizations that are specifically optimized for specific mixtures and combinations of elements.

10.4.10 eam generate tool

The tools/eam_generate directory contains several one-file C programs that convert an analytic formula into a tabulated *embedded atom method (EAM)* setfl potential file. The potentials they produce are in the potentials directory, and can be used with the *pair_style eam/alloy* command.

The source files and potentials were provided by Gerolf Ziegenhain (gerolf at ziegenhain.com).

10.4.11 eff tool

The tools/eff directory contains various scripts for generating structures and post-processing output for simulations using the electron force field (eFF).

These tools were provided by Andres Jaramillo-Botero at CalTech (ajaramil at wag.caltech.edu).

10.4.12 emacs tool

The tools/emacs directory contains an Emacs Lisp add-on file for GNU Emacs that enables a lammps-mode for editing input scripts when using GNU Emacs, with various highlighting options set up.

These tools were provided by Aidan Thompson at Sandia (athomps at sandia.gov).

10.4.13 fep tool

The tools/fep directory contains Python scripts useful for post-processing results from performing free-energy perturbation simulations using the FEP package.

The scripts were contributed by Agilio Padua (ENS de Lyon), agilio.padua at ens-lyon.fr.

See README file in the tools/fep directory.

10.4.14 i-PI tool

Changed in version 27June2024.

The tools/i-pi directory used to contain a bundled version of the i-PI software package for use with LAMMPS. This version, however, was removed in 06/2024.

The i-PI package was created and is maintained by Michele Ceriotti, michele.ceriotti at gmail.com, to interface to a variety of molecular dynamics codes.

i-PI is now available via PyPI using the pip package manager at: <https://pypi.org/project/ipi/>

Here are the commands to set up a virtual environment and install i-PI into it with all its dependencies.

```
python -m venv ipienv
source ipienv/bin/activate
pip install --upgrade pip
pip install ipi
```

To install the development version from GitHub, please use:

```
pip install git+https://github.com/i-pi/i-pi.git
```

For further information, please consult the [i-PI home page](<https://ipi-code.org>).

10.4.15 ipp tool

The tools/ipp directory contains a Perl script ipp which can be used to facilitate the creation of a complicated file (say, a LAMMPS input script or tools/createatoms input file) using a template file.

ipp was created and is maintained by Reese Jones (Sandia), rjones at sandia.gov.

See two examples in the tools/ipp directory. One of them is for the tools/createatoms tool's input file.

10.4.16 kate tool

The file in the tools/kate directory is an add-on to the Kate editor in the KDE suite that allow syntax highlighting of LAMMPS input scripts. See the README.txt file for details.

The file was provided by Alessandro Luigi Sellerio (alessandro.sellerio at ieni.cnr.it).

10.4.17 LAMMPS-GUI

Added in version 2Aug2023.

Overview

LAMMPS-GUI is a graphical text editor customized for editing LAMMPS input files that is linked to the *LAMMPS C-library* and thus can run LAMMPS directly using the contents of the editor's text buffer as input. It can retrieve and display information from LAMMPS while it is running, display visualizations created with the *dump image command*, and is adapted specifically for editing LAMMPS input files through syntax highlighting, text completion, and reformatting, and linking to the online LAMMPS documentation for known LAMMPS commands and styles.

This is similar to what people traditionally would do to run LAMMPS but all rolled into a single application: that is, using a text editor, plotting program, and a visualization program to edit the input, run LAMMPS, process the output into graphs and visualizations from a command line window. This similarity is a design goal. While making it easy for beginners to start with LAMMPS, it is also the expectation that LAMMPS-GUI users will eventually transition to workflows that most experienced LAMMPS users employ.

All features have been extensively exposed to keyboard shortcuts, so that there is also appeal for experienced LAMMPS users for prototyping and testing simulation setups.

Features

A detailed discussion and explanation of all features and functionality are in the *Using the LAMMPS-GUI* tutorial Howto page.

Here are a few highlights of LAMMPS-GUI

- Text editor with syntax highlighting customized for LAMMPS
- Text editor features command completion for known commands and styles
- Text editor will switch working directory to folder of file in buffer
- Text editor will remember up to 5 recent files
- Context specific LAMMPS command help via online documentation
- LAMMPS is running in a concurrent thread, so the GUI remains responsive
- Support for most accelerator packages
- Progress bar indicates how far a run command is completed
- LAMMPS can be started and stopped with a hotkey
- Screen output is captured in a Log Window
- Thermodynamic output is captured and displayed as line graph in a Chart Window
- Indicator for currently executed command
- Indicator for line that caused an error
- Visualization of current state in Image Viewer (via calling *write_dump image*)
- Capture of images created via *dump image* in Slide show window
- Many adjustable settings and preferences that are persistent
- Dialog to set variables, similar to the LAMMPS command line flag '-v' / '-var'

Parallelization

Due to its nature as a graphical application, it is not possible to use the LAMMPS-GUI in parallel with MPI, but OpenMP multi-threading and GPU acceleration is available and enabled by default.

Prerequisites and portability

LAMMPS-GUI is programmed in C++ based on the C++11 standard and using the [Qt GUI framework](#). Currently, Qt version 5.12 or later is required; Qt 5.15LTS is recommended; support for Qt version 6.x is available. Building LAMMPS with CMake is required.

The LAMMPS-GUI has been successfully compiled and tested on:

- Ubuntu Linux 20.04LTS x86_64 using GCC 9, Qt version 5.12
- Fedora Linux 40 x86_64 using GCC 14 and Clang 17, Qt version 5.15LTS
- Fedora Linux 40 x86_64 using GCC 14, Qt version 6.7
- Apple macOS 12 (Monterey) and macOS 13 (Ventura) with Xcode on arm64 and x86_64, Qt version 5.15LTS
- Windows 10 and 11 x86_64 with Visual Studio 2022 and Visual C++ 14.36, Qt version 5.15LTS
- Windows 10 and 11 x86_64 with MinGW / GCC 10.0 cross-compiler on Fedora 38, Qt version 5.15LTS

Pre-compiled executables

Pre-compiled LAMMPS executable packages that include the GUI are currently available from <https://download.lammps.org/static> or <https://github.com/lammps/lammps/releases>. You can unpack the archives (or mount the macOS disk image) and run the GUI directly in place. The folder may also be moved around and added to the PATH environment variable so the executables will be found automatically. The LAMMPS-GUI executable is called `lammps-gui` and either takes no arguments or attempts to load the first argument as LAMMPS input file.

Compilation

The source for the LAMMPS-GUI is included with the LAMMPS source code distribution in the folder `tools/lammps-gui` and thus it can be built as part of a regular LAMMPS compilation. *Using CMake* is required. To enable its compilation, the CMake variable `-D BUILD_LAMMPS_GUI=on` must be set when creating the CMake configuration. All other settings (compiler, flags, compile type) for LAMMPS-GUI are then inherited from the regular LAMMPS build. If the Qt library is packaged for Linux distributions, then its location is typically auto-detected since the required CMake configuration files are stored in a location where CMake can find them without additional help. Otherwise, the location of the Qt library installation must be indicated by setting `-D Qt5_DIR=/path/to/qt5/lib/cmake/Qt5`, which is a path to a folder inside the Qt installation that contains the file `Qt5Config.cmake`. Similarly, for Qt6 the location of the Qt library installation can be indicated by setting `-D Qt6_DIR=/path/to/qt6/lib/cmake/Qt6`, if necessary. When both, Qt5 and Qt6 are available, Qt6 will be preferred unless `-D LAMMPS_GUI_USE_QT5=yes` is set.

It is possible to build the LAMMPS-GUI as a standalone compilation (e.g. when LAMMPS has been compiled with traditional make). Then the CMake configuration needs to be told where to find the LAMMPS headers and the LAMMPS library, via `-D LAMMPS_SOURCE_DIR=/path/to/lammps/src`. CMake will try to guess a build folder with the LAMMPS library from that path, but it can also be set with `-D LAMMPS_LIB_DIR=/path/to/lammps/lib`.

Rather than linking to the LAMMPS library during compilation, it is also possible to compile the GUI with a plugin loader that will load the LAMMPS library dynamically at runtime during the start of the GUI from a shared library; e.g. `liblammps.so` or `liblammps.dylib` or `liblammps.dll` (depending on the operating system). This has the advantage that the LAMMPS library can be built from updated or modified LAMMPS source without having to recompile the

GUI. The ABI of the LAMMPS C-library interface is very stable and generally backward compatible. This feature is enabled by setting `-D LAMMPS_GUI_USE_PLUGIN=on` and then `-D LAMMPS_PLUGINLIB_DIR=/path/to/lammps/plugin/loader`. Typically, this would be the `examples/COUPLE/plugin` folder of the LAMMPS distribution.

Platform notes

macOS

When building on macOS, the build procedure will try to manufacture a drag-n-drop installer, `LAMMPS-macOS-multiarch.dmg`, when using the `'dmg'` target (i.e. `cmake --build <build dir> --target dmg` or `make dmg`).

To build multi-arch executables that will run on both, `arm64` and `x86_64` architectures natively, it is necessary to set the CMake variable `-D CMAKE_OSX_ARCHITECTURES=arm64;x86_64`. To achieve wide compatibility with different macOS versions, you can also set `-D CMAKE_OSX_DEPLOYMENT_TARGET=11.0` which will set compatibility to macOS 11 (Big Sur) and later, even if you are compiling on a more recent macOS version.

Windows

On Windows either native compilation from within Visual Studio 2022 with Visual C++ is supported and tested, or compilation with the MinGW / GCC cross-compiler environment on Fedora Linux.

Visual Studio

Using CMake and Ninja as build system are required. Qt needs to be installed, tested was a binary package downloaded from <https://www.qt.io>, which installs into the `C:\Qt` folder by default. There is a custom `x64-GUI-MSVC` build configuration provided in the `CMakeSettings.json` file that Visual Studio uses to store different compilation settings for project. Choosing this configuration will activate building the `lammps-gui.exe` executable in addition to LAMMPS through importing package selection from the `windows.cmake` preset file and enabling building the LAMMPS-GUI and disabling building with MPI. When requesting an installation from the *Build* menu in Visual Studio, it will create a compressed `LAMMPS-Win10-amd64.zip` zip file with the executables and required dependent .dll files. This zip file can be uncompressed and `lammps-gui.exe` run directly from there. The uncompressed folder can be added to the `PATH` environment and LAMMPS and LAMMPS-GUI can be launched from anywhere from the command line.

MinGW64 Cross-compiler

The standard CMake build procedure can be applied and the `mingw-cross.cmake` preset used. By using `mingw64-cmake` the CMake command will automatically include a suitable CMake toolchain file (the regular `cmake` command can be used after that to modify the configuration settings, if needed). After building the libraries and executables, you can build the target `'zip'` (i.e. `cmake --build <build dir> --target zip` or `make zip` to stage all installed files into a `LAMMPS_GUI` folder and then run a script to copy all required dependencies, some other files, and create a zip file from it.

Linux

Version 5.12 or later of the Qt library is required. Those are provided by, e.g., Ubuntu 20.04 LTS. Thus older Linux distributions are not likely to be supported, while more recent ones will work, even for pre-compiled executables (see above). After compiling with `cmake --build <build folder>`, use `cmake --build <build folder> --target tgz` or `make tgz` to build a `LAMMPS-Linux-amd64.tar.gz` file with the executables and their support libraries.

10.4.18 Imp2arc tool

The Imp2arc subdirectory contains a tool for converting LAMMPS output files to the format for Accelrys' Insight MD code (formerly MSI/Biosym and its Discover MD code). See the README file for more information.

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). John is now at the Mayo Clinic (jec at mayo.edu), but still fields questions about the tool.

This tool was updated for the current LAMMPS C++ version by Jeff Greathouse at Sandia (jagreat at sandia.gov).

10.4.19 Imp2cfg tool

The Imp2cfg subdirectory contains a tool for converting LAMMPS output files into a series of *.cfg files which can be read into the [AtomEye](#) visualizer. See the README file for more information.

This tool was written by Ara Kooser at Sandia (askoose at sandia.gov).

10.4.20 Magic patterns for the “file” command

Added in version 10Mar2021.

The file magic contains patterns that are used by the [file](#) program available on most Unix-like operating systems which enables it to detect various LAMMPS files and print some useful information about them. To enable these patterns, append or copy the contents of the file `.magic` in your home directory or (as administrator) to `/etc/magic` (for a system-wide installation). Afterwards the `file` command should be able to detect most LAMMPS restarts, dump, data and log files. Examples:

```
$ file *.*
dihedral-quadratic.restart:  LAMMPS binary restart file (rev 2), Version 10 Mar 2021,↵
↵Little Endian
mol-pair-wf_cut.restart:    LAMMPS binary restart file (rev 2), Version 24 Dec 2020,↵
↵Little Endian
atom.bin:                   LAMMPS atom style binary dump (rev 2), Little Endian,↵
↵First time step: 445570
custom.bin:                 LAMMPS custom style binary dump (rev 2), Little Endian,↵
↵First time step: 100
bn1.lammpstrj:              LAMMPS text mode dump, First time step: 5000
data.fourmol:               LAMMPS data file written by LAMMPS
pnc.data:                   LAMMPS data file written by msi2lmp
data.spce:                  LAMMPS data file written by TopoTools
B.data:                     LAMMPS data file written by OVITO
log.lammps:                 LAMMPS log file written by version 10 Feb 2021
```

10.4.21 matlab tool

The matlab subdirectory contains several **MATLAB** scripts for post-processing LAMMPS output. The scripts include readers for log and dump files, a reader for EAM potential files, and a converter that reads LAMMPS dump files and produces CFG files that can be visualized with the **AtomEye** visualizer.

See the README.pdf file for more information.

These scripts were written by Arun Subramaniyan at Purdue Univ (asubrama at purdue.edu).

10.4.22 micelle2d tool

The file micelle2d.f creates a LAMMPS data file containing short lipid chains in a monomer solution. It uses a text file containing lipid definition parameters as an input. The created molecules and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a “soft” pair potential to un-overlap it. The syntax for running the tool is

```
micelle2d < def.micelle2d > data.file
```

See the def.micelle2d file in the tools directory for an example of a definition file. This tool was used to create the system for the *micelle example*.

10.4.23 moltemplate tool

The moltemplate subdirectory contains instructions for installing moltemplate, a Python-based tool for building molecular systems based on a text-file description, and creating LAMMPS data files that encode their molecular topology as lists of bonds, angles, dihedrals, etc. See the README.txt file for more information.

This tool was written by Andrew Jewett (jewett.aj at gmail.com), who supports it. It has its own WWW page at <https://moltemplate.org>. The latest sources can be found on its [GitHub page](#)

10.4.24 msi2lmp tool

The msi2lmp subdirectory contains a tool for creating LAMMPS template input and data files from BIOVIA’s Materias Studio files (formerly Accelrys’ Insight MD code, formerly MSI/Biosym and its Discover MD code).

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). Several people contributed changes to remove bugs and adapt its output to changes in LAMMPS.

This tool has several known limitations and is no longer under active development, so there are no changes except for the occasional bug fix.

See the README file in the tools/msi2lmp folder for more information.

10.4.25 Scripts for building LAMMPS when offline

In some situations it might be necessary to build LAMMPS on a system without direct internet access. The scripts in `tools/offline` folder allow you to pre-load external dependencies for both the documentation build and for building LAMMPS with CMake.

It does so by

1. downloading necessary `pip` packages,
2. cloning `git` repositories
3. downloading tarballs

to a designated cache folder.

As of April 2021, all of these downloads make up around 600MB. By default, the offline scripts will download everything into the `$HOME/.cache/lammps` folder, but this can be changed by setting the `LAMMPS_CACHING_DIR` environment variable.

Once the caches have been initialized, they can be used for building the LAMMPS documentation or compiling LAMMPS using CMake on an offline system.

The `use_caches.sh` script must be sourced into the current shell to initialize the offline build environment. Note that it must use the same `LAMMPS_CACHING_DIR`. This script does the following:

1. Set up environment variables that modify the behavior of both, `pip` and `git`
2. Start a simple local HTTP server using Python to host files for CMake

Afterwards, it will print out instruction on how to modify the CMake command line to make sure it uses the local HTTP server.

To undo the environment changes and shutdown the local HTTP server, run the `deactivate_caches` command.

Examples

For all of the examples below, you first need to create the cache, which requires an internet connection.

```
./tools/offline/init_caches.sh
```

Afterwards, you can disconnect or copy the contents of the `LAMMPS_CACHING_DIR` folder to an offline system.

Documentation Build

The documentation build will create a new virtual environment that typically first installs dependencies from `pip`. With the offline environment loaded, these installations will instead grab the necessary packages from your local cache.

```
# if LAMMPS_CACHING_DIR is different from default, make sure to set it first
# export LAMMPS_CACHING_DIR=path/to/folder
source tools/offline/use_caches.sh
cd doc/
make html

deactivate_caches
```

CMake Build

When compiling certain packages with external dependencies, the CMake build system will download necessary files or sources from the web. For more flexibility the CMake configuration allows users to specify the URL of each of these dependencies. What the `init_caches.sh` script does is create a CMake “preset” file, which sets the URLs for all of the known dependencies and redirects the download to the local cache.

```
# if LAMMPS_CACHING_DIR is different from default, make sure to set it first
# export LAMMPS_CACHING_DIR=path/to/folder
source tools/offline/use_caches.sh

mkdir build
cd build
cmake -D LAMMPS_DOWNLOADS_URL=${HTTP_CACHE_URL} -C "${LAMMPS_HTTP_CACHE_CONFIG}" -C ../
→ cmake/presets/most.cmake ../cmake
make -j 8

deactivate_caches
```

10.4.26 phonon tool

The phonon subdirectory contains a post-processing tool, *phana*, useful for analyzing the output of the *fix phonon* command in the PHONON package.

See the README file for instruction on building the tool and what library it needs. And see the examples/PACKAGES/phonon directory for example problems that can be post-processed with this tool.

This tool was written by Ling-Ti Kong at Shanghai Jiao Tong University.

10.4.27 polybond tool

The polybond subdirectory contains a Python-based tool useful for performing “programmable polymer bonding”. The Python file `lmpsdata.py` provides a “Lmpsdata” class with various methods which can be invoked by a user-written Python script to create data files with complex bonding topologies.

See the Manual.pdf for details and example scripts.

This tool was written by Zachary Kraus at Georgia Tech.

10.4.28 pymol_asphere tool

The pymol_asphere subdirectory contains a tool for converting a LAMMPS dump file that contains orientation info for ellipsoidal particles into an input file for the [PyMol visualization package](#) or its [open source variant](#).

Specifically, the tool triangulates the ellipsoids so they can be viewed as true ellipsoidal particles within PyMol. See the README and examples directory within pymol_asphere for more information.

This tool was written by Mike Brown at Sandia.

10.4.29 python tool

The python subdirectory contains several Python scripts that perform common LAMMPS post-processing tasks, such as:

- extract thermodynamic info from a log file as columns of numbers
- plot two columns of thermodynamic info from a log file using GnuPlot
- sort the snapshots in a dump file by atom ID
- convert multiple *NEB* dump files into one dump file for viz
- convert dump files into XYZ, CFG, or PDB format for viz by other packages

These are simple scripts built on [Pizza.py](#) modules. See the README for more info on Pizza.py and how to use these scripts.

10.4.30 replica tool

The tools/replica directory contains the `reorder_remd_traj` python script which can be used to reorder the replica trajectories (resulting from the use of the `temper` command) according to temperature. This will produce discontinuous trajectories with all frames at the same temperature in each trajectory. Additional options can be used to calculate the canonical configurational log-weight for each frame at each temperature using the `pymbar` package. See the `README.md` file for further details. Try out the peptide example provided.

This tool was written by (and is maintained by) Tanmoy Sanyal, while at the Shell lab at UC Santa Barbara. (tanmoy dot 7989 at gmail.com)

10.4.31 smd tool

The smd subdirectory contains a C++ file `dump2vtk_tris.cpp` and `Makefile` which can be compiled and used to convert triangle output files created by the Smooth-Mach Dynamics (MACHDYN) package into a VTK-compatible unstructured grid file. It could then be read in and visualized by VTK.

See the header of `dump2vtk.cpp` for more details.

This tool was written by the MACHDYN package author, Georg Ganzenmuller at the Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute in Germany (georg.ganzenmueller at emi.fhg.de).

10.4.32 spin tool

The spin subdirectory contains a C file `interpolate.c` which can be compiled and used to perform a cubic polynomial interpolation of the MEP following a GNEB calculation.

See the `README` file in `tools/spin/interpolate_gneb` for more details.

This tool was written by the SPIN package author, Julien Tranchida at Sandia National Labs (jtranch at sandia.gov, and by Aleksei Ivanov, at University of Iceland (ali5 at hi.is).

10.4.33 singularity/apptainer tool

The singularity subdirectory contains container definitions files that can be used to build container images for building and testing LAMMPS on specific OS variants using the [Apptainer](#) or [Singularity](#) container software. Contributions for additional variants are welcome. For more details please see the README.md file in that folder.

10.4.34 stl_bin2txt tool

The file `stl_bin2txt.cpp` converts binary STL files - like they are frequently offered for download on the web - into ASCII format STL files that LAMMPS can read with the `create_atoms mesh` or the `fix smd/wall_surface` commands. The syntax for running the tool is

```
stl_bin2txt infile.stl outfile.stl
```

which creates `outfile.stl` from `infile.stl`. This tool must be compiled on a platform compatible with the byte-ordering that was used to create the binary file. This usually is a so-called little endian hardware (like x86).

10.4.35 SWIG interface

The [SWIG tool](#) offers a mostly automated way to incorporate compiled code modules into scripting languages. It processes the function prototypes in C and generates wrappers for a wide variety of scripting languages from it. Thus it can also be applied to the [C language library interface](#) of LAMMPS so that build a wrapper that allows to call LAMMPS from programming languages like: C#/Mono, Lua, Java, JavaScript, Perl, Python, R, Ruby, Tcl, and more.

What is included

We provide here an “interface file”, `lammps.i`, that has the content of the `library.h` file adapted so SWIG can process it. That will create wrappers for all the functions that are present in the LAMMPS C library interface. Please note that not all kinds of C functions can be automatically translated, so you would have to add custom functions to be able to utilize those where the automatic translation does not work. A few functions for converting pointers and accessing arrays are predefined. We provide the file here on an “as is” basis to help people getting started, but not as a fully tested and supported feature of the LAMMPS distribution. Any contributions to complete this are, of course, welcome. Please also note, that for the case of creating a Python wrapper, a fully supported [Ctypes based lammps module](#) already exists. That module is designed to be object-oriented while SWIG will generate a 1:1 translation of the functions in the interface file.

Building the wrapper

When using CMake, the build steps for building a wrapper module are integrated for the languages: Java, Lua, Perl5, Python, Ruby, and Tcl. These require that the LAMMPS library is build as a shared library and all necessary development headers and libraries are present.

```
-D WITH_SWIG=on           # to enable building any SWIG wrapper
-D BUILD_SWIG_JAVA=on     # to enable building the Java wrapper
-D BUILD_SWIG_LUA=on      # to enable building the Lua wrapper
-D BUILD_SWIG_PERL5=on    # to enable building the Perl 5.x wrapper
-D BUILD_SWIG_PYTHON=on   # to enable building the Python wrapper
```

(continues on next page)

(continued from previous page)

```
-D BUILD_SWIG_RUBY=on  # to enable building the Ruby wrapper
-D BUILD_SWIG_TCL=on   # to enable building the Tcl wrapper
```

Manual building allows a little more flexibility. E.g. one can choose the name of the module and build and use a dynamically loaded object for Tcl with:

```
swig -tcl -module tcllammps lammps.i
gcc -fPIC -shared $(pkg-config tcl --cflags) -o tcllammps.so \
    lammps_wrap.c -L ../src/ -llammps
tclsh
```

Or one can build an extended Tcl shell command with the wrapped functions included with:

```
swig -tcl -module tcllmps lammps_shell.i
gcc -o tcllmpsh lammps_wrap.c -Xlinker -export-dynamic \
    -DHAVE_CONFIG_H $(pkg-config tcl --cflags) \
    $(pkg-config tcl --libs) -L ../src -llammps
```

In both cases it is assumed that the LAMMPS library was compiled as a shared library in the `src` folder. Otherwise the last part of the commands needs to be adjusted.

Utility functions

Definitions for several utility functions required to manage and access data passed or returned as pointers are included in the `lammps.i` file. So most of the functionality of the library interface should be accessible. What works and what does not depends a bit on the individual language for which the wrappers are built and how well SWIG supports those. The [SWIG documentation](#) has very detailed instructions and recommendations.

Usage examples

The `tools/swig` folder has multiple shell scripts, `run_<name>_example.sh` that will create a small example script and demonstrate how to load the wrapper and run LAMMPS through it in the corresponding programming language.

For illustration purposes below is a part of the Tcl example script.

```
load ./tcllammps.so
set lmp [lammps_open_no_mpi 0 NULL NULL]
lammps_command $lmp "units real"
lammps_command $lmp "lattice fcc 2.5"
lammps_command $lmp "region box block -5 5 -5 5 -5 5"
lammps_command $lmp "create_box 1 box"
lammps_command $lmp "create_atoms 1 box"

set dt [doublep_value [voidp_to_doublep [lammps_extract_global $lmp dt]]]
puts "LAMMPS version $ver"
puts [format "Number of created atoms: %g" [lammps_get_natoms $lmp]]
puts "Current size of timestep: $dt"
puts "LAMMPS version: [lammps_version $lmp]"
lammps_close $lmp
```

10.4.36 tabulate tool

Added in version 22Dec2022.

The `tabulate` folder contains Python scripts to generate tabulated potential files for LAMMPS. The bulk of the code is in the `tabulate` module in the `tabulate.py` file. Some example files demonstrating its use are included. See the `README` file for more information.

10.4.37 vim tool

The files in the `tools/vim` directory are add-ons to the VIM editor that allow easier editing of LAMMPS input scripts. See the `README.txt` file for details.

These files were provided by Gerolf Ziegenhain (gerolf at ziegenhain.com)

10.4.38 xmgrace tool

The files in the `tools/xmgrace` directory can be used to plot the thermodynamic data in LAMMPS log files via the `xmgrace` plotting package. There are several tools in the directory that can be used in post-processing mode. The `lammplot.cpp` file can be compiled and used to create plots from the current state of a running LAMMPS simulation.

See the `README` file for details.

These files were provided by Vikas Varshney (vv0210 at gmail.com)

ERRORS

These doc pages describe many of the error and warning message you can encounter when using LAMMPS. The common problems include conceptual issues. The messages and warnings doc pages give complete lists of all the messages the code may generate, with additional details for many of them.

11.1 Common problems

If two LAMMPS runs do not produce the exact same answer on different machines or different numbers of processors, this is typically not a bug. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off can cause slight differences and eventual divergence of molecular dynamics phase space trajectories within a few 100s or few 1000s of timesteps. However, the statistical properties of the two runs (e.g. average energy or temperature) should still be the same.

If the *velocity* command is used to set initial atom velocities, a particular atom can be assigned a different velocity when the problem is run on a different number of processors or on different machines. If this happens, the phase space trajectories of the two simulations will rapidly diverge. See the discussion of the *loop* option in the *velocity* command for details and options that avoid this issue.

Similarly, the *create_atoms* command generates a lattice of atoms. For the same physical system, the ordering and numbering of atoms by atom ID may be different depending on the number of processors.

Some commands use random number generators which may be setup to produce different random number streams on each processor and hence will produce different effects when run on different numbers of processors. A commonly-used example is the *fix langevin* command for thermostating.

A LAMMPS simulation typically has two stages, setup and run. Most LAMMPS errors are detected at setup time; others like a bond stretching too far may not occur until the middle of a run.

LAMMPS tries to flag errors and print informative error messages so you can fix the problem. For most errors it will also print the last input script command that it was processing. Of course, LAMMPS cannot figure out your physics or numerical mistakes, like choosing too big a timestep, specifying erroneous force field coefficients, or putting 2 atoms on top of each other! If you run into errors that LAMMPS does not catch that you think it should flag, please send an email to the [developers](#).

If you get an error message about an invalid command in your input script, you can determine what command is causing the problem by looking in the log.lammps file or using the *echo command* to see it on the screen. If you get an error like “Invalid ... style”, with ... being fix, compute, pair, etc, it means that you mistyped the style name or that the command is part of an optional package which was not compiled into your executable. The list of available styles in your executable can be listed by using *the -h command-line switch*. The installation and compilation of optional packages is explained on the [Build packages](#) doc page.

For a given command, LAMMPS expects certain arguments in a specified order. If you mess this up, LAMMPS will often flag the error, but it may also simply read a bogus argument and assign a value that is valid, but not what you wanted. E.g. trying to read the string “abc” as an integer value of 0. Careful reading of the associated doc page for the

command should allow you to fix these problems. In most cases, where LAMMPS expects to read a number, either integer or floating point, it performs a stringent test on whether the provided input actually is an integer or floating-point number, respectively, and reject the input with an error message (for instance, when an integer is required, but a floating-point number 1.0 is provided):

ERROR: Expected integer parameter instead of '1.0' in input script or data file

Some commands allow for using variable references in place of numeric constants so that the value can be evaluated and may change over the course of a run. This is typically done with the syntax `v_name` for a parameter, where name is the name of the variable. On the other hand, immediate variable expansion with the syntax `${name}` is performed while reading the input and before parsing commands,

Note

Using a variable reference (i.e. `v_name`) is only allowed if the documentation of the corresponding command explicitly says it is. Otherwise, you will receive an error message of this kind:

ERROR: Expected floating point parameter instead of 'v_name' in input script or data file

Generally, LAMMPS will print a message to the screen and logfile and exit gracefully when it encounters a fatal error. Sometimes it will print a WARNING to the screen and logfile and continue on; you can decide if the WARNING is important or not. A WARNING message that is generated in the middle of a run is only printed to the screen, not to the logfile, to avoid cluttering up thermodynamic output. If LAMMPS crashes or hangs without spitting out an error message first then it could be a bug (see [this section](#)) or one of the following cases:

LAMMPS runs in the available memory a processor allows to be allocated. Most reasonable MD runs are compute limited, not memory limited, so this should not be a bottleneck on most platforms. Almost all large memory allocations in the code are done via C-style malloc's which will generate an error message if you run out of memory. Smaller chunks of memory are allocated via C++ "new" statements. If you are unlucky you could run out of memory just when one of these small requests is made, in which case the code will crash or hang (in parallel), since LAMMPS does not trap on those errors.

Illegal arithmetic can cause LAMMPS to run slow or crash. This is typically due to invalid physics and numerics that your simulation is computing. If you see wild thermodynamic values or NaN values in your LAMMPS output, something is wrong with your simulation. If you suspect this is happening, it is a good idea to print out thermodynamic info frequently (e.g. every timestep) via the [thermo](#) so you can monitor what is happening. Visualizing the atom movement is also a good idea to ensure your model is behaving as you expect.

In parallel, one way LAMMPS can hang is due to how different MPI implementations handle buffering of messages. If the code hangs without an error message, it may be that you need to specify an MPI setting or two (usually via an environment variable) to enable buffering or boost the sizes of messages that can be buffered.

11.2 Error and warning details

Many errors or warnings are self-explanatory and thus straightforward to resolve. However, there are also cases, where there is no single cause and explanation, where LAMMPS can only detect symptoms of an error but not the exact cause, or where the explanation needs to be more detailed than what can be fit into a message printed by the program. The following are discussions of such cases.

11.2.1 Unknown identifier in data file

This error happens when LAMMPS encounters a line of text with an unexpected keyword while *reading a data file*. This would be either header keywords or section header keywords. This is most commonly due to a mistyped keyword or due to a keyword that is inconsistent with the *atom style* used.

The header section informs LAMMPS how many entries or lines are expected in the various sections (like Atoms, Masses, Pair Coeffs, *etc.*) of the data file. If there is a mismatch, LAMMPS will either keep reading beyond the end of a section or stop reading before the section has ended. In that case the next line will not contain a recognized keyword.

Such a mismatch can also happen when the first line of the data is *not* a comment as required by the format, but a line with a valid header keyword. That would result in LAMMPS expecting, for instance, 0 atoms because the “atoms” header line is the first line and thus treated as a comment.

Another possibility to trigger this error is to have a keyword in the data file that corresponds to a fix (e.g. *fix cmap*) but the *read_data* command is missing the (optional) arguments that identify the fix and the header keyword and section keyword or those arguments are inconsistent with the keywords in the data file.

11.2.2 Incorrect format in ... section of data file

This error happens when LAMMPS reads the contents of a section of a *data file* and the number of parameters in the line differs from what is expected. This most commonly happens, when the atom style is different from what is expected for a specific data file since changing the atom style usually changes the format of the line.

This error can also happen when the number of entries indicated in the header of a data file (e.g. the number of atoms) is larger than the number of lines provided (e.g. in the corresponding Atoms section) and then LAMMPS will continue reading into the next section and that would have a completely different format.

11.3 Reporting bugs

If you are confident that you have found a bug in LAMMPS, please follow the steps outlined below:

- Check the [New features and bug fixes](#) section of the [LAMMPS WWW site](#) or the [GitHub Releases page](#) to see if the bug has already been addressed in a patch release.
- Check that your issue can be reproduced with the latest development version of LAMMPS.
- Check the manual carefully to verify that the unexpected behavior you are observing is indeed in conflict with the documentation
- Check the [GitHub Issue page](#) if your issue has already been reported and if it is still open.
- Check the [GitHub Pull Requests page](#) to see if there is already a fix for your bug pending.
- Check the [LAMMPS forum at MatSci](#) to see if the issue has been discussed before.

If none of these steps yields any useful information, please file a new bug report on the [GitHub Issue page](#). The website will offer you to select a suitable template with explanations and then you should replace those explanations with the information that you can provide to reproduce your issue.

The most useful thing you can do to help us verify and fix a bug is to isolate the problem. Run it on the smallest number of atoms and fewest number of processors with the simplest input script that reproduces the bug. Try to identify what command or combination of commands is causing the problem and upload the complete input deck as a tar or zip archive. Please avoid using binary restart files unless the issue requires it. In the latter case you should also include an input deck to quickly generate this restart from a data file or a simple additional input. This input deck can be used with tools like a debugger or *valgrind* to further *debug the crash*.

You may also post a message in the [development](#) category of the LAMMPS forum at [MatSci](#) describing the problem with the same kind of information. The forum can provide a faster response, especially if the bug reported is actually expected behavior or other LAMMPS users have come across it before.

11.4 Debugging crashes

If LAMMPS crashes with a “segmentation fault” or a “bus error” or similar message, then you can use the following two methods to further narrow down the origin of the issue. This will help the LAMMPS developers (or yourself) to understand the reason for the crash and apply a fix (either to the input script or the source code). This requires that your LAMMPS executable includes the required [debug information](#). Otherwise it is not possible to look up the names of functions or variables.

The following patch will introduce a bug into the code for pair style [lj/cut](#) when using the `examples/melt/in.melt` input. We use it to show how to identify the origin of a segmentation fault.

```
--- a/src/pair_lj_cut.cpp
+++ b/src/pair_lj_cut.cpp
@@ -81,6 +81,7 @@ void PairLJCut::compute(int eflag, int vflag)

Setting up Verlet run ...
Unit style      : lj
Current step    : 0
Time step       : 0.005
Segmentation fault (core dumped)

```

11.4.1 Using the GDB debugger to get a stack trace

There are two options to use the GDB debugger for identifying the origin of the segmentation fault or similar crash. The GDB debugger has many more features and options, as can be seen for example its [online documentation](#).

Run LAMMPS from within the debugger

Running LAMMPS under the control of the debugger as shown below only works for a single MPI rank (for debugging a program running in parallel you usually need a parallel debugger program). A simple way to launch GDB is to prefix the LAMMPS command line with `gdb --args` and then type the command “run” at the GDB prompt. This will launch the debugger, load the LAMMPS executable and its debug info, and then run it. When it reaches the code causing the segmentation fault, it will stop with a message why it stopped, print the current line of code, and drop back to the GDB prompt.

```

(gdb) run
[...]
Setting up Verlet run ...
Unit style      : lj
Current step    : 0
Time step       : 0.005

Program received signal SIGSEGV, Segmentation fault.
0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag=
-><optimized out>) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139
139      comx += atom->rmass[i]*x[i][0]; /* BUG */
(gdb)

```

Now typing the command “where” will show the stack of functions starting from the current function back to “main()”.

```

(gdb) where
#0  0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag=
-><optimized out>) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139
#1  0x00000000004cf0a2 in LAMMPS_NS::Verlet::setup (this=0x7e6c90, flag=1) at /home/
akohlmey/compile/lammps/src/verlet.cpp:131
#2  0x000000000049db42 in LAMMPS_NS::Run::command (this=this@entry=0x7fffffffcca0,
narg=narg@entry=1, arg=arg@entry=0x7e8750)
    at /home/akohlmey/compile/lammps/src/run.cpp:177

```

(continues on next page)

(continued from previous page)

```
#3 0x000000000041258a in LAMMPS_NS::Input::command_creator<LAMMPS_NS::Run> (lmp=
→<optimized out>, nargs=1, arg=0x7e8750)
   at /home/akohlmey/compile/lammps/src/input.cpp:878
#4 0x0000000000410ad3 in LAMMPS_NS::Input::execute_command (this=0x7d1410) at /home/
→akohlmey/compile/lammps/src/input.cpp:864
#5 0x00000000004111fb in LAMMPS_NS::Input::file (this=0x7d1410) at /home/akohlmey/
→compile/lammps/src/input.cpp:229
#6 0x000000000040933a in main (argc=<optimized out>, argv=<optimized out>) at /home/
→akohlmey/compile/lammps/src/main.cpp:65
(gdb)
```

You can also print the value of variables and see if there is anything unexpected. Segmentation faults, for example, commonly happen when a pointer variable is not assigned and still initialized to NULL.

```
(gdb) print x
$1 = (double **) 0x7ffff7ca1010
(gdb) print i
$2 = 0
(gdb) print x[0]
$3 = (double *) 0x7ffff6d80010
(gdb) print x[0][0]
$4 = 0
(gdb) print x[1][0]
$5 = 0.83979809569125363
(gdb) print atom->rmass
$6 = (double *) 0x0
(gdb)
```

Inspect a core dump file with the debugger

When an executable crashes with a “core dumped” message, it creates a file “core” or “core.<PID#>” which contains the information about the current state. This file may be located in the folder where you ran LAMMPS or in some hidden folder managed by the systemd daemon. In the latter case, you need to “extract” the core file with the `coredumpctl` utility to the current folder. Example: `coredumpctl -o core dump lmp`. Now you can launch the debugger to load the executable, its debug info and the core dump and drop you to a prompt like before.

```
$ gdb lmp core
Reading symbols from lmp...
[New LWP 1928535]
[Thread debugging using libthread_db enabled]
Using host libthread_db library "/lib64/libthread_db.so.1".
Core was generated by `./lmp -in in.melt'.
Program terminated with signal SIGSEGV, Segmentation fault.
#0 0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x1b10740, eflag=1, vflag=
→<optimized out>)
   at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139
139      comx += atom->rmass[i]*x[i][0]; /* BUG */
(gdb)
```

From here on, you use the same commands as shown before to get a stack trace and print current values of (pointer) variables.

11.4.2 Using valgrind to get a stack trace

The `valgrind` suite of tools allows to closely inspect the behavior of a compiled program by essentially emulating a CPU and instrumenting the program while running. This slows down execution quite significantly, but can also report issues that are not resulting in a crash. The default valgrind tool is a memory checker and you can use it by prefixing the normal command line with `valgrind`. Unlike GDB, this will also work for parallel execution, but it is recommended to redirect the valgrind output to a file (e.g. with `--log-file=crash-%p.txt`, the `%p` will be substituted with the process ID) so that the messages of the multiple valgrind instances to the console are not mixed.

```
$ valgrind ./lmp -in in.melt
==1933642== Memcheck, a memory error detector
==1933642== Copyright (C) 2002-2017, and GNU GPL'd, by Julian Seward et al.
==1933642== Using Valgrind-3.15.0 and LibVEX; rerun with -h for copyright info
==1933642== Command: ./lmp -in in.melt
==1933642==

==1933642== Address 0x0 is not stack'd, malloc'd or (recently) free'd
==1933642==
```

As you can see, the stack trace information is similar to that obtained from GDB. In addition you get a more specific hint about what cause the segmentation fault, i.e. that it is a NULL pointer dereference. To find out which pointer exactly was NULL, you need to use the debugger, though.

11.5 Error messages

This is an alphabetic list of the ERROR messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. Error messages also list the source file and line number where the error was generated. For example, a message like this:

`ERROR: Illegal velocity command (velocity.cpp:78)`

means that line #78 in the file `src/velocity.cpp` generated the error. Looking in the source code may help you figure out what went wrong.

Doc page with [WARNING messages](#)

1-3 bond count is inconsistent

An inconsistency was detected when computing the number of 1-3 neighbors for each atom. This likely means something is wrong with the bond topologies you have defined.

1-4 bond count is inconsistent

An inconsistency was detected when computing the number of 1-4 neighbors for each atom. This likely means something is wrong with the bond topologies you have defined.

Accelerator sharing is not currently supported on system

Multiple MPI processes cannot share the accelerator on your system. For NVIDIA GPUs, see the `nvidia-smi` command to change this setting.

All angle coeffs are not set

All angle coefficients must be set in the data file or by the `angle_coeff` command before running a simulation.

All atom IDs = 0 but atom_modify id = yes

Self-explanatory.

All atoms of a swapped type must have same charge.

Self-explanatory.

All atoms of a swapped type must have the same charge.

Self-explanatory.

All bond coeffs are not set

All bond coefficients must be set in the data file or by the `bond_coeff` command before running a simulation.

All dihedral coeffs are not set

All dihedral coefficients must be set in the data file or by the `dihedral_coeff` command before running a simulation.

All improper coeffs are not set

All improper coefficients must be set in the data file or by the `improper_coeff` command before running a simulation.

All masses are not set

For atom styles that define masses for each atom type, all masses must be set in the data file or by the `mass` command before running a simulation. They must also be set before using the `velocity` command.

All mol IDs should be set for fix gcmc group atoms

The molecule flag is on, yet not all molecule ids in the `fix` group have been set to non-zero positive values by the user. This is an error since all atoms in the `fix gcmc` group are eligible for deletion, rotation, and translation and therefore must have valid molecule ids.

All pair coeffs are not set

All pair coefficients must be set in the data file or by the `pair_coeff` command before running a simulation.

All read_dump x,y,z fields must be specified for scaled, triclinic coords

For triclinic boxes and scaled coordinates you must specify all 3 of the x,y,z fields, else LAMMPS cannot reconstruct the unscaled coordinates.

All universe/uloop variables must have same # of values

Self-explanatory.

All variables in next command must be same style

Self-explanatory.

Angle atom missing in delete_bonds

The delete_bonds command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

Angle atom missing in set command

The set command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

Angle atoms %d %d %d missing on proc %d at step %ld

One or more of 3 atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

Angle atoms missing on proc %d at step %ld

One or more of 3 atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

Angle coeff for hybrid has invalid style

Angle style hybrid uses another angle style as one of its coefficients. The angle style used in the angle_coeff command or read from a restart file is not recognized.

Angle coeffs are not set

No angle coefficients have been assigned in the data file or via the angle_coeff command.

Angle extent > half of periodic box length

This error was detected by the neigh_modify check yes setting. It is an error because the angle atoms are so far apart it is ambiguous how it should be defined.

Angle potential must be defined for SHAKE

When shaking angles, an angle_style potential must be used.

Angle style hybrid cannot have hybrid as an argument

Self-explanatory.

Angle style hybrid cannot have none as an argument

Self-explanatory.

Angle style hybrid cannot use same angle style twice

Self-explanatory.

Angle table must range from 0 to 180 degrees

Self-explanatory.

Angle table parameters did not set N

List of angle table parameters must include N setting.

Angle_coeff command before angle_style is defined

Coefficients cannot be set in the data file or via the angle_coeff command until an angle_style has been assigned.

Angle_coeff command before simulation box is defined

The angle_coeff command cannot be used before a read_data, read_restart, or create_box command.

Angle_coeff command when no angles allowed

The chosen atom style does not allow for angles to be defined.

Angle_style command when no angles allowed

The chosen atom style does not allow for angles to be defined.

Angles assigned incorrectly

Angles read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Angles defined but no angle types

The data file header lists angles but no angle types.

Append boundary must be shrink/minimum

The boundary style of the face where atoms are added must be of type m (shrink/minimum).

Arccos of invalid value in variable formula

Argument of arccos() must be between -1 and 1.

Arcsin of invalid value in variable formula

Argument of arcsin() must be between -1 and 1.

Assigning body parameters to non-body atom

Self-explanatory.

Assigning ellipsoid parameters to non-ellipsoid atom

Self-explanatory.

Assigning line parameters to non-line atom

Self-explanatory.

Assigning quat to non-body atom

Self-explanatory.

Assigning tri parameters to non-tri atom

Self-explanatory.

At least one atom of each swapped type must be present to define charges.

Self-explanatory.

Atom IDs must be consecutive for velocity create loop all

Self-explanatory.

Atom IDs must be used for molecular systems

Atom IDs are used to identify and find partner atoms in bonds.

Atom count changed in fix neb

This is not allowed in a NEB calculation.

Atom count is inconsistent, cannot write data file

The sum of atoms across processors does not equal the global number of atoms. Probably some atoms have been lost.

Atom count is inconsistent, cannot write restart file

Sum of atoms across processors does not equal initial total count. This is probably because you have lost some atoms.

Atom in too many rigid bodies - boost MAXBODY

Fix poems has a parameter MAXBODY (in fix_poems.cpp) which determines the maximum number of rigid bodies a single atom can belong to (i.e. a multibody joint). The bodies you have defined exceed this limit.

Atom sort did not operate correctly

This is an internal LAMMPS error. Please report it to the developers.

Atom style hybrid cannot have hybrid as an argument

Self-explanatory.

Atom style hybrid cannot use same atom style twice

Self-explanatory.

Atom style template molecule must have atom types

The defined molecule(s) does not specify atom types.

Atom style was redefined after using fix property/atom

This is not allowed.

Atom type must be zero in fix gcmc mol command

Self-explanatory.

Atom vector in equal-style variable formula

Atom vectors generate one value per atom which is not allowed in an equal-style variable.

Atom-style variable in equal-style variable formula

Atom-style variables generate one value per atom which is not allowed in an equal-style variable.

Atom_modify id command after simulation box is defined

The atom_modify id command cannot be used after a read_data, read_restart, or create_box command.

Atom_modify map command after simulation box is defined

The atom_modify map command cannot be used after a read_data, read_restart, or create_box command.

Atom_modify sort and first options cannot be used together

Self-explanatory.

Atom_style command after simulation box is defined

The atom_style command cannot be used after a read_data, read_restart, or create_box command.

Atom_style line can only be used in 2d simulations

Self-explanatory.

Atom_style tri can only be used in 3d simulations

Self-explanatory.

Atomfile variable could not read values

Check the file assigned to the variable.

Atomfile variable in equal-style variable formula

Self-explanatory.

Atomfile-style variable in equal-style variable formula

Self-explanatory.

Attempt to pop empty stack in fix box/relax

Internal LAMMPS error. Please report it to the developers.

Attempt to push beyond stack limit in fix box/relax

Internal LAMMPS error. Please report it to the developers.

Attempting to rescale a 0.0 temperature

Cannot rescale a temperature that is already 0.0.

Attempting to insert more particles than available lattice points

Self-explanatory.

Bad FENE bond

Two atoms in a FENE bond have become so far apart that the bond cannot be computed.

Bad TIP4P angle type for PPPM/TIP4P

Specified angle type is not valid.

Bad TIP4P angle type for PPPMDisp/TIP4P

Specified angle type is not valid.

Bad TIP4P bond type for PPPM/TIP4P

Specified bond type is not valid.

Bad TIP4P bond type for PPPMDisp/TIP4P

Specified bond type is not valid.

Bad fix ID in fix append/atoms command

The value of the fix_id for keyword spatial must start with “f_”.

Bad grid of processors

The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

Bad kspace_modify kmax/ewald parameter

Kspace_modify values for the kmax/ewald keyword must be integers > 0

Bad kspace_modify slab parameter

Kspace_modify value for the slab/volume keyword must be >= 2.0.

Bad matrix inversion in mldivide3

This error should not occur unless the matrix is badly formed.

Bad principal moments

Fix rigid did not compute the principal moments of inertia of a rigid group of atoms correctly.

Bad quadratic solve for particle/line collision

This is an internal error. It should normally not occur.

Bad quadratic solve for particle/tri collision

This is an internal error. It should normally not occur.

Bad real space Coulombic cutoff in fix tune/kspace

Fix tune/kspace tried to find the optimal real space Coulombic cutoff using the Newton-Rhaphson method, but found a non-positive or NaN cutoff

Balance command before simulation box is defined

The balance command cannot be used before a read_data, read_restart, or create_box command.

Balance produced bad splits

This should not occur. It means two or more cutting plane locations are on top of each other or out of order. Report the problem to the developers.

Balance rcb cannot be used with comm_style brick

Comm_style tiled must be used instead.

Balance shift string is invalid

The string can only contain the characters “x”, “y”, or “z”.

Bias compute does not calculate a velocity bias

The specified compute must compute a bias for temperature.

Bias compute does not calculate temperature

The specified compute must compute temperature.

Bias compute group does not match compute group

The specified compute must operate on the same group as the parent compute.

Big particle in fix srd cannot be point particle

Big particles must be extended spheroids or ellipsoids.

Bigint setting in lmptype.h is invalid

Size of bigint is less than size of tagint.

Bigint setting in lmptype.h is not compatible

Format of bigint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Bitmapped lookup tables require int/float be same size

Cannot use pair tables on this machine, because of word sizes. Use the pair_modify command with table 0 instead.

Bitmapped table in file does not match requested table

Setting for bitmapped table in pair_coeff command must match table in file exactly.

Bitmapped table is incorrect length in table file

Number of table entries is not a correct power of 2.

Bond and angle potentials must be defined for TIP4P

Cannot use TIP4P pair potential unless bond and angle potentials are defined.

Bond atom missing in box size check

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atom missing in delete_bonds

The delete_bonds command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

Bond atom missing in image check

The second atom in a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atom missing in set command

The set command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

Bond atoms %d %d missing on proc %d at step %ld

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atoms missing on proc %d at step %ld

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond coeff for hybrid has invalid style

Bond style hybrid uses another bond style as one of its coefficients. The bond style used in the bond_coeff command or read from a restart file is not recognized.

Bond coeffs are not set

No bond coefficients have been assigned in the data file or via the bond_coeff command.

Bond extent > half of periodic box length

This error was detected by the neigh_modify check yes setting. It is an error because the bond atoms are so far apart it is ambiguous how it should be defined.

Bond potential must be defined for SHAKE

Cannot use fix shake unless bond potential is defined.

Bond style hybrid cannot have hybrid as an argument

Self-explanatory.

Bond style hybrid cannot have none as an argument

Self-explanatory.

Bond style hybrid cannot use same bond style twice

Self-explanatory.

Bond style quartic cannot be used with 3,4-body interactions

No angle, dihedral, or improper styles can be defined when using bond style quartic.

Bond style quartic cannot be used with atom style template

This bond style can change the bond topology which is not allowed with this atom style.

Bond style quartic requires special_bonds = 1,1,1

This is a restriction of the current bond quartic implementation.

Bond table parameters did not set N

List of bond table parameters must include N setting.

Bond table values are not increasing

The values in the tabulated file must be monotonically increasing.

BondAngle coeff for hybrid angle has invalid format

No “ba” field should appear in data file entry.

BondBond coeff for hybrid angle has invalid format

No “bb” field should appear in data file entry.

Bond_coeff command before bond_style is defined

Coefficients cannot be set in the data file or via the bond_coeff command until an bond_style has been assigned.

Bond_coeff command before simulation box is defined

The bond_coeff command cannot be used before a read_data, read_restart, or create_box command.

Bond_coeff command when no bonds allowed

The chosen atom style does not allow for bonds to be defined.

Bond_style command when no bonds allowed

The chosen atom style does not allow for bonds to be defined.

Bonds assigned incorrectly

Bonds read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Bonds defined but no bond types

The data file header lists bonds but no bond types.

Both restart files must use % or neither

Self-explanatory.

Both restart files must use MPI-IO or neither

Self-explanatory.

Both sides of boundary must be periodic

Cannot specify a boundary as periodic only on the lo or hi side. Must be periodic on both sides.

Boundary command after simulation box is defined

The boundary command cannot be used after a read_data, read_restart, or create_box command.

Box bounds are invalid

The box boundaries specified in the read_data file are invalid. The lo value must be less than the hi value for all 3 dimensions.

Box command after simulation box is defined

The box command cannot be used after a read_data, read_restart, or create_box command.

CPU neighbor lists must be used for ellipsoid/sphere mix.

When using Gay-Berne or RE-squared pair styles with both ellipsoidal and spherical particles, the neighbor list must be built on the CPU

Can not specify Pxy/Pxz/Pyz in fix box/relax with non-triclinic box

Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

Can not specify Pxy/Pxz/Pyz in fix nvt/npt/nph with non-triclinic box

Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

Can only use -plog with multiple partitions

Self-explanatory. See page discussion of command-line switches.

Can only use -pscreen with multiple partitions

Self-explanatory. See page discussion of command-line switches.

Can only use Kokkos supported regions with Kokkos package

Self-explanatory.

Can only use NEB with 1-processor replicas

This is current restriction for NEB as implemented in LAMMPS.

Can only use TAD with 1-processor replicas for NEB

This is current restriction for NEB as implemented in LAMMPS.

Cannot (yet) do analytic differentiation with ppm/gpu

This is a current restriction of this command.

Cannot (yet) request ghost atoms with Kokkos half neighbor list

This feature is not yet supported.

Cannot (yet) use 'electron' units with dipoles

This feature is not yet supported.

Cannot (yet) use Ewald with triclinic box and slab correction

This feature is not yet supported.

Cannot (yet) use K-space slab correction with compute group/group for triclinic systems

This option is not yet supported.

Cannot (yet) use MSM with 2d simulation

This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and TIP4P

This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and kspace_modify diff ad

This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and slab correction

This feature is not yet supported.

Cannot (yet) use kspace slab correction with long-range dipoles and non-neutral systems or per-atom energy

This feature is not yet supported.

Cannot (yet) use kspace_modify diff ad with compute group/group

This option is not yet supported.

Cannot (yet) use kspace_style ppm/stagger with triclinic systems

This feature is not yet supported.

Cannot (yet) use molecular templates with Kokkos

Self-explanatory.

Cannot (yet) use respa with Kokkos

Self-explanatory.

Cannot (yet) use rigid bodies with fix deform and Kokkos

Self-explanatory.

Cannot (yet) use rigid bodies with fix nh and Kokkos

Self-explanatory.

Cannot (yet) use single precision with MSM (remove -DFFT_SINGLE from Makefile and re-compile)

Single precision cannot be used with MSM.

Cannot add atoms to fix move variable

Atoms can not be added afterwards to this fix option.

Cannot append atoms to a triclinic box

The simulation box must be defined with edges aligned with the Cartesian axes.

Cannot balance in z dimension for 2d simulation

Self-explanatory.

Cannot change box ortho/triclinic with certain fixes defined

This is because those fixes store the shape of the box. You need to use unfix to discard the fix, change the box, then redefine a new fix.

Cannot change box ortho/triclinic with dumps defined

This is because some dumps store the shape of the box. You need to use undump to discard the dump, change the box, then redefine a new dump.

Cannot change box tilt factors for orthogonal box

Cannot use tilt factors unless the simulation box is non-orthogonal.

Cannot change box to orthogonal when tilt is non-zero

Self-explanatory.

Cannot change box z boundary to non-periodic for a 2d simulation

Self-explanatory.

Cannot change dump_modify every for dump dcd

The frequency of writing dump dcd snapshots cannot be changed.

Cannot change dump_modify every for dump xtc

The frequency of writing dump xtc snapshots cannot be changed.

Cannot change timestep once fix srd is setup

This is because various SRD properties depend on the timestep size.

Cannot change timestep with fix pour

This is because fix pour pre-computes the time delay for particles to fall out of the insertion volume due to gravity.

Cannot change to comm_style brick from tiled layout

Self-explanatory.

Cannot change_box after reading restart file with per-atom info

This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

Cannot change_box in xz or yz for 2d simulation

Self-explanatory.

Cannot change_box in z dimension for 2d simulation

Self-explanatory.

Cannot clear group all

This operation is not allowed.

Cannot close restart file - MPI error: %s

This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot compute initial g_ewald_disp

LAMMPS failed to compute an initial guess for the PPPM_disp g_ewald_6 factor that partitions the computation between real space and k-space for Dispersion interactions.

Cannot create an atom map unless atoms have IDs

The simulation requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.

Cannot create atoms with undefined lattice

Must use the lattice command before using the create_atoms command.

Cannot create/grow a vector/array of pointers for %s

LAMMPS code is making an illegal call to the templated memory allocators, to create a vector or array of pointers.

Cannot create_atoms after reading restart file with per-atom info

The per-atom info was stored to be used when by a fix that you may re-define. If you add atoms before re-defining the fix, then there will not be a correct amount of per-atom info.

Cannot create_box after simulation box is defined

A simulation box can only be defined once.

Cannot currently use pair reax with pair hybrid

This is not yet supported.

Cannot currently use pppm/gpu with fix balance.

Self-explanatory.

Cannot delete group all

Self-explanatory.

Cannot delete group currently used by a compute

Self-explanatory.

Cannot delete group currently used by a dump

Self-explanatory.

Cannot delete group currently used by a fix

Self-explanatory.

Cannot delete group currently used by atom_modify first

Self-explanatory.

Cannot delete_atoms bond yes for non-molecular systems

Self-explanatory.

Cannot displace_atoms after reading restart file with per-atom info

This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

Cannot do GCMC on atoms in atom_modify first group

This is a restriction due to the way atoms are organized in a list to enable the atom_modify first command.

Cannot do atom/swap on atoms in atom_modify first group

This is a restriction due to the way atoms are organized in a list to enable the atom_modify first command.

Cannot dump sort on atom IDs with no atom IDs defined

Self-explanatory.

Cannot dump sort when multiple dump files are written

In this mode, each processor dumps its atoms to a file, so no sorting is allowed.

Cannot embed Python when also extending Python with LAMMPS

When running LAMMPS via Python through the LAMMPS library interface you cannot also use the input script python command.

Cannot evaporate atoms in atom_modify first group

This is a restriction due to the way atoms are organized in a list to enable the atom_modify first command.

Cannot find create_bonds group ID

Self-explanatory.

Cannot find delete_bonds group ID

Group ID used in the delete_bonds command does not exist.

Cannot find specified group ID for core particles

Self-explanatory.

Cannot find specified group ID for shell particles

Self-explanatory.

Cannot have both pair_modify shift and tail set to yes

These 2 options are contradictory.

Cannot intersect groups using a dynamic group

This operation is not allowed.

Cannot mix molecular and molecule template atom styles

Self-explanatory.

Cannot open -reorder file

Self-explanatory.

Cannot open ADP potential file %s

The specified ADP potential file cannot be opened. Check that the path and name are correct.

Cannot open AIREBO potential file %s

The specified AIREBO potential file cannot be opened. Check that the path and name are correct.

Cannot open BOP potential file %s

The specified BOP potential file cannot be opened. Check that the path and name are correct.

Cannot open COMB potential file %s

The specified COMB potential file cannot be opened. Check that the path and name are correct.

Cannot open COMB3 lib.comb3 file

The COMB3 library file cannot be opened. Check that the path and name are correct.

Cannot open COMB3 potential file %s

The specified COMB3 potential file cannot be opened. Check that the path and name are correct.

Cannot open EAM potential file %s

The specified EAM potential file cannot be opened. Check that the path and name are correct.

Cannot open EIM potential file %s

The specified EIM potential file cannot be opened. Check that the path and name are correct.

Cannot open LCBOP potential file %s

The specified LCBOP potential file cannot be opened. Check that the path and name are correct.

Cannot open MEAM potential file %s

The specified MEAM potential file cannot be opened. Check that the path and name are correct.

Cannot open SNAP coefficient file %s

The specified SNAP coefficient file cannot be opened. Check that the path and name are correct.

Cannot open SNAP parameter file %s

The specified SNAP parameter file cannot be opened. Check that the path and name are correct.

Cannot open Stillinger-Weber potential file %s

The specified SW potential file cannot be opened. Check that the path and name are correct.

Cannot open Tersoff potential file %s

The specified potential file cannot be opened. Check that the path and name are correct.

Cannot open Vashishta potential file %s

The specified Vashishta potential file cannot be opened. Check that the path and name are correct.

Cannot open balance output file

Self-explanatory.

Cannot open coul/streitz potential file %s

The specified coul/streitz potential file cannot be opened. Check that the path and name are correct.

Cannot open custom file

Self-explanatory.

Cannot open data file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open dir to search for restart file

Using a "*" in the name of the restart file will open the current directory to search for matching file names.

Cannot open dump file

Self-explanatory.

Cannot open dump file %s

The output file for the dump command cannot be opened. Check that the path and name are correct.

Cannot open file %s

The specified file cannot be opened. Check that the path and name are correct. If the file is a compressed file, also check that the gzip executable can be found and run.

Cannot open file variable file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/chunk file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/correlate file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/histo file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/time file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix balance output file

Self-explanatory.

Cannot open fix poems file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix print file %s

The output file generated by the fix print command cannot be opened

Cannot open fix qeq parameter file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix qeq/comb file %s

The output file for the fix qeq/combs command cannot be opened. Check that the path and name are correct.

Cannot open fix reax/bonds file %s

The output file for the fix reax/bonds command cannot be opened. Check that the path and name are correct.

Cannot open fix rigid infile %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix rigid restart file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix rigid/small infile %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix tmd file %s

The output file for the fix tmd command cannot be opened. Check that the path and name are correct.

Cannot open fix ttm file %s

The output file for the fix ttm command cannot be opened. Check that the path and name are correct.

Cannot open gzipped file

LAMMPS was compiled without support for reading and writing gzipped files through a pipeline to the gzip program with -DLAMMPS_GZIP.

Cannot open input script %s

Self-explanatory.

Cannot open log.cite file

This file is created when you use some LAMMPS features, to indicate what paper you should cite on behalf of those who implemented the feature. Check that you have write privileges into the directory you are running in.

Cannot open log.lammps for writing

The default LAMMPS log file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open logfile

The LAMMPS log file named in a command-line argument cannot be opened. Check that the path and name are correct.

Cannot open logfile %s

The LAMMPS log file specified in the input script cannot be opened. Check that the path and name are correct.

Cannot open molecule file %s

The specified file cannot be opened. Check that the path and name are correct.

Cannot open nb3b/harmonic potential file %s

The specified potential file cannot be opened. Check that the path and name are correct.

Cannot open pair_write file

The specified output file for pair energies and forces cannot be opened. Check that the path and name are correct.

Cannot open polymorphic potential file %s

The specified polymorphic potential file cannot be opened. Check that the path and name are correct.

Cannot open print file %s

Self-explanatory.

Cannot open processors output file

Self-explanatory.

Cannot open restart file %s

Self-explanatory.

Cannot open restart file for reading - MPI error: %s

This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot open restart file for writing - MPI error: %s

This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot open screen file

The screen file specified as a command-line argument cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open temporary file for world counter.

Self-explanatory.

Cannot open universe log file

For a multi-partition run, the master log file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open universe screen file

For a multi-partition run, the master screen file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot read from restart file - MPI error: %s

This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot read_data without add keyword after simulation box is defined

Self-explanatory.

Cannot read_restart after simulation box is defined

The read_restart command cannot be used after a read_data, read_restart, or create_box command.

Cannot redefine variable as a different style

An equal-style variable can be re-defined but only if it was originally an equal-style variable.

Cannot replicate 2d simulation in z dimension

The replicate command cannot replicate a 2d simulation in the z dimension.

Cannot replicate with fixes that store atom quantities

Either fixes are defined that create and store atom-based vectors or a restart file was read which included atom-based vectors for fixes. The replicate command cannot duplicate that information for new atoms. You should use the replicate command before fixes are applied to the system.

Cannot reset timestep with a dynamic region defined

Dynamic regions (see the region command) have a time dependence. Thus you cannot change the timestep when one or more of these are defined.

Cannot reset timestep with a time-dependent fix defined

You cannot reset the timestep when a fix that keeps track of elapsed time is in place.

Cannot run 2d simulation with non-periodic Z dimension

Use the boundary command to make the z dimension periodic in order to run a 2d simulation.

Cannot set bond topology types for atom style template

The bond, angle, etc types cannot be changed for this atom style since they are static settings in the molecule template files.

Cannot set both respa pair and inner/middle/outer

In the rRESPA integrator, you must compute pairwise potentials either all together (pair), or in pieces (inner/middle/outer). You can't do both.

Cannot set cutoff/multi before simulation box is defined

Self-explanatory.

Cannot set dpd/theta for this atom style

Self-explanatory.

Cannot set dump_modify flush for dump xtc

Self-explanatory.

Cannot set mass for this atom style

This atom style does not support mass settings for each atom type. Instead they are defined on a per-atom basis in the data file.

Cannot set meso/cv for this atom style

Self-explanatory.

Cannot set meso/e for this atom style

Self-explanatory.

Cannot set meso/rho for this atom style

Self-explanatory.

Cannot set non-zero image flag for non-periodic dimension

Self-explanatory.

Cannot set non-zero z velocity for 2d simulation

Self-explanatory.

Cannot set quaternion for atom that has none

Self-explanatory.

Cannot set quaternion with xy components for 2d system

Self-explanatory.

Cannot set respa hybrid and any of pair/inner/middle/outer

In the rRESPA integrator, you must compute pairwise potentials either all together (pair), with different cutoff regions (inner/middle/outer), or per hybrid sub-style (hybrid). You cannot mix those.

Cannot set respa middle without inner/outer

In the rRESPA integrator, you must define both a inner and outer setting in order to use a middle setting.

Cannot set restart file size - MPI error: %s

This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot set smd/contact/radius for this atom style

Self-explanatory.

Cannot set smd/mass/density for this atom style

Self-explanatory.

Cannot set temperature for fix rigid/nph

The temp keyword cannot be specified.

Cannot set theta for atom that is not a line

Self-explanatory.

Cannot set this attribute for this atom style

The attribute being set does not exist for the defined atom style.

Cannot set variable z velocity for 2d simulation

Self-explanatory.

Cannot skew triclinic box in z for 2d simulation

Self-explanatory.

Cannot subtract groups using a dynamic group

This operation is not allowed.

Cannot union groups using a dynamic group

This operation is not allowed.

Cannot use -kokkos on without KOKKOS installed

Self-explanatory.

Cannot use -reorder after -partition

Self-explanatory. See page discussion of command-line switches.

Cannot use Ewald with 2d simulation

The kspace style ewald cannot be used in 2d simulations. You can use 2d Ewald in a 3d simulation; see the kspace_modify command.

Cannot use Ewald/disp solver on system with no charge, dipole, or LJ particles

No atoms in system have a non-zero charge or dipole, or are LJ particles. Change charges/dipoles or change options of the kspace solver/pair style.

Cannot use EwaldDisp with 2d simulation

This is a current restriction of this command.

Cannot use Kokkos pair style with rRESPA inner/middle

Self-explanatory.

Cannot use NEB unless atom map exists

Use the atom_modify command to create an atom map.

Cannot use NEB with a single replica

Self-explanatory.

Cannot use NEB with atom_modify sort enabled

This is current restriction for NEB implemented in LAMMPS.

Cannot use PPPM with 2d simulation

The kspace style ppm cannot be used in 2d simulations. You can use 2d PPPM in a 3d simulation; see the kspace_modify command.

Cannot use PPPMDisp with 2d simulation

The kspace style ppm/disp cannot be used in 2d simulations. You can use 2d ppm/disp in a 3d simulation; see the kspace_modify command.

Cannot use PRD with a changing box

The current box dimensions are not copied between replicas

Cannot use PRD with a time-dependent fix defined

PRD alters the timestep in ways that will mess up these fixes.

Cannot use PRD with a time-dependent region defined

PRD alters the timestep in ways that will mess up these regions.

Cannot use PRD with atom_modify sort enabled

This is a current restriction of PRD. You must turn off sorting, which is enabled by default, via the atom_modify command.

Cannot use PRD with multi-processor replicas unless atom map exists

Use the atom_modify command to create an atom map.

Cannot use TAD unless atom map exists for NEB

See atom_modify map command to set this.

Cannot use TAD with a single replica for NEB

NEB requires multiple replicas.

Cannot use TAD with atom_modify sort enabled for NEB

This is a current restriction of NEB.

Cannot use a damped dynamics min style with fix box/relax

This is a current restriction in LAMMPS. Use another minimizer style.

Cannot use a damped dynamics min style with per-atom DOF

This is a current restriction in LAMMPS. Use another minimizer style.

Cannot use append/atoms in periodic dimension

The boundary style of the face where atoms are added can not be of type p (periodic).

Cannot use atomfile-style variable unless atom map exists

Self-explanatory. See the atom_modify command to create a map.

Cannot use both com and bias with compute temp/chunk

Self-explanatory.

Cannot use chosen neighbor list style with buck/coul/cut/kk

Self-explanatory.

Cannot use chosen neighbor list style with buck/coul/long/kk

Self-explanatory.

Cannot use chosen neighbor list style with buck/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/cut/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/debye/kk

Self-explanatory.

Cannot use chosen neighbor list style with coul/dsf/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/wolf/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/charmm/coul/charmm/implicit/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/charmm/coul/charmm/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/charmm/coul/long/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/class2/coul/cut/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/class2/coul/long/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/class2/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/cut/coul/cut/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/cut/coul/debye/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/cut/coul/long/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/cut/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/expand/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/gromacs/coul/gromacs/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/gromacs/kk

Self-explanatory.

Cannot use chosen neighbor list style with lj/spica/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with pair eam/kk

That style is not supported by Kokkos.

Cannot use chosen neighbor list style with pair eam/kk/alloy

Self-explanatory.

Cannot use chosen neighbor list style with pair eam/kk/fs

Self-explanatory.

Cannot use chosen neighbor list style with pair sw/kk

Self-explanatory.

Cannot use chosen neighbor list style with tersoff/kk

Self-explanatory.

Cannot use chosen neighbor list style with tersoff/zbl/kk

Self-explanatory.

Cannot use compute chunk/atom bin z for 2d model

Self-explanatory.

Cannot use compute cluster/atom unless atoms have IDs

Atom IDs are used to identify clusters.

Cannot use create_atoms rotate unless single style

Self-explanatory.

Cannot use create_bonds unless atoms have IDs

This command requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.

Cannot use create_bonds with non-molecular system

Self-explanatory.

Cannot use cwiggle in variable formula between runs

This is a function of elapsed time.

Cannot use delete_atoms bond yes with atom_style template

This is because the bonds for that atom style are hardwired in the molecule template.

Cannot use delete_atoms unless atoms have IDs

Your atoms do not have IDs, so the delete_atoms command cannot be used.

Cannot use delete_bonds with non-molecular system

Your choice of atom style does not have bonds.

Cannot use dump_modify fileper without % in dump file name

Self-explanatory.

Cannot use dump_modify nfile without % in dump file name

Self-explanatory.

Cannot use dynamic group with fix adapt atom

This is not yet supported.

Cannot use fix TMD unless atom map exists

Using this fix requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom_modify map command will force an atom map to be created.

Cannot use fix bond/break with non-molecular systems

Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Cannot use fix bond/create with non-molecular systems

Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Cannot use fix bond/swap with non-molecular systems

Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Cannot use fix box/relax on a 2nd non-periodic dimension

When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix box/relax on a non-periodic dimension

When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix box/relax with both relaxation and scaling on a tilt factor

When specifying scaling on a tilt factor component, that component can not also be controlled by the barostat. E.g. if scalexy yes is specified and also keyword tri or xy, this is wrong.

Cannot use fix box/relax with tilt factor scaling on a 2nd non-periodic dimension

When specifying scaling on a tilt factor component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix deform on a shrink-wrapped boundary

The x, y, z options cannot be applied to shrink-wrapped dimensions.

Cannot use fix deform tilt on a shrink-wrapped 2nd dim

This is because the shrink-wrapping will change the value of the strain implied by the tilt factor.

Cannot use fix deform trape on a box with zero tilt

The trape style alters the current strain.

Cannot use fix deposit rigid and not molecule

Self-explanatory.

Cannot use fix deposit rigid and shake

These two attributes are conflicting.

Cannot use fix deposit shake and not molecule

Self-explanatory.

Cannot use fix enforce2d with 3d simulation

Self-explanatory.

Cannot use fix gcmc in a 2d simulation

Fix gcmc is set up to run in 3d only. No 2d simulations with fix gcmc are allowed.

Cannot use fix gcmc shake and not molecule

Self-explanatory.

Cannot use fix msst without per-type mass defined

Self-explanatory.

Cannot use fix npt and fix deform on same component of stress tensor

This would be changing the same box dimension twice.

Cannot use fix nvt/npt/nph on a 2nd non-periodic dimension

When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix nvt/npt/nph on a non-periodic dimension

When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix nvt/npt/nph with both xy dynamics and xy scaling

Self-explanatory.

Cannot use fix nvt/npt/nph with both xz dynamics and xz scaling

Self-explanatory.

Cannot use fix nvt/npt/nph with both yz dynamics and yz scaling

Self-explanatory.

Cannot use fix nvt/npt/nph with xy scaling when y is non-periodic dimension

The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix nvt/npt/nph with xz scaling when z is non-periodic dimension

The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix nvt/npt/nph with yz scaling when z is non-periodic dimension

The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix pour rigid and not molecule

Self-explanatory.

Cannot use fix pour rigid and shake

These two attributes are conflicting.

Cannot use fix pour shake and not molecule

Self-explanatory.

Cannot use fix pour with triclinic box

This option is not yet supported.

Cannot use fix press/berendsen and fix deform on same component of stress tensor

These commands both change the box size/shape, so you cannot use both together.

Cannot use fix press/berendsen on a non-periodic dimension

Self-explanatory.

Cannot use fix press/berendsen with triclinic box

Self-explanatory.

Cannot use fix reax/bonds without pair_style reax

Self-explanatory.

Cannot use fix rigid npt/nph and fix deform on same component of stress tensor

This would be changing the same box dimension twice.

Cannot use fix rigid npt/nph on a non-periodic dimension

When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix rigid/small npt/nph on a non-periodic dimension

When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix shake with non-molecular system

Your choice of atom style does not have bonds.

Cannot use fix ttm with 2d simulation

This is a current restriction of this fix due to the grid it creates.

Cannot use fix ttm with triclinic box

This is a current restriction of this fix due to the grid it creates.

Cannot use fix tune/kspace without a kspace style

Self-explanatory.

Cannot use fix tune/kspace without a pair style

This fix (tune/kspace) can only be used when a pair style has been specified.

Cannot use fix wall in periodic dimension

Self-explanatory.

Cannot use fix wall zlo/zhi for a 2d simulation

Self-explanatory.

Cannot use fix wall/reflect in periodic dimension

Self-explanatory.

Cannot use fix wall/reflect zlo/zhi for a 2d simulation

Self-explanatory.

Cannot use fix wall/srd in periodic dimension

Self-explanatory.

Cannot use fix wall/srd more than once

Nor is there a need to since multiple walls can be specified in one command.

Cannot use fix wall/srd without fix srd

Self-explanatory.

Cannot use fix wall/srd zlo/zhi for a 2d simulation

Self-explanatory.

Cannot use fix_deposit unless atoms have IDs

Self-explanatory.

Cannot use fix_pour unless atoms have IDs

Self-explanatory.

Cannot use include command within an if command

Self-explanatory.

Cannot use lines with fix srd unless overlap is set

This is because line segments are connected to each other.

Cannot use multiple fix wall commands with pair brownian

Self-explanatory.

Cannot use multiple fix wall commands with pair lubricate

Self-explanatory.

Cannot use multiple fix wall commands with pair lubricate/poly

Self-explanatory.

Cannot use multiple fix wall commands with pair lubricateU

Self-explanatory.

Cannot use neigh_modify exclude with GPU neighbor builds

This is a current limitation of the GPU implementation in LAMMPS.

Cannot use neighbor bins - box size << cutoff

Too many neighbor bins will be created. This typically happens when the simulation box is very small in some dimension, compared to the neighbor cutoff. Use the “nsq” style instead of “bin” style.

Cannot use newton pair with beck/gpu pair style

Self-explanatory.

Cannot use newton pair with born/coul/long/gpu pair style

Self-explanatory.

Cannot use newton pair with born/coul/wolf/gpu pair style

Self-explanatory.

Cannot use newton pair with born/gpu pair style

Self-explanatory.

Cannot use newton pair with buck/coul/cut/gpu pair style

Self-explanatory.

Cannot use newton pair with buck/coul/long/gpu pair style

Self-explanatory.

Cannot use newton pair with buck/gpu pair style

Self-explanatory.

Cannot use newton pair with colloid/gpu pair style

Self-explanatory.

Cannot use newton pair with coul/cut/gpu pair style

Self-explanatory.

Cannot use newton pair with coul/debye/gpu pair style

Self-explanatory.

Cannot use newton pair with coul/dsf/gpu pair style

Self-explanatory.

Cannot use newton pair with coul/long/gpu pair style

Self-explanatory.

Cannot use newton pair with dipole/cut/gpu pair style

Self-explanatory.

Cannot use newton pair with dipole/sf/gpu pair style

Self-explanatory.

Cannot use newton pair with dpd/gpu pair style

Self-explanatory.

Cannot use newton pair with dpd/tstat/gpu pair style

Self-explanatory.

Cannot use newton pair with eam/alloy/gpu pair style

Self-explanatory.

Cannot use newton pair with eam/fs/gpu pair style

Self-explanatory.

Cannot use newton pair with eam/gpu pair style

Self-explanatory.

Cannot use newton pair with gauss/gpu pair style

Self-explanatory.

Cannot use newton pair with gayberne/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/charmm/coul/long/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/class2/coul/long/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/class2/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/cubic/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/cut/coul/cut/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/cut/coul/debye/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/cut/coul/dsf/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/cut/coul/long/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/cut/coul/msm/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/cut/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/expand/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/gromacs/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/spica/coul/long/gpu pair style

Self-explanatory.

Cannot use newton pair with lj/spica/gpu pair style

Self-explanatory.

Cannot use newton pair with lj96/cut/gpu pair style

Self-explanatory.

Cannot use newton pair with mie/cut/gpu pair style

Self-explanatory.

Cannot use newton pair with morse/gpu pair style

Self-explanatory.

Cannot use newton pair with resquared/gpu pair style

Self-explanatory.

Cannot use newton pair with soft/gpu pair style

Self-explanatory.

Cannot use newton pair with table/gpu pair style

Self-explanatory.

Cannot use newton pair with yukawa/colloid/gpu pair style

Self-explanatory.

Cannot use newton pair with yukawa/gpu pair style

Self-explanatory.

Cannot use newton pair with zbl/gpu pair style

Self-explanatory.

Cannot use non-zero forces in an energy minimization

Fix setforce cannot be used in this manner. Use fix addforce instead.

Cannot use non-periodic boundares with fix ttm

This fix requires a fully periodic simulation box.

Cannot use non-periodic boundaries with Ewald

For kspace style ewald, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use non-periodic boundaries with EwaldDisp

For kspace style ewald/disp, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use non-periodic boundaries with PPPM

For kspace style pppm, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use non-periodic boundaries with PPPMDisp

For kspace style pppm/disp, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use order greater than 8 with pppm/gpu.

Self-explanatory.

Cannot use package gpu neigh yes with triclinic box

This is a current restriction in LAMMPS.

Cannot use pair tail corrections with 2d simulations

The correction factors are only currently defined for 3d systems.

Cannot use processors part command without using partitions

See the command-line -partition switch.

Cannot use ramp in variable formula between runs

This is because the ramp() function is time dependent.

Cannot use read_data add before simulation box is defined

Self-explanatory.

Cannot use read_data extra with add flag

Self-explanatory.

Cannot use read_data offset without add flag

Self-explanatory.

Cannot use read_data shift without add flag

Self-explanatory.

Cannot use region INF or EDGE when box does not exist

Regions that extend to the box boundaries can only be used after the create_box command has been used.

Cannot use set atom with no atom IDs defined

Atom IDs are not defined, so they cannot be used to identify an atom.

Cannot use set mol with no molecule IDs defined

Self-explanatory.

Cannot use swiggle in variable formula between runs

This is a function of elapsed time.

Cannot use tris with fix srd unless overlap is set

This is because triangles are connected to each other.

Cannot use variable energy with constant efield in fix efield

LAMMPS computes the energy itself when the E-field is constant.

Cannot use variable energy with constant force in fix addforce

This is because for constant force, LAMMPS can compute the change in energy directly.

Cannot use variable every setting for dump dcd

The format of DCD dump files requires snapshots be output at a constant frequency.

Cannot use variable every setting for dump xtc

The format of this file requires snapshots at regular intervals.

Cannot use vdisplace in variable formula between runs

This is a function of elapsed time.

Cannot use velocity bias command without temp keyword

Self-explanatory.

Cannot use velocity create loop all unless atoms have IDs

Atoms in the simulation do not have IDs, so this style of velocity creation cannot be performed.

Cannot use wall in periodic dimension

Self-explanatory.

Cannot use write_restart fileper without % in restart file name

Self-explanatory.

Cannot use write_restart nfile without % in restart file name

Self-explanatory.

Cannot wiggle and shear fix wall/gran

Cannot specify both options at the same time.

Cannot write to restart file - MPI error: %s

This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot yet use KSpace solver with grid with comm style tiled

This is current restriction in LAMMPS.

Cannot yet use comm_style tiled with multi-mode comm

Self-explanatory.

Cannot yet use comm_style tiled with triclinic box

Self-explanatory.

Cannot yet use compute tally with Kokkos

This feature is not yet supported.

Cannot yet use fix bond/break with this improper style

This is a current restriction in LAMMPS.

Cannot yet use fix bond/create with this improper style

This is a current restriction in LAMMPS.

Cannot yet use minimize with Kokkos

This feature is not yet supported.

Cannot yet use pair hybrid with Kokkos

This feature is not yet supported.

Cannot zero Langevin force of 0 atoms

The group has zero atoms, so you cannot request its force be zeroed.

Cannot zero gld force for zero atoms

There are no atoms currently in the group.

Cannot zero momentum of no atoms

Self-explanatory.

Change_box command before simulation box is defined

Self-explanatory.

Change_box volume used incorrectly

The “dim volume” option must be used immediately following one or two settings for “dim1 ...” (and optionally “dim2 ...”) and must be for a different dimension, i.e. $\text{dim} \neq \text{dim1}$ and $\text{dim} \neq \text{dim2}$.

Chunk/atom compute does not exist for compute angmom/chunk

Self-explanatory.

Chunk/atom compute does not exist for compute com/chunk

Self-explanatory.

Chunk/atom compute does not exist for compute gyration/chunk

Self-explanatory.

Chunk/atom compute does not exist for compute inertia/chunk

Self-explanatory.

Chunk/atom compute does not exist for compute msd/chunk

Self-explanatory.

Chunk/atom compute does not exist for compute omega/chunk

Self-explanatory.

Chunk/atom compute does not exist for compute property/chunk

Self-explanatory.

Chunk/atom compute does not exist for compute temp/chunk

Self-explanatory.

Chunk/atom compute does not exist for compute torque/chunk

Self-explanatory.

Chunk/atom compute does not exist for compute vcm/chunk

Self-explanatory.

Chunk/atom compute does not exist for fix ave/chunk

Self-explanatory.

Comm tiled invalid index in box drop brick

Internal error check in comm_style tiled which should not occur. Contact the developers.

Comm tiled mis-match in box drop brick

Internal error check in comm_style tiled which should not occur. Contact the developers.

Comm_modify group != atom_modify first group

Self-explanatory.

Communication cutoff for comm_style tiled cannot exceed periodic box length

Self-explanatory.

Communication cutoff too small for SNAP micro load balancing

This can happen if you change the neighbor skin after your pair_style command or if your box dimensions grow during a run. You can set the cutoff explicitly via the comm_modify cutoff command.

Compute %s does not allow use of dynamic group

Dynamic groups have not yet been enabled for this compute.

Compute for fix pafi does not calculate a local array

Self-explanatory.

Compute for fix pafi must have 9 fields per atom

Self-explanatory.

Compute ID for compute chunk /atom does not exist

Self-explanatory.

Compute ID for compute chunk/atom does not exist

Self-explanatory.

Compute gyration ID does not exist for compute gyration/shape

Self-explanatory. Provide a valid compute ID.

Compute gyration/shape compute ID does not point to a gyration compute

Self-explanatory. Provide an ID of a compute gyration command.

Compute ID for compute reduce does not exist

Self-explanatory.

Compute ID for compute slice does not exist

Self-explanatory.

Compute ID for fix ave/atom does not exist

Self-explanatory.

Compute ID for fix ave/chunk does not exist

Self-explanatory.

Compute ID for fix ave/correlate does not exist

Self-explanatory.

Compute ID for fix ave/histo does not exist

Self-explanatory.

Compute ID for fix ave/time does not exist

Self-explanatory.

Compute ID for fix numdiff does not exist

Self-explanatory.

Compute ID for fix numdiff/virial does not exist

Self-explanatory.

Compute ID for fix store/state does not exist

Self-explanatory.

Compute ID for fix vector does not exist

Self-explanatory.

Compute ID must be alphanumeric or underscore characters

Self-explanatory.

Compute angle/local used when angles are not allowed

The atom style does not support angles.

Compute angmom/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute body/local requires atom style body

Self-explanatory.

Compute bond/local used when bonds are not allowed

The atom style does not support bonds.

Compute centro/atom requires a pair style be defined

This is because the computation of the centro-symmetry values uses a pairwise neighbor list.

Compute chunk/atom bin/cylinder radius is too large for periodic box

Radius cannot be bigger than 1/2 of a non-axis periodic dimension.

Compute chunk/atom bin/sphere radius is too large for periodic box

Radius cannot be bigger than 1/2 of any periodic dimension.

Compute chunk/atom compute array is accessed out-of-range

The index for the array is out of bounds.

Compute chunk/atom compute does not calculate a per-atom array

Self-explanatory.

Compute chunk/atom compute does not calculate a per-atom vector

Self-explanatory.

Compute chunk/atom compute does not calculate per-atom values

Self-explanatory.

Compute chunk/atom cylinder axis must be z for 2d

Self-explanatory.

Compute chunk/atom fix array is accessed out-of-range

the index for the array is out of bounds.

Compute chunk/atom fix does not calculate a per-atom array

Self-explanatory.

Compute chunk/atom fix does not calculate a per-atom vector

Self-explanatory.

Compute chunk/atom fix does not calculate per-atom values

Self-explanatory.

Compute chunk/atom for triclinic boxes requires units reduced

Self-explanatory.

Compute chunk/atom ids once but nchunk is not once

You cannot assign chunks IDs to atom permanently if the number of chunks may change.

Compute chunk/atom molecule for non-molecular system

Self-explanatory.

Compute chunk/atom sphere z origin must be 0.0 for 2d

Self-explanatory.

Compute chunk/atom stores no IDs for compute property/chunk

It will only store IDs if its compress option is enabled.

Compute chunk/atom stores no coord1 for compute property/chunk

Only certain binning options for compute chunk/atom store coordinates.

Compute chunk/atom stores no coord2 for compute property/chunk

Only certain binning options for compute chunk/atom store coordinates.

Compute chunk/atom stores no coord3 for compute property/chunk

Only certain binning options for compute chunk/atom store coordinates.

Compute chunk/atom variable is not atom-style variable

Self-explanatory.

Compute chunk/atom without bins cannot use discard mixed

That discard option only applies to the binning styles.

Compute cluster/atom cutoff is longer than pairwise cutoff

Cannot identify clusters beyond cutoff.

Compute cluster/atom requires a pair style be defined

This is so that the pair style defines a cutoff distance which is used to find clusters.

Compute cna/atom cutoff is longer than pairwise cutoff

Self-explanatory.

Compute cna/atom requires a pair style be defined

Self-explanatory.

Compute com/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute contact/atom requires a pair style be defined

Self-explanatory.

Compute contact/atom requires atom style sphere

Self-explanatory.

Compute coord/atom cutoff is longer than pairwise cutoff

Cannot compute coordination at distances longer than the pair cutoff, since those atoms are not in the neighbor list.

Compute coord/atom requires a pair style be defined

Self-explanatory.

Compute damage/atom requires peridynamic potential

Damage is a Peridynamic-specific metric. It requires you to be running a Peridynamics simulation.

Compute dihedral/local used when dihedrals are not allowed

The atom style does not support dihedrals.

Compute dilatation/atom cannot be used with this pair style

Self-explanatory.

Compute dilatation/atom requires Peridynamic pair style

Self-explanatory.

Compute does not allow an extra compute or fix to be reset

This is an internal LAMMPS error. Please report it to the developers.

Compute erotate/asphere requires atom style ellipsoid or line or tri

Self-explanatory.

Compute erotate/asphere requires extended particles

This compute cannot be used with point particles.

Compute erotate/rigid with non-rigid fix-ID

Self-explanatory.

Compute erotate/sphere requires atom style sphere

Self-explanatory.

Compute erotate/sphere/atom requires atom style sphere

Self-explanatory.

Compute event/displace has invalid fix event assigned

This is an internal LAMMPS error. Please report it to the developers.

Compute group/group group ID does not exist

Self-explanatory.

Compute gyration/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute heat/flux compute ID does not compute ke/atom

Self-explanatory.

Compute heat/flux compute ID does not compute pe/atom

Self-explanatory.

Compute heat/flux compute ID does not compute stress/atom

Self-explanatory.

Compute hexorder/atom cutoff is longer than pairwise cutoff

Cannot compute order parameter beyond cutoff.

Compute hexorder/atom requires a pair style be defined

Self-explanatory.

Compute improper/local used when impropers are not allowed

The atom style does not support impropers.

Compute inertia/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute ke/rigid with non-rigid fix-ID

Self-explanatory.

Compute msd/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute msd/chunk nchunk is not static

This is required because the MSD cannot be computed consistently if the number of chunks is changing. Compute chunk/atom allows setting nchunk to be static.

Compute nve/asphere requires atom style ellipsoid

Self-explanatory.

Compute nvt/nph/npt asphere requires atom style ellipsoid

Self-explanatory.

Compute nvt/nph/npt body requires atom style body

Self-explanatory.

Compute omega/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute orientorder/atom cutoff is longer than pairwise cutoff

Cannot compute order parameter beyond cutoff.

Compute orientorder/atom requires a pair style be defined

Self-explanatory.

Compute pair must use group all

Pair styles accumulate energy on all atoms.

Compute pe must use group all

Energies computed by potentials (pair, bond, etc) are computed on all atoms.

Compute plasticity/atom cannot be used with this pair style

Self-explanatory.

Compute plasticity/atom requires Peridynamic pair style

Self-explanatory.

Compute pressure must use group all

Virial contributions computed by potentials (pair, bond, etc) are computed on all atoms.

Compute pressure requires temperature ID to include kinetic energy

The keflag cannot be used unless a temperature compute is provided.

Compute pressure temperature ID does not compute temperature

The compute ID assigned to a pressure computation must compute temperature.

Compute property/atom floating point vector does not exist

The command is accessing a vector added by the fix property/atom command, that does not exist.

Compute property/atom for atom property that is not allocated

Self-explanatory.

Compute property/atom integer vector does not exist

The command is accessing a vector added by the fix property/atom command, that does not exist.

Compute property/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute property/local cannot use these inputs together

Only inputs that generate the same number of datums can be used together. E.g. bond and angle quantities cannot be mixed.

Compute property/local does not (yet) work with atom_style template

Self-explanatory.

Compute property/local for property that is not allocated

Self-explanatory.

Compute rdf requires a pair style be defined

Self-explanatory.

Compute reduce compute array is accessed out-of-range

An index for the array is out of bounds.

Compute reduce compute calculates global values

A compute that calculates peratom or local values is required.

Compute reduce compute does not calculate a local array

Self-explanatory.

Compute reduce compute does not calculate a local vector

Self-explanatory.

Compute reduce compute does not calculate a per-atom array

Self-explanatory.

Compute reduce compute does not calculate a per-atom vector

Self-explanatory.

Compute reduce fix array is accessed out-of-range

An index for the array is out of bounds.

Compute reduce fix calculates global values

A fix that calculates peratom or local values is required.

Compute reduce fix does not calculate a local array

Self-explanatory.

Compute reduce fix does not calculate a local vector

Self-explanatory.

Compute reduce fix does not calculate a per-atom array

Self-explanatory.

Compute reduce fix does not calculate a per-atom vector

Self-explanatory.

Compute reduce replace requires min or max mode

Self-explanatory.

Compute reduce variable is not atom-style variable

Self-explanatory.

Compute slice compute array is accessed out-of-range

An index for the array is out of bounds.

Compute slice compute does not calculate a global array

Self-explanatory.

Compute slice compute does not calculate a global vector

Self-explanatory.

Compute slice compute does not calculate global vector or array

Self-explanatory.

Compute slice compute vector is accessed out-of-range

The index for the vector is out of bounds.

Compute slice fix array is accessed out-of-range

An index for the array is out of bounds.

Compute slice fix does not calculate a global array

Self-explanatory.

Compute slice fix does not calculate a global vector

Self-explanatory.

Compute slice fix does not calculate global vector or array

Self-explanatory.

Compute slice fix vector is accessed out-of-range

The index for the vector is out of bounds.

Compute sna/atom cutoff is longer than pairwise cutoff

Self-explanatory.

Compute sna/atom requires a pair style be defined

Self-explanatory.

Compute snad/atom cutoff is longer than pairwise cutoff

Self-explanatory.

Compute snad/atom requires a pair style be defined

Self-explanatory.

Compute snav/atom cutoff is longer than pairwise cutoff

Self-explanatory.

Compute snav/atom requires a pair style be defined

Self-explanatory.

Compute stress/atom temperature ID does not compute temperature

The specified compute must compute temperature.

Compute temp/asphere requires atom style ellipsoid

Self-explanatory.

Compute temp/asphere requires extended particles

This compute cannot be used with point particles.

Compute temp/body requires atom style body

Self-explanatory.

Compute temp/body requires bodies

This compute can only be applied to body particles.

Compute temp/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute temp/cs requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Compute temp/cs used when bonds are not allowed

This compute only works on pairs of bonded particles.

Compute temp/partial cannot use vz for 2d systemx

Self-explanatory.

Compute temp/profile cannot bin z for 2d systems

Self-explanatory.

Compute temp/profile cannot use vz for 2d systemx

Self-explanatory.

Compute temp/sphere requires atom style sphere

Self-explanatory.

Compute ti kspace style does not exist

Self-explanatory.

Compute ti pair style does not exist

Self-explanatory.

Compute ti tail when pair style does not compute tail corrections

Self-explanatory.

Compute torque/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Compute used in dump between runs is not current

The compute was not invoked on the current timestep, therefore it cannot be used in a dump between runs.

Compute used in variable between runs is not current

Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the page for the variable command for more info.

Compute used in variable thermo keyword between runs is not current

Some thermo keywords rely on a compute to calculate their value(s). Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the page for the variable command for more info.

Compute vcm/chunk does not use chunk/atom compute

The style of the specified compute is not chunk/atom.

Computed temperature for fix temp/berendsen cannot be 0.0

Self-explanatory.

Computed temperature for fix temp/rescale cannot be 0.0

Cannot rescale the temperature to a new value if the current temperature is 0.0.

Core/shell partner atom not found

Could not find one of the atoms in the bond pair.

Core/shell partners were not all found

Could not find or more atoms in the bond pairs.

Could not adjust g_ewald_6

The Newton-Raphson solver failed to converge to a good value for g_ewald. This error should not occur for typical problems. Please send an email to the developers.

Could not compute g_ewald

The Newton-Raphson solver failed to converge to a good value for g_ewald. This error should not occur for typical problems. Please send an email to the developers.

Could not compute grid size

The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

Could not compute grid size for Coulomb interaction

The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

Could not compute grid size for Dispersion

The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

Could not create 3d FFT plan

The FFT setup for the PPPM solver failed, typically due to lack of memory. This is an unusual error. Check the size of the FFT grid you are requesting.

Could not create 3d grid of processors

The specified constraints did not allow a Px by Py by Pz grid to be created where $P_x * P_y * P_z = P$ = total number of processors.

Could not create 3d remap plan

The FFT setup in pppm failed.

Could not create Python function arguments

This is an internal Python error, possibly because the number of inputs to the function is too large.

Could not create numa grid of processors

The specified constraints did not allow this style of grid to be created. Usually this is because the total processor count is not a multiple of the cores/node or the user specified processor count is > 1 in one of the dimensions.

Could not create twolevel 3d grid of processors

The specified constraints did not allow this style of grid to be created.

Could not evaluate Python function input variable

Self-explanatory.

Could not find Python function

The provided Python code was run successfully, but it not define a callable function with the required name.

Could not find atom_modify first group ID

Self-explanatory.

Could not find change_box group ID

Group ID used in the change_box command does not exist.

Could not find compute ID for PRD

Self-explanatory.

Could not find compute ID for TAD

Self-explanatory.

Could not find compute ID for temperature bias

Self-explanatory.

Could not find compute ID to delete

Self-explanatory.

Could not find compute displace/atom fix ID

Self-explanatory.

Could not find compute event/displace fix ID

Self-explanatory.

Could not find compute group ID

Self-explanatory.

Could not find compute heat/flux compute ID

Self-explanatory.

Could not find compute msd fix ID

Self-explanatory.

Could not find compute msd/chunk fix ID

The compute creates an internal fix, which has been deleted.

Could not find compute pressure temperature ID

The compute ID for calculating temperature does not exist.

Could not find compute stress/atom temperature ID

Self-explanatory.

Could not find compute vacf fix ID

Self-explanatory.

Could not find compute/voronoi surface group ID

Self-explanatory.

Could not find compute_modify ID

Self-explanatory.

Could not find custom per-atom property ID

Self-explanatory.

Could not find delete_atoms group ID

Group ID used in the delete_atoms command does not exist.

Could not find delete_atoms region ID

Region ID used in the delete_atoms command does not exist.

Could not find displace_atoms group ID

Group ID used in the displace_atoms command does not exist.

Could not find dump custom compute ID

Self-explanatory.

Could not find dump custom fix ID

Self-explanatory.

Could not find dump custom variable name

Self-explanatory.

Could not find dump group ID

A group ID used in the dump command does not exist.

Could not find dump local compute ID

Self-explanatory.

Could not find dump local fix ID

Self-explanatory.

Could not find dump modify compute ID

Self-explanatory.

Could not find dump modify custom atom floating point property ID

Self-explanatory.

Could not find dump modify custom atom integer property ID

Self-explanatory.

Could not find dump modify fix ID

Self-explanatory.

Could not find dump modify variable name

Self-explanatory.

Could not find fix ID to delete

Self-explanatory.

Could not find fix adapt storage fix ID

This should not happen unless you explicitly deleted a secondary fix that fix adapt created internally.

Could not find fix halt variable name

Self-explanatory.

Could not find fix gcmc exclusion group ID

Self-explanatory.

Could not find fix gcmc rotation group ID

Self-explanatory.

Could not find fix group ID

A group ID used in the fix command does not exist.

Could not find fix msst compute ID

Self-explanatory.

Could not find fix poems group ID

A group ID used in the fix poems command does not exist.

Could not find fix recenter group ID

A group ID used in the fix recenter command does not exist.

Could not find fix rigid group ID

A group ID used in the fix rigid command does not exist.

Could not find fix srd group ID

Self-explanatory.

Could not find fix_modify ID

A fix ID used in the fix_modify command does not exist.

Could not find fix_modify pressure ID

The compute ID for computing pressure does not exist.

Could not find fix_modify temperature ID

The compute ID for computing temperature does not exist.

Could not find group clear group ID

Self-explanatory.

Could not find group delete group ID

Self-explanatory.

Could not find pair fix ID

A fix is created internally by the pair style to store shear history information. You cannot delete it.

Could not find set group ID

Group ID specified in set command does not exist.

Could not find specified fix gcmc group ID

Self-explanatory.

Could not find thermo compute ID

Compute ID specified in thermo_style command does not exist.

Could not find thermo custom compute ID

The compute ID needed by thermo style custom to compute a requested quantity does not exist.

Could not find thermo custom fix ID

The fix ID needed by thermo style custom to compute a requested quantity does not exist.

Could not find thermo custom variable name

Self-explanatory.

Could not find thermo fix ID

Fix ID specified in thermo_style command does not exist.

Could not find thermo variable name

Self-explanatory.

Could not find thermo_modify pressure ID

The compute ID needed by thermo style custom to compute pressure does not exist.

Could not find thermo_modify temperature ID

The compute ID needed by thermo style custom to compute temperature does not exist.

Could not find undump ID

A dump ID used in the undump command does not exist.

Could not find velocity group ID

A group ID used in the velocity command does not exist.

Could not find velocity temperature ID

The compute ID needed by the velocity command to compute temperature does not exist.

Could not find/initialize a specified accelerator device

Could not initialize at least one of the devices specified for the gpu package

Could not grab element entry from EIM potential file

Self-explanatory

Could not grab global entry from EIM potential file

Self-explanatory.

Could not grab pair entry from EIM potential file

Self-explanatory.

Could not initialize embedded Python

The main module in Python was not accessible.

Could not open Python file

The specified file of Python code cannot be opened. Check that the path and name are correct.

Could not process Python file

The Python code in the specified file was not run successfully by Python, probably due to errors in the Python code.

Could not process Python string

The Python code in the here string was not run successfully by Python, probably due to errors in the Python code.

Coulomb PPPMDisp order has been reduced below minorder

The default minimum order is 2. This can be reset by the kspace_modify minorder command.

Coulombic cutoff not supported in pair_style buck/long/coul/coul

Must use long-range Coulombic interactions.

Coulombic cutoff not supported in pair_style lj/long/coul/long

Must use long-range Coulombic interactions.

Coulombic cutoff not supported in pair_style lj/long/tip4p/long

Must use long-range Coulombic interactions.

Coulombic cutoffs of pair hybrid sub-styles do not match

If using a Kspace solver, all Coulombic cutoffs of long pair styles must be the same.

Coulombic cut not supported in pair_style lj/long/dipole/long

Must use long-range Coulombic interactions.

Cound not find dump_modify ID

Self-explanatory.

Create_atoms command before simulation box is defined

The create_atoms command cannot be used before a read_data, read_restart, or create_box command.

Create_atoms molecule has atom IDs, but system does not

The atom_style id command can be used to force atom IDs to be stored.

Create_atoms molecule must have atom types

The defined molecule does not specify atom types.

Create_atoms molecule must have coordinates

The defined molecule does not specify coordinates.

Create_atoms region ID does not exist

A region ID used in the create_atoms command does not exist.

Create_bonds command before simulation box is defined

Self-explanatory.

Create_bonds command requires no kspace_style be defined

This is so that atom pairs that are already bonded to not appear in the neighbor list.

Create_bonds command requires special_bonds 1-2 weights be 0.0

This is so that atom pairs that are already bonded to not appear in the neighbor list.

Create_bonds max distance > neighbor cutoff

Can only create bonds for atom pairs that will be in neighbor list.

Create_bonds requires a pair style be defined

Self-explanatory.

Create_box region ID does not exist

Self-explanatory.

Create_box region does not support a bounding box

Not all regions represent bounded volumes. You cannot use such a region with the create_box command.

Custom floating point vector for fix store/state does not exist

The command is accessing a vector added by the fix property/atom command, that does not exist.

Custom integer vector for fix store/state does not exist

The command is accessing a vector added by the fix property/atom command, that does not exist.

Custom per-atom property ID is not floating point

Self-explanatory.

Custom per-atom property ID is not integer

Self-explanatory.

Cut-offs missing in pair_style lj/long/dipole/long

Self-explanatory.

Cutoffs missing in pair_style buck/long/coul/long

Self-explanatory.

Cutoffs missing in pair_style lj/long/coul/long

Self-explanatory.

Cyclic loop in joint connections

Fix poems cannot (yet) work with coupled bodies whose joints connect the bodies in a ring (or cycle).

Degenerate lattice primitive vectors

Invalid set of 3 lattice vectors for lattice command.

Delete region ID does not exist

Self-explanatory.

Delete_atoms command before simulation box is defined

The delete_atoms command cannot be used before a read_data, read_restart, or create_box command.

Delete_atoms cutoff > max neighbor cutoff

Can only delete atoms in atom pairs that will be in neighbor list.

Delete_atoms mol yes requires atom attribute molecule

Cannot use this option with a non-molecular system.

Delete_atoms requires a pair style be defined

This is because atom deletion within a cutoff uses a pairwise neighbor list.

Delete_bonds command before simulation box is defined

The delete_bonds command cannot be used before a read_data, read_restart, or create_box command.

Delete_bonds command with no atoms existing

No atoms are yet defined so the delete_bonds command cannot be used.

Deposition region extends outside simulation box

Self-explanatory.

Did not assign all atoms correctly

Atoms read in from a data file were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box.

Did not assign all restart atoms correctly

Atoms read in from the restart file were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box. Normally this should not happen. You may wish to use the “remap” option on the read_restart command to see if this helps.

Did not find all elements in MEAM library file

Some requested elements were not found in the MEAM file. Check spelling etc.

Did not find fix shake partner info

Could not find bond partners implied by fix shake command. This error can be triggered if the delete_bonds command was used before fix shake, and it removed bonds without resetting the 1-2, 1-3, 1-4 weighting list via the special keyword.

Did not find keyword in table file

Keyword used in pair_coeff command was not found in table file.

Did not set pressure for fix rigid/nph

The press keyword must be specified.

Did not set temp for fix rigid/nvt/small

Self-explanatory.

Did not set temp or press for fix rigid/npt/small

Self-explanatory.

Did not set temperature for fix rigid/nvt

The temp keyword must be specified.

Did not set temperature or pressure for fix rigid/npt

The temp and press keywords must be specified.

Dihedral atom missing in delete_bonds

The delete_bonds command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

Dihedral atom missing in set command

The set command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

Dihedral atoms %d %d %d %d missing on proc %d at step %ld

One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

Dihedral atoms missing on proc %d at step %ld

One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

Dihedral charmm is incompatible with Pair style

Dihedral style charmm must be used with a pair style charmm in order for the 1-4 epsilon/sigma parameters to be defined.

Dihedral coeff for hybrid has invalid style

Dihedral style hybrid uses another dihedral style as one of its coefficients. The dihedral style used in the dihedral_coeff command or read from a restart file is not recognized.

Dihedral coeffs are not set

No dihedral coefficients have been assigned in the data file or via the dihedral_coeff command.

Dihedral style hybrid cannot have hybrid as an argument

Self-explanatory.

Dihedral style hybrid cannot have none as an argument

Self-explanatory.

Dihedral style hybrid cannot use same dihedral style twice

Self-explanatory.

Dihedral/improper extent > half of periodic box length

This error was detected by the neigh_modify check yes setting. It is an error because the dihedral atoms are so far apart it is ambiguous how it should be defined.

Dihedral_coeff command before dihedral_style is defined

Coefficients cannot be set in the data file or via the dihedral_coeff command until an dihedral_style has been assigned.

Dihedral_coeff command before simulation box is defined

The dihedral_coeff command cannot be used before a read_data, read_restart, or create_box command.

Dihedral_coeff command when no divedrals allowed

The chosen atom style does not allow for divedrals to be defined.

Dihedral_style command when no divedrals allowed

The chosen atom style does not allow for divedrals to be defined.

Dihedrals assigned incorrectly

Dihedrals read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Dihedrals defined but no dihedral types

The data file header lists divedrals but no dihedral types.

Dimension command after simulation box is defined

The dimension command cannot be used after a read_data, read_restart, or create_box command.

Disk limit not supported by OS or illegal path

Self-explanatory.

Dispersion PPPMDisp order has been reduced below minorder

The default minimum order is 2. This can be reset by the kspace_modify minorder command.

Displace_atoms command before simulation box is defined

The displace_atoms command cannot be used before a read_data, read_restart, or create_box command.

Distance must be > 0 for compute event/displace

Self-explanatory.

Divide by 0 in influence function

This should not normally occur. It is likely a problem with your model.

Divide by 0 in influence function of pair peri/lps

This should not normally occur. It is likely a problem with your model.

Divide by 0 in variable formula

Self-explanatory.

Domain too large for neighbor bins

The domain has become extremely large so that neighbor bins cannot be used. Most likely, one or more atoms have been blown out of the simulation box to a great distance.

Double precision is not supported on this accelerator

Self-explanatory

Dump atom/gz only writes compressed files

The dump atom/gz output file name must have a .gz suffix.

Dump cfg arguments can not mix xs|ys|zs with xsu|ysu|zsu

Self-explanatory.

Dump cfg arguments must start with 'mass type xs ys zs' or 'mass type xsu ysu zsu'

This is a requirement of the CFG output format. See the dump cfg doc page for more details.

Dump cfg requires one snapshot per file

Use the wildcard "*" character in the filename.

Dump cfg/gz only writes compressed files

The dump cfg/gz output file name must have a .gz suffix.

Dump custom and fix not computed at compatible times

The fix must produce per-atom quantities on timesteps that dump custom needs them.

Dump custom compute does not calculate per-atom array

Self-explanatory.

Dump custom compute does not calculate per-atom vector

Self-explanatory.

Dump custom compute does not compute per-atom info

Self-explanatory.

Dump custom compute vector is accessed out-of-range

Self-explanatory.

Dump custom fix does not compute per-atom array

Self-explanatory.

Dump custom fix does not compute per-atom info

Self-explanatory.

Dump custom fix does not compute per-atom vector

Self-explanatory.

Dump custom fix vector is accessed out-of-range

Self-explanatory.

Dump custom variable is not atom-style variable

Only atom-style variables generate per-atom quantities, needed for dump output.

Dump custom/gz only writes compressed files

The dump custom/gz output file name must have a .gz suffix.

Dump dcd of non-matching # of atoms

Every snapshot written by dump dcd must contain the same # of atoms.

Dump dcd requires sorting by atom ID

Use the dump_modify sort command to enable this.

Dump every variable returned a bad timestep

The variable must return a timestep greater than the current timestep.

Dump file MPI-IO output not allowed with % in filename

This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

Dump file does not contain requested snapshot

Self-explanatory.

Dump file is incorrectly formatted

Self-explanatory.

Dump image body yes requires atom style body

Self-explanatory.

Dump image bond not allowed with no bond types

Self-explanatory.

Dump image cannot perform sorting

Self-explanatory.

Dump image line requires atom style line

Self-explanatory.

Dump image requires one snapshot per file

Use a "*" in the filename.

Dump image tri requires atom style tri

Self-explanatory.

Dump local and fix not computed at compatible times

The fix must produce per-atom quantities on timesteps that dump local needs them.

Dump local attributes contain no compute or fix

Self-explanatory.

Dump local cannot sort by atom ID

This is because dump local does not really dump per-atom info.

Dump local compute does not calculate local array

Self-explanatory.

Dump local compute does not calculate local vector

Self-explanatory.

Dump local compute does not compute local info

Self-explanatory.

Dump local compute vector is accessed out-of-range

Self-explanatory.

Dump local count is not consistent across input fields

Every column of output must be the same length.

Dump local fix does not compute local array

Self-explanatory.

Dump local fix does not compute local info

Self-explanatory.

Dump local fix does not compute local vector

Self-explanatory.

Dump local fix vector is accessed out-of-range

Self-explanatory.

Dump modify bcolor not allowed with no bond types

Self-explanatory.

Dump modify bdiam not allowed with no bond types

Self-explanatory.

Dump modify compute ID does not compute per-atom array

Self-explanatory.

Dump modify compute ID does not compute per-atom info

Self-explanatory.

Dump modify compute ID does not compute per-atom vector

Self-explanatory.

Dump modify compute ID vector is not large enough

Self-explanatory.

Dump modify element names do not match atom types

Number of element names must equal number of atom types.

Dump modify fix ID does not compute per-atom array

Self-explanatory.

Dump modify fix ID does not compute per-atom info

Self-explanatory.

Dump modify fix ID does not compute per-atom vector

Self-explanatory.

Dump modify fix ID vector is not large enough

Self-explanatory.

Dump modify variable is not atom-style variable

Self-explanatory.

Dump sort column is invalid

Self-explanatory.

Dump xtc requires sorting by atom ID

Use the dump_modify sort command to enable this.

Dump xyz/gz only writes compressed files

The dump xyz/gz output file name must have a .gz suffix.

Dump_modify buffer yes not allowed for this style

Self-explanatory.

Dump_modify format string is too short

There are more fields to be dumped in a line of output than your format string specifies.

Dump_modify region ID does not exist

Self-explanatory.

Dumping an atom property that is not allocated

The chosen atom style does not define the per-atom quantity being dumped.

Duplicate atom IDs exist

Self-explanatory.

Duplicate fields in read_dump command

Self-explanatory.

Duplicate particle in PeriDynamic bond - simulation box is too small

This is likely because your box length is shorter than 2 times the bond length.

Electronic temperature dropped below zero

Something has gone wrong with the fix ttm electron temperature model.

Element not defined in potential file

The specified element is not in the potential file.

Empty brackets in variable

There is no variable syntax that uses empty brackets. Check the variable doc page.

Energy was not tallied on needed timestep

You are using a thermo keyword that requires potentials to have tallied energy, but they did not on this timestep. See the variable page for ideas on how to make this work.

Epsilon or sigma reference not set by pair style in PPPMDisp

Self-explanatory.

Epsilon or sigma reference not set by pair style in ewald/n

The pair style is not providing the needed epsilon or sigma values.

Error in MEAM parameter file: keyword %s (further information)

Self-explanatory. Check the parameter file.

Error in vdw spline: inner radius > outer radius

A pre-tabulated spline is invalid. Likely a problem with the potential parameters.

Error writing averaged chunk data

Something in the output to the file triggered an error.

Error writing file header

Something in the output to the file triggered an error.

Error writing out correlation data

Something in the output to the file triggered an error.

Error writing out histogram data

Something in the output to the file triggered an error.

Error writing out time averaged data

Something in the output to the file triggered an error.

Failed to allocate %ld bytes for array %s

Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.

Failed to open FFmpeg pipeline to file %s

The specified file cannot be opened. Check that the path and name are correct and writable and that the FFmpeg executable can be found and run.

Failed to reallocate %ld bytes for array %s

Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.

Fewer SRD bins than processors in some dimension

This is not allowed. Make your SRD bin size smaller.

File variable could not read value

Check the file assigned to the variable.

Final box dimension due to fix deform is < 0.0

Self-explanatory.

Fix %s does not allow use of dynamic group

Dynamic groups have not yet been enabled for this fix.

Fix ID for compute chunk/atom does not exist

Self-explanatory.

Fix ID for compute erotate/rigid does not exist

Self-explanatory.

Fix ID for compute ke/rigid does not exist

Self-explanatory.

Fix ID for compute reduce does not exist

Self-explanatory.

Fix ID for compute slice does not exist

Self-explanatory.

Fix ID for fix ave/atom does not exist

Self-explanatory.

Fix ID for fix ave/chunk does not exist

Self-explanatory.

Fix ID for fix ave/correlate does not exist

Self-explanatory.

Fix ID for fix ave/histo does not exist

Self-explanatory.

Fix ID for fix ave/time does not exist

Self-explanatory.

Fix ID for fix store/state does not exist

Self-explanatory

Fix ID for fix vector does not exist

Self-explanatory.

Fix ID for read_data does not exist

Self-explanatory.

Fix ID for velocity does not exist

Self-explanatory.

Fix ID must be alphanumeric or underscore characters

Self-explanatory.

Fix SRD: bad bin assignment for SRD advection

Something has gone wrong in your SRD model; try using more conservative settings.

Fix SRD: bad search bin assignment

Something has gone wrong in your SRD model; try using more conservative settings.

Fix SRD: bad stencil bin for big particle

Something has gone wrong in your SRD model; try using more conservative settings.

Fix SRD: too many big particles in bin

Reset the ATOMPERBIN parameter at the top of fix_srd.cpp to a larger value, and re-compile the code.

Fix SRD: too many walls in bin

This should not happen unless your system has been setup incorrectly.

Fix adapt interface to this pair style not supported

New coding for the pair style would need to be done.

Fix adapt kspace style does not exist

Self-explanatory.

Fix adapt pair style does not exist

Self-explanatory

Fix adapt pair style param not supported

The pair style does not know about the parameter you specified.

Fix adapt requires atom attribute charge

The atom style being used does not specify an atom charge.

Fix adapt requires atom attribute diameter

The atom style being used does not specify an atom diameter.

Fix adapt type pair range is not valid for pair hybrid sub-style

Self-explanatory.

Fix append/atoms requires a lattice be defined

Use the lattice command for this purpose.

Fix ave/atom compute array is accessed out-of-range

Self-explanatory.

Fix ave/atom compute does not calculate a per-atom array

Self-explanatory.

Fix ave/atom compute does not calculate a per-atom vector

A compute used by fix ave/atom must generate per-atom values.

Fix ave/atom compute does not calculate per-atom values

A compute used by fix ave/atom must generate per-atom values.

Fix ave/atom fix array is accessed out-of-range

Self-explanatory.

Fix ave/atom fix does not calculate a per-atom array

Self-explanatory.

Fix ave/atom fix does not calculate a per-atom vector

A fix used by fix ave/atom must generate per-atom values.

Fix ave/atom fix does not calculate per-atom values

A fix used by fix ave/atom must generate per-atom values.

Fix ave/atom variable is not atom-style variable

A variable used by fix ave/atom must generate per-atom values.

Fix ave/chunk compute does not calculate a per-atom array

Self-explanatory.

Fix ave/chunk compute does not calculate a per-atom vector

Self-explanatory.

Fix ave/chunk compute does not calculate per-atom values

Self-explanatory.

Fix ave/chunk compute vector is accessed out-of-range

Self-explanatory.

Fix ave/chunk does not use chunk/atom compute

The specified compute is not for a compute chunk/atom command.

Fix ave/chunk fix does not calculate a per-atom array

Self-explanatory.

Fix ave/chunk fix does not calculate a per-atom vector

Self-explanatory.

Fix ave/chunk fix does not calculate per-atom values

Self-explanatory.

Fix ave/chunk fix vector is accessed out-of-range

Self-explanatory.

Fix ave/chunk variable is not atom-style variable

Self-explanatory.

Fix ave/correlate compute does not calculate a scalar

Self-explanatory.

Fix ave/correlate compute does not calculate a vector

Self-explanatory.

Fix ave/correlate compute vector is accessed out-of-range

The index for the vector is out of bounds.

Fix ave/correlate fix does not calculate a scalar

Self-explanatory.

Fix ave/correlate fix does not calculate a vector

Self-explanatory.

Fix ave/correlate fix vector is accessed out-of-range

The index for the vector is out of bounds.

Fix ave/correlate variable is not equal-style variable

Self-explanatory.

Fix ave/histo cannot input local values in scalar mode

Self-explanatory.

Fix ave/histo cannot input per-atom values in scalar mode

Self-explanatory.

Fix ave/histo compute array is accessed out-of-range

Self-explanatory.

Fix ave/histo compute does not calculate a global array

Self-explanatory.

Fix ave/histo compute does not calculate a global scalar

Self-explanatory.

Fix ave/histo compute does not calculate a global vector

Self-explanatory.

Fix ave/histo compute does not calculate a local array

Self-explanatory.

Fix ave/histo compute does not calculate a local vector

Self-explanatory.

Fix ave/histo compute does not calculate a per-atom array

Self-explanatory.

Fix ave/histo compute does not calculate a per-atom vector

Self-explanatory.

Fix ave/histo compute does not calculate local values

Self-explanatory.

Fix ave/histo compute does not calculate per-atom values

Self-explanatory.

Fix ave/histo compute vector is accessed out-of-range

Self-explanatory.

Fix ave/histo fix array is accessed out-of-range

Self-explanatory.

Fix ave/histo fix does not calculate a global array

Self-explanatory.

Fix ave/histo fix does not calculate a global scalar

Self-explanatory.

Fix ave/histo fix does not calculate a global vector

Self-explanatory.

Fix ave/histo fix does not calculate a local array

Self-explanatory.

Fix ave/histo fix does not calculate a local vector

Self-explanatory.

Fix ave/histo fix does not calculate a per-atom array

Self-explanatory.

Fix ave/histo fix does not calculate a per-atom vector

Self-explanatory.

Fix ave/histo fix does not calculate local values

Self-explanatory.

Fix ave/histo fix does not calculate per-atom values

Self-explanatory.

Fix ave/histo fix vector is accessed out-of-range

Self-explanatory.

Fix ave/histo input is invalid compute

Self-explanatory.

Fix ave/histo input is invalid fix

Self-explanatory.

Fix ave/histo input is invalid variable

Self-explanatory.

Fix ave/histo inputs are not all global, peratom, or local

All inputs in a single fix ave/histo command must be of the same style.

Fix ave/histo/weight value and weight vector lengths do not match

Self-explanatory.

Fix ave/time cannot set output array intensive/extensive from these inputs

One of more of the vector inputs has individual elements which are flagged as intensive or extensive. Such an input cannot be flagged as all intensive/extensive when turned into an array by fix ave/time.

Fix ave/time cannot use variable with vector mode

Variables produce scalar values.

Fix ave/time columns are inconsistent lengths

Self-explanatory.

Fix ave/time compute array is accessed out-of-range

An index for the array is out of bounds.

Fix ave/time compute does not calculate a scalar

Self-explanatory.

Fix ave/time compute does not calculate a vector

Self-explanatory.

Fix ave/time compute does not calculate an array

Self-explanatory.

Fix ave/time compute vector is accessed out-of-range

The index for the vector is out of bounds.

Fix ave/time fix array cannot be variable length

Self-explanatory.

Fix ave/time fix array is accessed out-of-range

An index for the array is out of bounds.

Fix ave/time fix does not calculate a scalar

Self-explanatory.

Fix ave/time fix does not calculate a vector

Self-explanatory.

Fix ave/time fix does not calculate an array

Self-explanatory.

Fix ave/time fix vector cannot be variable length

Self-explanatory.

Fix ave/time fix vector is accessed out-of-range

The index for the vector is out of bounds.

Fix ave/time variable is not equal-style variable

Self-explanatory.

Fix balance rcb cannot be used with comm_style brick

Comm_style tiled must be used instead.

Fix balance shift string is invalid

The string can only contain the characters “x”, “y”, or “z”.

Fix bond/break needs ghost atoms from further away

This is because the fix needs to walk bonds to a certain distance to acquire needed info, The comm_modify cutoff command can be used to extend the communication range.

Fix bond/create angle type is invalid

Self-explanatory.

Fix bond/create cutoff is longer than pairwise cutoff

This is not allowed because bond creation is done using the pairwise neighbor list.

Fix bond/create dihedral type is invalid

Self-explanatory.

Fix bond/create improper type is invalid

Self-explanatory.

Fix bond/create induced too many angles/dihedrals/impropers per atom

See the read_data command for info on using the “extra/angle/per/atom”, (or dihedral, improper) keywords to allow for additional angles, dihedrals, and impropers to be formed.

Fix bond/create needs ghost atoms from further away

This is because the fix needs to walk bonds to a certain distance to acquire needed info, The comm_modify cutoff command can be used to extend the communication range.

Fix bond/react: Cannot use fix bond/react with non-molecular systems

Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Fix bond/react: Invalid template atom ID in map file

Atom IDs in molecule templates range from 1 to the number of atoms in the template.

Fix bond/react: Rmax cutoff is longer than pairwise cutoff

This is not allowed because bond creation is done using the pairwise neighbor list.

Fix bond/react: Molecule template ID for fix bond/react does not exist

A valid molecule template must have been created with the molecule command.

Fix bond/react: Reaction templates must contain the same number of atoms

There should be a one-to-one correspondence between atoms in the pre-reacted and post-reacted templates, as specified by the map file.

Fix bond/react: Unknown section in map file

Please ensure reaction map files are properly formatted.

Fix bond/react: Atom/Bond type affected by reaction too close to template edge

This means an atom which changes type or connectivity during the reaction is too close to an ‘edge’ atom defined in the map file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.

Fix bond/react: Fix bond/react needs ghost atoms from farther away

This is because a processor needs to map the entire unreacted molecule template onto simulation atoms it knows about. The comm_modify cutoff command can be used to extend the communication range.

Fix bond/react: A deleted atom cannot remain bonded to an atom that is not deleted

Self-explanatory.

Fix bond/react: First neighbors of chiral atoms must be of mutually different types

Self-explanatory.

Fix bond/react: Chiral atoms must have exactly four first neighbors

Self-explanatory.

Fix bond/react: Molecule template 'Coords' section required for chiralIDs keyword

The coordinates of atoms in the pre-reacted template are used to determine chirality.

Fix bond/react special bond generation overflow

The number of special bonds per-atom created by a reaction exceeds the system setting. See the read_data or create_box command for how to specify this value.

Fix bond/react topology/atom exceed system topology/atom

The number of bonds, angles etc per-atom created by a reaction exceeds the system setting. See the read_data or create_box command for how to specify this value.

Fix bond/swap cannot use dihedral or improper styles

These styles cannot be defined when using this fix.

Fix bond/swap requires pair and bond styles

Self-explanatory.

Fix bond/swap requires special_bonds = 0,1,1

Self-explanatory.

Fix box/relax generated negative box length

The pressure being applied is likely too large. Try applying it incrementally, to build to the high pressure.

Fix command before simulation box is defined

The fix command cannot be used before a read_data, read_restart, or create_box command.

Fix deform cannot use yz variable with xy

The yz setting cannot be a variable if xy deformation is also specified. This is because LAMMPS cannot determine if the yz setting will induce a box flip which would be invalid if xy is also changing.

Fix deform is changing yz too much with xy

When both yz and xy are changing, it induces changes in xz if the box must flip from one tilt extreme to another. Thus it is not allowed for yz to grow so much that a flip is induced.

Fix deform tilt factors require triclinic box

Cannot deform the tilt factors of a simulation box unless it is a triclinic (non-orthogonal) box.

Fix deform volume setting is invalid

Cannot use volume style unless other dimensions are being controlled.

Fix deposit and fix rigid/small not using same molecule template ID

Self-explanatory.

Fix deposit and fix shake not using same molecule template ID

Self-explanatory.

Fix deposit molecule must have atom types

The defined molecule does not specify atom types.

Fix deposit molecule must have coordinates

The defined molecule does not specify coordinates.

Fix deposit molecule template ID must be same as atom_style template ID

When using atom_style template, you cannot deposit molecules that are not in that template.

Fix deposit region cannot be dynamic

Only static regions can be used with fix deposit.

Fix deposit region does not support a bounding box

Not all regions represent bounded volumes. You cannot use such a region with the fix deposit command.

Fix deposit shake fix does not exist

Self-explanatory.

Fix efield requires atom attribute q or mu

The atom style defined does not have this attribute.

Fix efield with dipoles cannot use atom-style variables

This option is not supported.

Fix evaporate molecule requires atom attribute molecule

The atom style being used does not define a molecule ID.

Fix external callback function not set

This must be done by an external program in order to use this fix.

Fix for fix ave/atom not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/atom is requesting a value on a non-allowed timestep.

Fix for fix ave/chunk not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/chunk is requesting a value on a non-allowed timestep.

Fix for fix ave/correlate not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/correlate is requesting a value on a non-allowed timestep.

Fix for fix ave/histo not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/histo is requesting a value on a non-allowed timestep.

Fix for fix ave/spatial not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/spatial is requesting a value on a non-allowed timestep.

Fix for fix ave/time not computed at compatible time

Fixes generate their values on specific timesteps. Fix ave/time is requesting a value on a non-allowed timestep.

Fix for fix store/state not computed at compatible time

Fixes generate their values on specific timesteps. Fix store/state is requesting a value on a non-allowed timestep.

Fix for fix vector not computed at compatible time

Fixes generate their values on specific timesteps. Fix vector is requesting a value on a non-allowed timestep.

Fix freeze requires atom attribute torque

The atom style defined does not have this attribute.

Fix gcmc and fix shake not using same molecule template ID

Self-explanatory.

Fix gcmc atom has charge, but atom style does not

Self-explanatory.

Fix gcmc cannot exchange individual atoms belonging to a molecule

This is an error since you should not delete only one atom of a molecule. The user has specified atomic (non-molecular) gas exchanges, but an atom belonging to a molecule could be deleted.

Fix gcmc does not (yet) work with atom_style template

Self-explanatory.

Fix gcmc molecule command requires that atoms have molecule attributes

Should not choose the gcmc molecule feature if no molecules are being simulated. The general molecule flag is off, but gcmc's molecule flag is on.

Fix gcmc molecule has charges, but atom style does not

Self-explanatory.

Fix gcmc molecule must have atom types

The defined molecule does not specify atom types.

Fix gcmc molecule must have coordinates

The defined molecule does not specify coordinates.

Fix gcmc molecule template ID must be same as atom_style template ID

When using atom_style template, you cannot insert molecules that are not in that template.

Fix gcmc put atom outside box

This should not normally happen. Contact the developers.

Fix gcmc ran out of available atom IDs

See the setting for tagint in the src/lmptype.h file.

Fix gcmc ran out of available molecule IDs

See the setting for tagint in the src/lmptype.h file.

Fix gcmc region cannot be dynamic

Only static regions can be used with fix gcmc.

Fix gcmc region does not support a bounding box

Not all regions represent bounded volumes. You cannot use such a region with the fix gcmc command.

Fix gcmc region extends outside simulation box

Self-explanatory.

Fix gcmc shake fix does not exist

Self-explanatory.

Fix gld c coefficients must be ≥ 0

Self-explanatory.

Fix gld needs more prony series coefficients

Self-explanatory.

Fix gld prony terms must be > 0

Self-explanatory.

Fix gld series type must be pprony for now

Self-explanatory.

Fix gld start temperature must be ≥ 0

Self-explanatory.

Fix gld stop temperature must be ≥ 0

Self-explanatory.

Fix gld tau coefficients must be > 0

Self-explanatory.

Fix halt variable is not equal-style variable

Self-explanatory.

Fix heat group has no atoms

Self-explanatory.

Fix heat kinetic energy of an atom went negative

This will cause the velocity rescaling about to be performed by fix heat to be invalid.

Fix heat kinetic energy went negative

This will cause the velocity rescaling about to be performed by fix heat to be invalid.

Fix in variable not computed at compatible time

Fixes generate their values on specific timesteps. The variable is requesting the values on a non-allowed timestep.

Fix langevin angmom is not yet implemented with kokkos

This option is not yet available.

Fix langevin angmom requires atom style ellipsoid

Self-explanatory.

Fix langevin angmom requires extended particles

This fix option cannot be used with point particles.

Fix langevin gif and respa are not compatible

Self-explanatory.

Fix langevin gif cannot have period equal to dt/2

If the period is equal to dt/2 then division by zero will happen.

Fix langevin gif should come before fix nve

Self-explanatory.

Fix langevin gif with tbias is not yet implemented with kokkos

This option is not yet available.

Fix langevin omega is not yet implemented with kokkos

This option is not yet available.

Fix langevin omega requires atom style sphere

Self-explanatory.

Fix langevin omega requires extended particles

One of the particles has radius 0.0.

Fix langevin period must be > 0.0

The time window for temperature relaxation must be > 0

Fix langevin variable returned negative temperature

Self-explanatory.

Fix momentum group has no atoms

Self-explanatory.

Fix move cannot define z or vz variable for 2d problem

Self-explanatory.

Fix move cannot rotate around non z-axis for 2d problem

Self-explanatory.

Fix move cannot set linear z motion for 2d problem

Self-explanatory.

Fix move cannot set wiggle z motion for 2d problem

Self-explanatory.

Fix msst compute ID does not compute potential energy

Self-explanatory.

Fix msst compute ID does not compute pressure

Self-explanatory.

Fix msst compute ID does not compute temperature

Self-explanatory.

Fix msst requires a periodic box

Self-explanatory.

Fix msst tscale must satisfy $0 \leq tscale < 1$

Self-explanatory.

Fix npt/nph has tilted box too far in one step - periodic cell is too far from equilibrium state

Self-explanatory. The change in the box tilt is too extreme on a short timescale.

Fix numdiff requires an atom map, see atom_modify

Self-explanatory. Efficient loop over all atoms for numerical difference requires an atom map.

Fix numdiff requires consecutive atom IDs

Self-explanatory. Efficient loop over all atoms for numerical difference requires consecutive atom IDs.

Fix numdiff/virial must use group all

Virial contributions computed by this fix are computed on all atoms.

Fix nve/asphere requires extended particles

This fix can only be used for particles with a shape setting.

Fix nve/asphere/noforce requires atom style ellipsoid

Self-explanatory.

Fix nve/asphere/noforce requires extended particles

One of the particles is not an ellipsoid.

Fix nve/body requires atom style body

Self-explanatory.

Fix nve/body requires bodies

This fix can only be used for particles that are bodies.

Fix nve/line can only be used for 2d simulations

Self-explanatory.

Fix nve/line requires atom style line

Self-explanatory.

Fix nve/line requires line particles

Self-explanatory.

Fix nve/sphere dipole requires atom attribute mu

An atom style with this attribute is needed.

Fix nve/sphere requires atom style sphere

Self-explanatory.

Fix nve/sphere requires extended particles

This fix can only be used for particles of a finite size.

Fix nve/tri can only be used for 3d simulations

Self-explanatory.

Fix nve/tri requires atom style tri

Self-explanatory.

Fix nve/tri requires tri particles

Self-explanatory.

Fix nvt/nph/npt asphere requires extended particles

The shape setting for a particle in the fix group has shape = 0.0, which means it is a point particle.

Fix nvt/nph/npt body requires bodies

Self-explanatory.

Fix nvt/nph/npt sphere requires atom style sphere

Self-explanatory.

Fix nvt/npt/nph damping parameters must be > 0.0

Self-explanatory.

Fix nvt/npt/nph dilate group ID does not exist

Self-explanatory.

Fix nvt/sphere requires extended particles

This fix can only be used for particles of a finite size.

Fix orient/fcc file open failed

The fix orient/fcc command could not open a specified file.

Fix orient/fcc file read failed

The fix orient/fcc command could not read the needed parameters from a specified file.

Fix orient/fcc found self twice

The neighbor lists used by fix orient/fcc are messed up. If this error occurs, it is likely a bug, so send an email to the [developers](#).

Fix peri neigh does not exist

Somehow a fix that the pair style defines has been deleted.

Fix pour and fix rigid/small not using same molecule template ID

Self-explanatory.

Fix pour and fix shake not using same molecule template ID

Self-explanatory.

Fix pour insertion count per timestep is 0

Self-explanatory.

Fix pour molecule must have atom types

The defined molecule does not specify atom types.

Fix pour molecule must have coordinates

The defined molecule does not specify coordinates.

Fix pour molecule template ID must be same as atom style template ID

When using atom_style template, you cannot pour molecules that are not in that template.

Fix pour polydisperse fractions do not sum to 1.0

Self-explanatory.

Fix pour region ID does not exist

Self-explanatory.

Fix pour region cannot be dynamic

Only static regions can be used with fix pour.

Fix pour region does not support a bounding box

Not all regions represent bounded volumes. You cannot use such a region with the fix pour command.

Fix pour requires atom attributes radius, rmass

The atom style defined does not have these attributes.

Fix pour rigid fix does not exist

Self-explanatory.

Fix pour shake fix does not exist

Self-explanatory.

Fix press/berendsen damping parameters must be > 0.0

Self-explanatory.

Fix property/atom cannot specify mol twice

Self-explanatory.

Fix property/atom cannot specify q twice

Self-explanatory.

Fix property/atom mol when atom_style already has molecule attribute

Self-explanatory.

Fix property/atom q when atom_style already has charge attribute

Self-explanatory.

Fix property/atom vector name already exists

The name for an integer or floating-point vector must be unique.

Fix qeq has negative upper Taper radius cutoff

Self-explanatory.

Fix qeq/comb group has no atoms

Self-explanatory.

Fix qeq/comb requires atom attribute q

An atom style with charge must be used to perform charge equilibration.

Fix qeq/dynamic group has no atoms

Self-explanatory.

Fix qeq/dynamic requires atom attribute q

Self-explanatory.

Fix qeq/fire group has no atoms

Self-explanatory.

Fix qeq/fire requires atom attribute q

Self-explanatory.

Fix qeq/point group has no atoms

Self-explanatory.

Fix qeq/point has insufficient QEq matrix size

Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/point requires atom attribute q

Self-explanatory.

Fix qeq/shielded group has no atoms

Self-explanatory.

Fix qeq/shielded has insufficient QEq matrix size

Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/shielded requires atom attribute q

Self-explanatory.

Fix qeq/slater could not extract params from pair coul/streitz

This should not happen unless pair coul/streitz has been altered.

Fix qeq/slater group has no atoms

Self-explanatory.

Fix qeq/slater has insufficient QEq matrix size

Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/slater requires atom attribute q

Self-explanatory.

Fix reax/bonds numbonds > nsbmax_most

The limit of the number of bonds expected by the ReaxFF force field was exceeded.

Fix recenter group has no atoms

Self-explanatory.

Fix restrain requires an atom map, see atom_modify

Self-explanatory.

Fix rigid atom has non-zero image flag in a non-periodic dimension

Image flags for non-periodic dimensions should not be set.

Fix rigid file has no lines

Self-explanatory.

Fix rigid langevin period must be > 0.0

Self-explanatory.

Fix rigid molecule requires atom attribute molecule

Self-explanatory.

Fix rigid npt/nph dilate group ID does not exist

Self-explanatory.

Fix rigid npt/nph does not yet allow triclinic box

This is a current restriction in LAMMPS.

Fix rigid npt/nph period must be > 0.0

Self-explanatory.

Fix rigid npt/small t_chain should not be less than 1

Self-explanatory.

Fix rigid npt/small t_order must be 3 or 5

Self-explanatory.

Fix rigid nvt/npt/nph damping parameters must be > 0.0

Self-explanatory.

Fix rigid nvt/small t_chain should not be less than 1

Self-explanatory.

Fix rigid nvt/small t_iter should not be less than 1

Self-explanatory.

Fix rigid nvt/small t_order must be 3 or 5

Self-explanatory.

Fix rigid xy torque cannot be on for 2d simulation

Self-explanatory.

Fix rigid z force cannot be on for 2d simulation

Self-explanatory.

Fix rigid/npt period must be > 0.0

Self-explanatory.

Fix rigid/npt temperature order must be 3 or 5

Self-explanatory.

Fix rigid/npt/small period must be > 0.0

Self-explanatory.

Fix rigid/nvt period must be > 0.0

Self-explanatory.

Fix rigid/nvt temperature order must be 3 or 5

Self-explanatory.

Fix rigid/nvt/small period must be > 0.0

Self-explanatory.

Fix rigid/small atom has non-zero image flag in a non-periodic dimension

Image flags for non-periodic dimensions should not be set.

Fix rigid/small langevin period must be > 0.0

Self-explanatory.

Fix rigid/small molecule must have atom types

The defined molecule does not specify atom types.

Fix rigid/small molecule must have coordinates

The defined molecule does not specify coordinates.

Fix rigid/small npt/nph period must be > 0.0

Self-explanatory.

Fix rigid/small nvt/npt/nph damping parameters must be > 0.0

Self-explanatory.

Fix rigid/small nvt/npt/nph dilate group ID does not exist

Self-explanatory.

Fix rigid/small requires an atom map, see atom_modify

Self-explanatory.

Fix rigid/small requires atom attribute molecule

Self-explanatory.

Fix rigid: Bad principal moments

The principal moments of inertia computed for a rigid body are not within the required tolerances.

Fix shake cannot be used with minimization

Cannot use fix shake while doing an energy minimization since it turns off bonds that should contribute to the energy.

Fix shake molecule template must have shake info

The defined molecule does not specify SHAKE information.

Fix spring couple group ID does not exist

Self-explanatory.

Fix srd can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

Fix srd lamda must be ≥ 0.6 of SRD grid size

This is a requirement for accuracy reasons.

Fix srd no-slip requires atom attribute torque

This is because the SRD collisions will impart torque to the solute particles.

Fix srd requires SRD particles all have same mass

Self-explanatory.

Fix srd requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Fix srd requires newton pair on

Self-explanatory.

Fix store/state compute array is accessed out-of-range

Self-explanatory.

Fix store/state compute does not calculate a per-atom array

The compute calculates a per-atom vector.

Fix store/state compute does not calculate a per-atom vector

The compute calculates a per-atom vector.

Fix store/state compute does not calculate per-atom values

Computes that calculate global or local quantities cannot be used with fix store/state.

Fix store/state fix array is accessed out-of-range

Self-explanatory.

Fix store/state fix does not calculate a per-atom array

The fix calculates a per-atom vector.

Fix store/state fix does not calculate a per-atom vector

The fix calculates a per-atom array.

Fix store/state fix does not calculate per-atom values

Fixes that calculate global or local quantities cannot be used with fix store/state.

Fix store/state for atom property that is not allocated

Self-explanatory.

Fix store/state variable is not atom-style variable

Only atom-style variables calculate per-atom quantities.

Fix temp/berendsen period must be > 0.0

Self-explanatory.

Fix temp/berendsen variable returned negative temperature

Self-explanatory.

Fix temp/csld is not compatible with fix rattle or fix shake

These two commands cannot currently be used together with fix temp/csld.

Fix temp/csld variable returned negative temperature

Self-explanatory.

Fix temp/csvr variable returned negative temperature

Self-explanatory.

Fix temp/rescale variable returned negative temperature

Self-explanatory.

Fix tfmc displacement length must be > 0

Self-explanatory.

Fix tfmc is not compatible with fix shake

These two commands cannot currently be used together.

Fix tfmc temperature must be > 0

Self-explanatory.

Fix thermal/conductivity swap value must be positive

Self-explanatory.

Fix tmd must come after integration fixes

Any fix tmd command must appear in the input script after all time integration fixes (nve, nvt, npt). See the fix tmd documentation for details.

Fix ttm electron temperatures must be > 0.0

Self-explanatory.

Fix ttm electronic_density must be > 0.0

Self-explanatory.

Fix ttm electronic_specific_heat must be > 0.0

Self-explanatory.

Fix ttm electronic_thermal_conductivity must be >= 0.0

Self-explanatory.

Fix ttm gamma_p must be > 0.0

Self-explanatory.

Fix ttm gamma_s must be >= 0.0

Self-explanatory.

Fix ttm number of nodes must be > 0

Self-explanatory.

Fix ttm v_0 must be >= 0.0

Self-explanatory.

Fix used in compute chunk/atom not computed at compatible time

The chunk/atom compute cannot query the output of the fix on a timestep it is needed.

Fix used in compute reduce not computed at compatible time

Fixes generate their values on specific timesteps. Compute reduce is requesting a value on a non-allowed timestep.

Fix used in compute slice not computed at compatible time

Fixes generate their values on specific timesteps. Compute slice is requesting a value on a non-allowed timestep.

Fix vector cannot set output array intensive/extensive from these inputs

The inputs to the command have conflicting intensive/extensive attributes. You need to use more than one fix vector command.

Fix vector compute does not calculate a scalar

Self-explanatory.

Fix vector compute does not calculate a vector

Self-explanatory.

Fix vector compute vector is accessed out-of-range

Self-explanatory.

Fix vector fix does not calculate a scalar

Self-explanatory.

Fix vector fix does not calculate a vector

Self-explanatory.

Fix vector fix vector is accessed out-of-range

Self-explanatory.

Fix vector variable is not equal-style variable

Self-explanatory.

Fix viscosity swap value must be positive

Self-explanatory.

Fix viscosity vtarget value must be positive

Self-explanatory.

Fix wall cutoff <= 0.0

Self-explanatory.

Fix wall/colloid requires atom style sphere

Self-explanatory.

Fix wall/colloid requires extended particles

One of the particles has radius 0.0.

Fix wall/gran is incompatible with Pair style

Must use a granular pair style to define the parameters needed for this fix.

Fix wall/gran requires atom style sphere

Self-explanatory.

Fix wall/piston command only available at zlo

The face keyword must be zlo.

Fix wall/region colloid requires atom style sphere

Self-explanatory.

Fix wall/region colloid requires extended particles

One of the particles has radius 0.0.

Fix wall/region cutoff <= 0.0

Self-explanatory.

Fix_modify pressure ID does not compute pressure

The compute ID assigned to the fix must compute pressure.

Fix_modify temperature ID does not compute temperature

The compute ID assigned to the fix must compute temperature.

For triclinic deformation, specified target stress must be hydrostatic

Triclinic pressure control is allowed using the tri keyword, but non-hydrostatic pressure control can not be used in this case.

Found no restart file matching pattern

When using a "*" in the restart file name, no matching file was found.

GPU library not compiled for this accelerator

Self-explanatory.

GPU package does not (yet) work with atom_style template

Self-explanatory.

GPU particle split must be set to 1 for this pair style.

For this pair style, you cannot run part of the force calculation on the host. See the package command.

GPUs are requested but Kokkos has not been compiled for CUDA

Re-compile Kokkos with CUDA support to use GPUs.

Ghost velocity forward comm not yet implemented with Kokkos

This is a current restriction.

Gmask function in equal-style variable formula

Gmask is per-atom operation.

Gravity changed since fix pour was created

The gravity vector defined by fix gravity must be static.

Gravity must point in -y to use with fix pour in 2d

Self-explanatory.

Gravity must point in -z to use with fix pour in 3d

Self-explanatory.

Gmask function in equal-style variable formula

Grmask is per-atom operation.

Group ID does not exist

A group ID used in the group command does not exist.

Group ID in variable formula does not exist

Self-explanatory.

Group all cannot be made dynamic

This operation is not allowed.

Group command before simulation box is defined

The group command cannot be used before a read_data, read_restart, or create_box command.

Group dynamic cannot reference itself

Self-explanatory.

Group dynamic parent group cannot be dynamic

Self-explanatory.

Group dynamic parent group does not exist

Self-explanatory.

Group region ID does not exist

A region ID used in the group command does not exist.

If read_dump purges it cannot replace or trim

These operations are not compatible. See the read_dump doc page for details.

Illegal ... command

Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.

Illegal COMB parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal COMB3 parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal Stillinger-Weber parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal Tersoff parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal Vashishta parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal compute voronoi/atom command (occupation and (surface or edges))

Self-explanatory.

Illegal coul/streitz parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal dump_modify sfactor value (must be > 0.0)

Self-explanatory.

Illegal dump_modify tfactor value (must be > 0.0)

Self-explanatory.

Illegal fix gcmc gas mass <= 0

The computed mass of the designated gas molecule or atom type was less than or equal to zero.

Illegal fix tfmc random seed

Seeds can only be nonzero positive integers.

Illegal fix wall/piston velocity

The piston velocity must be positive.

Illegal integrate style

Self-explanatory.

Illegal nb3b/harmonic parameter

One or more of the coefficients defined in the potential file is invalid.

Illegal number of angle table entries

There must be at least 2 table entries.

Illegal number of bond table entries

There must be at least 2 table entries.

Illegal number of pair table entries

There must be at least 2 table entries.

Illegal or unset periodicity in restart

This error should not normally occur unless the restart file is invalid.

Illegal range increment value

The increment must be ≥ 1 .

Illegal simulation box

The lower bound of the simulation box is greater than the upper bound.

Illegal size double vector read requested

This error should not normally occur unless the restart file is invalid.

Illegal size integer vector read requested

This error should not normally occur unless the restart file is invalid.

Illegal size string or corrupt restart

This error should not normally occur unless the restart file is invalid.

Imageint setting in lmptype.h is invalid

Imageint must be as large or larger than smallint.

Imageint setting in lmptype.h is not compatible

Format of imageint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Improper atom missing in delete_bonds

The delete_bonds command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

Improper atom missing in set command

The set command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

Improper atoms %d %d %d %d missing on proc %d at step %ld

One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

Improper atoms missing on proc %d at step %ld

One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

Improper coeff for hybrid has invalid style

Improper style hybrid uses another improper style as one of its coefficients. The improper style used in the improper_coeff command or read from a restart file is not recognized.

Improper coeffs are not set

No improper coefficients have been assigned in the data file or via the improper_coeff command.

Improper style hybrid cannot have hybrid as an argument

Self-explanatory.

Improper style hybrid cannot have none as an argument

Self-explanatory.

Improper style hybrid cannot use same improper style twice

Self-explanatory.

Improper_coeff command before improper_style is defined

Coefficients cannot be set in the data file or via the improper_coeff command until an improper_style has been assigned.

Improper_coeff command before simulation box is defined

The improper_coeff command cannot be used before a read_data, read_restart, or create_box command.

Improper_coeff command when no impropers allowed

The chosen atom style does not allow for impropers to be defined.

Improper_style command when no impropers allowed

The chosen atom style does not allow for impropers to be defined.

Impropers assigned incorrectly

Impropers read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Impropers defined but no improper types

The data file header lists improper but no improper types.

Incompatible KIM Simulator Model

The requested KIM Simulator Model was defined for a different MD code and thus is not compatible with LAMMPS.

Incompatible units for KIM Simulator Model

The selected unit style is not compatible with the requested KIM Simulator Model.

Incomplete use of variables in create_atoms command

The var and set options must be used together.

Inconsistent iparam/jparam values in fix bond/create command

If itype and jtype are the same, then their maxbond and newtype settings must also be the same.

Inconsistent line segment in data file

The end points of the line segment are not equal distances from the center point which is the atom coordinate.

Inconsistent triangle in data file

The centroid of the triangle as defined by the corner points is not the atom coordinate.

Inconsistent use of finite-size particles by molecule template molecules

Not all of the molecules define a radius for their constituent particles.

Incorrect # of floating-point values in Bodies section of data file

See page for body style.

Incorrect # of integer values in Bodies section of data file

See page for body style.

Incorrect %s format in data file

A section of the data file being read by fix property/atom does not have the correct number of values per line.

Incorrect SNAP parameter file

The file cannot be parsed correctly, check its internal syntax.

Incorrect args for angle coefficients

Self-explanatory. Check the input script or data file.

Incorrect args for bond coefficients

Self-explanatory. Check the input script or data file.

Incorrect args for dihedral coefficients

Self-explanatory. Check the input script or data file.

Incorrect args for improper coefficients

Self-explanatory. Check the input script or data file.

Incorrect args for pair coefficients

Self-explanatory. Check the input script or data file.

Incorrect args in pair_style command

Self-explanatory.

Incorrect atom format in data file

Number of values per atom line in the data file is not consistent with the atom style.

Incorrect atom format in neb file

The number of fields per line is not what expected.

Incorrect bonus data format in data file

See the read_data page for a description of how various kinds of bonus data must be formatted for certain atom styles.

Incorrect boundaries with slab Ewald

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.

Incorrect boundaries with slab EwaldDisp

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.

Incorrect boundaries with slab PPPM

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with PPPM.

Incorrect boundaries with slab PPPMDisp

Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with ppm/disp.

Incorrect conversion in format string

A format style variable was not using either a %f, a %g, or a %e conversion. Or an immediate variable with format suffix was not using either a %f, a %g or a %e conversion in the format suffix.

Incorrect element names in ADP potential file

The element names in the ADP file do not match those requested.

Incorrect element names in EAM potential file

The element names in the EAM file do not match those requested.

Incorrect format of ... section in data file

Number or type of values per line in the given section of the data file is not consistent with the requirements for this section.

Incorrect format in COMB potential file

Incorrect number of words per line in the potential file.

Incorrect format in COMB3 potential file

Incorrect number of words per line in the potential file.

Incorrect format in MEAM library file

Incorrect number of words per line in the potential file.

Incorrect format in SNAP coefficient file

Incorrect number of words per line in the coefficient file.

Incorrect format in SNAP parameter file

Incorrect number of words per line in the parameter file.

Incorrect format in Stillinger-Weber potential file

Incorrect number of words per line in the potential file.

Incorrect format in TMD target file

Format of file read by fix tmd command is incorrect.

Incorrect format in Tersoff potential file

Incorrect number of words per line in the potential file.

Incorrect format in Vashishta potential file

Incorrect number of words per line in the potential file.

Incorrect format in coul/streitz potential file

Incorrect number of words per line in the potential file.

Incorrect format in nb3b/harmonic potential file

Incorrect number of words per line in the potential file.

Incorrect integer value in Bodies section of data file

See page for body style.

Incorrect multiplicity arg for dihedral coefficients

Self-explanatory. Check the input script or data file.

Incorrect number of elements in potential file

Self-explanatory.

Incorrect rigid body format in fix rigid file

The number of fields per line is not what expected.

Incorrect rigid body format in fix rigid/small file

The number of fields per line is not what expected.

Incorrect sign arg for dihedral coefficients

Self-explanatory. Check the input script or data file.

Incorrect table format check for element types

Self-explanatory.

Incorrect velocity format in data file

Each atom style defines a format for the Velocity section of the data file. The read-in lines do not match.

Incorrect weight arg for dihedral coefficients

Self-explanatory. Check the input script or data file.

Index between variable brackets must be positive

Self-explanatory.

Indexed per-atom vector in variable formula without atom map

Accessing a value from an atom vector requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom_modify map command will force an atom map to be created.

Initial temperatures not all set in fix ttm

Self-explanatory.

Input line quote not followed by white-space

An end quote must be followed by white-space.

Insertion region extends outside simulation box

Self-explanatory.

Insufficient Jacobi rotations for POEMS body

Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for body nparticle

Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for rigid body

Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for rigid molecule

Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for triangle

The calculation of the inertia tensor of the triangle failed. This should not happen if it is a reasonably shaped triangle.

Insufficient memory on accelerator

There is insufficient memory on one of the devices specified for the gpu package

Internal error in atom_style body

This error should not occur. Contact the developers.

Invalid -reorder N value

Self-explanatory.

Invalid Angles section in molecule file

Self-explanatory.

Invalid Bonds section in molecule file

Self-explanatory.

Invalid Boolean syntax in if command

Self-explanatory.

Invalid Charges section in molecule file

Self-explanatory.

Invalid Coords section in molecule file

Self-explanatory.

Invalid Diameters section in molecule file

Self-explanatory.

Invalid Dihedrals section in molecule file

Self-explanatory.

Invalid Improvers section in molecule file

Self-explanatory.

Invalid Kokkos command-line args

Self-explanatory. See Section 2.7 of the manual for details.

Invalid LAMMPS restart file

The file does not appear to be a LAMMPS restart file since it does not contain the correct magic string at the beginning.

Invalid Masses section in molecule file

Self-explanatory.

Invalid molecule ID in molecule file

Molecule ID must be a non-zero positive integer.

Invalid Molecules section in molecule file

Self-explanatory.

Invalid REAX atom type

There is a mis-match between LAMMPS atom types and the elements listed in the ReaxFF force field file.

Invalid Special Bond Counts section in molecule file

Self-explanatory.

Invalid Types section in molecule file

Self-explanatory.

Invalid angle count in molecule file

Self-explanatory.

Invalid angle table length

Length must be 2 or greater.

Invalid angle type in Angles section of data file

Angle type must be positive integer and within range of specified angle types.

Invalid angle type in Angles section of molecule file

Self-explanatory.

Invalid angle type index for fix shake

Self-explanatory.

Invalid args for non-hybrid pair coefficients

“NULL” is only supported in pair_coeff calls when using pair hybrid

Invalid argument to factorial %d

N must be ≥ 0 and ≤ 167 , otherwise the factorial result is too large.

Invalid atom ID in %s section of data file

An atom in a section of the data file being read by fix property/atom has an invalid atom ID that is ≤ 0 or $>$ the maximum existing atom ID.

Invalid atom ID in Angles section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Angles section of molecule file

Self-explanatory.

Invalid atom ID in Atoms section of data file

Atom IDs must be positive integers.

Invalid atom ID in Bodies section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Bonds section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Bonds section of molecule file

Self-explanatory.

Invalid atom ID in Bonus section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Dihedrals section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Fragments section of molecule file

Self-explanatory.

Invalid atom ID in Improvers section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Velocities section of data file

Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in dihedrals section of molecule file

Self-explanatory.

Invalid atom ID in improvers section of molecule file

Self-explanatory.

Invalid atom ID in variable file

Self-explanatory.

Invalid atom IDs in neb file

An ID in the file was not found in the system.

Invalid atom diameter in molecule file

Diameters must be ≥ 0.0 .

Invalid atom mass for fix shake

Mass specified in fix shake command must be > 0.0 .

Invalid atom mass in molecule file

Masses must be > 0.0 .

Invalid atom type in Atoms section of data file

Atom types must range from 1 to specified # of types.

Invalid atom type in create_atoms command

The create_box command specified the range of valid atom types. An invalid type is being requested.

Invalid atom type in create_atoms mol command

The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

Invalid atom type in fix atom/swap command

The atom type specified in the atom/swap command does not exist.

Invalid atom type in fix bond/create command

Self-explanatory.

Invalid atom type in fix deposit command

Self-explanatory.

Invalid atom type in fix deposit mol command

The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

Invalid atom type in fix gcmc command

The atom type specified in the gcmc command does not exist.

Invalid atom type in fix pour command

Self-explanatory.

Invalid atom type in fix pour mol command

The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

Invalid atom type in molecule file

Atom types must range from 1 to specified # of types.

Invalid atom type in neighbor exclusion list

Atom types must range from 1 to Ntypes inclusive.

Invalid atom type index for fix shake

Atom types must range from 1 to Ntypes inclusive.

Invalid atom types in pair_write command

Atom types must range from 1 to Ntypes inclusive.

Invalid atom vector in variable formula

The atom vector is not recognized.

Invalid atom_style body command

No body style argument was provided.

Invalid atom_style command

Self-explanatory.

Invalid attribute in dump custom command

Self-explanatory.

Invalid attribute in dump local command

Self-explanatory.

Invalid attribute in dump modify command

Self-explanatory.

Invalid basis setting in create_atoms command

The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.

Invalid basis setting in fix append/atoms command

The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.

Invalid bin bounds in compute chunk/atom

The lo/hi values are inconsistent.

Invalid bin bounds in fix ave/spatial

The lo/hi values are inconsistent.

Invalid body nparticle command

Arguments in atom-style command are not correct.

Invalid bond count in molecule file

Self-explanatory.

Invalid bond table length

Length must be 2 or greater.

Invalid bond type in Bonds section of data file

Bond type must be positive integer and within range of specified bond types.

Invalid bond type in Bonds section of molecule file

Self-explanatory.

Invalid bond type in create_bonds command

Self-explanatory.

Invalid bond type in fix bond/break command

Self-explanatory.

Invalid bond type in fix bond/create command

Self-explanatory.

Invalid bond type index for fix shake

Self-explanatory. Check the fix shake command in the input script.

Invalid coeffs for this dihedral style

Cannot set class 2 coeffs in data file for this dihedral style.

Invalid color in dump_modify command

The specified color name was not in the list of recognized colors. See the dump_modify doc page.

Invalid color map min/max values

The min/max values are not consistent with either each other or with values in the color map.

Invalid command-line argument

One or more command-line arguments is invalid. Check the syntax of the command you are using to launch LAMMPS.

Invalid compute ID in variable formula

The compute is not recognized.

Invalid create_atoms rotation vector for 2d model

The rotation vector can only have a z component.

Invalid custom OpenCL parameter string.

There are not enough or too many parameters in the custom string for package GPU.

Invalid cutoff in comm_modify command

Specified cutoff must be ≥ 0.0 .

Invalid cutoffs in pair_write command

Inner cutoff must be larger than 0.0 and less than outer cutoff.

Invalid d1 or d2 value for pair colloid coeff

Neither d1 or d2 can be < 0 .

Invalid data file section: Angle Coeffs

Atom style does not allow angles.

Invalid data file section: AngleAngle Coeffs

Atom style does not allow impropers.

Invalid data file section: AngleAngleTorsion Coeffs

Atom style does not allow dihedrals.

Invalid data file section: AngleTorsion Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Angles

Atom style does not allow angles.

Invalid data file section: Bodies

Atom style does not allow bodies.

Invalid data file section: Bond Coeffs

Atom style does not allow bonds.

Invalid data file section: BondAngle Coeffs

Atom style does not allow angles.

Invalid data file section: BondBond Coeffs

Atom style does not allow angles.

Invalid data file section: BondBond13 Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Bonds

Atom style does not allow bonds.

Invalid data file section: Dihedral Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Dihedrals

Atom style does not allow dihedrals.

Invalid data file section: Ellipsoids

Atom style does not allow ellipsoids.

Invalid data file section: EndBondTorsion Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Improper Coeffs

Atom style does not allow impropers.

Invalid data file section: Impropers

Atom style does not allow impropers.

Invalid data file section: Lines

Atom style does not allow lines.

Invalid data file section: MiddleBondTorsion Coeffs

Atom style does not allow dihedrals.

Invalid data file section: Triangles

Atom style does not allow triangles.

Invalid delta_conf in tad command

The value must be between 0 and 1 inclusive.

Invalid density in Atoms section of data file

Density value cannot be ≤ 0.0 .

Invalid density in set command

Density must be > 0.0 .

Invalid diameter in set command

Self-explanatory.

Invalid dihedral count in molecule file

Self-explanatory.

Invalid dihedral type in Dihedrals section of data file

Dihedral type must be positive integer and within range of specified dihedral types.

Invalid dihedral type in dihedrals section of molecule file

Self-explanatory.

Invalid dipole length in set command

Self-explanatory.

Invalid displace_atoms rotate axis for 2d

Axis must be in z direction.

Invalid dump dcd filename

Filenames used with the dump dcd style cannot be binary or compressed or cause multiple files to be written.

Invalid dump frequency

Dump frequency must be 1 or greater.

Invalid dump image element name

The specified element name was not in the standard list of elements. See the dump_modify doc page.

Invalid dump image filename

The file produced by dump image cannot be binary and must be for a single processor.

Invalid dump image theta value

Theta must be between 0.0 and 180.0 inclusive.

Invalid dump image zoom value

Zoom value must be > 0.0 .

Invalid dump movie filename

The file produced by dump movie cannot be binary or compressed and must be a single file for a single processor.

Invalid dump xtc filename

Filenames used with the dump xtc style cannot be binary or compressed or cause multiple files to be written.

Invalid dump xyz filename

Filenames used with the dump xyz style cannot be binary or cause files to be written by each processor.

Invalid dump_modify threshold operator

Operator keyword used for threshold specification is not recognized.

Invalid entry in -reorder file

Self-explanatory.

Invalid fix ID in variable formula

The fix is not recognized.

Invalid fix ave/time off column

Self-explanatory.

Invalid fix box/relax command for a 2d simulation

Fix box/relax styles involving the z dimension cannot be used in a 2d simulation.

Invalid fix box/relax command pressure settings

If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix box/relax pressure settings

Settings for coupled dimensions must be the same.

Invalid fix halt attribute

Self-explanatory.

Invalid fix halt operator

Self-explanatory.

Invalid fix nvt/npt/nph command for a 2d simulation

Cannot control z dimension in a 2d model.

Invalid fix nvt/npt/nph command pressure settings

If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix nvt/npt/nph pressure settings

Settings for coupled dimensions must be the same.

Invalid fix press/berendsen for a 2d simulation

The z component of pressure cannot be controlled for a 2d model.

Invalid fix press/berendsen pressure settings

Settings for coupled dimensions must be the same.

Invalid fix qeq parameter file

Element index > number of atom types.

Invalid fix rigid npt/nph command for a 2d simulation

Cannot control z dimension in a 2d model.

Invalid fix rigid npt/nph command pressure settings

If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix rigid/small npt/nph command for a 2d simulation

Cannot control z dimension in a 2d model.

Invalid fix rigid/small npt/nph command pressure settings

If multiple dimensions are coupled, those dimensions must be specified.

Invalid flag in force field section of restart file

Unrecognized entry in restart file.

Invalid flag in header section of restart file

Unrecognized entry in restart file.

Invalid flag in peratom section of restart file

The format of this section of the file is not correct.

Invalid flag in type arrays section of restart file

Unrecognized entry in restart file.

Invalid frequency in temper command

Nevery must be > 0.

Invalid group ID in neigh_modify command

A group ID used in the neigh_modify command does not exist.

Invalid group function in variable formula

Group function is not recognized.

Invalid group in comm_modify command

Self-explanatory.

Invalid image up vector

Up vector cannot be (0,0,0).

Invalid immediate variable

Syntax of immediate value is incorrect.

Invalid improper count in molecule file

Self-explanatory.

Invalid improper type in Improvers section of data file

Improper type must be positive integer and within range of specified improper types.

Invalid improper type in improvers section of molecule file

Self-explanatory.

Invalid index for non-body particles in compute body/local command

Only indices 1,2,3 can be used for non-body particles.

Invalid index in compute body/local command

Self-explanatory.

Invalid is_active() function in variable formula

Self-explanatory.

Invalid is_available() function in variable formula

Self-explanatory.

Invalid is_defined() function in variable formula

Self-explanatory.

Invalid keyword in angle table parameters

Self-explanatory.

Invalid keyword in bond table parameters

Self-explanatory.

Invalid keyword in compute angle/local command

Self-explanatory.

Invalid keyword in compute bond/local command

Self-explanatory.

Invalid keyword in compute dihedral/local command

Self-explanatory.

Invalid keyword in compute improper/local command

Self-explanatory.

Invalid keyword in compute pair/local command

Self-explanatory.

Invalid keyword in compute property/atom command

Self-explanatory.

Invalid keyword in compute property/chunk command

Self-explanatory.

Invalid keyword in compute property/local command

Self-explanatory.

Invalid keyword in dump cfg command

Self-explanatory.

Invalid keyword in pair table parameters

Keyword used in list of table parameters is not recognized.

Invalid length in set command

Self-explanatory.

Invalid mass in set command

Self-explanatory.

Invalid mass line in data file

Self-explanatory.

Invalid mass value

Self-explanatory.

Invalid math function in variable formula

Self-explanatory.

Invalid math/group/special function in variable formula

Self-explanatory.

Invalid option in lattice command for non-custom style

Certain lattice keywords are not supported unless the lattice style is “custom”.

Invalid order of forces within respa levels

For respa, ordering of force computations within respa levels must obey certain rules. E.g. bonds cannot be compute less frequently than angles, pairwise forces cannot be computed less frequently than kspace, etc.

Invalid pair table cutoff

Cutoffs in pair_coeff command are not valid with read-in pair table.

Invalid pair table length

Length of read-in pair table is invalid

Invalid param file for fix qeq/shielded

Invalid value of gamma.

Invalid param file for fix qeq/slater

Zeta value is 0.0.

Invalid partitions in processors part command

Valid partitions are numbered 1 to N and the sender and receiver cannot be the same partition.

Invalid python command

Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.

Invalid radius in Atoms section of data file

Radius must be ≥ 0.0 .

Invalid random number seed in fix ttm command

Random number seed must be > 0 .

Invalid random number seed in set command

Random number seed must be > 0 .

Invalid replace values in compute reduce

Self-explanatory.

Invalid rigid body ID in fix rigid file

The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid command.

Invalid rigid body ID in fix rigid/small file

The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid/small command.

Invalid run command N value

The number of timesteps must fit in a 32-bit integer. If you want to run for more steps than this, perform multiple shorter runs.

Invalid run command start/stop value

Self-explanatory.

Invalid run command upto value

Self-explanatory.

Invalid seed for Marsaglia random # generator

The initial seed for this random number generator must be a positive integer less than or equal to 900 million.

Invalid seed for Park random # generator

The initial seed for this random number generator must be a positive integer.

Invalid shake angle type in molecule file

Self-explanatory.

Invalid shake atom in molecule file

Self-explanatory.

Invalid shake bond type in molecule file

Self-explanatory.

Invalid shake flag in molecule file

Self-explanatory.

Invalid shape in Ellipsoids section of data file

Self-explanatory.

Invalid shape in Triangles section of data file

Two or more of the triangle corners are duplicate points.

Invalid shape in set command

Self-explanatory.

Invalid shear direction for fix wall/gran

Self-explanatory.

Invalid special atom index in molecule file

Self-explanatory.

Invalid special function in variable formula

Self-explanatory.

Invalid style in pair_write command

Self-explanatory. Check the input script.

Invalid syntax in variable formula

Self-explanatory.

Invalid t_event in prd command

Self-explanatory.

Invalid t_event in tad command

The value must be greater than 0.

Invalid template atom in Atoms section of data file

The atom indices must be between 1 to N, where N is the number of atoms in the template molecule the atom belongs to.

Invalid template index in Atoms section of data file

The template indices must be between 1 to N, where N is the number of molecules in the template.

Invalid thermo keyword in variable formula

The keyword is not recognized.

Invalid threads_per_atom specified.

For 3-body potentials on the GPU, the threads_per_atom setting cannot be greater than 4 for NVIDIA GPUs.

Invalid timestep reset for fix ave/atom

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/chunk

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/correlate

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/histo

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/spatial

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/time

Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid tmax in tad command

The value must be greater than 0.0.

Invalid type for mass set

Mass command must set a type from 1-N where N is the number of atom types.

Invalid label2type() function syntax in variable formula

The first argument must be a label map kind (atom, bond, angle, dihedral, or improper) and the second argument must be a valid type label that has been assigned to a numeric type.

Invalid use of library file() function

This function is called through the library interface. This error should not occur. Contact the developers if it does.

Invalid value in set command

The value specified for the setting is invalid, likely because it is too small or too large.

Invalid variable evaluation in variable formula

A variable used in a formula could not be evaluated.

Invalid variable in next command

Self-explanatory.

Invalid variable name

Variable name used in an input script line is invalid.

Invalid variable name in variable formula

Variable name is not recognized.

Invalid variable style in special function next

Only file-style or atomfile-style variables can be used with next().

Invalid variable style with next command

Variable styles *equal* and *world* cannot be used in a next command.

Invalid volume in set command

Volume must be > 0.0.

Invalid wiggle direction for fix wall/gran

Self-explanatory.

Invoked angle equil angle on angle style none

Self-explanatory.

Invoked angle single on angle style none

Self-explanatory.

Invoked bond equil distance on bond style none

Self-explanatory.

Invoked bond single on bond style none

Self-explanatory.

Invoked pair single on pair style none

A command (e.g. a dump) attempted to invoke the single() function on a pair style none, which is illegal. You are probably attempting to compute per-atom quantities with an undefined pair style.

Invoking coulombic in pair style lj/coul requires atom attribute q

The atom style defined does not have this attribute.

Invoking coulombic in pair style lj/long/dipole/long requires atom attribute q

The atom style defined does not have these attributes.

KIM Simulator Model has no Model definition

There is no model definition (key: model-defn) in the KIM Simulator Model. Please contact the OpenKIM database maintainers to verify and potentially correct this.

KOKKOS package does not yet support comm_style tiled

Self-explanatory.

KOKKOS package requires a kokkos enabled atom_style

Self-explanatory.

KSpace accuracy must be > 0

The kspace accuracy designated in the input must be greater than zero.

KSpace accuracy too large to estimate G vector

Reduce the accuracy request or specify gewald explicitly via the kspace_modify command.

KSpace accuracy too low

Requested accuracy must be less than 1.0.

KSpace solver requires a pair style

No pair style is defined.

KSpace style does not yet support triclinic geometries

The specified kspace style does not allow for non-orthogonal simulation boxes.

KSpace style has not yet been set

Cannot use kspace_modify command until a kspace style is set.

KSpace style is incompatible with Pair style

Setting a kspace style requires that a pair style with matching long-range Coulombic or dispersion components be used.

Keyword %s in MEAM parameter file not recognized

Self-explanatory.

Kokkos has been compiled for CUDA but no GPUs are requested

One or more GPUs must be used when Kokkos is compiled for CUDA.

Kspace_modify mesh parameter must be all zero or all positive

Valid kspace mesh parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero (the default).

Kspace_modify mesh/disp parameter must be all zero or all positive

Valid kspace mesh/disp parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero **and** the required accuracy via *force/disp/real* as well as *force/disp/kspace* is set.

Kspace style does not support compute group/group

Self-explanatory.

Kspace style ppm/disp/tip4p requires newton on

Self-explanatory.

Kspace style ppm/tip4p requires newton on

Self-explanatory.

Kspace style requires atom attribute q

The atom style defined does not have these attributes.

Kspace_modify eigtol must be smaller than one

Self-explanatory.

LAMMPS is not built with Python embedded

This is done by including the PYTHON package before LAMMPS is built. This is required to use python-style variables.

LAMMPS unit_style lj not supported by KIM models

Self-explanatory. Check the input script or data file.

LJ6 off not supported in pair_style buck/long/coul/long

Self-explanatory.

Label map is incomplete: all types must be assigned a unique type label

For a given type-kind (atom types, bond types, etc.) to be written to the data file, all associated types must be assigned a type label, and each type label can be assigned to only one numeric type.

Label wasn't found in input script

Self-explanatory.

Labelmap command before simulation box is defined

The labelmap command cannot be used before a read_data, read_restart, or create_box command.

Lattice orient vectors are not orthogonal

The three specified lattice orientation vectors must be mutually orthogonal.

Lattice orient vectors are not right-handed

The three specified lattice orientation vectors must create a right-handed coordinate system such that $\mathbf{a}_1 \times \mathbf{a}_2 = \mathbf{a}_3$.

Lattice primitive vectors are collinear

The specified lattice primitive vectors do not form a unit cell with non-zero volume.

Lattice settings are not compatible with 2d simulation

One or more of the specified lattice vectors has a non-zero z component.

Lattice spacings are invalid

Each x,y,z spacing must be > 0.

Lattice style incompatible with simulation dimension

2d simulation can use sq, sq2, or hex lattice. 3d simulation can use sc, bcc, or fcc lattice.

Log of zero/negative value in variable formula

Self-explanatory.

Lost atoms via balance: original %ld current %ld

This should not occur. Report the problem to the developers.

Lost atoms: original %ld current %ld

Lost atoms are checked for each time thermo output is done. See the thermo_modify lost command for options.

Lost atoms usually indicate bad dynamics, e.g. atoms have been blown far out of the simulation box, or moved further than one processor's subdomain away before reneighboring.

MEAM library error %d

A call to the MEAM Fortran library returned an error.

MPI_LMP_BIGINT and bigint in lmptype.h are not compatible

The size of the MPI datatype does not match the size of a bigint.

MPI_LMP_TAGINT and tagint in lmptype.h are not compatible

The size of the MPI datatype does not match the size of a tagint.

MSM can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

MSM grid is too large

The global MSM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 16384.

You likely need to decrease the requested accuracy.

MSM order must be 4, 6, 8, or 10

This is a limitation of the MSM implementation in LAMMPS: the MSM order can only be 4, 6, 8, or 10.

Mass command before simulation box is defined

The mass command cannot be used before a read_data, read_restart, or create_box command.

Matrix factorization to split dispersion coefficients failed

This should not normally happen. Contact the developers.

Min_style command before simulation box is defined

The min_style command cannot be used before a read_data, read_restart, or create_box command.

Minimization could not find thermo_pe compute

This compute is created by the thermo command. It must have been explicitly deleted by an uncompute command.

Minimize command before simulation box is defined

The minimize command cannot be used before a read_data, read_restart, or create_box command.

Mismatched brackets in variable

Self-explanatory.

Mismatched compute in variable formula

A compute is referenced incorrectly or a compute that produces per-atom values is used in an equal-style variable formula.

Mismatched fix in variable formula

A fix is referenced incorrectly or a fix that produces per-atom values is used in an equal-style variable formula.

Mismatched parameter in MEAM library file: z!=lat

The coordination number and lattice do not match, check that consistent values are given.

Mismatched variable in variable formula

A variable is referenced incorrectly or an atom-style variable that produces per-atom values is used in an equal-style variable formula.

Modulo 0 in variable formula

Self-explanatory.

Molecule IDs too large for compute chunk/atom

The IDs must not be larger than can be stored in a 32-bit integer since chunk IDs are 32-bit integers.

Molecule auto special bond generation overflow

Counts exceed maxspecial setting for other atoms in system.

Molecule file has angles but no nangles setting

Self-explanatory.

Molecule file has body params but no setting for them

Self-explanatory.

Molecule file has bonds but no nbonds setting

Self-explanatory.

Molecule file has dihedrals but no ndihedrals setting

Self-explanatory.

Molecule file has fragments but no nfragments setting

Self-explanatory.

Molecule file has impropers but no nimpropers setting

Self-explanatory.

Molecule file has no Body Doubles section

Self-explanatory.

Molecule file has no Body Integers section

Self-explanatory.

Molecule file has no Fragments section

Self-explanatory.

Molecule file has special flags but no bonds

Self-explanatory.

Molecule file needs both Special Bond sections

Self-explanatory.

Molecule file requires atom style body

Self-explanatory.

Molecule file shake flags not before shake atoms

The order of the two sections is important.

Molecule file shake flags not before shake bonds

The order of the two sections is important.

Molecule file shake info is incomplete

All 3 SHAKE sections are needed.

Molecule file special list does not match special count

The number of values in an atom's special list does not match count.

Molecule file z center-of-mass must be 0.0 for 2d

Self-explanatory.

Molecule file z coord must be 0.0 for 2d

Self-explanatory.

Molecule natoms must be 1 for body particle

Self-explanatory.

Molecule sizescale must be 1.0 for body particle

Self-explanatory.

Molecule template ID for atom_style template does not exist

Self-explanatory.

Molecule template ID for create_atoms does not exist

Self-explanatory.

Molecule template ID for fix deposit does not exist

Self-explanatory.

Molecule template ID for fix gcmc does not exist

Self-explanatory.

Molecule template ID for fix pour does not exist

Self-explanatory.

Molecule template ID for fix rigid/small does not exist

Self-explanatory.

Molecule template ID for fix shake does not exist

Self-explanatory.

Molecule template ID must be alphanumeric or underscore characters

Self-explanatory.

Molecule topology/atom exceeds system topology/atom

The number of bonds, angles, etc per-atom in the molecule exceeds the system setting. See the create_box command for how to specify these values.

Molecule topology type exceeds system topology type

The number of bond, angle, etc types in the molecule exceeds the system setting. See the create_box command for how to specify these values.

More than one fix deform

Only one fix deform can be defined at a time.

More than one fix freeze

Only one of these fixes can be defined, since the granular pair potentials access it.

More than one fix shake

Only one fix shake can be defined.

Mu not allowed when not using semi-grand in fix atom/swap command

Self-explanatory.

Must define angle_style before Angle Coeffs

Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define angle_style before BondAngle Coeffs

Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define angle_style before BondBond Coeffs

Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define bond_style before Bond Coeffs

Must use a bond_style command before reading a data file that defines Bond Coeffs.

Must define dihedral_style before AngleAngleTorsion Coeffs

Must use a dihedral_style command before reading a data file that defines AngleAngleTorsion Coeffs.

Must define dihedral_style before AngleTorsion Coeffs

Must use a dihedral_style command before reading a data file that defines AngleTorsion Coeffs.

Must define dihedral_style before BondBond13 Coeffs

Must use a dihedral_style command before reading a data file that defines BondBond13 Coeffs.

Must define dihedral_style before Dihedral Coeffs

Must use a dihedral_style command before reading a data file that defines Dihedral Coeffs.

Must define dihedral_style before EndBondTorsion Coeffs

Must use a dihedral_style command before reading a data file that defines EndBondTorsion Coeffs.

Must define dihedral_style before MiddleBondTorsion Coeffs

Must use a dihedral_style command before reading a data file that defines MiddleBondTorsion Coeffs.

Must define improper_style before AngleAngle Coeffs

Must use an improper_style command before reading a data file that defines AngleAngle Coeffs.

Must define improper_style before Improper Coeffs

Must use an improper_style command before reading a data file that defines Improper Coeffs.

Must define pair_style before Pair Coeffs

Must use a pair_style command before reading a data file that defines Pair Coeffs.

Must define pair_style before PairIJ Coeffs

Must use a pair_style command before reading a data file that defines PairIJ Coeffs.

Must have more than one processor partition to temper

Cannot use the temper command with only one processor partition. Use the -partition command-line option.

Must not have multiple fixes change box parameter ...

Self-explanatory.

Must read Angle Type Labels before Angles

An Angle Type Labels section of a data file must come before the Angles section.

Must read Atom Type Labels before Atoms

An Atom Type Labels section of a data file must come before the Atoms section.

Must read Atoms before Angles

The Atoms section of a data file must come before an Angles section.

Must read Atoms before Bodies

The Atoms section of a data file must come before a Bodies section.

Must read Atoms before Bonds

The Atoms section of a data file must come before a Bonds section.

Must read Atoms before Dihedrals

The Atoms section of a data file must come before a Dihedrals section.

Must read Atoms before Ellipsoids

The Atoms section of a data file must come before a Ellipsoids section.

Must read Atoms before Improvers

The Atoms section of a data file must come before an Improvers section.

Must read Atoms before Lines

The Atoms section of a data file must come before a Lines section.

Must read Atoms before Triangles

The Atoms section of a data file must come before a Triangles section.

Must read Atoms before Velocities

The Atoms section of a data file must come before a Velocities section.

Must read Bond Type Labels before Bonds

A Bond Type Labels section of a data file must come before the Bonds section.

Must read Dihedral Type Labels before Dihedrals

An Dihedral Type Labels section of a data file must come before the Dihedrals section.

Must read Improper Type Labels before Improvers

An Improper Type Labels section of a data file must come before the Improvers section.

Must re-specify non-restarted pair style (xxx) after read_restart

For pair styles, that do not store their settings in a restart file, it must be defined with a new 'pair_style' command after read_restart.

Must set both respa inner and outer

Cannot use just the inner or outer option with respa without using the other.

Must set number of threads via package omp command

Because you are using the OPENMP package, set the number of threads via its settings, not by the pair_style snap nthreads setting.

Must shrink-wrap piston boundary

The boundary style of the face where the piston is applied must be of type s (shrink-wrapped).

Must specify a region in fix deposit

The region keyword must be specified with this fix.

Must specify a region in fix pour

Self-explanatory.

Must specify at least 2 types in fix atom/swap command

Self-explanatory.

Must use 'kim_style init' command before simulation box is defined

Self-explanatory.

Must use 'kim_style define' command after simulation box is defined

Self-explanatory.

Must use 'kim_style init' command before 'kim_style define'

Self-explanatory.

Must use 'kspace_modify pressure/scalar no' for rRESPA with kspace_style MSM

The kspace scalar pressure option cannot (yet) be used with rRESPA.

Must use 'kspace_modify pressure/scalar no' for tensor components with kspace_style msm

Otherwise MSM will compute only a scalar pressure. See the kspace_modify command for details on this setting.

Must use 'kspace_modify pressure/scalar no' to obtain per-atom virial with kspace_style MSM

The kspace scalar pressure option cannot be used to obtain per-atom virial.

Must use 'kspace_modify pressure/scalar no' with GPU MSM Pair styles

The kspace scalar pressure option is not (yet) compatible with GPU MSM Pair styles.

Must use 'kspace_modify pressure/scalar no' with kspace_style msm/cg

The kspace scalar pressure option is not compatible with kspace_style msm/cg.

Must use -in switch with multiple partitions

A multi-partition simulation cannot read the input script from stdin. The -in command-line option must be used to specify a file.

Must use Kokkos half/thread or full neighbor list with threads or GPUs

Using Kokkos half-neighbor lists with threading is not allowed.

Must use a block or cylinder region with fix pour

Self-explanatory.

Must use a block region with fix pour for 2d simulations

Self-explanatory.

Must use a bond style with TIP4P potential

TIP4P potentials assume bond lengths in water are constrained by a fix shake command.

Must use a molecular atom style with fix poems molecule

Self-explanatory.

Must use a z-axis cylinder region with fix pour

Self-explanatory.

Must use an angle style with TIP4P potential

TIP4P potentials assume angles in water are constrained by a fix shake command.

Must use atom map style array with Kokkos

See the atom_modify map command.

Must use atom style with molecule IDs with fix bond/swap

Self-explanatory.

Must use pair_style comb or comb3 with fix qeq/comb

Self-explanatory.

Must use variable energy with fix addforce

Must define an energy variable when applying a dynamic force during minimization.

Must use variable energy with fix efield

You must define an energy when performing a minimization with a variable E-field.

NEB command before simulation box is defined

Self-explanatory.

NEB requires damped dynamics minimizer

Use a different minimization style.

NEB requires use of fix neb

Self-explanatory.

NL ramp in wall/piston only implemented in zlo for now

The ramp keyword can only be used for piston applied to face zlo.

Need nswaptypes mu values in fix atom/swap command

Self-explanatory.

Needed bonus data not in data file

Some atom styles require bonus data. See the read_data page for details.

Needed molecular topology not in data file

The header of the data file indicated bonds, angles, etc would be included, but they are not present.

Neigh_modify exclude molecule requires atom attribute molecule

Self-explanatory.

Neigh_modify include group != atom_modify first group

Self-explanatory.

Neighbor delay must be 0 or multiple of every setting

The delay and every parameters set via the neigh_modify command are inconsistent. If the delay setting is non-zero, then it must be a multiple of the every setting.

Neighbor include group not allowed with ghost neighbors

This is a current restriction within LAMMPS.

Neighbor list overflow, boost neigh_modify one

There are too many neighbors of a single atom. Use the neigh_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

Neighbor multi not yet enabled for ghost neighbors

This is a current restriction within LAMMPS.

Neighbor multi not yet enabled for granular

Self-explanatory.

Neighbor multi not yet enabled for rRESPA

Self-explanatory.

Neighbor page size must be >= 10x the one atom setting

This is required to prevent wasting too much memory.

New atom IDs exceed maximum allowed ID

See the setting for tagint in the src/lmptype.h file.

New bond exceeded bonds per atom in create_bonds See the read_data command for info on using the “extra/bond/per/atom” keyword to allow for additional bonds to be formed

New bond exceeded bonds per atom in fix bond/create

See the read_data command for info on using the “extra/bond/per/atom” keyword to allow for additional bonds to be formed

New bond exceeded special list size in fix bond/create

See the “read_data extra/special/per/atom” command (or the “create_box extra/special/per/atom” command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

Newton bond change after simulation box is defined

The newton command cannot be used to change the newton bond value after a read_data, read_restart, or create_box command.

Next command must list all universe and uloop variables

This is to ensure they stay in sync.

No Kspace style defined for compute group/group

Self-explanatory.

No OpenMP support compiled in

An OpenMP flag is set, but LAMMPS was not built with OpenMP support.

No angle style is defined for compute angle/local

Self-explanatory.

No angles allowed with this atom style

Self-explanatory.

No atoms in data file

The header of the data file indicated that atoms would be included, but they are not present.

No basis atoms in lattice

Basis atoms must be defined for lattice style user.

No bodies allowed with this atom style

Self-explanatory. Check data file.

No bond style is defined for compute bond/local

Self-explanatory.

No bonds allowed with this atom style

Self-explanatory.

No box information in dump. You have to use 'box no'

Self-explanatory.

No count or invalid atom count in molecule file

The number of atoms must be specified.

No dihedral style is defined for compute dihedral/local

Self-explanatory.

No dihedrals allowed with this atom style

Self-explanatory.

No dump custom arguments specified

The dump custom command requires that atom quantities be specified to output to dump file.

No dump local arguments specified

Self-explanatory.

No ellipsoids allowed with this atom style

Self-explanatory. Check data file.

No fix gravity defined for fix pour

Gravity is required to use fix pour.

No improper style is defined for compute improper/local

Self-explanatory.

No impropers allowed with this atom style

Self-explanatory.

No input values for fix ave/spatial

Self-explanatory.

No lines allowed with this atom style

Self-explanatory. Check data file.

No matching element in ADP potential file

The ADP potential file does not contain elements that match the requested elements.

No matching element in EAM potential file

The EAM potential file does not contain elements that match the requested elements.

No molecule topology allowed with atom style template

The data file cannot specify the number of bonds, angles, etc, because this info is inferred from the molecule templates.

No overlap of box and region for create_atoms

Self-explanatory.

No pair coul/streitz for fix qeq/slater

These commands must be used together.

No pair hbond/dreiding coefficients set

Self-explanatory.

No pair style defined for compute group/group

Cannot calculate group interactions without a pair style defined.

No pair style is defined for compute pair/local

Self-explanatory.

No pair style is defined for compute property/local

Self-explanatory.

No rigid bodies defined

The fix specification did not end up defining any rigid bodies.

No triangles allowed with this atom style

Self-explanatory. Check data file.

No values in fix ave/chunk command

Self-explanatory.

No values in fix ave/time command

Self-explanatory.

Non digit character between brackets in variable

Self-explanatory.

Non integer # of swaps in temper command

Swap frequency in temper command must evenly divide the total # of timesteps.

Non-numeric box dimensions - simulation unstable

The box size has apparently blown up.

Non-zero atom IDs with atom_modify id = no

Self-explanatory.

Non-zero read_data shift z value for 2d simulation

Self-explanatory.

Nprocs not a multiple of N for -reorder

Self-explanatory.

Number of core atoms != number of shell atoms

There must be a one-to-one pairing of core and shell atoms.

Numeric index is out of bounds

A command with an argument that specifies an integer or range of integers is using a value that is less than 1 or greater than the maximum allowed limit.

One or more Atom IDs is negative

Atom IDs must be positive integers.

One or more atom IDs is too big

The limit on atom IDs is set by the SMALLBIG, BIGBIG, SMALLSMALL setting in your LAMMPS build. See the [Build settings](#) page for more info.

One or more atom IDs is zero

Either all atoms IDs must be zero or none of them.

One or more atoms belong to multiple rigid bodies

Two or more rigid bodies defined by the fix rigid command cannot contain the same atom.

One or more rigid bodies are a single particle

Self-explanatory.

One or zero atoms in rigid body

Any rigid body defined by the fix rigid command must contain 2 or more atoms.

Only 2 types allowed when not using semi-grand in fix atom/swap command

Self-explanatory.

Only one cut-off allowed when requesting all long

Self-explanatory.

Only one cutoff allowed when requesting all long

Self-explanatory.

Only zhi currently implemented for fix append/atoms

Self-explanatory.

Out of range atoms - cannot compute MSM

One or more atoms are attempting to map their charge to a MSM grid point that is not owned by a processor. This is likely for one of two reasons, both of them bad. First, it may mean that an atom near the boundary of a processor's subdomain has moved more than 1/2 the *neighbor skin distance* without neighbor lists being rebuilt and atoms being migrated to new processors. This also means you may be missing pairwise interactions that need to be computed. The solution is to change the re-neighboring criteria via the *neigh_modify* command. The safest settings are "delay 0 every 1 check yes". Second, it may mean that an atom has moved far outside a processor's subdomain or even the entire simulation box. This indicates bad physics, e.g. due to highly overlapping atoms, too large a timestep, etc.

Out of range atoms - cannot compute PPPM

One or more atoms are attempting to map their charge to a PPPM grid point that is not owned by a processor. This is likely for one of two reasons, both of them bad. First, it may mean that an atom near the boundary of a processor's subdomain has moved more than 1/2 the *neighbor skin distance* without neighbor lists being rebuilt and atoms being migrated to new processors. This also means you may be missing pairwise interactions that need to be computed. The solution is to change the re-neighboring criteria via the *neigh_modify* command. The safest settings are "delay 0 every 1 check yes". Second, it may mean that an atom has moved far outside a processor's subdomain or even the entire simulation box. This indicates bad physics, e.g. due to highly overlapping atoms, too large a timestep, etc.

Out of range atoms - cannot compute PPPMDisp

One or more atoms are attempting to map their charge to a PPPM grid point that is not owned by a processor. This is likely for one of two reasons, both of them bad. First, it may mean that an atom near the boundary of a processor's subdomain has moved more than 1/2 the *neighbor skin distance* without neighbor lists being rebuilt and atoms being migrated to new processors. This also means you may be missing pairwise interactions that need to be computed. The solution is to change the re-neighboring criteria via the *neigh_modify* command. The safest settings are "delay 0 every 1 check yes". Second, it may mean that an atom has moved far outside a processor's subdomain or even the entire simulation box. This indicates bad physics, e.g. due to highly overlapping atoms, too large a timestep, etc.

Overflow of allocated fix vector storage

This should not normally happen if the fix correctly calculated how long the vector will grow to. Contact the developers.

Overlapping large/large in pair colloid

This potential is infinite when there is an overlap.

Overlapping small/large in pair colloid

This potential is infinite when there is an overlap.

POEMS fix must come before NPT/NPH fix

NPT/NPH fix must be defined in input script after all poems fixes, else the fix contribution to the pressure virial is incorrect.

PPPM can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

PPPM grid is too large

The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPM grid stencil extends beyond nearest neighbor processor

This is not allowed if the kspace_modify overlap setting is no.

PPPM order < minimum allowed order

The default minimum order is 2. This can be reset by the kspace_modify minorder command.

PPPM order cannot be < 2 or > than %d

This is a limitation of the PPPM implementation in LAMMPS.

PPPMDisp Coulomb grid is too large

The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPMDisp Dispersion grid is too large

The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPMDisp can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

PPPMDisp coulomb order cannot be greater than %d

This is a limitation of the PPPM implementation in LAMMPS.

PPPMDisp used but no parameters set, for further information please see the ppm/disp documentation

An efficient and accurate usage of the ppm/disp requires settings via the kspace_modify command. Please see the ppm/disp documentation for further instructions.

PRD command before simulation box is defined

The prd command cannot be used before a read_data, read_restart, or create_box command.

PRD nsteps must be multiple of t_event

Self-explanatory.

PRD t_corr must be multiple of t_event

Self-explanatory.

Package command after simulation box is defined

The package command cannot be used after a read_data, read_restart, or create_box command.

Package gpu command without GPU package installed

The GPU package must be installed via “make yes-gpu” before LAMMPS is built.

Package intel command without INTEL package installed

The INTEL package must be installed via “make yes-intel” before LAMMPS is built.

Package kokkos command without KOKKOS package enabled

The KOKKOS package must be installed via “make yes-kokkos” before LAMMPS is built, and the “-k on” must be used to enable the package.

Package omp command without OPENMP package installed

The OPENMP package must be installed via “make yes-openmp” before LAMMPS is built.

Pair body requires atom style body

Self-explanatory.

Pair body requires body style nparticle

This pair style is specific to the nparticle body style.

Pair brownian requires atom style sphere

Self-explanatory.

Pair brownian requires extended particles

One of the particles has radius 0.0.

Pair brownian requires monodisperse particles

All particles must be the same finite size.

Pair brownian/poly requires atom style sphere

Self-explanatory.

Pair brownian/poly requires extended particles

One of the particles has radius 0.0.

Pair brownian/poly requires newton pair off

Self-explanatory.

Pair coeff for hybrid has invalid style

Style in pair coeff must have been listed in pair_style command.

Pair coul/wolf requires atom attribute q

The atom style defined does not have this attribute.

Pair cutoff < Respa interior cutoff

One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.

Pair dipole/cut requires atom attributes q, mu, torque

The atom style defined does not have these attributes.

Pair dipole/cut/gpu requires atom attributes q, mu, torque

The atom style defined does not have this attribute.

Pair dipole/long requires atom attributes q, mu, torque

The atom style defined does not have these attributes.

Pair dipole/sf/gpu requires atom attributes q, mu, torque

The atom style defined does not one or more of these attributes.

Pair distance < table inner cutoff

Two atoms are closer together than the pairwise table allows.

Pair distance > table outer cutoff

Two atoms are further apart than the pairwise table allows.

Pair dpd requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair gayberne epsilon a,b,c coeffs are not all set

Each atom type involved in pair_style gayberne must have these 3 coefficients set at least once.

Pair gayberne requires atom style ellipsoid

Self-explanatory.

Pair gayberne requires atoms with same type have same shape

Self-explanatory.

Pair gayberne/gpu requires atom style ellipsoid

Self-explanatory.

Pair gayberne/gpu requires atoms with same type have same shape

Self-explanatory.

Pair granular requires atom attributes radius, rmass

The atom style defined does not have these attributes.

Pair granular requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair granular with shear history requires newton pair off

This is a current restriction of the implementation of pair granular styles with history.

Pair hybrid single calls do not support per sub-style special bond values

Self-explanatory.

Pair hybrid sub-style does not support single call

You are attempting to invoke a single() call on a pair style that does not support it.

Pair hybrid sub-style is not used

No pair_coeff command used a sub-style specified in the pair_style command.

Pair inner cutoff < Respa interior cutoff

One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.

Pair inner cutoff >= Pair outer cutoff

The specified cutoffs for the pair style are inconsistent.

Pair line/lj requires atom style line

Self-explanatory.

Pair lj/long/dipole/long requires atom attributes mu, torque

The atom style defined does not have these attributes.

Pair lubricate requires atom style sphere

Self-explanatory.

Pair lubricate requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair lubricate requires monodisperse particles

All particles must be the same finite size.

Pair lubricate/poly requires atom style sphere

Self-explanatory.

Pair lubricate/poly requires extended particles

One of the particles has radius 0.0.

Pair lubricate/poly requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair lubricate/poly requires newton pair off

Self-explanatory.

Pair lubricateU requires atom style sphere

Self-explanatory.

Pair lubricateU requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair lubricateU requires monodisperse particles

All particles must be the same finite size.

Pair lubricateU/poly requires ghost atoms store velocity

Use the comm_modify vel yes command to enable this.

Pair lubricateU/poly requires newton pair off

Self-explanatory.

Pair peri lattice is not identical in x, y, and z

The lattice defined by the lattice command must be cubic.

Pair peri requires a lattice be defined

Use the lattice command for this purpose.

Pair peri requires an atom map, see atom_modify

Even for atomic systems, an atom map is required to find Peridynamic bonds. Use the atom_modify command to define one.

Pair resquared epsilon a,b,c coeffs are not all set

Self-explanatory.

Pair resquared epsilon and sigma coeffs are not all set

Self-explanatory.

Pair resquared requires atom style ellipsoid

Self-explanatory.

Pair resquared requires atoms with same type have same shape

Self-explanatory.

Pair resquared/gpu requires atom style ellipsoid

Self-explanatory.

Pair resquared/gpu requires atoms with same type have same shape

Self-explanatory.

Pair style AIREBO requires atom IDs

This is a requirement to use the AIREBO potential.

Pair style AIREBO requires newton pair on

See the newton command. This is a restriction to use the AIREBO potential.

Pair style BOP requires atom IDs

This is a requirement to use the BOP potential.

Pair style BOP requires newton pair on

See the newton command. This is a restriction to use the BOP potential.

Pair style COMB requires atom IDs

This is a requirement to use the AIREBO potential.

Pair style COMB requires atom attribute q

Self-explanatory.

Pair style COMB requires newton pair on

See the newton command. This is a restriction to use the COMB potential.

Pair style COMB3 requires atom IDs

This is a requirement to use the COMB3 potential.

Pair style COMB3 requires atom attribute q

Self-explanatory.

Pair style COMB3 requires newton pair on

See the newton command. This is a restriction to use the COMB3 potential.

Pair style LCBOP requires atom IDs

This is a requirement to use the LCBOP potential.

Pair style LCBOP requires newton pair on

See the newton command. This is a restriction to use the Tersoff potential.

Pair style MEAM requires newton pair on

See the newton command. This is a restriction to use the MEAM potential.

Pair style SNAP requires newton pair on

See the newton command. This is a restriction to use the SNAP potential.

Pair style Stillinger-Weber requires atom IDs

This is a requirement to use the SW potential.

Pair style Stillinger-Weber requires newton pair on

See the newton command. This is a restriction to use the SW potential.

Pair style Tersoff requires atom IDs

This is a requirement to use the Tersoff potential.

Pair style Tersoff requires newton pair on

See the newton command. This is a restriction to use the Tersoff potential.

Pair style Vashishta requires atom IDs

This is a requirement to use the Vashishta potential.

Pair style Vashishta requires newton pair on

See the newton command. This is a restriction to use the Vashishta potential.

Pair style bop requires comm ghost cutoff at least 3x larger than %g

Use the communicate ghost command to set this. See the pair bop page for more details.

Pair style born/coul/long requires atom attribute q

An atom style that defines this attribute must be used.

Pair style born/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style born/coul/wolf requires atom attribute q

The atom style defined does not have this attribute.

Pair style buck/coul/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style buck/coul/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style buck/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style buck/long/coul/long requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/cut requires atom attribute q

The atom style defined does not have these attributes.

Pair style coul/cut/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/debye/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/dsf requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/dsf/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style coul/long/gpu requires atom attribute q

The atom style defined does not have these attributes.

Pair style coul/streitz requires atom attribute q

Self-explanatory.

Pair style does not have extra field requested by compute pair/local

The pair style does not support the pN value requested by the compute pair/local command.

Pair style does not support bond_style quartic

The pair style does not have a single() function, so it can not be invoked by bond_style quartic.

Pair style does not support compute group/group

The pair_style does not have a single() function, so it cannot be invoked by the compute group/group command.

Pair style does not support compute pair/local

The pair style does not have a single() function, so it can not be invoked by compute pair/local.

Pair style does not support compute property/local

The pair style does not have a single() function, so it can not be invoked by fix bond/swap.

Pair style does not support fix bond/swap

The pair style does not have a single() function, so it can not be invoked by fix bond/swap.

Pair style does not support pair_write

The pair style does not have a single() function, so it can not be invoked by pair write.

Pair style does not support rRESPA inner/middle/outer

You are attempting to use rRESPA options with a pair style that does not support them.

Pair style granular with history requires atoms have IDs

Atoms in the simulation do not have IDs, so history effects cannot be tracked by the granular pair potential.

Pair style hbond/dreiding requires an atom map, see atom_modify

Self-explanatory.

Pair style hbond/dreiding requires atom IDs

Self-explanatory.

Pair style hbond/dreiding requires molecular system

Self-explanatory.

Pair style hbond/dreiding requires newton pair on

See the newton command for details.

Pair style hybrid cannot have hybrid as an argument

Self-explanatory.

Pair style hybrid cannot have none as an argument

Self-explanatory.

Pair style is incompatible with KSpace style

If a pair style with a long-range Coulombic component is selected, then a kspace style must also be used.

Pair style is incompatible with TIP4P KSpace style

The pair style does not have the requires TIP4P settings.

Pair style lj/charmm/coul/charmm requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/charmm/coul/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/charmm/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/class2/coul/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/class2/coul/long requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/class2/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/cut/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/debye/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/dsf requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/cut/coul/dsf/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/long requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/tip4p/cut requires atom IDs

This is a requirement to use this potential.

Pair style lj/cut/tip4p/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style lj/cut/tip4p/cut requires newton pair on

See the newton command. This is a restriction to use this potential.

Pair style lj/cut/tip4p/long requires atom IDs

There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style lj/cut/tip4p/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/cut/tip4p/long requires newton pair on

This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair style lj/gromacs/coul/gromacs requires atom attribute q

An atom_style with this attribute is needed.

Pair style lj/long/dipole/long does not currently support respa

This feature is not yet supported.

Pair style lj/long/tip4p/long requires atom IDs

There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style lj/long/tip4p/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style lj/long/tip4p/long requires newton pair on

This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair style lj/spica/coul/long/gpu requires atom attribute q

The atom style defined does not have this attribute.

Pair style nb3b/harmonic requires atom IDs

This is a requirement to use this potential.

Pair style nb3b/harmonic requires newton pair on

See the newton command. This is a restriction to use this potential.

Pair style nm/cut/coul/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style nm/cut/coul/long requires atom attribute q

The atom style defined does not have this attribute.

Pair style peri requires atom style peri

Self-explanatory.

Pair style polymorphic requires atom IDs

This is a requirement to use the polymorphic potential.

Pair style polymorphic requires newton pair on

See the newton command. This is a restriction to use the polymorphic potential.

Pair style reax requires atom IDs

This is a requirement to use the ReaxFF potential.

Pair style reax requires atom attribute q

The atom style defined does not have this attribute.

Pair style reax requires newton pair on

This is a requirement to use the ReaxFF potential.

Pair style requires a KSpace style

No kspace style is defined.

Pair style requires use of kspace_style ewald/disp

Self-explanatory.

Pair style sw/gpu requires atom IDs

This is a requirement to use this potential.

Pair style sw/gpu requires newton pair off

See the newton command. This is a restriction to use this potential.

Pair style vashishta/gpu requires atom IDs

This is a requirement to use this potential.

Pair style vashishta/gpu requires newton pair off

See the newton command. This is a restriction to use this potential.

Pair style tersoff/gpu requires atom IDs

This is a requirement to use the tersoff/gpu potential.

Pair style tersoff/gpu requires newton pair off

See the newton command. This is a restriction to use this pair style.

Pair style tip4p/cut requires atom IDs

This is a requirement to use this potential.

Pair style tip4p/cut requires atom attribute q

The atom style defined does not have this attribute.

Pair style tip4p/cut requires newton pair on

See the newton command. This is a restriction to use this potential.

Pair style tip4p/long requires atom IDs

There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style tip4p/long requires atom attribute q

The atom style defined does not have these attributes.

Pair style tip4p/long requires newton pair on

This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair table cutoffs must all be equal to use with KSpace

When using pair style table with a long-range KSpace solver, the cutoffs for all atom type pairs must all be the same, since the long-range solver starts at that cutoff.

Pair table parameters did not set N

List of pair table parameters must include N setting.

Pair tersoff/zbl requires metal or real units

This is a current restriction of this pair potential.

Pair tersoff/zbl/kk requires metal or real units

This is a current restriction of this pair potential.

Pair tri/lj requires atom style tri

Self-explanatory.

Pair yukawa/colloid requires atom style sphere

Self-explanatory.

Pair yukawa/colloid requires atoms with same type have same radius

Self-explanatory.

Pair yukawa/colloid/gpu requires atom style sphere

Self-explanatory.

PairKIM only works with 3D problems

This is a current limitation.

Pair_coeff command before pair_style is defined

Self-explanatory.

Pair_coeff command before simulation box is defined

The pair_coeff command cannot be used before a read_data, read_restart, or create_box command.

Pair_modify command before pair_style is defined

Self-explanatory.

Pair_modify special setting for pair hybrid incompatible with global special_bonds setting

Cannot override a setting of 0.0 or 1.0 or change a setting between 0.0 and 1.0.

Pair_write command before pair_style is defined

Self-explanatory.

Particle on or inside fix wall surface

Particles must be “exterior” to the wall in order for energy/force to be calculated.

Particle outside surface of region used in fix wall/region

Particles must be inside the region for energy/force to be calculated. A particle outside the region generates an error.

Per-atom compute in equal-style variable formula

Equal-style variables cannot use per-atom quantities.

Per-atom energy was not tallied on needed timestep

You are using a thermo keyword that requires potentials to have tallied energy, but they did not on this timestep. See the variable page for ideas on how to make this work.

Per-atom fix in equal-style variable formula

Equal-style variables cannot use per-atom quantities.

Per-atom virial was not tallied on needed timestep

You are using a thermo keyword that requires potentials to have tallied the virial, but they did not on this timestep. See the variable page for ideas on how to make this work.

Per-processor system is too big

The number of owned atoms plus ghost atoms on a single processor must fit in 32-bit integer.

Potential energy ID for fix neb does not exist

Self-explanatory.

Potential energy ID for fix nvt/nph/npt does not exist

A compute for potential energy must be defined.

Potential file has duplicate entry

The potential file has more than one entry for the same element.

Potential file is missing an entry

The potential file does not have a needed entry.

Power by 0 in variable formula

Self-explanatory.

Pressure ID for fix box/relax does not exist

The compute ID needed to compute pressure for the fix does not exist.

Pressure ID for fix modify does not exist

Self-explanatory.

Pressure ID for fix npt/nph does not exist

Self-explanatory.

Pressure ID for fix press/berendsen does not exist

The compute ID needed to compute pressure for the fix does not exist.

Pressure ID for fix rigid npt/nph does not exist

Self-explanatory.

Pressure ID for thermo does not exist

The compute ID needed to compute pressure for thermodynamics does not exist.

Pressure control can not be used with fix nvt

Self-explanatory.

Pressure control can not be used with fix nvt/asphere

Self-explanatory.

Pressure control can not be used with fix nvt/body

Self-explanatory.

Pressure control can not be used with fix nvt/sllod

Self-explanatory.

Pressure control can not be used with fix nvt/sphere

Self-explanatory.

Pressure control must be used with fix nph

Self-explanatory.

Pressure control must be used with fix nph/asphere

Self-explanatory.

Pressure control must be used with fix nph/body

Self-explanatory.

Pressure control must be used with fix nph/small

Self-explanatory.

Pressure control must be used with fix nph/sphere

Self-explanatory.

Pressure control must be used with fix nphug

A pressure control keyword (iso, aniso, tri, x, y, or z) must be provided.

Pressure control must be used with fix npt

Self-explanatory.

Pressure control must be used with fix npt/asphere

Self-explanatory.

Pressure control must be used with fix npt/body

Self-explanatory.

Pressure control must be used with fix npt/sphere

Self-explanatory.

Processor count in z must be 1 for 2d simulation

Self-explanatory.

Processor partitions do not match number of allocated processors

The total number of processors in all partitions must match the number of processors LAMMPS is running on.

Processors command after simulation box is defined

The processors command cannot be used after a read_data, read_restart, or create_box command.

Processors custom grid file is inconsistent

The vales in the custom file are not consistent with the number of processors you are running on or the Px,Py,Pz settings of the processors command. Or there was not a setting for every processor.

Processors grid numa and map style are incompatible

Using numa for gstyle in the processors command requires using cart for the map option.

Processors part option and grid style are incompatible

Cannot use gstyle numa or custom with the part option.

Processors twogrid requires proc count be a multiple of core count

Self-explanatory.

Pstart and Pstop must have the same value

Self-explanatory.

Python function evaluation failed

The Python function did not run successfully and/or did not return a value (if it is supposed to return a value). This is probably due to some error condition in the function.

Python function is not callable

The provided Python code was run successfully, but it not define a callable function with the required name.

Python invoke of undefined function

Cannot invoke a function that has not been previously defined.

Python variable does not match Python function

This matching is defined by the python-style variable and the python command.

Python variable has no function

No python command was used to define the function associated with the python-style variable.

QEQ with 'newton pair off' not supported

See the newton command. This is a restriction to use the QEQ fixes.

R0 < 0 for fix spring command

Equilibrium spring length is invalid.

RATTLE coordinate constraints are not satisfied up to desired tolerance

Self-explanatory.

RATTLE determinant = 0.0

The determinant of the matrix being solved for a single cluster specified by the fix rattle command is numerically invalid.

RATTLE failed

Certain constraints were not satisfied.

RATTLE velocity constraints are not satisfied up to desired tolerance

Self-explanatory.

Read data add offset is too big

It cannot be larger than the size of atom IDs, e.g. the maximum 32-bit integer.

Read dump of atom property that is not allocated

Self-explanatory.

Read rerun dump file timestep > specified stop

Self-explanatory.

Read restart MPI-IO input not allowed with % in filename

This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

Read_data shrink wrap did not assign all atoms correctly

This is typically because the box-size specified in the data file is large compared to the actual extent of atoms in a shrink-wrapped dimension. When LAMMPS shrink-wraps the box atoms will be lost if the processor they are re-assigned to is too far away. Choose a box size closer to the actual extent of the atoms.

Read_dump command before simulation box is defined

The read_dump command cannot be used before a read_data, read_restart, or create_box command.

Read_dump field not found in dump file

Self-explanatory.

Read_dump triclinic status does not match simulation

Both the dump snapshot and the current LAMMPS simulation must be using either an orthogonal or triclinic box.

Read_dump xyz fields do not have consistent scaling/wrapping

Self-explanatory.

Reax_defs.h setting for NATDEF is too small

Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

Reax_defs.h setting for NNEIGHMAXDEF is too small

Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

Receiving partition in processors part command is already a receiver

Cannot specify a partition to be a receiver twice.

Region ID for compute chunk/atom does not exist

Self-explanatory.

Region ID for compute reduce/region does not exist

Self-explanatory.

Region ID for compute temp/region does not exist

Self-explanatory.

Region ID for dump custom does not exist

Self-explanatory.

Region ID for fix addforce does not exist

Self-explanatory.

Region ID for fix atom/swap does not exist

Self-explanatory.

Region ID for fix ave/spatial does not exist

Self-explanatory.

Region ID for fix aveforce does not exist

Self-explanatory.

Region ID for fix deposit does not exist

Self-explanatory.

Region ID for fix efield does not exist

Self-explanatory.

Region ID for fix evaporate does not exist

Self-explanatory.

Region ID for fix gcmc does not exist

Self-explanatory.

Region ID for fix heat does not exist

Self-explanatory.

Region ID for fix setforce does not exist

Self-explanatory.

Region ID for fix wall/region does not exist

Self-explanatory.

Region ID for group dynamic does not exist

Self-explanatory.

Region ID in variable formula does not exist

Self-explanatory.

Region cannot have 0 length rotation vector

Self-explanatory.

Region for fix oneway does not exist

Self-explanatory.

Region intersect region ID does not exist

Self-explanatory.

Region union or intersect cannot be dynamic

The sub-regions can be dynamic, but not the combined region.

Region union region ID does not exist

One or more of the region IDs specified by the region union command does not exist.

Replacing a fix, but new style != old style

A fix ID can be used a second time, but only if the style matches the previous fix. In this case it is assumed you want to reset a fix's parameters. This error may mean you are mistakenly re-using a fix ID when you do not intend to.

Replicate command before simulation box is defined

The replicate command cannot be used before a read_data, read_restart, or create_box command.

Replicate did not assign all atoms correctly

Atoms replicated by the replicate command were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box.

Replicated system atom IDs are too big

See the setting for tagint in the src/lmptype.h file.

Replicated system is too big

See the setting for bigint in the src/lmptype.h file.

Required border comm not yet implemented with Kokkos

There are various limitations in the communication options supported by Kokkos.

Rerun command before simulation box is defined

The rerun command cannot be used before a read_data, read_restart, or create_box command.

Rerun dump file does not contain requested snapshot

Self-explanatory.

Resetting timestep size is not allowed with fix move

This is because fix move is moving atoms based on elapsed time.

Respa inner cutoffs are invalid

The first cutoff must be \leq the second cutoff.

Respa levels must be ≥ 1

Self-explanatory.

Respa middle cutoffs are invalid

The first cutoff must be \leq the second cutoff.

Restart file MPI-IO output not allowed with % in filename

This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

Restart file byte ordering is not recognized

The file does not appear to be a LAMMPS restart file since it does not contain a recognized byte-ordering flag at the beginning.

Restart file byte ordering is swapped

The file was written on a machine with different byte-ordering than the machine you are reading it on. Convert it to a text data file instead, on the machine you wrote it on.

Restart file incompatible with current version

This is probably because you are trying to read a file created with a version of LAMMPS that is too old compared to the current version. Use your older version of LAMMPS and convert the restart file to a data file.

Restart file is a MPI-IO file

The file is inconsistent with the filename you specified for it.

Restart file is a multi-proc file

The file is inconsistent with the filename you specified for it.

Restart file is not a MPI-IO file

The file is inconsistent with the filename you specified for it.

Restart file is not a multi-proc file

The file is inconsistent with the filename you specified for it.

Restart variable returned a bad timestep

The variable must return a timestep greater than the current timestep.

Restrain atoms %d %d %d %d missing on proc %d at step %ld

The 4 atoms in a restrain dihedral specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Restrain atoms %d %d %d missing on proc %d at step %ld

The 3 atoms in a restrain angle specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Restrain atoms %d %d missing on proc %d at step %ld

The 2 atoms in a restrain bond specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Reuse of compute ID

A compute ID cannot be used twice.

Reuse of dump ID

A dump ID cannot be used twice.

Reuse of molecule template ID

The template IDs must be unique.

Reuse of region ID

A region ID cannot be used twice.

Rigid body atoms %d %d missing on proc %d at step %ld

This means that an atom cannot find the atom that owns the rigid body it is part of, or vice versa. The solution is to use the communicate cutoff command to ensure ghost atoms are acquired from far enough away to encompass the max distance printed when the fix rigid/small command was invoked.

Rigid body has degenerate moment of inertia

Fix poems will only work with bodies (collections of atoms) that have non-zero principal moments of inertia. This means they must be 3 or more non-collinear atoms, even with joint atoms removed.

Rigid fix must come before NPT/NPH fix

NPT/NPH fix must be defined in input script after all rigid fixes, else the rigid fix contribution to the pressure virial is incorrect.

Rmask function in equal-style variable formula

Rmask is per-atom operation.

Run command before simulation box is defined

The run command cannot be used before a read_data, read_restart, or create_box command.

Run command start value is after start of run

Self-explanatory.

Run command stop value is before end of run

Self-explanatory.

Run_style command before simulation box is defined

The run_style command cannot be used before a read_data, read_restart, or create_box command.

SRD bin size for fix srd differs from user request

Fix SRD had to adjust the bin size to fit the simulation box. See the cubic keyword if you want this message to be an error vs warning.

SRD bins for fix srd are not cubic enough

The bin shape is not within tolerance of cubic. See the cubic keyword if you want this message to be an error vs warning.

SRD particle %d started inside big particle %d on step %ld bounce %d

See the inside keyword if you want this message to be an error vs warning.

SRD particle %d started inside wall %d on step %ld bounce %d

See the inside keyword if you want this message to be an error vs warning.

Same dimension twice in fix ave/spatial

Self-explanatory.

Sending partition in processors part command is already a sender

Cannot specify a partition to be a sender twice.

Set command before simulation box is defined

The set command cannot be used before a read_data, read_restart, or create_box command.

Set command floating point vector does not exist

Self-explanatory.

Set command integer vector does not exist

Self-explanatory.

Set command with no atoms existing

No atoms are yet defined so the set command cannot be used.

Set region ID does not exist

Region ID specified in set command does not exist.

Shake angles have different bond types

All 3-atom angle-constrained SHAKE clusters specified by the fix shake command that are the same angle type, must also have the same bond types for the 2 bonds in the angle.

Shake atoms %d %d %d %d missing on proc %d at step %ld

The 4 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake atoms %d %d %d missing on proc %d at step %ld

The 3 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake atoms %d %d missing on proc %d at step %ld

The 2 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake cluster of more than 4 atoms

A single cluster specified by the fix shake command can have no more than 4 atoms.

Shake clusters are connected

A single cluster specified by the fix shake command must have a single central atom with up to 3 other atoms bonded to it.

Shake determinant = 0.0

The determinant of the matrix being solved for a single cluster specified by the fix shake command is numerically invalid.

Shake fix must come before NPT/NPH fix

NPT fix must be defined in input script after SHAKE fix, else the SHAKE fix contribution to the pressure virial is incorrect.

Shear history overflow, boost neigh_modify one

There are too many neighbors of a single atom. Use the neigh_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

Small to big integers are not sized correctly

This error occurs when the sizes of smallint, imageint, tagint, bigint, as defined in src/lmptype.h are not what is expected. Contact the developers if this occurs.

Smallint setting in lmptype.h is invalid

It has to be the size of an integer.

Smallint setting in lmptype.h is not compatible

Smallint stored in restart file is not consistent with LAMMPS version you are running.

Special list size exceeded in fix bond/create

See the “read_data extra/special/per/atom” command (or the “create_box extra/special/per/atom” command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

Species XXX is not supported by this KIM Simulator Model

The kim_style define command was referencing a species that is not present in the requested KIM Simulator Model.

Specified processors != physical processors

The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

Specified target stress must be uniaxial or hydrostatic

Self-explanatory.

Sqrt of negative value in variable formula

Self-explanatory.

Subsequent read data induced too many angles per atom

See the extra/angle/per/atom keyword for the create_box or the read_data command to set this limit larger

Subsequent read data induced too many bonds per atom

See the extra/bond/per/atom keyword for the create_box or the read_data command to set this limit larger

Subsequent read data induced too many dihedrals per atom

See the extra/dihedral/per/atom keyword for the create_box or the read_data command to set this limit larger

Subsequent read data induced too many improper per atom

See the extra/improper/per/atom keyword for the create_box or the read_data command to set this limit larger

Substitution for illegal variable

Input script line contained a variable that could not be substituted for.

Support for writing images in JPEG format not included

LAMMPS was not built with the -DLAMMPS_JPEG switch in the Makefile.

Support for writing images in PNG format not included

LAMMPS was not built with the -DLAMMPS_PNG switch in the Makefile.

Support for writing movies not included

LAMMPS was not built with the -DLAMMPS_FFMPEG switch in the Makefile

System in data file is too big

See the setting for bigint in the src/lmptype.h file.

System is not charge neutral, net charge = %g

The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is an error.

TAD nsteps must be multiple of t_event

Self-explanatory.

TIP4P hydrogen has incorrect atom type

The TIP4P pairwise computation found an H atom whose type does not agree with the specified H type.

TIP4P hydrogen is missing

The TIP4P pairwise computation failed to find the correct H atom within a water molecule.

TMD target file did not list all group atoms

The target file for the fix tmd command did not list all atoms in the fix group.

Tad command before simulation box is defined

Self-explanatory.

Tagint setting in lmptype.h is invalid

Tagint must be as large or larger than smallint.

Tagint setting in lmptype.h is not compatible

Format of tagint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Target pressure for fix rigid/nph cannot be < 0.0

Self-explanatory.

Target pressure for fix rigid/npt/small cannot be < 0.0

Self-explanatory.

Target temperature for fix nvt/npt/nph cannot be 0.0

Self-explanatory.

Target temperature for fix rigid/npt cannot be 0.0

Self-explanatory.

Target temperature for fix rigid/npt/small cannot be 0.0

Self-explanatory.

Target temperature for fix rigid/nvt cannot be 0.0

Self-explanatory.

Target temperature for fix rigid/nvt/small cannot be 0.0

Self-explanatory.

Temper command before simulation box is defined

The temper command cannot be used before a read_data, read_restart, or create_box command.

Temperature ID for fix bond/swap does not exist

Self-explanatory.

Temperature ID for fix box/relax does not exist

Self-explanatory.

Temperature ID for fix nvt/npt does not exist

Self-explanatory.

Temperature ID for fix press/berendsen does not exist

Self-explanatory.

Temperature ID for fix rigid nvt/npt/nph does not exist

Self-explanatory.

Temperature ID for fix temp/berendsen does not exist

Self-explanatory.

Temperature ID for fix temp/csld does not exist

Self-explanatory.

Temperature ID for fix temp/csvr does not exist

Self-explanatory.

Temperature ID for fix temp/rescale does not exist

Self-explanatory.

Temperature compute degrees of freedom < 0

This should not happen if you are calculating the temperature on a valid set of atoms.

Temperature control can not be used with fix nph

Self-explanatory.

Temperature control can not be used with fix nph/asphere

Self-explanatory.

Temperature control can not be used with fix nph/body

Self-explanatory.

Temperature control can not be used with fix nph/sphere

Self-explanatory.

Temperature control must be used with fix nphug

The temp keyword must be provided.

Temperature control must be used with fix npt

Self-explanatory.

Temperature control must be used with fix npt/asphere

Self-explanatory.

Temperature control must be used with fix npt/body

Self-explanatory.

Temperature control must be used with fix npt/sphere

Self-explanatory.

Temperature control must be used with fix nvt

Self-explanatory.

Temperature control must be used with fix nvt/asphere

Self-explanatory.

Temperature control must be used with fix nvt/body

Self-explanatory.

Temperature control must be used with fix nvt/sllod

Self-explanatory.

Temperature control must be used with fix nvt/sphere

Self-explanatory.

Temperature control must not be used with fix nph/small

Self-explanatory.

Temperature for fix nvt/sllod does not have a bias

The specified compute must compute temperature with a bias.

Tempering could not find thermo_pe compute

This compute is created by the thermo command. It must have been explicitly deleted by a uncompute command.

Tempering fix ID is not defined

The fix ID specified by the temper command does not exist.

Tempering temperature fix is not valid

The fix specified by the temper command is not one that controls temperature (nvt or langevin).

Test_descriptor_string already allocated

This is an internal error. Contact the developers.

The package gpu command is required for gpu styles

Self-explanatory.

Thermo and fix not computed at compatible times

Fixes generate values on specific timesteps. The thermo output does not match these timesteps.

Thermo compute array is accessed out-of-range

Self-explanatory.

Thermo compute does not compute array

Self-explanatory.

Thermo compute does not compute scalar

Self-explanatory.

Thermo compute does not compute vector

Self-explanatory.

Thermo compute vector is accessed out-of-range

Self-explanatory.

Thermo custom variable cannot be indexed

Self-explanatory.

Thermo custom variable is not equal-style variable

Only equal-style variables can be output with thermodynamics, not atom-style variables.

Thermo every variable returned a bad timestep

The variable must return a timestep greater than the current timestep.

Thermo fix array is accessed out-of-range

Self-explanatory.

Thermo fix does not compute array

Self-explanatory.

Thermo fix does not compute scalar

Self-explanatory.

Thermo fix does not compute vector

Self-explanatory.

Thermo fix vector is accessed out-of-range

Self-explanatory.

Thermo keyword in variable requires thermo to use/init pe

You are using a thermo keyword in a variable that requires potential energy to be calculated, but your thermo output does not use it. Add it to your thermo output.

Thermo keyword in variable requires thermo to use/init press

You are using a thermo keyword in a variable that requires pressure to be calculated, but your thermo output does not use it. Add it to your thermo output.

Thermo keyword in variable requires thermo to use/init temp

You are using a thermo keyword in a variable that requires temperature to be calculated, but your thermo output does not use it. Add it to your thermo output.

Thermo style does not use press

Cannot use thermo_modify to set this parameter since the thermo_style is not computing this quantity.

Thermo style does not use temp

Cannot use thermo_modify to set this parameter since the thermo_style is not computing this quantity.

Thermo_modify every variable returned a bad timestep

The returned timestep is less than or equal to the current timestep.

Thermo_modify int format does not contain d character

Self-explanatory.

Thermo_modify pressure ID does not compute pressure

The specified compute ID does not compute pressure.

Thermo_modify temperature ID does not compute temperature

The specified compute ID does not compute temperature.

Thermo_style command before simulation box is defined

The thermo_style command cannot be used before a read_data, read_restart, or create_box command.

This variable thermo keyword cannot be used between runs

Keywords that refer to time (such as cpu, elapsed) do not make sense in between runs.

Threshold for an atom property that is not allocated

A dump threshold has been requested on a quantity that is not defined by the atom style used in this simulation.

Timestep must be >= 0

Specified timestep is invalid.

Too big a problem to use velocity create loop all

The system size must fit in a 32-bit integer to use this option.

Too big a timestep for dump dcd

The timestep must fit in a 32-bit integer to use this dump style.

Too big a timestep for dump xtc

The timestep must fit in a 32-bit integer to use this dump style.

Too few bits for lookup table

Table size specified via pair_modify command does not work with your machine's floating point representation.

Too few lines in %s section of data file

Self-explanatory.

Too few values in body lines in data file

Self-explanatory.

Too few values in body section of molecule file

Self-explanatory.

Too many -pk arguments in command line

The string formed by concatenating the arguments is too long. Use a package command in the input script instead.

Too many MSM grid levels

The max number of MSM grid levels is hardwired to 10.

Too many args in variable function

More args are used than any variable function allows.

Too many atom pairs for pair bop

The number of atomic pairs exceeds the expected number. Check your atomic structure to ensure that it is realistic.

Too many atom sorting bins

This is likely due to an immense simulation box that has blown up to a large size.

Too many atom triplets for pair bop

The number of three atom groups for angle determinations exceeds the expected number. Check your atomic structure to ensure that it is realistic.

Too many atoms for dump dcd

The system size must fit in a 32-bit integer to use this dump style.

Too many atoms for dump xtc

The system size must fit in a 32-bit integer to use this dump style.

Too many elements extracted from MEAM library.

Increase 'maxelt' in meam.h and recompile.

Too many exponent bits for lookup table

Table size specified via pair_modify command does not work with your machine's floating point representation.

Too many groups

The maximum number of atom groups (including the "all" group) is given by MAX_GROUP in group.cpp and is 32.

Too many iterations

You must use a number of iterations that fit in a 32-bit integer for minimization.

Too many lines in one body in data file - boost MAXBODY

MAXBODY is a setting at the top of the src/read_data.cpp file. Set it larger and re-compile the code.

Too many local+ghost atoms for neighbor list

The number of nlocal + nghost atoms on a processor is limited by the size of a 32-bit integer with 2 bits removed for masking 1-2, 1-3, 1-4 neighbors.

Too many mantissa bits for lookup table

Table size specified via pair_modify command does not work with your machine's floating point representation.

Too many masses for fix shake

The fix shake command cannot list more masses than there are atom types.

Too many molecules for fix poems

The limit is $2^{31} = \sim 2$ billion molecules.

Too many molecules for fix rigid

The limit is $2^{31} = \sim 2$ billion molecules.

Too many neighbor bins

This is likely due to an immense simulation box that has blown up to a large size.

Too many timesteps

The cumulative timesteps must fit in a 64-bit integer.

Too many timesteps for NEB

You must use a number of timesteps that fit in a 32-bit integer for NEB.

Too many total atoms

See the setting for bigint in the src/lmptype.h file.

Too many total bits for bitmapped lookup table

Table size specified via pair_modify command is too large. Note that a value of N generates a 2^N size table.

Too many values in body lines in data file

Self-explanatory.

Too many values in body section of molecule file

Self-explanatory.

Too much buffered per-proc info for dump

The size of the buffered string must fit in a 32-bit integer for a dump.

Too much per-proc info for dump

Number of local atoms times number of columns must fit in a 32-bit integer for dump.

Topology type exceeds system topology type

The number of bond, angle, etc types exceeds the system setting. See the create_box or read_data command for how to specify these values.

Tree structure in joint connections

Fix poems cannot (yet) work with coupled bodies whose joints connect the bodies in a tree structure.

Tried to convert a double to int, but input_double > INT_MAX

Self-explanatory.

Trying to build an occasional neighbor list before initialization completed

This is not allowed. Source code caller needs to be modified.

Two fix ave commands using same compute chunk/atom command in incompatible ways

They are both attempting to “lock” the chunk/atom command so that the chunk assignments persist for some number of timesteps, but are doing it in different ways.

Two groups cannot be the same in fix spring couple

Self-explanatory.

The %s type label %s is already in use for type %s

For a given type-kind (atom types, bond types, etc.), a given type label can be assigned to only one numeric type.

Type label string %s for %s type %s is invalid

See the labelmap command documentation for valid type labels.

Unable to initialize accelerator for use

There was a problem initializing an accelerator for the gpu package

Unbalanced quotes in input line

No matching end double quote was found following a leading double quote.

Unexpected end of -reorder file

Self-explanatory.

Unexpected empty line in Angle Coeffs section

Read a blank line where there should be coefficient data.

Unexpected empty line in Bond Coeffs section

Read a blank line where there should be coefficient data.

Unexpected empty line in Dihedral Coeffs section

Read a blank line where there should be coefficient data.

Unexpected empty line in Improper Coeffs section

Read a blank line where there should be coefficient data.

Unexpected empty line in Pair Coeffs section

Read a blank line where there should be coefficient data.

Unexpected end of custom file

Self-explanatory.

Unexpected end of data file

LAMMPS hit the end of the data file while attempting to read a section. Something is wrong with the format of the data file.

Unexpected end of dump file

A read operation from the file failed.

Unexpected end of fix rigid file

A read operation from the file failed.

Unexpected end of fix rigid/small file

A read operation from the file failed.

Unexpected end of molecule file

Self-explanatory.

Unexpected end of neb file

A read operation from the file failed.

Units command after simulation box is defined

The units command cannot be used after a read_data, read_restart, or create_box command.

Universe/uloop variable count < # of partitions

A universe or uloop style variable must specify a number of values \geq to the number of processor partitions.

Unrecognized angle style

The choice of angle style is unknown.

Unrecognized atom style

The choice of atom style is unknown.

Unrecognized body style

The choice of body style is unknown.

Unrecognized bond style

The choice of bond style is unknown.

Unknown category for info is_active()

Self-explanatory.

Unknown category for info is_available()

Self-explanatory.

Unknown category for info is_defined()

Self-explanatory.

Unrecognized command: %s

The command is not known to LAMMPS. Check the input script.

Unrecognized compute style

The choice of compute style is unknown.

Unrecognized dihedral style

The choice of dihedral style is unknown.

Unrecognized dump reader style

The choice of dump reader style via the format keyword is unknown.

Unrecognized dump style

The choice of dump style is unknown.

Unknown error in GPU library

Self-explanatory.

Unrecognized fix style

The choice of fix style is unknown.

Unknown identifier in data file: %s

A section of the data file cannot be read by LAMMPS.

Unrecognized improper style

The choice of improper style is unknown.

Unknown keyword in thermo_style custom command

One or more specified keywords are not recognized.

Unrecognized kspace style

The choice of kspace style is unknown.

Unknown name for info newton category

Self-explanatory.

Unknown name for info package category

Self-explanatory.

Unknown name for info pair category

Self-explanatory.

Unrecognized pair style

The choice of pair style is unknown.

Unknown pair_modify hybrid sub-style

The choice of sub-style is unknown.

Unrecognized region style

The choice of region style is unknown.

Unknown section in molecule file

Self-explanatory.

Unknown table style in angle style table

Self-explanatory.

Unknown table style in bond style table

Self-explanatory.

Unknown table style in pair_style command

Style of table is invalid for use with pair_style table command.

Unknown unit_style

Self-explanatory. Check the input script or data file.

Unrecognized lattice type in MEAM library file

The lattice type in an entry of the MEAM library file is not valid.

Unrecognized lattice type in MEAM parameter file

The lattice type in an entry of the MEAM parameter file is not valid.

Unrecognized pair style in compute pair command

Self-explanatory.

Unsupported mixing rule in kspace_style ewald/disp

Only geometric mixing is supported.

Unsupported order in kspace_style ewald/disp

Only $1/r^6$ dispersion or dipole terms are supported.

Unsupported order in kspace_style ppm/disp, pair_style %s

Only pair styles with $1/r$ and $1/r^6$ dependence are currently supported.

Unsupported parameter in MEAM library file

Self-explanatory.

Use cutoff keyword to set cutoff in single mode

Mode is single so cutoff/multi keyword cannot be used.

Use cutoff/multi keyword to set cutoff in multi mode

Mode is multi so cutoff keyword cannot be used.

Using fix nvt/sllod with inconsistent fix deform remap option

Fix nvt/sllod requires that deforming atoms have a velocity profile provided by “remap v” as a fix deform option.

Using fix nvt/sllod with no fix deform defined

Self-explanatory.

Using fix srd with inconsistent fix deform remap option

When shearing the box in an SRD simulation, the remap v option for fix deform needs to be used.

Using pair lubricate with inconsistent fix deform remap option

Must use remap v option with fix deform with this pair style.

Using pair lubricate/poly with inconsistent fix deform remap option

If fix deform is used, the remap v option is required.

Using suffix gpu without GPU package installed

Self-explanatory.

Using suffix intel without INTEL package installed

Self-explanatory.

Using suffix kk without KOKKOS package enabled

Self-explanatory.

Using suffix omp without OPENMP package installed

Self-explanatory.

Using update dipole flag requires atom attribute mu

Self-explanatory.

Using update dipole flag requires atom style sphere

Self-explanatory.

Variable ID in variable formula does not exist

Self-explanatory.

Variable atom ID is too large

Specified ID is larger than the maximum allowed atom ID.

Variable evaluation before simulation box is defined

Cannot evaluate a compute or fix or atom-based value in a variable before the simulation has been setup.

Variable evaluation in fix wall gave bad value

The returned value for epsilon or sigma < 0.0.

Variable evaluation in region gave bad value

Variable returned a radius < 0.0.

Variable for compute ti is invalid style

Self-explanatory.

Variable for create_atoms is invalid style

The variables must be equal-style variables.

Variable for displace_atoms is invalid style

It must be an equal-style or atom-style variable.

Variable for dump every is invalid style

Only equal-style variables can be used.

Variable for dump image center is invalid style

Must be an equal-style variable.

Variable for dump image phi is invalid style

Must be an equal-style variable.

Variable for dump image theta is invalid style

Must be an equal-style variable.

Variable for dump image zoom is invalid style

Must be an equal-style variable.

Variable for fix adapt is invalid style

Only equal-style variables can be used.

Variable for fix addforce is invalid style

Self-explanatory.

Variable for fix aveforce is invalid style

Only equal-style variables can be used.

Variable for fix deform is invalid style

The variable must be an equal-style variable.

Variable for fix efield is invalid style

The variable must be an equal- or atom-style variable.

Variable for fix gravity is invalid style

Only equal-style variables can be used.

Variable for fix heat is invalid style

Only equal-style or atom-style variables can be used.

Variable for fix indent is invalid style

Only equal-style variables can be used.

Variable for fix indent is not equal style

Only equal-style variables can be used.

Variable for fix langevin is invalid style

It must be an equal-style variable.

Velocity command before simulation box is defined

The velocity command cannot be used before a read_data, read_restart, or create_box command.

Velocity command with no atoms existing

A velocity command has been used, but no atoms yet exist.

Velocity ramp in z for a 2d problem

Self-explanatory.

Velocity rigid used with non-rigid fix-ID

Self-explanatory.

Velocity temperature ID does calculate a velocity bias

The specified compute must compute a bias for temperature.

Velocity temperature ID does not compute temperature

The compute ID given to the velocity command must compute temperature.

Verlet/split can only currently be used with comm_style brick

This is a current restriction in LAMMPS.

Verlet/split does not yet support TIP4P

This is a current limitation.

Verlet/split requires 2 partitions

See the -partition command-line switch.

Verlet/split requires Rspace partition layout be multiple of Kspace partition layout in each dim

This is controlled by the processors command.

Verlet/split requires Rspace partition size be multiple of Kspace partition size

This is so there is an equal number of Rspace processors for every Kspace processor.

Virial was not tallied on needed timestep

You are using a thermo keyword that requires potentials to have tallied the virial, but they did not on this timestep. See the variable page for ideas on how to make this work.

Voro++ error: narea and neigh have a different size

This error is returned by the Voro++ library.

Wall defined twice in fix wall command

Self-explanatory.

Wall defined twice in fix wall/reflect command

Self-explanatory.

Wall defined twice in fix wall/srd command

Self-explanatory.

Water H epsilon must be 0.0 for pair style lj/cut/tip4p/cut

This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

Water H epsilon must be 0.0 for pair style lj/cut/tip4p/long

This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

Water H epsilon must be 0.0 for pair style lj/long/tip4p/long

This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

World variable count does not match # of partitions

A world-style variable must specify a number of values equal to the number of processor partitions.

Write_data command before simulation box is defined

Self-explanatory.

Write_restart command before simulation box is defined

The write_restart command cannot be used before a read_data, read_restart, or create_box command.

Zero-length lattice orient vector

Self-explanatory.

11.6 Warning messages

This is an alphabetic list of the WARNING messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. Warning messages also list the source file and line number where the warning was generated. For example, a message like this:

WARNING: Bond atom missing in box size check (domain.cpp:187)

means that line #187 in the file src/domain.cpp generated the error. Looking in the source code may help you figure out what went wrong.

Doc page with [ERROR messages](#)

Adjusting Coulombic cutoff for MSM, new cutoff = %g

The adjust/cutoff command is turned on and the Coulombic cutoff has been adjusted to match the user-specified accuracy.

Angle atoms missing at step %ld

One or more of 3 atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

Angle style in data file differs from currently defined angle style

Self-explanatory.

Angles are defined but no angle style is set

The topology contains angles, but there are no angle forces computed since there was no angle_style command.

Atom style in data file differs from currently defined atom style

Self-explanatory.

Bond atom missing in box size check

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atom missing in image check

The second atom in a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atoms missing at step %ld

The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond style in data file differs from currently defined bond style

Self-explanatory.

Bonds are defined but no bond style is set

The topology contains bonds, but there are no bond forces computed since there was no bond_style command.

Bond/angle/dihedral extent > half of periodic box length

This is a restriction because LAMMPS can be confused about which image of an atom in the bonded interaction is the correct one to use. “Extent” in this context means the maximum end-to-end length of the bond/angle/dihedral. LAMMPS computes this by taking the maximum bond length, multiplying by the number of bonds in the interaction (e.g. 3 for a dihedral) and adding a small amount of stretch.

Both groups in compute group/group have a net charge; the Kspace boundary correction to energy will be non-zero

Self-explanatory.

Calling write_dump before a full system init.

The write_dump command is used before the system has been fully initialized as part of a ‘run’ or ‘minimize’ command. Not all dump styles and features are fully supported at this point and thus the command may fail or produce incomplete or incorrect output. Insert a “run 0” command, if a full system init is required.

Cannot count rigid body degrees-of-freedom before bodies are fully initialized

This means the temperature associated with the rigid bodies may be incorrect on this timestep.

Cannot count rigid body degrees-of-freedom before bodies are initialized

This means the temperature associated with the rigid bodies may be incorrect on this timestep.

Cannot include log terms without 1/r terms; setting flagHI to 1

Self-explanatory.

Cannot include log terms without 1/r terms; setting flagHI to 1.

Self-explanatory.

Charges are set, but coulombic solver is not used

Self-explanatory.

Charges did not converge at step %ld: %lg

Self-explanatory.

Communication cutoff is 0.0. No ghost atoms will be generated. Atoms may get lost

The communication cutoff defaults to the maximum of what is inferred from pair and bond styles (will be zero, if none are defined) and what is specified via [comm_modify cutoff](#) (defaults to 0.0). If this results to 0.0, no ghost atoms will be generated and LAMMPS may lose atoms or use incorrect periodic images of atoms in interaction lists. To avoid, either use [pair style zero](#) with a suitable cutoff or use [comm_modify cutoff](#).

Communication cutoff is shorter than a bond length based estimate. This may lead to errors.

Since LAMMPS stores topology data with individual atoms, all atoms comprising a bond, angle, dihedral or improper must be present on any subdomain that “owns” the atom with the information, either as a local or a ghost atom. The communication cutoff is what determines up to what distance from a subdomain boundary ghost atoms are created. The communication cutoff is by default the largest non-bonded cutoff plus the neighbor skin distance, but for short or non-bonded cutoffs and/or long bonds, this may not be sufficient. This warning indicates that there is an increased risk of a simulation stopping unexpectedly because of Bond/Angle/Dihedral/Improper atoms missing. It can be silenced by manually setting the communication cutoff via [comm_modify cutoff](#). However, since the heuristic used to determine the estimate is not always accurate, it is not changed automatically and the warning may be ignored depending on the specific system being simulated.

Communication cutoff is too small for SNAP micro load balancing, increased to %lf

Self-explanatory.

Compute cna/atom cutoff may be too large to find ghost atom neighbors

The neighbor cutoff used may not encompass enough ghost atoms to perform this operation correctly.

Computing temperature of portions of rigid bodies

The group defined by the temperature compute does not encompass all the atoms in one or more rigid bodies, so the change in degrees-of-freedom for the atoms in those partial rigid bodies will not be accounted for.

Create_bonds max distance > minimum neighbor cutoff

This means atom pairs for some atom types may not be in the neighbor list and thus no bond can be created between them.

Delete_atoms cutoff > minimum neighbor cutoff

This means atom pairs for some atom types may not be in the neighbor list and thus an atom in that pair cannot be deleted.

Dihedral atoms missing at step %ld

One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

Dihedral problem

Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

Dihedral problem: %d %ld %d %d %d %d

Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

Dihedral style in data file differs from currently defined dihedral style

Self-explanatory.

Dihedrals are defined but no dihedral style is set

The topology contains dihedrals, but there are no dihedral forces computed since there was no dihedral_style command.

Dump dcd/xtc timestamp may be wrong with fix dt/reset

If the fix changes the timestep, the dump dcd file will not reflect the change.

Energy due to X extra global DOFs will be included in minimizer energies

When using fixes like box/relax, the potential energy used by the minimizer is augmented by an additional energy provided by the fix. Thus the printed converged energy may be different from the total potential energy.

Estimated error in splitting of dispersion coeffs is %g

Error is greater than 0.0001 percent.

Ewald/disp Newton solver failed, using old method to estimate g_ewald

Self-explanatory. Choosing a different cutoff value may help.

FENE bond too long

A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

FENE bond too long: %ld %d %d %g

A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

FENE bond too long: %ld %g

A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

Fix halt condition for fix-id %s met on step %ld with value %g

Self explanatory.

Fix SRD walls overlap but fix srd overlap not set

You likely want to set this in your input script.

Fix bond/create is used multiple times or with fix bond/break - may not work as expected

When using fix bond/create multiple times or in combination with fix bond/break, the individual fix instances do not share information about changes they made at the same time step and thus it may result in unexpected behavior.

Fix bond/react: Atom affected by reaction too close to template edge

This means an atom which changes type or connectivity during the reaction is too close to an 'edge' atom defined in the superimpose file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.

Fix bond/swap will ignore defined angles

See the page for fix bond/swap for more info on this restriction.

Fix deposit near setting < possible overlap separation %g

This test is performed for finite size particles with a diameter, not for point particles. The near setting is smaller than the particle diameter which can lead to overlaps.

Fix evaporate may delete atom with non-zero molecule ID

This is probably an error, since you should not delete only one atom of a molecule.

Fix gcmc using full_energy option

Fix gcmc has automatically turned on the full_energy option since it is required for systems like the one specified by the user. User input included one or more of the following: kspace, triclinic, a hybrid pair style, an eam pair style, or no “single” function for the pair style.

Fix langevin gif using random gaussians is not implemented with kokkos This will most likely cause errors in kinetic fluctuations.

Fix property/atom mol or charge w/out ghost communication

A model typically needs these properties defined for ghost atoms.

Fix qeq CG convergence failed (%g) after %d iterations at %ld step

Self-explanatory.

Fix qeq has non-zero lower Taper radius cutoff

Absolute value must be ≤ 0.01 .

Fix qeq has very low Taper radius cutoff

Value should typically be ≥ 5.0 .

Fix qeq/dynamic tolerance may be too small for damped dynamics

Self-explanatory.

Fix qeq/fire tolerance may be too small for damped fires

Self-explanatory.

Fix rattle should come after all other integration fixes

This fix is designed to work after all other integration fixes change atom positions. Thus it should be the last integration fix specified. If not, it will not satisfy the desired constraints as well as it otherwise would.

Fix recenter should come after all other integration fixes

Other fixes may change the position of the center-of-mass, so fix recenter should come last.

Fix srd SRD moves may trigger frequent reneighboring

This is because the SRD particles may move long distances.

Fix srd grid size > 1/4 of big particle diameter

This may cause accuracy problems.

Fix srd particle moved outside valid domain

This may indicate a problem with your simulation parameters.

Fix srd particles may move > big particle diameter

This may cause accuracy problems.

Fix srd viscosity < 0.0 due to low SRD density

This may cause accuracy problems.

Fixes cannot send data in Kokkos communication, switching to classic communication

This is current restriction with Kokkos.

For better accuracy use ‘pair_modify table 0’

The user-specified force accuracy cannot be achieved unless the table feature is disabled by using ‘pair_modify table 0’.

Geometric mixing assumed for $1/r^6$ coefficients

Self-explanatory.

Group for fix_modify temp != fix group

The fix_modify command is specifying a temperature computation that computes a temperature on a different group of atoms than the fix itself operates on. This is probably not what you want to do.

H matrix size has been exceeded: m_fill=%d H.m=%dn

This is the size of the matrix.

Ignoring unknown or incorrect info command flag

Self-explanatory. An unknown argument was given to the info command. Compare your input with the documentation.

Improper atoms missing at step %ld

One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

Improper problem: %d %ld %d %d %d %d

Conformation of the 4 listed improper atoms is extreme; you may want to check your simulation geometry.

Improper style in data file differs from currently defined improper style

Self-explanatory.

Impropers are defined but no improper style is set

The topology contains impropers, but there are no improper forces computed since there was no improper_style command.

Inconsistent image flags

The image flags for a pair on bonded atoms appear to be inconsistent. Inconsistent means that when the coordinates of the two atoms are unwrapped using the image flags, the two atoms are far apart. Specifically they are further apart than half a periodic box length. Or they are more than a box length apart in a non-periodic dimension. This is usually due to the initial data file not having correct image flags for the 2 atoms in a bond that straddles a periodic boundary. They should be different by 1 in that case. This is a warning because inconsistent image flags will not cause problems for dynamics or most LAMMPS simulations. However they can cause problems when such atoms are used with the fix rigid or replicate commands. Note that if you have an infinite periodic crystal with bonds then it is impossible to have fully consistent image flags, since some bonds will cross periodic boundaries and connect two atoms with the same image flag.

Increasing communication cutoff for GPU style

The pair style has increased the communication cutoff to be consistent with the communication cutoff requirements for this pair style when run on the GPU.

KIM Model does not provide 'energy'; Potential energy will be zero

Self-explanatory.

KIM Model does not provide 'forces'; Forces will be zero

Self-explanatory.

KIM Model does not provide 'particleEnergy'; energy per atom will be zero

Self-explanatory.

KIM Model does not provide 'particleVirial'; virial per atom will be zero

Self-explanatory.

Kspace_modify slab param < 2.0 may cause unphysical behavior

The kspace_modify slab parameter should be larger to ensure periodic grids padded with empty space do not overlap.

Less insertions than requested

The fix pour command was unsuccessful at finding open space for as many particles as it tried to insert.

Library error in lammps_gather_atoms

This library function cannot be used if atom IDs are not defined or are not consecutively numbered.

Library error in lammmps_scatter_atoms

This library function cannot be used if atom IDs are not defined or are not consecutively numbered, or if no atom map is defined. See the atom_modify command for details about atom maps.

Likewise 1-2 special neighbor interactions != 1.0

The topology contains bonds, but there is no bond style defined and a 1-2 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the bond style.

Likewise 1-3 special neighbor interactions != 1.0

The topology contains angles, but there is no angle style defined and a 1-3 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the angle style.

Likewise 1-4 special neighbor interactions != 1.0

The topology contains dihedrals, but there is no dihedral style defined and a 1-4 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the dihedral style.

Lost atoms via change_box: original %ld current %ld

The command options you have used caused atoms to be lost.

Lost atoms via displace_atoms: original %ld current %ld

The command options you have used caused atoms to be lost.

Lost atoms: original %ld current %ld

Lost atoms are checked for each time thermo output is done. See the thermo_modify lost command for options. Lost atoms usually indicate bad dynamics, e.g. atoms have been blown far out of the simulation box, or moved further than one processor's subdomain away before reneighboring.

MSM mesh too small, increasing to 2 points in each direction

Self-explanatory.

Mismatch between velocity and compute groups

The temperature computation used by the velocity command will not be on the same group of atoms that velocities are being set for.

Mixing forced for lj coefficients

Self-explanatory.

Molecule attributes do not match system attributes

An attribute is specified (e.g. diameter, charge) that is not defined for the specified atom style.

Molecule has bond topology but no special bond settings

This means the bonded atoms will not be excluded in pairwise interactions.

Molecule template for create_atoms has multiple molecules

The create_atoms command will only create molecules of a single type, i.e. the first molecule in the template.

Molecule template for fix gcmc has multiple molecules

The fix gcmc command will only create molecules of a single type, i.e. the first molecule in the template.

Molecule template for fix shake has multiple molecules

The fix shake command will only recognize molecules of a single type, i.e. the first molecule in the template.

More than one compute centro/atom

It is not efficient to use compute centro/atom more than once.

More than one compute cluster/atom

It is not efficient to use compute cluster/atom more than once.

More than one compute cna/atom defined

It is not efficient to use compute cna/atom more than once.

More than one compute contact/atom

It is not efficient to use compute contact/atom more than once.

More than one compute coord/atom

It is not efficient to use compute coord/atom more than once.

More than one compute damage/atom

It is not efficient to use compute ke/atom more than once.

More than one compute dilatation/atom

Self-explanatory.

More than one compute erorate/sphere/atom

It is not efficient to use compute erorate/sphere/atom more than once.

More than one compute hexorder/atom

It is not efficient to use compute hexorder/atom more than once.

More than one compute ke/atom

It is not efficient to use compute ke/atom more than once.

More than one compute orientorder/atom

It is not efficient to use compute orientorder/atom more than once.

More than one compute plasticity/atom

Self-explanatory.

More than one compute sna/atom

Self-explanatory.

More than one compute sna/grid

Self-explanatory.

More than one compute sna/grid/local

Self-explanatory.

More than one compute snad/atom

Self-explanatory.

More than one compute snav/atom

Self-explanatory.

More than one fix poems

It is not efficient to use fix poems more than once.

More than one fix rigid

It is not efficient to use fix rigid more than once.

Neighbor exclusions used with KSpace solver may give inconsistent Coulombic energies

This is because excluding specific pair interactions also excludes them from long-range interactions which may not be the desired effect. The special_bonds command handles this consistently by ensuring excluded (or weighted) 1-2, 1-3, 1-4 interactions are treated consistently by both the short-range pair style and the long-range solver. This is not done for exclusions of charged atom pairs via the neigh_modify exclude command.

New thermo_style command, previous thermo_modify settings will be lost

If a thermo_style command is used after a thermo_modify command, the settings changed by the thermo_modify command will be reset to their default values. This is because the thermo_modify command acts on the currently defined thermo style, and a thermo_style command creates a new style.

No Kspace calculation with verlet/split

The second partition performs a kspace calculation so the kspace_style command must be used.

No automatic unit conversion to XTC file format conventions possible for units lj

This means no scaling will be performed.

No fixes defined, atoms won't move

If you are not using a fix like nve, nvt, npt then atom velocities and coordinates will not be updated during timestepping.

No joints between rigid bodies, use fix rigid instead

The bodies defined by fix poems are not connected by joints. POEMS will integrate the body motion, but it would be more efficient to use fix rigid.

Not using real units with pair reaxff

This is most likely an error, unless you have created your own ReaxFF parameter file in a different set of units.

Number of MSM mesh points changed to be a multiple of 2

MSM requires that the number of grid points in each direction be a multiple of two and the number of grid points in one or more directions have been adjusted to meet this requirement.

OMP_NUM_THREADS environment is not set.

This environment variable must be set appropriately to use the OPENMP package.

One or more atoms are time integrated more than once

This is probably an error since you typically do not want to advance the positions or velocities of an atom more than once per timestep.

One or more chunks do not contain all atoms in molecule

This may not be what you intended.

One or more dynamic groups may not be updated at correct point in timestep

If there are other fixes that act immediately after the initial stage of time integration within a timestep (i.e. after atoms move), then the command that sets up the dynamic group should appear after those fixes. This will ensure that dynamic group assignments are made after all atoms have moved.

One or more respa levels compute no forces

This is computationally inefficient.

Pair COMB charge %.10f with force %.10f hit max barrier

Something is possibly wrong with your model.

Pair COMB charge %.10f with force %.10f hit min barrier

Something is possibly wrong with your model.

Pair brownian needs newton pair on for momentum conservation

Self-explanatory.

Pair dpd needs newton pair on for momentum conservation

Self-explanatory.

Pair dsmc: num_of_collisions > number_of_A

Collision model in DSMC is breaking down.

Pair dsmc: num_of_collisions > number_of_B

Collision model in DSMC is breaking down.

Pair style in data file differs from currently defined pair style

Self-explanatory.

Pair style restartinfo set but has no restart support

This pair style has a bug, where it does not support reading and writing information to a restart file, but does not set the member variable "restartinfo" to 0 as required in that case.

Particle deposition was unsuccessful

The fix deposit command was not able to insert as many atoms as needed. The requested volume fraction may be too high, or other atoms may be in the insertion region.

Proc subdomain size < neighbor skin, could lead to lost atoms

The decomposition of the physical domain (likely due to load balancing) has led to a processor's subdomain being smaller than the neighbor skin in one or more dimensions. Since reneighboring is triggered by atoms moving the skin distance, this may lead to lost atoms, if an atom moves all the way across a neighboring processor's subdomain before reneighboring is triggered.

Reducing PPPM order b/c stencil extends beyond nearest neighbor processor

This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

Reducing PPPMDisp Coulomb order b/c stencil extends beyond neighbor processor

This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

Reducing PPPMDisp dispersion order b/c stencil extends beyond neighbor processor

This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

Replacing a fix, but new group != old group

The ID and style of a fix match for a fix you are changing with a fix command, but the new group you are specifying does not match the old group.

Replicating in a non-periodic dimension

The parameters for a replicate command will cause a non-periodic dimension to be replicated; this may cause unwanted behavior.

Resetting reneighboring criteria during PRD

A PRD simulation requires that neigh_modify settings be delay = 0, every = 1, check = yes. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the PRD simulation.

Resetting reneighboring criteria during TAD

A TAD simulation requires that neigh_modify settings be delay = 0, every = 1, check = yes. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the PRD simulation.

Resetting reneighboring criteria during minimization

Minimization requires that neigh_modify settings be delay = 0, every = 1, check = yes. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the minimization.

Restart file used different # of processors

The restart file was written out by a LAMMPS simulation running on a different number of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

Restart file used different 3d processor grid

The restart file was written out by a LAMMPS simulation running on a different 3d grid of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

Restart file used different boundary settings, using restart file values

Your input script cannot change these restart file settings.

Restart file used different newton bond setting, using restart file value

The restart file value will override the setting in the input script.

Restart file used different newton pair setting, using input script value

The input script value will override the setting in the restart file.

Restrain problem: %d %ld %d %d %d %d

Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

Running PRD with only one replica

This is allowed, but you will get no parallel speed-up.

SRD bin shifting turned on due to small lamda

This is done to try to preserve accuracy.

SRD bin size for fix srd differs from user request

Fix SRD had to adjust the bin size to fit the simulation box. See the cubic keyword if you want this message to be an error vs warning.

SRD bins for fix srd are not cubic enough

The bin shape is not within tolerance of cubic. See the cubic keyword if you want this message to be an error vs warning.

SRD particle %d started inside big particle %d on step %ld bounce %d

See the inside keyword if you want this message to be an error vs warning.

SRD particle %d started inside wall %d on step %ld bounce %d

See the inside keyword if you want this message to be an error vs warning.

Shake determinant < 0.0

The determinant of the quadratic equation being solved for a single cluster specified by the fix shake command is numerically suspect. LAMMPS will set it to 0.0 and continue.

Shell command '%s' failed with error '%s'

Self-explanatory.

Shell command returned with non-zero status

This may indicate the shell command did not operate as expected.

Should not allow rigid bodies to bounce off reflecting walls

LAMMPS allows this, but their dynamics are not computed correctly.

Should not use fix nve/limit with fix shake or fix rattle

This will lead to invalid constraint forces in the SHAKE/RATTLE computation.

Simulations might be very slow because of large number of structure factors

Self-explanatory.

Slab correction not needed for MSM

Slab correction is intended to be used with Ewald or PPPM and is not needed by MSM.

Specifying an 'subset' value of '0' is equivalent to no 'subset' keyword

Self-explanatory.

System is not charge neutral, net charge = %g

The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is only a warning.

Table inner cutoff >= outer cutoff

You specified an inner cutoff for a Coulombic table that is longer than the global cutoff. Probably not what you wanted.

Temperature for MSST is not for group all

User-assigned temperature to MSST fix does not compute temperature for all atoms. Since MSST computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by MSST could be inaccurate.

Temperature for NPT is not for group all

User-assigned temperature to NPT fix does not compute temperature for all atoms. Since NPT computes a

global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by NPT could be inaccurate.

Temperature for fix modify is not for group all

The temperature compute is being used with a pressure calculation which does operate on group all, so this may be inconsistent.

Temperature for thermo pressure is not for group all

User-assigned temperature to thermo via the thermo_modify command does not compute temperature for all atoms. Since thermo computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure printed by thermo could be inaccurate.

The fix ave/spatial command has been replaced by the more flexible fix ave/chunk and compute chunk/atom commands – fix ave/spatial will be removed in the summer of 2015

Self-explanatory.

The minimizer does not re-orient dipoles when using fix efield

This means that only the atom coordinates will be minimized, not the orientation of the dipoles.

Too many common neighbors in CNA %d times

More than the maximum # of neighbors was found multiple times. This was unexpected.

Too many inner timesteps in fix ttm

Self-explanatory.

Too many neighbors in CNA for %d atoms

More than the maximum # of neighbors was found multiple times. This was unexpected.

Use special bonds = 0,1,1 with bond style fene

Most FENE models need this setting for the special_bonds command.

Use special bonds = 0,1,1 with bond style fene/expand

Most FENE models need this setting for the special_bonds command.

Using a many-body potential with bonds/angles/dihedrals and special_bond exclusions

This is likely not what you want to do. The exclusion settings will eliminate neighbors in the neighbor list, which the many-body potential needs to calculate its terms correctly.

Using compute temp/deform with inconsistent fix deform remap option

Fix nvt/sllod assumes deforming atoms have a velocity profile provided by “remap v” or “remap none” as a fix deform option.

Using compute temp/deform with no fix deform defined

This is probably an error, since it makes little sense to use compute temp/deform in this case.

Using fix srd with box deformation but no SRD thermostat

The deformation will heat the SRD particles so this can be dangerous.

Using kspace solver on system with no charge

Self-explanatory.

Using largest cut-off for lj/long/dipole/long long long

Self-explanatory.

Using largest cutoff for buck/long/coul/long

Self-explanatory.

Using largest cutoff for lj/long/coul/long

Self-explanatory.

Using largest cutoff for pair_style lj/long/tip4p/long

Self-explanatory.

Using package gpu without any pair style defined

Self-explanatory.

Using pair potential shift with pair_modify compute no

The shift effects will thus not be computed.

Using pair tail corrections with nonperiodic system

This is probably a bogus thing to do, since tail corrections are computed by integrating the density of a periodic system out to infinity.

Using pair tail corrections with pair_modify compute no

The tail corrections will thus not be computed.

Part II

Programmer Guide

LAMMPS LIBRARY INTERFACES

As described on the [library interface to LAMMPS](#) page, LAMMPS can be built as a library (static or shared), so that it can be called by another code, used in a [coupled manner](#) with other codes, or driven through a [Python script](#). The LAMMPS standalone executable itself is essentially a thin wrapper on top of the LAMMPS library, which creates a LAMMPS instance, passes the input for processing to that instance, and then exits.

Most of the APIs described below are based on C language wrapper functions in the files `src/library.h` and `src/library.cpp`, but it is also possible to use C++ directly. The basic procedure is always the same: you create one or more instances of [LAMMPS](#), pass commands as strings or from files to that LAMMPS instance to execute calculations, and/or call functions that read, manipulate, and update data from the active class instances inside LAMMPS to do analysis or perform operations that are not possible with existing input script commands.

Thread-safety

LAMMPS was initially not conceived as a thread-safe program, but over the years changes have been applied to replace operations that collide with creating multiple LAMMPS instances from multiple-threads of the same process with thread-safe alternatives. This primarily applies to the core LAMMPS code and less so on add-on packages, especially when those packages require additional code in the *lib* folder, interface LAMMPS to Fortran libraries, or the code uses static variables (like the COLVARS package).

Another major issue to deal with is to correctly handle MPI. Creating a LAMMPS instance requires passing an MPI communicator, or it assumes the `MPI_COMM_WORLD` communicator, which spans all MPI processor ranks. When creating multiple LAMMPS object instances from different threads, this communicator has to be different for each thread or else collisions can happen. Or it has to be guaranteed, that only one thread at a time is active. MPI communicators, however, are not a problem, if LAMMPS is compiled with the MPI STUBS library, which implies that there is no MPI communication and only 1 MPI rank.

1.1 LAMMPS C Library API

The C library interface is the most commonly used path to manage LAMMPS instances from a compiled code and it is the basis for the [Python](#) and [Fortran](#) modules. Almost all functions of the C language API require an argument containing a “handle” in the form of a `void *` type variable, which points to the location of a LAMMPS class instance.

The `library.h` header file by default does not include the `mpi.h` header file and thus hides the [lammps_open\(\)](#) function which requires the declaration of the `MPI_comm` data type. This is only a problem when the communicator that would be passed is different from `MPI_COMM_WORLD`. Otherwise calling [lammps_open_no_mpi\(\)](#) will work just as well. To make [lammps_open\(\)](#) available, you need to compile the code with `-DLAMMPS_LIB_MPI` or add the line `#define LAMMPS_LIB_MPI` before `#include "library.h"`.

Please note the `mpi.h` file must usually be the same (and thus the MPI library in use) for the LAMMPS code and library and the calling code. The exception is when LAMMPS was compiled in serial mode using the STUBS MPI library. In that case the calling code may be compiled with a different MPI library so long as `lammps_open_no_mpi()` is called to create a LAMMPS instance. In that case each MPI rank will run LAMMPS in serial mode.

Errors versus exceptions

If the LAMMPS executable encounters an error condition, it will abort after printing an error message. It does so by catching the exceptions that LAMMPS could throw. For a C library interface this is usually not desirable since the calling code might lack the ability to catch such exceptions. Thus, the library functions will catch those exceptions and return from the affected functions. The error status *can be queried* and an *error message retrieved*. This is, for example used by the *LAMMPS python module* and then a suitable Python exception is thrown.

Using the C library interface as a plugin

Rather than including the C library directly and link to the LAMMPS library at compile time, you can use the `liblammpsplugin.h` header file and the `liblammpsplugin.c` C code in the `examples/COUPLE/plugin` folder for an interface to LAMMPS that is largely identical to the regular library interface, only that it will load a LAMMPS shared library file at runtime. This can be useful for applications where the interface to LAMMPS would be an optional feature.

Warning

No checks are made on the arguments of the function calls of the C library interface. *All* function arguments must be non-NULL unless *explicitly* allowed, and must point to consistent and valid data. Buffers for storing returned data must be allocated to a suitable size. Passing invalid or unsuitable information will likely cause crashes or corrupt data.

1.1.1 Creating or deleting a LAMMPS object

This section documents the following functions:

- `lammps_open()`
- `lammps_open_no_mpi()`
- `lammps_open_fortran()`
- `lammps_close()`
- `lammps_mpi_init()`
- `lammps_mpi_finalize()`
- `lammps_kokkos_finalize()`
- `lammps_python_finalize()`
- `lammps_error()`

The `lammps_open()` and `lammps_open_no_mpi()` functions are used to create and initialize a LAMMPS() instance. They return a reference to this instance as a `void *` pointer to be used as the “handle” argument in subsequent function calls until that instance is destroyed by calling `lammps_close()`. Here is a simple example demonstrating its use:

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
    int version;
    const char *lmpargv[] = { "liblammps", "-log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    /* create LAMMPS instance */
    handle = lammps_open_no_mpi(lmpargc, (char **)lmpargv, NULL);
    if (handle == NULL) {
        printf("LAMMPS initialization failed");
        lammps_mpi_finalize();
        return 1;
    }

    /* get and print numerical version code */
    version = lammps_version(handle);
    printf("LAMMPS Version: %d\n",version);

    /* delete LAMMPS instance and shut down MPI */
    lammps_close(handle);
    lammps_mpi_finalize();
    return 0;
}
```

The LAMMPS library uses the MPI library it was compiled with and will either run on all processors in the `MPI_COMM_WORLD` communicator or on the set of processors in the communicator passed as the `comm` argument of `lammps_open()`. This means the calling code can run LAMMPS on all or a subset of processors. For example, a wrapper code might decide to alternate between LAMMPS and another code, allowing them both to run on all the processors. Or it might allocate part of the processors to LAMMPS and the rest to the other code by creating a custom communicator with `MPI_Comm_split()` and running both codes concurrently before syncing them up periodically. Or it might instantiate multiple instances of LAMMPS to perform different calculations and either alternate between them, run them concurrently on split communicators, or run them one after the other. The `lammps_open()` function may be called multiple times for this latter purpose.

The `lammps_close()` function is used to shut down the LAMMPS class pointed to by the handle passed as an argument and free all its memory. This has to be called for every instance created with one of the `lammps_open()` functions. It will, however, **not** call `MPI_Finalize()`, since that may only be called once. See `lammps_mpi_finalize()` for an alternative to invoking `MPI_Finalize()` explicitly from the calling program.

```
void *lammps_open(int argc, char **argv, MPI_Comm comm, void **ptr)
```

Create instance of the LAMMPS class and return pointer to it.

The `lammops_open()` function creates a new `LAMMPS` class instance while passing in a list of strings as if they were *command-line arguments* for the LAMMPS executable, and an MPI communicator for LAMMPS to run under. Since the list of arguments is **exactly** as when called from the command line, the first argument would be the name of the executable and thus is otherwise ignored. However `argc` may be set to 0 and then `argv` may be NULL. If MPI is not yet initialized, `MPI_Init()` will be called during creation of the LAMMPS class instance.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument *ptr*.

Deprecated since version 18Sep2020: The *ptr* argument will be removed in a future release of LAMMPS. It should be set to NULL instead.

See also

`lammops_open_no_mpi()`, `lammops_open_fortran()`

Note

This function is **only** declared when the code using the LAMMPS `library.h` include file is compiled with `-DLAMMPS_LIB_MPI`, or contains a `#define LAMMPS_LIB_MPI 1` statement before `#include "library.h"`. Otherwise you can only use the `lammops_open_no_mpi()` or `lammops_open_fortran()` functions.

Parameters

- **argc** – number of command line arguments
- **argv** – list of command line argument strings
- **comm** – MPI communicator for this LAMMPS instance
- **ptr** – pointer to a void pointer variable which serves as a handle; may be NULL

Returns

pointer to new LAMMPS instance cast to void *

`void *lammops_open_no_mpi(int argc, char **argv, void **ptr)`

Variant of `lammops_open()` that implicitly uses `MPI_COMM_WORLD`.

This function is a version of `lammops_open()`, that is missing the MPI communicator argument. It will use `MPI_COMM_WORLD` instead. The type and purpose of arguments and return value are otherwise the same.

Outside of the convenience, this function is useful, when the LAMMPS library was compiled in serial mode, but the calling code runs in parallel and the `MPI_Comm` data type of the STUBS library would not be compatible with that of the calling code.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument *ptr*.

Deprecated since version 18Sep2020: The *ptr* argument will be removed in a future release of LAMMPS. It should be set to NULL instead.

See also

[*lammps_open\(\)*](#), [*lammps_open_fortran\(\)*](#)

Parameters

- **argc** – number of command line arguments
- **argv** – list of command line argument strings
- **ptr** – pointer to a void pointer variable which serves as a handle; may be NULL

Returns

pointer to new LAMMPS instance cast to void *

void ***lammps_open_fortran**(int argc, char **argv, int f_comm)

Variant of [*lammps_open\(\)*](#) using a Fortran MPI communicator.

Added in version 18Sep2020.

This function is a version of [*lammps_open\(\)*](#), that uses an integer for the MPI communicator as the MPI Fortran interface does. It is used in the [*lammps\(\)*](#) constructor of the LAMMPS Fortran module. Internally it converts the *f_comm* argument into a C-style MPI communicator with [*MPI_Comm_f2c\(\)*](#) and then calls [*lammps_open\(\)*](#).

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

See also

[*lammps_open_fortran\(\)*](#), [*lammps_open_no_mpi\(\)*](#)

Parameters

- **argc** – number of command line arguments
- **argv** – list of command line argument strings
- **f_comm** – Fortran style MPI communicator for this LAMMPS instance

Returns

pointer to new LAMMPS instance cast to void *

void **lammps_close**(void *handle)

Delete a LAMMPS instance created by [*lammps_open\(\)*](#) or its variants.

This function deletes the LAMMPS class instance pointed to by **handle** that was created by one of the [*lammps_open\(\)*](#) variants. It does **not** call [*MPI_Finalize\(\)*](#) to allow creating and deleting multiple LAMMPS instances concurrently or sequentially. See [*lammps_mpi_finalize\(\)*](#) for a function performing this operation.

Parameters

handle – pointer to a previously created LAMMPS instance

void **lammops_mpi_init()**

Ensure the MPI environment is initialized.

Added in version 18Sep2020.

The MPI standard requires that any MPI application must call `MPI_Init()` exactly once before performing any other MPI function calls. This function checks, whether MPI is already initialized and calls `MPI_Init()` in case it is not.

void **lammops_mpi_finalize()**

Shut down the MPI infrastructure.

Added in version 18Sep2020.

The MPI standard requires that any MPI application calls `MPI_Finalize()` before exiting. Even if a calling program does not do any MPI calls, MPI is still initialized internally to avoid errors accessing any MPI functions. This function should then be called right before exiting the program to wait until all (parallel) tasks are completed and then MPI is cleanly shut down. After calling this function no more MPI calls may be made.

See also

[`lammops_kokkos_finalize\(\)`](#), [`lammops_python_finalize\(\)`](#)

void **lammops_kokkos_finalize()**

Shut down the Kokkos library environment.

Added in version 2Jul2021.

The Kokkos library may only be initialized once during the execution of a process. This is done automatically the first time Kokkos functionality is used. This requires that the Kokkos environment must be explicitly shut down after any LAMMPS instance using it is closed (to release associated resources). After calling this function no Kokkos functionality may be used.

See also

[`lammops_mpi_finalize\(\)`](#), [`lammops_python_finalize\(\)`](#)

void **lammops_python_finalize()**

Clear the embedded Python environment

Added in version 20Sep2021.

This function resets and clears an embedded Python environment by calling the [`Py_Finalize\(\)`](#) function of the embedded Python library, if enabled. This call would free up all allocated resources and release loaded shared objects.

However, this is **not** done when a LAMMPS instance is deleted because a) LAMMPS may have been used through the Python module and thus the Python interpreter is external and not embedded into LAMMPS and therefore may not be reset by LAMMPS b) some Python modules and extensions, most notably NumPy, are not compatible with being initialized multiple times, which would happen if additional LAMMPS instances using Python would be created *after* after calling `Py_Finalize()`.

This function can be called to explicitly clear the Python environment in case it is safe to do so.

See also

`lammps_mpi_finalize()`, `lammps_kokkos_finalize()`

void **lammps_error**(void *handle, int error_type, const char *error_text)

Call a LAMMPS Error class function

Added in version 3Nov2022.

This function is a wrapper around functions in the `Error` to print an error message and then stop LAMMPS.

The `error_type` parameter selects which function to call. It is a sum of constants from `_LMP_ERROR_CONST`. If the value does not match any valid combination of constants a warning is printed and the function returns.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **error_type** – parameter to select function in the Error class
- **error_text** – error message

1.1.2 Executing commands

This section documents the following functions:

- `lammps_file()`
 - `lammps_command()`
 - `lammps_commands_list()`
 - `lammps_commands_string()`
-

Once a LAMMPS instance is created, there are multiple ways to “drive” a simulation. In most cases it is easiest to process single or multiple LAMMPS commands like in an input file. This can be done through reading a file or passing single commands or lists of commands or blocks of commands with the following functions.

Via these functions, the calling code can have LAMMPS act on a series of *input file commands* that are either read from a file or passed as strings. For example, this allows setup of a problem from an input script, and then running it in stages while performing other operations in between or concurrently. The caller can interleave the LAMMPS function calls with operations it performs, such as calls to extract information from or set information within LAMMPS, or calls to another code’s library.

Just as with *input script parsing* comments can be included in the file or strings, and expansion of variables with `${name}` or `$(expression)` syntax is performed. Below is a short example using some of these functions.

```
/* define to make the otherwise hidden prototype for "lammps_open()" visible */
#define LAMMPS_LIB_MPI
#include "library.h"

#include <mpi.h>
#include <stdio.h>

int main(int argc, char **argv)
```

(continues on next page)

(continued from previous page)

```
{
  void *handle;
  int i;

  MPI_Init(&argc, &argv);
  handle = lammps_open(0, NULL, MPI_COMM_WORLD, NULL);
  lammps_file(handle, "in.sysinit");
  lammps_command(handle, "run 1000 post no");

  for (i=0; i < 100; ++i) {
    lammps_commands_string(handle, "run 100 pre no post no\n"
                                "print 'PE = $(pe)'\n"
                                "print 'KE = $(ke)'\n");
  }
  lammps_close(handle);
  MPI_Finalize();
  return 0;
}
```

void **lammps_file**(void *handle, const char *file)

Process LAMMPS input from a file.

This function processes commands in the file pointed to by *filename* line by line and thus functions very similar to the *include* command. The function returns when the end of the file is reached and the commands have completed.

The actual work is done by the functions *Input::file(const char *)* and *Input::file()*.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **filename** – name of a file with LAMMPS input

char ***lammps_command**(void *handle, const char *cmd)

Process a single LAMMPS input command from a string.

This function tells LAMMPS to execute the single command in the string *cmd*. The entire string is considered as command and need not have a (final) newline character. Newline characters in the body of the string, however, will be treated as part of the command and will **not** start a second command. The function *lammps_commands_string()* processes a string with multiple command lines.

The function returns the name of the command on success or NULL when passing a string without a command.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **cmd** – string with a single LAMMPS command

Returns

string with parsed command name or NULL

void **lammops_commands_list**(void *handle, int ncmd, const char **cmds)

Process multiple LAMMPS input commands from list of strings.

This function processes multiple commands from a list of strings by first concatenating the individual strings in *cmds* into a single string, inserting newline characters as needed. The combined string is passed to [lammops_commands_string\(\)](#) for processing.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
 - **ncmd** – number of lines in *cmds*
 - **cmds** – list of strings with LAMMPS commands
-

void **lammops_commands_string**(void *handle, const char *str)

Process a block of LAMMPS input commands from a single string.

This function processes a multi-line string similar to a block of commands from a file. The string may have multiple lines (separated by newline characters) and also single commands may be distributed over multiple lines with continuation characters ('&'). Those lines are combined by removing the '&' and the following newline character. After this processing the string is handed to LAMMPS for parsing and executing.

Added in version 21Nov2023: The command is now able to process long strings with triple quotes and loops using *jump SELF <label>*.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **str** – string with block of LAMMPS input commands

1.1.3 System properties

This section documents the following functions:

- [lammops_get_natoms\(\)](#)
- [lammops_get_thermo\(\)](#)
- [lammops_last_thermo\(\)](#)
- [lammops_extract_box\(\)](#)
- [lammops_reset_box\(\)](#)
- [lammops_memory_usage\(\)](#)
- [lammops_get_mpi_comm\(\)](#)
- [lammops_extract_setting\(\)](#)
- [lammops_extract_global_datatype\(\)](#)
- [lammops_extract_global\(\)](#)

- `lammps_extract_pair_dimension()`
 - `lammps_extract_pair()`
 - `lammps_map_atom()`
-

The library interface allows the extraction of different kinds of information about the active simulation instance and also - in some cases - to apply modifications to it. This enables combining of a LAMMPS simulation with other processing and simulation methods computed by the calling code, or by another code that is coupled to LAMMPS via the library interface. In some cases the data returned is direct reference to the original data inside LAMMPS, cast to a void pointer. In that case the data needs to be cast to a suitable pointer for the calling program to access it, and you may need to know the correct dimensions and lengths. This also means you can directly change those value(s) from the calling program (e.g., to modify atom positions). Of course, changing values should be done with care. When accessing per-atom data, please note that these data are the per-processor **local** data and are indexed accordingly. Per-atom data can change sizes and ordering at every neighbor list rebuild or atom sort event as atoms migrate between subdomains and processors.

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;
    int i;

    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.sysinit");
    printf("Running a simulation with %g atoms.\n",
          lammps_get_natoms(handle));

    printf(" %d local and %d ghost atoms. %d atom types\n",
          lammps_extract_setting(handle, "nlocal"),
          lammps_extract_setting(handle, "nghost"),
          lammps_extract_setting(handle, "ntypes"));

    double *dt = (double *)lammps_extract_global(handle, "dt");
    printf("Changing timestep from %g to 0.5\n", *dt);
    *dt = 0.5;

    lammps_command(handle, "run 1000 post no");

    for (i=0; i < 10; ++i) {
        lammps_command(handle, "run 100 pre no post no");
        printf("PE = %g\nKE = %g\n",
              lammps_get_thermo(handle, "pe"),
              lammps_get_thermo(handle, "ke"));
    }
    lammps_close(handle);
    return 0;
}
```

double `lammps_get_natoms`(void *handle)

Return the total number of atoms in the system.

This number may be very large when running large simulations across multiple processes. Depending on compile time choices, LAMMPS may be using either 32-bit or a 64-bit integer to store this number. For portability this function returns thus a double precision floating point number, which can represent up to a 53-bit signed integer exactly ($\approx 10^{16}$).

As an alternative, you can use `lammps_extract_global()` and cast the resulting pointer to an integer pointer of the correct size and dereference it. The size of that integer (in bytes) can be queried by calling `lammps_extract_setting()` to return the size of a `bigint` integer.

Changed in version 18Sep2020: The type of the return value was changed from `int` to `double` to accommodate reporting atom counts for larger systems that would overflow a 32-bit `int` without having to depend on a 64-bit integer type definition.

Parameters

handle – pointer to a previously created LAMMPS instance

Returns

total number of atoms or 0 if value is too large

`double lammps_get_thermo(void *handle, const char *keyword)`

Evaluate a thermo keyword.

This function returns the current value of a *thermo keyword*. Unlike `lammps_extract_global()` it does not give access to the storage of the desired data but returns its value as a `double`, so it can also return information that is computed on-the-fly. Use `lammps_last_thermo()` to get access to the cached data from the last thermo output.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **keyword** – string with the name of the thermo keyword

Returns

value of the requested thermo property or 0.0

`void *lammps_last_thermo(void *handle, const char *what, int index)`

Access cached data from last thermo output

Added in version 15Jun2023.

This function provides access to cached data from the last thermo output. This differs from `lammps_get_thermo()` in that it does not trigger an evaluation. Instead it provides direct access to a read-only location of the last thermo output data and the corresponding keyword strings. The how to handle the return value depends on the value of the *what* argument string.

Value of what	Description of return value	Data type	Uses index
setup	1 if setup is not completed and thus thermo data invalid, 0 otherwise	pointer to int	no
line	line number (0-based) of current line in current file or buffer	pointer to int	no
image-name	file name of the last <i>dump image</i> file written	pointer to 0-terminated const char array	no
step	timestep when the last thermo output was generated or -1	pointer to bigint	no
num	number of fields in thermo output	pointer to int	no
keyword	column keyword for thermo output	pointer to 0-terminated const char array	yes
type	data type of thermo output column; see <code>_LMP_DATATYPE_CONST</code>	pointer to int	yes
data	actual field data for column	pointer to int, int64_t or double	yes

Note

The *type* property points to a static location that is reassigned with every call, so the returned pointer should be recast, dereferenced, and assigned immediately. Otherwise, its value may be changed with the next invocation of the function.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **what** – string with the kind of data requested
- **index** – integer with index into data arrays, ignored for scalar data

Returns

pointer to location of requested data cast to void or NULL

```
void lammers_extract_box(void *handle, double *boxlo, double *boxhi, double *xy, double *yz, double *xz, int *pflags, int *boxflag)
```

Extract simulation box parameters.

This function (re-)initializes the simulation box and boundary information and then assign the designated data to the locations in the pointers passed as arguments. Any argument (except the first) may be a NULL pointer and then will not be assigned.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **boxlo** – pointer to 3 doubles where the lower box boundary is stored
- **boxhi** – pointer to 3 doubles where the upper box boundary is stored
- **xy** – pointer to a double where the xy tilt factor is stored
- **yz** – pointer to a double where the yz tilt factor is stored

- **xz** – pointer to a double where the xz tilt factor is stored
 - **pflags** – pointer to 3 ints, set to 1 for periodic boundaries and 0 for non-periodic
 - **boxflag** – pointer to an int, which is set to 1 if the box will be changed during a simulation by a fix and 0 if not.
-

void **lammops_reset_box**(void *handle, double *boxlo, double *boxhi, double xy, double yz, double xz)

Reset simulation box parameters.

This function sets the simulation box dimensions (upper and lower bounds and tilt factors) from the provided data and then re-initializes the box information and all derived settings. It may only be called before atoms are created.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
 - **boxlo** – pointer to 3 doubles containing the lower box boundary
 - **boxhi** – pointer to 3 doubles containing the upper box boundary
 - **xy** – xy tilt factor
 - **yz** – yz tilt factor
 - **xz** – xz tilt factor
-

void **lammops_memory_usage**(void *handle, double *meminfo)

Get memory usage information

Added in version 18Sep2020.

This function will retrieve memory usage information for the current LAMMPS instance or process. The *meminfo* buffer will be filled with 3 different numbers (if supported by the operating system). The first is the tally (in MBytes) of all large memory allocations made by LAMMPS. This is a lower boundary of how much memory is requested and does not account for memory allocated on the stack or allocations via `new`. The second number is the current memory allocation of the current process as returned by a memory allocation reporting in the system library. The third number is the maximum amount of RAM (not swap) used by the process so far. If any of the two latter parameters is not supported by the operating system it will be set to zero.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
 - **meminfo** – buffer with space for at least 3 double to store data in.
-

int **lammops_get_mpi_comm**(void *handle)

Return current LAMMPS world communicator as integer

Added in version 18Sep2020.

This will take the LAMMPS “world” communicator and convert it to an integer using `MPI_Comm_c2f()`, so it is equivalent to the corresponding MPI communicator in Fortran. This way it can be safely passed around between different programming languages. To convert it to the C language representation use `MPI_Comm_f2c()`.

If LAMMPS was compiled with MPI_STUBS, this function returns -1.

See also

[*lammmps_open_fortran\(\)*](#)

Parameters

handle – pointer to a previously created LAMMPS instance

Returns

Fortran representation of the LAMMPS world communicator

int **lammmps_extract_setting**(void *handle, const char *keyword)

Query LAMMPS about global settings.

This function will retrieve or compute global properties. In contrast to [*lammmps_get_thermo\(\)*](#) this function returns an int. The following tables list the currently supported keyword. If a keyword is not recognized, the function returns -1. The integer sizes functions may be called without a valid LAMMPS object handle (it is ignored).

- [*Integer sizes*](#)
- [*Image masks*](#)
- [*System status*](#)
- [*System sizes*](#)
- [*Atom style flags*](#)

Integer sizes

Keyword	Description / Return value
bigint	size of the bigint integer type, 4 or 8 bytes. Set at <i>compile time</i> .
tagint	size of the tagint integer type, 4 or 8 bytes. Set at <i>compile time</i> .
imageint	size of the imageint integer type, 4 or 8 bytes. Set at <i>compile time</i> .

Image masks

These settings are related to how LAMMPS stores and interprets periodic images. The values are used internally by the [*Fortran interface*](#) and are not likely to be useful to users.

Keyword	Description / Return value
IMGMASK	Bit-mask used to convert image flags to a single integer
IMGMAX	Maximum allowed image number for a particular atom
IMGBITS	Bits used in image counts
IMG2BITS	Second bitmask used in image counts

System status

Keyword	Description / Return value
dimension	Number of dimensions: 2 or 3. See dimension command .
box_exist	1 if the simulation box is defined, 0 if not. See create_box command .
kokkos_active	1 if the KOKKOS package is compiled in and activated, 0 if not. See KOKKOS package .
kokkos_nthread	Number of Kokkos threads per MPI process, 0 if Kokkos is not active. See KOKKOS package .
kokkos_ngpus	Number of Kokkos gpus per physical node, 0 if Kokkos is not active or no GPU support. See KOKKOS package .
nthreads	Number of requested OpenMP threads per MPI process for LAMMPS' execution
newton_bond	1 if Newton's 3rd law is applied to bonded interactions, 0 if not.
newton_pair	1 if Newton's 3rd law is applied to non-bonded interactions, 0 if not.
triclinic	1 if the the simulation box is triclinic, 0 if orthogonal. See change_box command .

Communication status

Keyword	Description / Return value
uni- verse_rank	MPI rank on LAMMPS' universe communicator (0 <= universe_rank < universe_size)
uni- verse_size	Number of ranks on LAMMPS' universe communicator (world_size <= universe_size)
world_rank	MPI rank on LAMMPS' world communicator (0 <= world_rank < world_size, aka comm->me)
world_size	Number of ranks on LAMMPS' world communicator (aka comm->nprocs)
comm_style	communication style (0 = BRICK, 1 = TILED)
comm_layout	communication layout (0 = LAYOUT_UNIFORM, 1 = LAYOUT_NONUNIFORM, 2 = LAYOUT_TILED)
comm_mode	communication mode (0 = SINGLE, 1 = MULTI, 2 = MULTIOLD)
ghost_velocity	whether velocities are communicated for ghost atoms (0 = no, 1 = yes)

System sizes

Keyword	Description / Return value
nlocal	number of "owned" atoms of the current MPI rank.
nghost	number of "ghost" atoms of the current MPI rank.
nall	number of all "owned" and "ghost" atoms of the current MPI rank.
nmax	maximum of nlocal+nghost across all MPI ranks (for per-atom data array size).
ntypes	number of atom types
nbondtypes	number of bond types
nangletypes	number of angle types
ndihedraltypes	number of dihedral types
nimproptypes	number of improper types
nellipsoids	number of atoms that have ellipsoid data
nlines	number of atoms that have line data (see pair style line/lj)
ntris	number of atoms that have triangle data (see pair style tri/lj)
nbodies	number of atoms that have body data (see the Body particle HowTo)

Atom style flags

Keyword	Description / Return value
molecule_flag	1 if the atom style includes molecular topology data. See <i>atom_style command</i> .
q_flag	1 if the atom style includes point charges. See <i>atom_style command</i> .
mu_flag	1 if the atom style includes point dipoles. See <i>atom_style command</i> .
rmass_flag	1 if the atom style includes per-atom masses, 0 if there are per-type masses. See <i>atom_style command</i> .
radius_flag	1 if the atom style includes a per-atom radius. See <i>atom_style command</i> .
ellip-soid_flag	1 if the atom style describes extended particles that may be ellipsoidal. See <i>atom_style command</i> .
omega_flag	1 if the atom style can store per-atom rotational velocities. See <i>atom_style command</i> .
torque_flag	1 if the atom style can store per-atom torques. See <i>atom_style command</i> .
angmom_flag	1 if the atom style can store per-atom angular momentum. See <i>atom_style command</i> .

See also

lammops_extract_global()

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **keyword** – string with the name of the thermo keyword

Returns

value of the queried setting or -1 if unknown

int **lammops_extract_global_datatype**(void *handle, const char *name)

Get data type of internal global LAMMPS variables or arrays.

Added in version 18Sep2020.

This function returns an integer that encodes the data type of the global property with the specified name. See `_LMP_DATATYPE_CONST` for valid values. Callers of *lammops_extract_global()* can use this information to then decide how to cast the `void *` pointer and access the data.

Parameters

- **handle** – pointer to a previously created LAMMPS instance (unused)
- **name** – string with the name of the extracted property

Returns

integer constant encoding the data type of the property or -1 if not found.

void ***lammops_extract_global**(void *handle, const char *name)

Get pointer to internal global LAMMPS variables or arrays.

This function returns a pointer to the location of some global property stored in one of the constituent classes of a LAMMPS instance. The returned pointer is cast to `void *` and needs to be cast to a pointer of the type that the entity represents. The pointers returned by this function are generally persistent; therefore it is not necessary to

call the function again, unless a *clear command* command is issued which wipes out and recreates the contents of the *LAMMPS* class.

Please also see *lammps_extract_setting()*, *lammps_get_thermo()*, and *lammps_extract_box()*.

The following tables list the supported names, their data types, length of the data area, and a short description. The data type can also be queried through calling *lammps_extract_global_datatype()*. The *bigint* type may be defined to be either an *int* or an *int64_t*. This is set at *compile time* of the LAMMPS library and can be queried through calling *lammps_extract_setting()*. The function *lammps_extract_global_datatype()* will directly report the “native” data type. The following tables are provided:

- *Timestep settings*
- *Simulation box settings*
- *System property settings*
- *Unit settings*

Timestep settings

Name	Type	Length	Description
dt	double	1	length of the time step. See <i>timestep command</i> .
ntimestep	bigint	1	current time step number. See <i>reset_timestep command</i> .
atime	double	1	accumulated simulation time in time units.
atimestep	bigint	1	the number of the timestep when “atime” was last updated.
respa_levels	int	1	number of r-RESPA levels. See <i>run_style command</i> .
respa_dt	double	number of r-RESPA levels	length of the time steps with r-RESPA. See <i>run_style command</i> .

Simulation box settings

Name	Type	Length	Description
boxlo	double	3	lower box boundaries. See <i>create_box command</i> .
boxhi	double	3	upper box boundaries. See <i>create_box command</i> .
boxxlo	double	1	lower box boundary in x-direction. See <i>create_box command</i> .
boxxhi	double	1	upper box boundary in x-direction. See <i>create_box command</i> .
boxylo	double	1	lower box boundary in y-direction. See <i>create_box command</i> .
boxyhi	double	1	upper box boundary in y-direction. See <i>create_box command</i> .
boxzlo	double	1	lower box boundary in z-direction. See <i>create_box command</i> .
boxzhi	double	1	upper box boundary in z-direction. See <i>create_box command</i> .
sublo	double	3	subbox lower boundaries
subhi	double	3	subbox upper boundaries
sublo_lambda	double	3	subbox lower boundaries in fractional coordinates (for triclinic cells)
subhi_lambda	double	3	subbox upper boundaries in fractional coordinates (for triclinic cells)
periodicity	int	3	0 if non-periodic, 1 if periodic for x, y, and z; See <i>boundary command</i> .
triclinic	int	1	1 if the the simulation box is triclinic, 0 if orthogonal; See <i>change_box command</i> .
xy	double	1	triclinic tilt factor. See <i>Triclinic (non-orthogonal) simulation boxes</i> .
yz	double	1	triclinic tilt factor. See <i>Triclinic (non-orthogonal) simulation boxes</i> .
xz	double	1	triclinic tilt factor. See <i>Triclinic (non-orthogonal) simulation boxes</i> .
procgrid	int	3	processor count assigned to each dimension of 3d grid. See <i>processors command</i> .

System property settings

Name	Type	Length	Description
ntypes	int	1	number of atom types
nbonds	bigint	1	total number of bonds in the simulation.
nangles	bigint	1	total number of angles in the simulation.
ndihedrals	bigint	1	total number of dihedrals in the simulation.
nimprop-ers	bigint	1	total number of impropers in the simulation.
natoms	bigint	1	total number of atoms in the simulation.
nlocal	int	1	number of “owned” atoms of the current MPI rank.
nghost	int	1	number of “ghost” atoms of the current MPI rank.
nmax	int	1	maximum of nlocal+nghost across all MPI ranks (for per-atom data array size).
special_lj	double	4	special <i>pair weighting factors</i> for LJ interactions (first element is always 1.0)
special_coul	double	4	special <i>pair weighting factors</i> for Coulomb interactions (first element is always 1.0)
map_style	int	1	<i>atom map setting</i> : 0 = none, 1 = array, 2 = hash, 3 = yes
map_tag_max	bigint or int	1	largest atom ID that can be mapped to a local index (bigint only with -DLAMMPS_BIGBIG)
sametag	int	nlocal+nghost	index of next local atom with the same ID in ascending order. -1 signals end.
sortfreq	int	1	frequency of atom sorting. 0 means sorting is off.
nextsort	bigint	1	timestep when atoms are sorted next
q_flag	int	1	deprecated. Use <code>lammps_extract_setting()</code> instead.
atom_style	char *	1	string with the current atom style.
pair_style	char *	1	string with the current pair style.
bond_style	char *	1	string with the current bond style.
angle_style	char *	1	string with the current angle style.
dihedral_style	char *	1	string with the current dihedral style.
improper_style	char *	1	string with the current improper style.
kspace_style	char *	1	string with the current KSpace style.

Unit settings

Name	Type	Length	Description
units	char *	1	string with the current unit style. See units command .
boltz	double	1	value of the “boltz” constant. See units command .
hplanck	double	1	value of the “hplanck” constant. See units command .
mvv2e	double	1	factor to convert $\frac{1}{2}mv^2$ for a particle to the current energy unit; See units command .
ftm2v	double	1	(description missing) See units command .
mv2d	double	1	(description missing) See units command .
nktv2p	double	1	(description missing) See units command .
qqr2e	double	1	factor to convert $\frac{q_i q_j}{r}$ to energy units; See units command .
qe2f	double	1	(description missing) See units command .
vxmu2f	double	1	(description missing) See units command .
xxt2kmu	double	1	(description missing) See units command .
dielectric	double	1	value of the dielectric constant. See dielectric command .
qqr2e	double	1	(description missing) See units command .
e_mass	double	1	(description missing) See units command .
hmmrr2e	double	1	(description missing) See units command .
mvh2r	double	1	(description missing) See units command .
angstrom	double	1	constant to convert current length unit to angstroms; 1.0 for reduced (aka “lj”) units. See units command .
femtosecond	double	1	constant to convert current time unit to femtoseconds; 1.0 for reduced (aka “lj”) units
qelectron	double	1	(description missing) See units command .

Warning

Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures or crashes or bogus simulations. In general it is thus usually better to use a LAMMPS input command that sets or changes these parameters. Those will take care of all side effects and necessary updates of settings derived from such settings. Where possible, a reference to such a command or a relevant section of the manual is given below.

Parameters

- **handle** – pointer to a previously created LAMMPS instance

- **name** – string with the name of the extracted property

Returns

pointer (cast to `void *`) to the location of the requested property. NULL if name is not known.

int **lammmps_extract_pair_dimension**(void *handle, const char *name)

Get data dimension of pair style data accessible via `Pair::extract()`.

Added in version TBD.

This function returns an integer that specified the dimensionality of the data that can be extracted from the current pair style with `Pair::extract()`. Callers of `lammmps_extract_pair()` can use this information to then decide how to cast the `void *` pointer and access the data.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – string with the name of the extracted property

Returns

integer constant encoding the dimensionality of the extractable pair style property or -1 if not found.

void ***lammmps_extract_pair**(void *handle, const char *name)

Get extract pair style data accessible via `Pair::extract()`.

Added in version TBD.

This function returns a pointer to data available from the current pair style with `Pair::extract()`. The dimensionality of the returned pointer can be determined with `lammmps_extract_pair_dimension()`.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – string with the name of the extracted property

Returns

pointer (cast to `void *`) to the location of the requested property. NULL if name is not known.

int **lammmps_map_atom**(void *handle, const void *id)

Map global atom ID to local atom index

Added in version 27June2024.

This function returns an integer that corresponds to the local atom index for an atom with the global atom ID *id*. The atom ID is passed as a void pointer so that it can use the same interface for either a 32-bit or 64-bit tagint. The size of the tagint can be determined using `lammmps_extract_setting()`.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **id** – void pointer to the atom ID (of data type tagint, i.e. 32-bit or 64-bit integer)

Returns

local atom index or -1 if the atom is not found or no map exists

1.1.4 Per-atom properties

This section documents the following functions:

- `lammops_extract_atom_datatype()`
 - `lammops_extract_atom()`
-

int **lammops_extract_atom_datatype**(void *handle, const char *name)

Get data type of a LAMMPS per-atom property

Added in version 18Sep2020.

This function returns an integer that encodes the data type of the per-atom property with the specified name. See `_LMP_DATATYPE_CONST` for valid values. Callers of `lammops_extract_atom()` can use this information to then decide how to cast the void * pointer and access the data.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – string with the name of the extracted property

Returns

integer constant encoding the data type of the property or -1 if not found.

void ***lammops_extract_atom**(void *handle, const char *name)

Get pointer to a LAMMPS per-atom property.

This function returns a pointer to the location of per-atom properties (and per-atom-type properties in the case of the ‘mass’ keyword). Per-atom data is distributed across sub-domains and thus MPI ranks. The returned pointer is cast to void * and needs to be cast to a pointer of data type that the entity represents.

A table with supported keywords is included in the documentation of the `Atom::extract()` function.

Warning

The pointers returned by this function are generally not persistent since per-atom data may be re-distributed, re-allocated, and re-ordered at every re-neighboring operation.

Parameters

- **handle** – pointer to a previously created LAMMPS instance

- **name** – string with the name of the extracted property

Returns

pointer (cast to void *) to the location of the requested data or NULL if not found.

1.1.5 Compute, fixes, variables

This section documents accessing or modifying data stored by computes, fixes, or variables in LAMMPS using the following functions:

- `lammmps_extract_compute()`
- `lammmps_extract_fix()`
- `lammmps_extract_variable_datatype()`
- `lammmps_extract_variable()`
- `lammmps_set_variable()`
- `lammmps_set_string_variable()`
- `lammmps_set_internal_variable()`
- `lammmps_variable_info()`

void ***lammmps_extract_compute**(void *handle, const char *id, int style, int type)

Get pointer to data from a LAMMPS compute.

This function returns a pointer to the location of data provided by a *compute command* instance identified by the compute-ID. Computes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array or they may provide the information about the dimensions of the respective data. Since computes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines to what kind of pointer the returned pointer needs to be cast to access the data correctly. The function returns NULL if the compute ID is not found or the requested data is not available or current. The following table lists the available options.

Style (see <code>_LMP_STYLE_CONST</code>)	Type (see <code>_LMP_TYPE_CONST</code>)	Returned type	Returned data
LMP_STYLE_GLOBAL	LMP_TYPE_SCALAR	double *	Global scalar
LMP_STYLE_GLOBAL	LMP_TYPE_VECTOR	double *	Global vector
LMP_STYLE_GLOBAL	LMP_TYPE_ARRAY	double **	Global array
LMP_STYLE_GLOBAL	LMP_SIZE_VECTOR	int *	Length of global vector
LMP_STYLE_GLOBAL	LMP_SIZE_ROWS	int *	Rows of global array
LMP_STYLE_GLOBAL	LMP_SIZE_COLS	int *	Columns of global array
LMP_STYLE_ATOM	LMP_TYPE_VECTOR	double *	Per-atom value
LMP_STYLE_ATOM	LMP_TYPE_ARRAY	double **	Per-atom vector
LMP_STYLE_ATOM	LMP_SIZE_COLS	int *	Columns in per-atom array, 0 if vector
LMP_STYLE_LOCAL	LMP_TYPE_VECTOR	double *	Local data vector
LMP_STYLE_LOCAL	LMP_TYPE_ARRAY	double **	Local data array
LMP_STYLE_LOCAL	LMP_SIZE_VECTOR	int *	Alias for using LMP_SIZE_ROWS
LMP_STYLE_LOCAL	LMP_SIZE_ROWS	int *	Number of local array rows or length of vector
LMP_STYLE_LOCAL	LMP_SIZE_COLS	int *	Number of local array columns, 0 if vector

Note

If the compute's data is not computed for the current step, the compute will be invoked. LAMMPS cannot easily check at that time, if it is valid to invoke a compute, so it may fail with an error. The caller has to check to avoid such an error.

Warning

The pointers returned by this function are generally not persistent since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation. It is advisable to re-invoke this function before the data is accessed, or make a copy if the data shall be used after other LAMMPS commands have been issued.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **id** – string with ID of the compute
- **style** – constant indicating the style of data requested (global, per-atom, or local)
- **type** – constant indicating type of data (scalar, vector, or array) or size of rows or columns

Returns

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

```
void *lammers_extract_fix(void *handle, const char *id, int style, int type, int nrow, int ncol)
```

Get pointer to data from a LAMMPS fix.

This function returns a pointer to data provided by a *fix command* instance identified by its fix-ID. Fixes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array, or they may provide the information about the dimensions of the respective data. Since individual fixes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines to what kind of pointer the returned pointer needs to be cast to access the data correctly. The function returns NULL if the fix ID is not found or the requested data is not available.

The following table lists the available options.

Style (see <code>_LMP_STYLE_CONST</code>)	Type (see <code>_LMP_TYPE_CONST</code>)	Returned type	Returned data
LMP_STYLE_GLOBAL	LMP_TYPE_SCALAR	double *	Copy of global scalar
LMP_STYLE_GLOBAL	LMP_TYPE_VECTOR	double *	Copy of global vector element at index nrow
LMP_STYLE_GLOBAL	LMP_TYPE_ARRAY	double *	Copy of global array element at nrow, ncol
LMP_STYLE_GLOBAL	LMP_SIZE_VECTOR	int *	Length of global vector
LMP_STYLE_GLOBAL	LMP_SIZE_ROWS	int *	Rows in global array
LMP_STYLE_GLOBAL	LMP_SIZE_COLS	int *	Columns in global array
LMP_STYLE_ATOM	LMP_TYPE_VECTOR	double *	Per-atom value
LMP_STYLE_ATOM	LMP_TYPE_ARRAY	double **	Per-atom vector
LMP_STYLE_ATOM	LMP_SIZE_COLS	int *	Columns of per-atom array, 0 if vector
LMP_STYLE_LOCAL	LMP_TYPE_VECTOR	double *	Local data vector
LMP_STYLE_LOCAL	LMP_TYPE_ARRAY	double **	Local data array
LMP_STYLE_LOCAL	LMP_SIZE_ROWS	int *	Number of local data rows
LMP_STYLE_LOCAL	LMP_SIZE_COLS	int *	Number of local data columns

Note

When requesting global data, the fix data can only be accessed one item at a time without access to the pointer itself. Thus this function will allocate storage for a single double value, copy the returned value to it, and returns a pointer to the location of the copy. Therefore the allocated storage needs to be freed after its use to avoid a memory leak. Example:

```
double *dptr = (double *) lammps_extract_fix(handle, name,
                                             LMP_STYLE_GLOBAL, LMP_TYPE_VECTOR, 0, 0);
double value = *dptr;
lammps_free((void *)dptr);
```

Note

LAMMPS cannot easily check if it is valid to access the data, so it may fail with an error. The caller has to avoid such an error.

Warning

The pointers returned by this function for per-atom or local data are generally not persistent, since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation of the fix. It is thus advisable

to re-invoke this function before the data is accessed, or make a copy, if the data shall be used after other LAMMPS commands have been issued.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **id** – string with ID of the fix
- **style** – constant indicating the style of data requested (global, per-atom, or local)
- **type** – constant indicating type of data (scalar, vector, or array) or size of rows or columns
- **nrow** – row index (only used for global vectors and arrays)
- **ncol** – column index (only used for global arrays)

Returns

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

int **lammers_extract_variable_datatype**(void *handle, const char *name)

Get data type of a LAMMPS variable.

Added in version 3Nov2022.

This function returns an integer that encodes the data type of the variable with the specified name. See [_LMP_VAR_CONST](#) for valid values. Callers of [lammers_extract_variable\(\)](#) can use this information to decide how to cast the `void *` pointer and access the data.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – string with the name of the extracted variable

Returns

integer constant encoding the data type of the property or -1 if not found.

void ***lammers_extract_variable**(void *handle, const char *name, const char *group)

Get pointer to data from a LAMMPS variable.

This function returns a pointer to data from a LAMMPS *variable command* identified by its name. When the variable is either an *equal*-style compatible variable, a *vector*-style variable, or an *atom*-style variable, the variable is evaluated and the corresponding value(s) returned. Variables of style *internal* are compatible with *equal*-style variables and so are *python*-style variables, if they return a numeric value. For other variable styles, their string value is returned. The function returns NULL when a variable of the provided *name* is not found or of an incompatible style. The *group* argument is only used for *atom*-style variables and ignored otherwise, with one exception: for style *vector*, if *group* is “GET_VECTOR_SIZE”, the returned pointer will yield the length of the vector to be returned when dereferenced. This pointer must be deallocated after the value is read to avoid a memory leak. If *group* is set to NULL when extracting data from an *atom*-style variable, the group is assumed to be “all”.

When requesting data from an *equal*-style or compatible variable this function allocates storage for a single double value, copies the returned value to it, and returns a pointer to the location of the copy. Therefore the allocated storage needs to be freed after its use to avoid a memory leak. Example:

```
double *dptr = (double *) lammps_extract_variable(handle, name, NULL);
double value = *dptr;
lammps_free((void *)dptr);
```

For *atom*-style variables, the return value is a pointer to an allocated block of storage of double of the length `atom->nlocal`. Since the data returned are a copy, the location will persist, but its content will not be updated in case the variable is re-evaluated. To avoid a memory leak, this pointer needs to be freed after use in the calling program.

For *vector*-style variables, the returned pointer points to actual LAMMPS data and thus it should **not** be deallocated. Its length depends on the variable, compute, or fix data used to construct the *vector*-style variable. This length can be fetched by calling this function with *group* set to a non-NULL pointer (NULL returns the vector). In that case it will return the vector length as an allocated int pointer cast to a `void *` pointer. That pointer can be recast and dereferenced to an integer yielding the length of the vector. This pointer must be deallocated when finished with it to avoid memory leaks. Example:

```
double *vectvals = (double *) lammps_extract_variable(handle, name, NULL);
int *intptr = (int *) lammps_extract_variable(handle, name, 1);
int vectlen = *intptr;
lammps_free((void *)intptr);
```

For other variable styles the returned pointer needs to be cast to a char pointer and it should **not** be deallocated. Example:

```
const char *cptr = (const char *) lammps_extract_variable(handle, name, NULL);
printf("The value of variable %s is %s\n", name, cptr);
```

Note

LAMMPS cannot easily check if it is valid to access the data referenced by the variables (e.g., computes, fixes, or thermodynamic info), so it may fail with an error. The caller has to make certain that the data is extracted only when it safe to evaluate the variable and thus an error or crash are avoided.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – name of the variable
- **group** – group-ID for atom style variable or NULL

Returns

pointer (cast to `void *`) to the location of the requested data or NULL if not found.

```
int lammps_set_variable(void *handle, const char *name, const char *str)
```

Set the value of a string-style variable.

Deprecated since version 7Feb2024.

This function assigns a new value from the string `str` to the string-style variable *name*. This is a way to directly change the string value of a LAMMPS variable that was previous defined with a *variable name string* command without using any LAMMPS commands to delete and redefine the variable.

Returns -1 if a variable of that name does not exist or if it is not a string-style variable, otherwise 0.

Warning

This function is deprecated and `lammops_set_string_variable()` should be used instead.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – name of the variable
- **str** – new value of the variable

Returns

0 on success or -1 on failure

int **lammops_set_string_variable**(void *handle, const char *name, const char *str)

Set the value of a string-style variable.

Added in version 7Feb2024.

This function assigns a new value from the string `str` to the string-style variable *name*. This is a way to directly change the string value of a LAMMPS variable that was previous defined with a *variable name string* command without using any LAMMPS commands to delete and redefine the variable.

Returns -1 if a variable of that name does not exist or if it is not a string-style variable, otherwise 0.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – name of the variable
- **str** – new value of the variable

Returns

0 on success or -1 on failure

int **lammops_set_internal_variable**(void *handle, const char *name, double value)

Set the value of an internal-style variable.

Added in version 7Feb2024.

This function assigns a new value from the floating point number *value* to the internal-style variable *name*. This is a way to directly change the numerical value of such a LAMMPS variable that was previous defined with a *variable name internal* command without using any LAMMPS commands to delete and redefine the variable.

Returns -1 if a variable of that name does not exist or is not an internal-style variable, otherwise 0.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – name of the variable
- **value** – new value of the variable

Returns

0 on success or -1 on failure

int **lammops_variable_info**(void *handle, int idx, char *buf, int bufsize)

Retrieve informational string for a variable.

Added in version 21Nov2023.

This function copies a string with human readable information about a defined variable: name, style, current value(s) into the provided C-style string buffer. That is the same info as produced by the *info variables* command. The length of the buffer must be provided as *buf_size* argument. If the info exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *.
- **idx** – index of the variable (0 <= idx < nvar)
- **buffer** – string buffer to copy the info to
- **buf_size** – size of the provided string buffer

Returns

1 if successful, otherwise 0

enum LAMMPS_NS::multitype::_LMP_DATATYPE_CONST

Data type constants for extracting data from atoms, computes and fixes

This enum must be kept in sync with the corresponding enum or constants in `python/lammps/constants.py`, `fortran/lammps.f90`, `tools/swig/lammps.i`, `src/library.h`, and `examples/COUPLE/plugin/liblammpsplugin.h`

Values:

enumerator **LAMMPS_NONE**

no data type assigned (yet)

enumerator **LAMMPS_INT**

32-bit integer (array)

enumerator **LAMMPS_INT_2D**

two-dimensional 32-bit integer array

enumerator **LAMMPS_DOUBLE**

64-bit double (array)

enumerator **LAMMPS_DOUBLE_2D**

two-dimensional 64-bit double array

enumerator **LAMMPS_INT64**

64-bit integer (array)

enumerator **LAMMPS_INT64_2D**

two-dimensional 64-bit integer array

enumerator **LAMMPS_STRING**

C-String

enum **_LMP_STYLE_CONST**

Style constants for extracting data from computes and fixes.

Must be kept in sync with the equivalent constants in `python/lammps/constants.py`, `fortran/lammps.f90`, `tools/swig/lammps.i`, and `examples/COUPLE/plugin/liblammpsplugin.h`

Values:

enumerator **LMP_STYLE_GLOBAL**

return global data

enumerator **LMP_STYLE_ATOM**

return per-atom data

enumerator **LMP_STYLE_LOCAL**

return local data

enum **_LMP_TYPE_CONST**

Type and size constants for extracting data from computes and fixes.

Must be kept in sync with the equivalent constants in `python/lammps/constants.py`, `fortran/lammps.f90`, `tools/swig/lammps.i`, and `examples/COUPLE/plugin/liblammpsplugin.h`

Values:

enumerator **LMP_TYPE_SCALAR**

return scalar

enumerator **LMP_TYPE_VECTOR**

return vector

enumerator **LMP_TYPE_ARRAY**

return array

enumerator **LMP_SIZE_VECTOR**

return length of vector

enumerator **LMP_SIZE_ROWS**

return number of rows

enumerator **LMP_SIZE_COLS**

return number of columns

enum **_LMP_VAR_CONST**

Variable style constants for extracting data from variables.

Must be kept in sync with the equivalent constants in `python/lammps/constants.py`, `fortran/lammps.f90`, `tools/swig/lammps.i`, and `examples/COUPLE/plugin/liblammpsplugin.h`

Values:

enumerator **LMP_VAR_EQUAL**

compatible with equal-style variables

enumerator **LMP_VAR_ATOM**

compatible with atom-style variables

enumerator **LMP_VAR_VECTOR**

compatible with vector-style variables

enumerator **LMP_VAR_STRING**

return value will be a string (catch-all)

1.1.6 Scatter/gather operations

This section has functions which gather per-atom data from one or more processors into a contiguous global list ordered by atom ID. The same list is returned to all calling processors. It also contains functions which scatter per-atom data from a contiguous global list across the processors that own those atom IDs. It also has a `create_atoms()` function which can create new atoms by scattering them appropriately to owning processors in the LAMMPS spatial decomposition.

It documents the following functions:

- `lammps_gather_atoms()`
- `lammps_gather_atoms_concat()`
- `lammps_gather_atoms_subset()`
- `lammps_scatter_atoms()`
- `lammps_scatter_atoms_subset()`
- `lammps_gather_bonds()`
- `lammps_gather_angles()`
- `lammps_gather_dihedrals()`

- `lammgs_gather_impropers()`
 - `lammgs_gather()`
 - `lammgs_gather_concat()`
 - `lammgs_gather_subset()`
 - `lammgs_scatter()`
 - `lammgs_scatter_subset()`
 - `lammgs_create_atoms()`
-

void **lammgs_gather_atoms**(void *handle, const char *name, int type, int count, void *data)

Gather the named atom-based entity for all atoms across all processes, in order.

This subroutine gathers data for all atoms and stores them in a one-dimensional array allocated by the user. The data will be ordered by atom ID, which requires consecutive atom IDs (1 to *natoms*). If you need a similar array but have non-consecutive atom IDs, see `lammgs_gather_atoms_concat()`; for a similar array but for a subset of atoms, see `lammgs_gather_atoms_subset()`.

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = *x*[0][0], *x*[0][1], *x*[0][2], *x*[1][0], *x*[1][1], *x*[1][2], *x*[2][0], ...); *data* must be pre-allocated by the caller to length (*count* × *natoms*), as queried by `lammgs_get_natoms()`, `lammgs_extract_global()`, or `lammgs_extract_setting()`.

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined and consecutive.

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance
 - **name** – desired quantity (e.g., *x* or *charge*)
 - **type** – 0 for int values, 1 for double values
 - **count** – number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with *image* if you want a single image flag unpacked into (*x*,*y*,*z*) components.
 - **data** – per-atom values packed in a 1-dimensional array of length *natoms* * *count*.
-

void **lammgs_gather_atoms_concat**(void *handle, const char *name, int type, int count, void *data)

Gather the named atom-based entity for all atoms across all processes, unordered.

This subroutine gathers data for all atoms and stores them in a one-dimensional array allocated by the user. The data will be a concatenation of chunks from each processor's owned atoms, in whatever order the atoms are in on each processor. This process has no requirement that the atom IDs be consecutive. If you need the ID of each

atom, you can do another `lammps_gather_atoms_concat()` call with `name` set to `id`. If you have consecutive IDs and want the data to be in order, use `lammps_gather_atoms()`; for a similar array but for a subset of atoms, use `lammps_gather_atoms_subset()`.

The `data` array will be in groups of `count` values, with `natoms` groups total, but not in order by atom ID (e.g., if `name` is `x` and `count` is 3, then `data` might be something like `x[10][0]`, `x[10][1]`, `x[10][2]`, `x[2][0]`, `x[2][1]`, `x[2][2]`, `x[4][0]`, ...); `data` must be pre-allocated by the caller to length (`count × natoms`), as queried by `lammps_get_natoms()`, `lammps_extract_global()`, or `lammps_extract_setting()`.

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined.

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – desired quantity (e.g., `x` or `charge`)
- **type** – 0 for `int` values, 1 for `double` values
- **count** – number of per-atom values (e.g., 1 for `type` or `charge`, 3 for `x` or `f`); use `count = 3` with “image” if you want single image flags unpacked into `(x,y,z)`
- **data** – per-atom values packed in a 1-dimensional array of length `natoms * count`.

```
void lammps_gather_atoms_subset(void *handle, const char *name, int type, int count, int ndata, int *ids, void
                               *data)
```

Gather the named atom-based entity for a subset of atoms.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional array allocated by the user. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use `lammps_gather_atoms()` or `lammps_gather_atoms_concat()`.

The `data` array will be in groups of `count` values, sorted by atom ID in the same order as the array `ids` (e.g., if `name` is `x`, `count = 3`, and `ids` is {100, 57, 210}, then `data` might look like {`x[100][0]`, `x[100][1]`, `x[100][2]`, `x[57][0]`, `x[57][1]`, `x[57][2]`, `x[210][0]`, ...); `ids` must be provided by the user with length `ndata`, and `data` must be pre-allocated by the caller to length (`count × ndata`).

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance

- **name** – desired quantity (e.g., *x* or *charge*)
- **type** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with “image” if you want single image flags unpacked into (*x,y,z*)
- **ndata** – number of atoms for which to return data (can be all of them)
- **ids** – list of *ndata* atom IDs for which to return data
- **data** – per-atom values packed in a 1-dimensional array of length *ndata* * *count*.

void **lammops_scatter_atoms**(void *handle, const char *name, int type, int count, void *data)

Scatter the named atom-based entities in *data* to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processes. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use [lammops_scatter_atoms_subset\(\)](#) to scatter data for some (or all) atoms, unordered.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = {*x*[0][0], *x*[0][1], *x*[0][2], *x*[1][0], *x*[1][1], *x*[1][2], *x*[2][0], ...}); *data* must be of length (*count* × *natoms*).

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined, must be consecutive, and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – desired quantity (e.g., *x* or *charge*)
- **type** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with *image* if you have a single image flag packed into (*x,y,z*) components.
- **data** – per-atom values packed in a one-dimensional array of length *natoms* * *count*.

void **lammops_scatter_atoms_subset**(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)

Scatter the named atom-based entities in *data* from a subset of atoms to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processes. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array. Use [lammops_scatter_atoms\(\)](#) to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of *count* values, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array {x[1][0], x[1][1], x[1][2], x[100][0], x[100][1], x[100][2], x[57][0], x[57][1], x[57][2]}, then *count* = 3, *ndata* = 3, and *ids* would be {1, 100, 57}.

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – desired quantity (e.g., *x* or *charge*)
- **type** – 0 for *int* values, 1 for *double* values
- **count** – number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with “image” if you have all the image flags packed into (*xyz*)
- **ndata** – number of atoms listed in *ids* and *data* arrays
- **ids** – list of *ndata* atom IDs to scatter data to
- **data** – per-atom values packed in a 1-dimensional array of length *ndata* * *count*.

void **lammops_gather_bonds**(void *handle, void *data)

Gather type and constituent atom info for all bonds

Added in version 28Jul2021.

This function copies the list of all bonds into a buffer provided by the calling code. The buffer will be filled with bond type, bond atom 1, bond atom 2 for each bond. Thus the buffer has to be allocated to the dimension of 3 times the **total** number of bonds times the size of the LAMMPS “tagint” type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling *lammops_extract_setting()* with the keyword “tagint”.

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** bonds in the system.

Below is a brief C code demonstrating accessing this collected bond information.

```
#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
```

(continues on next page)

(continued from previous page)

```

int64_t i, nbonds;
void *handle, *bonds;

handle = lammps_open_no_mpi(0, NULL, NULL);
lammps_file(handle, "in.some_input");

tagintsize = lammps_extract_setting(handle, "tagint");
if (tagintsize == 4)
    nbonds = *(int32_t *)lammps_extract_global(handle, "nbonds");
else
    nbonds = *(int64_t *)lammps_extract_global(handle, "nbonds");
bonds = malloc(nbonds * 3 * tagintsize);

lammps_gather_bonds(handle, bonds);

if (lammps_extract_setting(handle, "world_rank") == 0) {
    if (tagintsize == 4) {
        int32_t *bonds_real = (int32_t *)bonds;
        for (i = 0; i < nbonds; ++i) {
            printf("bond % 4ld: type = %d, atoms: % 4d % 4d\n", i,
                bonds_real[3*i], bonds_real[3*i+1], bonds_real[3*i+2]);
        }
    } else {
        int64_t *bonds_real = (int64_t *)bonds;
        for (i = 0; i < nbonds; ++i) {
            printf("bond % 4ld: type = %ld, atoms: % 4ld % 4ld\n", i,
                bonds_real[3*i], bonds_real[3*i+1], bonds_real[3*i+2]);
        }
    }
}

lammps_close(handle);
lammps_mpi_finalize();
free(bonds);
return 0;
}

```

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **data** – pointer to data to copy the result to

void **lammps_gather_angles**(void *handle, void *data)

Gather type and constituent atom info for all angles

Added in version 8Feb2023.

This function copies the list of all angles into a buffer provided by the calling code. The buffer will be filled with angle type, angle atom 1, angle atom 2, angle atom 3 for each angle. Thus the buffer has to be allocated to the dimension of 4 times the **total** number of angles times the size of the LAMMPS “tagint” type, which

is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling `lammps_extract_setting()` with the keyword “tagint”.

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** angles in the system.

Below is a brief C code demonstrating accessing this collected angle information.

```
#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, nangles;
    void *handle, *angles;

    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.some_input");

    tagintsize = lammps_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        nangles = *(int32_t *)lammps_extract_global(handle, "nangles");
    else
        nangles = *(int64_t *)lammps_extract_global(handle, "nangles");
    angles = malloc(nangles * 4 * tagintsize);

    lammps_gather_angles(handle, angles);

    if (lammps_extract_setting(handle, "world_rank") == 0) {
        if (tagintsize == 4) {
            int32_t *angles_real = (int32_t *)angles;
            for (i = 0; i < nangles; ++i) {
                printf("angle %4ld: type = %d, atoms: %4d %4d %4d\n", i,
                    angles_real[4*i], angles_real[4*i+1], angles_real[4*i+2],
↪ angles_real[4*i+3]);
            }
        } else {
            int64_t *angles_real = (int64_t *)angles;
            for (i = 0; i < nangles; ++i) {
                printf("angle %4ld: type = %ld, atoms: %4ld %4ld %4ld\n", i,
                    angles_real[4*i], angles_real[4*i+1], angles_real[4*i+2],
↪ angles_real[4*i+3]);
            }
        }
    }

    lammps_close(handle);
    lammps_mpi_finalize();
    free(angles);
}
```

(continues on next page)

(continued from previous page)

```

return 0;
}

```

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **data** – pointer to data to copy the result to

void **lammgs_gather_dihedrals**(void *handle, void *data)

Gather type and constituent atom info for all dihedrals

Added in version 8Feb2023.

This function copies the list of all dihedrals into a buffer provided by the calling code. The buffer will be filled with dihedral type, dihedral atom 1, dihedral atom 2, dihedral atom 3, dihedral atom 4 for each dihedral. Thus the buffer has to be allocated to the dimension of 5 times the **total** number of dihedrals times the size of the LAMMPS “tagint” type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling *lammgs_extract_setting()* with the keyword “tagint”.

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** dihedrals in the system.

Below is a brief C code demonstrating accessing this collected dihedral information.

```

#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, ndihedrals;
    void *handle, *dihedrals;

    handle = lammgs_open_no_mpi(0, NULL, NULL);
    lammgs_file(handle, "in.some_input");

    tagintsize = lammgs_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        ndihedrals = *(int32_t *)lammgs_extract_global(handle, "ndihedrals");
    else
        ndihedrals = *(int64_t *)lammgs_extract_global(handle, "ndihedrals");
    dihedrals = malloc(ndihedrals * 5 * tagintsize);

    lammgs_gather_dihedrals(handle, dihedrals);

    if (lammgs_extract_setting(handle, "world_rank") == 0) {

```

                dihedrals_real[5*i], dihedrals_real[5*i+1], dihedrals_
                real[5*i+2], dihedrals_real[5*i+3], dihedrals_real[5*i+4]);
        }
    } else {
        int64_t *dihedrals_real = (int64_t *)dihedrals;
        for (i = 0; i < ndihedrals; ++i) {
            printf("dihedral % 4ld: type = %ld, atoms: % 4ld % 4ld % 4ld %_
                4ld\n", i,
                dihedrals_real[5*i], dihedrals_real[5*i+1], dihedrals_
                real[5*i+2], dihedrals_real[5*i+3], dihedrals_real[5*i+4]);
        }
    }

    lammps_close(handle);
    lammps_mpi_finalize();
    free(dihedrals);
    return 0;
}

```

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **data** – pointer to data to copy the result to

void **lammps_gather_impropers**(void *handle, void *data)

Gather type and constituent atom info for all impropers

Added in version 8Feb2023.

This function copies the list of all impropers into a buffer provided by the calling code. The buffer will be filled with improper type, improper atom 1, improper atom 2, improper atom 3, improper atom 4 for each improper. Thus the buffer has to be allocated to the dimension of 5 times the **total** number of impropers times the size of the LAMMPS “tagint” type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling `lammps_extract_setting()` with the keyword “tagint”.

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** impropers in the system.

Below is a brief C code demonstrating accessing this collected improper information.

```

#include "library.h"

#include <stdint.h>

```

(continues on next page)

(continued from previous page)

```

#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, nimpropers;
    void *handle, *impropers;

    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.some_input");

    tagintsize = lammps_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        nimpropers = *(int32_t *)lammps_extract_global(handle, "nimpropers");
    else
        nimpropers = *(int64_t *)lammps_extract_global(handle, "nimpropers");
    impropers = malloc(nimpropers * 5 * tagintsize);

    lammps_gather_impropers(handle, impropers);

    if (lammps_extract_setting(handle, "world_rank") == 0) {
        if (tagintsize == 4) {
            int32_t *impropers_real = (int32_t *)impropers;
            for (i = 0; i < nimpropers; ++i) {
                printf("improper % 4ld: type = %d, atoms: % 4d % 4d % 4d % 4d\n",
→i,
                    impropers_real[5*i], impropers_real[5*i+1], impropers_
→real[5*i+2], impropers_real[5*i+3], impropers_real[5*i+4]);
            }
        } else {
            int64_t *impropers_real = (int64_t *)impropers;
            for (i = 0; i < nimpropers; ++i) {
                printf("improper % 4ld: type = %ld, atoms: % 4ld % 4ld % 4ld %_
→4ld\n", i,
                    impropers_real[5*i], impropers_real[5*i+1], impropers_
→real[5*i+2], impropers_real[5*i+3], impropers_real[5*i+4]);
            }
        }
    }

    lammps_close(handle);
    lammps_mpi_finalize();
    free(impropers);
    return 0;
}

```

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **data** – pointer to data to copy the result to

void **lammmps_gather**(void *handle, const char *name, int type, int count, void *data)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, in order by atom ID.

This subroutine gathers data from all processes and stores them in a one-dimensional array allocated by the user. The array *data* will be ordered by atom ID, which requires consecutive IDs (1 to *natoms*). If you need a similar array but for non-consecutive atom IDs, see [lammmps_gather_concat\(\)](#); for a similar array but for a subset of atoms, see [lammmps_gather_subset\(\)](#).

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x*, then *data* is {*x*[0][0], *x*[0][1], *x*[0][2], *x*[1][0], *x*[1][1], *x*[1][2], *x*[2][0], ...}); *data* must be pre-allocated by the caller to the correct length (*count* × *natoms*), as queried by [lammmps_get_natoms\(\)](#), [lammmps_extract_global\(\)](#), or [lammmps_extract_setting\(\)](#).

This function will return an error if fix or compute data are requested and the fix or compute ID given does not have per-atom data.

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and must be consecutive.

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **type** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (x,y,z) components.
- **data** – per-atom values packed into a one-dimensional array of length *natoms* * *count*.

void **lammmps_gather_concat**(void *handle, const char *name, int type, int count, void *data)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, unordered.

This subroutine gathers data for all atoms and stores them in a one-dimensional array allocated by the user. The data will be a concatenation of chunks from each processor’s owned atoms, in whatever order the atoms are in on each processor. This process has no requirement that the atom IDs be consecutive. If you need the ID of each atom, you can do another call to either [lammmps_gather_atoms_concat\(\)](#) or [lammmps_gather_concat\(\)](#) with *name* set to *id*. If you have consecutive IDs and want the data to be in order, use [lammmps_gather\(\)](#); for a similar array but for a subset of atoms, use [lammmps_gather_subset\(\)](#).

The *data* array will be in groups of *count* values, with *natoms* groups total, but not in order by atom ID (e.g., if *name* is *x* and *count* is 3, then *data* might be something like {*x*[10][0], *x*[10][1], *x*[10][2], *x*[2][0], *x*[2][1],

`x[2][2], x[4][0], ...});` *data* must be pre-allocated by the caller to length (*count* \times *natoms*), as queried by `lammps_get_natoms()`, `lammps_extract_global()`, or `lammps_extract_setting()`.

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined.

The total number of atoms must be less than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **type** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (*x,y,z*) components.
- **data** – per-atom values packed into a one-dimensional array of length *natoms* * *count*.

void **lammps_gather_subset**(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes for a subset of atoms.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional array allocated by the user. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use `lammps_gather()` or `lammps_gather_concat()`.

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is {100, 57, 210}, then *data* might look like {`x[100][0]`, `x[100][1]`, `x[100][2]`, `x[57][0]`, `x[57][1]`, `x[57][2]`, `x[210][0]`, ...}); *ids* must be provided by the user with length *ndata*, and *data* must be pre-allocated by the caller to length (*count* \times *ndata*).

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)

- **type** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (x,y,z) components.
- **ndata** – number of atoms for which to return data (can be all of them)
- **ids** – list of *ndata* atom IDs for which to return data
- **data** – per-atom values packed into a one-dimensional array of length *ndata* * *count*.

void **lammops_scatter**(void *handle, const char *name, int type, int count, void *data)

Scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entity in *data* to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processes. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use [lammops_scatter_subset\(\)](#) to scatter data for some (or all) atoms, unordered.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = {x[0][0], x[0][1], x[0][2], x[1][0], x[1][1], x[1][2], x[2][0], ...}); *data* must be of length (*count* × *natoms*).

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined, must be consecutive, and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **type** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with *image* if you have a single image flag packed into (x,y,z) components.
- **data** – per-atom values packed in a one-dimensional array of length *natoms* * *count*.

void **lammops_scatter_subset**(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)

Scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities in *data* from a subset of atoms to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processes. The array *data* contains data associated with atom IDs, but there is no requirement that

the IDs be consecutive, as they are provided in a separate array. Use `lammps_scatter()` to scatter data for all atoms, in order.

The `data` array needs to be organized in groups of `count` values, with the groups in the same order as the array `ids`. For example, if you want `data` to be the array `{x[1][0], x[1][1], x[1][2], x[100][0], x[100][1], x[100][2], x[57][0], x[57][1], x[57][2]}`, then `count = 3`, `ndata = 3`, and `ids` would be `{1, 100, 57}`.

Restrictions

This function is not compatible with `-DLAMMPS_BIGBIG`.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **name** – desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with `count = 1`, “d2_name” or “i2_name” for fix property/atom vectors with `count > 1`)
- **type** – 0 for int values, 1 for double values
- **count** – number of per-atom values (e.g., 1 for `type` or `charge`, 3 for `x` or `f`); use `count = 3` with “image” if you want single image flags unpacked into `(x,y,z)`
- **ndata** – number of atoms listed in `ids` and `data` arrays
- **ids** – list of `ndata` atom IDs to scatter data to
- **data** – per-atom values packed in a 1-dimensional array of length `ndata * count`.

```
int lammps_create_atoms(void *handle, int n, const int *id, const int *type, const double *x, const double *v,
                        const int *image, int bexpand)
```

Create N atoms from list of coordinates

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```
int lammps_create_atoms(void *handle, int n, int64_t *id, int *type, double *x,
    →double *v, int64_t *image, int bexpand);
```

This function creates additional atoms from a given list of coordinates and a list of atom types. Additionally the atom-IDs, velocities, and image flags may be provided. If atom-IDs are not provided, they will be automatically created as a sequence following the largest existing atom-ID.

This function is useful to add atoms to a simulation or - in tandem with `lammps_reset_box()` - to restore a previously extracted and saved state of a simulation. Additional properties for the new atoms can then be assigned via the `lammps_scatter_atoms()` `lammps_extract_atom()` functions.

For non-periodic boundaries, atoms will **not** be created that have coordinates outside the box unless it is a shrink-wrap boundary and the `shrinkexceed` flag has been set to a non-zero value. For periodic boundaries atoms will be wrapped back into the simulation cell and its image flags adjusted accordingly, unless explicit image flags are provided.

The function returns the number of atoms created or -1 on failure (e.g., when called before as box has been created).

Coordinates and velocities have to be given in a 1d-array in the order $X(1), Y(1), Z(1), X(2), Y(2), Z(2), \dots, X(N), Y(N), Z(N)$.

Parameters

- **handle** – pointer to a previously created LAMMPS instance
- **n** – number of atoms, N , to be added to the system
- **id** – pointer to N atom IDs; NULL will generate IDs
- **type** – pointer to N atom types (required)
- **x** – pointer to $3N$ doubles with x-,y-,z- positions of the new atoms (required)
- **v** – pointer to $3N$ doubles with x-,y-,z- velocities of the new atoms (set to 0.0 if NULL)
- **image** – pointer to N imageint sets of image flags, or NULL
- **bexpand** – if 1, atoms outside of shrink-wrap boundaries will still be created and not dropped and the box extended

Returns

number of atoms created on success; -1 on failure (no box, no atom IDs, etc.)

1.1.7 Neighbor list access

The following functions enable access to neighbor lists generated by LAMMPS or querying of their properties:

- `lammps_find_compute_neighlist()`
- `lammps_find_fix_neighlist()`
- `lammps_find_pair_neighlist()`
- `lammps_neighlist_num_elements()`
- `lammps_neighlist_element_neighbors()`

int **lammps_find_compute_neighlist**(void *handle, const char *id, int request)

Find index of a neighbor list requested by a compute

The neighbor list request from a compute is identified by the compute ID and the request ID. The request ID is typically 0, but will be

0 in case a compute has multiple neighbor list requests.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *.
- **id** – Identifier of compute instance
- **reqid** – request id to identify neighbor list in case there are multiple requests from the same compute

Returns

return neighbor list index if found, otherwise -1

int **lammops_find_fix_neighlist**(void *handle, const char *id, int request)

Find index of a neighbor list requested by a fix

The neighbor list request from a fix is identified by the fix ID and the request ID. The request ID is typically 0, but will be > 0 in case a fix has multiple neighbor list requests.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *.
- **id** – Identifier of fix instance
- **reqid** – request id to identify neighbor list in case there are multiple requests from the same fix

Returns

return neighbor list index if found, otherwise -1

int **lammops_find_pair_neighlist**(void *handle, const char *style, int exact, int nsub, int request)

Find index of a neighbor list requested by a pair style

This function determines which of the available neighbor lists for pair styles matches the given conditions. It first matches the style name. If exact is 1 the name must match exactly, if exact is 0, a regular expression or sub-string match is done. If the pair style is hybrid or hybrid/overlay the style is matched against the sub styles instead. If a the same pair style is used multiple times as a sub-style, the nsub argument must be > 0 and represents the nth instance of the sub-style (same as for the pair_coeff command, for example). In that case nsub=0 will not produce a match and this function will return -1.

The final condition to be checked is the request ID (reqid). This will normally be 0, but some pair styles request multiple neighbor lists and set the request ID to a value > 0.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *.
- **style** – String used to search for pair style instance
- **exact** – Flag to control whether style should match exactly or only a regular expression / sub-string match is applied.
- **nsub** – match nsub-th hybrid sub-style instance of the same style
- **reqid** – request id to identify neighbor list in case there are multiple requests from the same pair style instance

Returns

return neighbor list index if found, otherwise -1

int **lammops_neighlist_num_elements**(void *handle, int idx)

Return the number of entries in the neighbor list with given index

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *.
- **idx** – neighbor list index

Returns

return number of entries in neighbor list, -1 if idx is not a valid index

void **lammops_neighlist_element_neighbors**(void *handle, int idx, int element, int *iatom, int *numneigh, int **neighbors)

Return atom local index, number of neighbors, and array of neighbor local atom indices of neighbor list entry

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *.
- **idx** – index of this neighbor list in the list of all neighbor lists
- **element** – index of this neighbor list entry
- **iatom** – [out] local atom index (i.e. in the range [0, nlocal + nghost), -1 if invalid idx or element value
- **numneigh** – [out] number of neighbors of atom iatom or 0
- **neighbors** – [out] pointer to array of neighbor atom local indices or NULL

1.1.8 Configuration information

This section documents the following functions:

- *lammops_version()*
- *lammops_get_os_info()*
- *lammops_config_has_mpi_support()*
- *lammops_config_has_gzip_support()*
- *lammops_config_has_png_support()*
- *lammops_config_has_jpeg_support()*
- *lammops_config_has_ffmpeg_support()*
- *lammops_config_has_exceptions()*
- *lammops_config_has_package()*
- *lammops_config_package_count()*
- *lammops_config_package_name()*
- *lammops_config_accelerator()*
- *lammops_has_gpu_device()*
- *lammops_gpu_device_info()*
- *lammops_has_style()*
- *lammops_style_count()*
- *lammops_style_name()*
- *lammops_has_id()*
- *lammops_id_count()*
- *lammops_id_name()*

These library functions can be used to query the LAMMPS library for compile time settings and included packages and styles. This enables programs that use the library interface to determine whether the linked LAMMPS library is compatible with the requirements of the application without crashing during the LAMMPS functions (e.g. due to missing pair styles from packages) or to choose between different options (e.g. whether to use `lj/cut`, `lj/cut/opt`, `lj/cut/omp` or `lj/cut/intel`). Most of the functions can be called directly without first creating a LAMMPS instance. While crashes within LAMMPS may be recovered from by enabling *exceptions*, avoiding them proactively is a safer approach.

Listing 1: Example for using configuration settings functions

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
    void *handle;

    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.missing");
    if (lammps_has_error(handle)) {
        char errmsg[256];
        int errtype;
        errtype = lammps_get_last_error_message(handle, errmsg, 256);
        fprintf(stderr, "LAMMPS failed with error: %s\n", errmsg);
        return 1;
    }
    /* write compressed dump file depending on available of options */
    if (lammps_has_style(handle, "dump", "atom/zstd")) {
        lammps_command(handle, "dump d1 all atom/zstd 100 dump.zst");
    } else if (lammps_has_style(handle, "dump", "atom/gz")) {
        lammps_command(handle, "dump d1 all atom/gz 100 dump.gz");
    } else if (lammps_config_has_gzip_support()) {
        lammps_command(handle, "dump d1 all atom 100 dump.gz");
    } else {
        lammps_command(handle, "dump d1 all atom 100 dump");
    }
    lammps_close(handle);
    return 0;
}
```

int **lammps_version**(void *handle)

Get numerical representation of the LAMMPS version date.

The `lammps_version()` function returns an integer representing the version of the LAMMPS code in the format YYYYMMDD. This can be used to implement backward compatibility in software using the LAMMPS library interface. The specific format guarantees, that this version number is growing with every new LAMMPS release.

Parameters

handle – pointer to a previously created LAMMPS instance

Returns

an integer representing the version data in the format YYYYMMDD

void **lammops_get_os_info**(char *buffer, int buf_size)

Get operating system and architecture information

Added in version 9Oct2020.

The *lammops_get_os_info()* function can be used to retrieve detailed information about the hosting operating system and compiler/runtime.

A suitable buffer for a C-style string has to be provided and its length. The assembled text will be truncated to not overflow this buffer. The string is typically a few hundred bytes long.

Parameters

- **buffer** – string buffer to copy the information to
- **buf_size** – size of the provided string buffer

int **lammops_config_has_mpi_support**()

This function is used to query whether LAMMPS was compiled with a real MPI library or in serial. For the real MPI library it reports the size of the MPI communicator in bytes (4 or 8), which allows to check for compatibility with a hosting code.

Returns

0 when compiled with MPI STUBS, otherwise the MPI_Comm size in bytes

int **lammops_config_has_gzip_support**()

Check if the LAMMPS library supports reading or writing compressed files via a pipe to gzip or similar compression programs

Several LAMMPS commands (e.g., *read_data command*, *write_data command*, *dump styles atom, custom, and xyz*) support reading and writing compressed files via creating a pipe to the **gzip** program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether ```gzip``` or any other supported compression programs themselves are installed and usable.

Returns

1 if yes, otherwise 0

int **lammops_config_has_png_support**()

Check if the LAMMPS library supports writing PNG format images

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the *PNG image file format* is available in the current LAMMPS library.

Returns

1 if yes, otherwise 0

int **lammops_config_has_jpeg_support()**

Check if the LAMMPS library supports writing JPEG format images

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the *JPEG image file format* is available in the current LAMMPS library.

Returns

1 if yes, otherwise 0

int **lammops_config_has_ffmpeg_support()**

Check if the LAMMPS library supports creating movie files via a pipe to ffmpeg

The LAMMPS *dump style movie* supports generating movies from images on-the-fly via creating a pipe to the *ffmpeg* program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether the *ffmpeg* itself is installed and usable.

Returns

1 if yes, otherwise 0

int **lammops_config_has_exceptions()**

Check whether LAMMPS errors will throw C++ exceptions.

Deprecated since version 21Nov2023: LAMMPS has now exceptions always enabled, so this function will now always return 1 and can be removed from applications using the library interface.

In case of an error, LAMMPS will either abort or throw a C++ exception. The latter has to be *enabled at compile time*. This function checks if exceptions were enabled.

When using the library interface with C++ exceptions enabled, the library interface functions will “catch” them and the error status can then be checked by calling *lammops_has_error()* and the most recent error message can be retrieved via *lammops_get_last_error_message()*. This can allow to restart a calculation or delete and recreate the LAMMPS instance when C++ exceptions are enabled. One application of using exceptions this way is the *LAMMPS-GUI*. If C++ exceptions are disabled and an error happens during a call to LAMMPS, the application will terminate.

Returns

1 if yes, otherwise 0

int **lammops_config_has_package**(const char*)

Check whether a specific package has been included in LAMMPS

This function checks whether the LAMMPS library in use includes the specific *LAMMPS package* provided as argument.

Parameters

name – string with the name of the package

Returns

1 if included, 0 if not.

int **lammops_config_package_count**()

Count the number of installed packages in the LAMMPS library.

This function counts how many *LAMMPS packages* are included in the LAMMPS library in use.

Returns

number of packages included

int **lammops_config_package_name**(int, char*, int)

Get the name of a package in the list of installed packages in the LAMMPS library.

This function copies the name of the package with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the package exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1;

Parameters

- **idx** – index of the package in the list of included packages ($0 \leq \text{idx} < \text{package count}$)
- **buffer** – string buffer to copy the name of the package to
- **buf_size** – size of the provided string buffer

Returns

1 if successful, otherwise 0

int **lammops_config_accelerator**(const char*, const char*, const char*)

Check for compile time settings in accelerator packages included in LAMMPS.

This function checks availability of compile time settings of included *accelerator packages* in LAMMPS. Supported packages names are “GPU”, “KOKKOS”, “INTEL”, and “OPENMP”. Supported categories are “api” with possible settings “cuda”, “hip”, “phi”, “pthreads”, “opencl”, “openmp”, and “serial”, and “precision” with possible settings “double”, “mixed”, and “single”. If the combination of package, category, and setting is available, the function returns 1, otherwise 0.

Parameters

- **package** – string with the name of the accelerator package
- **category** – string with the category name of the setting
- **setting** – string with the name of the specific setting

Returns

1 if available, 0 if not.

int **lammops_has_gpu_device**()

Check for presence of a viable GPU package device

Added in version 14May2021.

The *lammops_has_gpu_device()* function checks at runtime if an accelerator device is present that can be used with the *GPU package*. If at least one suitable device is present the function will return 1, otherwise 0.

More detailed information about the available device or devices can be obtained by calling the *lammops_get_gpu_device_info()* function.

Returns

1 if viable device is available, 0 if not.

void **lammops_get_gpu_device_info**(char *buffer, int buf_size)

Get GPU package device information

Added in version 14May2021.

The `lammops_get_gpu_device_info()` function can be used to retrieve detailed information about any accelerator devices that are viable for use with the *GPU package*. It will produce a string that is equivalent to the output of the `nvc_get_device` or `ocl_get_device` or `hip_get_device` tools that are compiled alongside LAMMPS if the GPU package is enabled.

A suitable buffer for a C-style string has to be provided and its length. The assembled text will be truncated to not overflow this buffer. This string can be several kilobytes long, if multiple devices are present.

Parameters

- **buffer** – string buffer to copy the information to
 - **buf_size** – size of the provided string buffer
-

int **lammops_has_style**(void*, const char*, const char*)

Check if a specific style has been included in LAMMPS

This function checks if the LAMMPS library in use includes the specific *style* of a specific *category* provided as an argument. Valid categories are: *atom*, *integrate*, *minimize*, *pair*, *bond*, *angle*, *dihedral*, *improper*, *kspace*, *compute*, *fix*, *region*, *dump*, and *command*.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *
- **category** – category of the style
- **name** – name of the style

Returns

1 if included, 0 if not.

int **lammops_style_count**(void*, const char*)

Count the number of styles of category in the LAMMPS library.

This function counts how many styles in the provided *category* are included in the LAMMPS library in use. Please see `lammops_has_style()` for a list of valid categories.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *
- **category** – category of styles

Returns

number of styles in category

```
int lammops_style_name(void*, const char*, int, char*, int)
```

Look up the name of a style by index in the list of style of a given category in the LAMMPS library.

This function copies the name of the *category* style with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *
- **category** – category of styles
- **idx** – index of the style in the list of *category* styles (0 <= idx < style count)
- **buffer** – string buffer to copy the name of the style to
- **buf_size** – size of the provided string buffer

Returns

1 if successful, otherwise 0

```
int lammops_has_id(void*, const char*, const char*)
```

Check if a specific ID exists in the current LAMMPS instance

Added in version 9Oct2020.

This function checks if the current LAMMPS instance a *category* ID of the given *name* exists. Valid categories are: *compute*, *dump*, *fix*, *group*, *molecule*, *region*, and *variable*.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *
- **category** – category of the id
- **name** – name of the id

Returns

1 if included, 0 if not.

```
int lammops_id_count(void*, const char*)
```

Count the number of IDs of a category.

Added in version 9Oct2020.

This function counts how many IDs in the provided *category* are defined in the current LAMMPS instance. Please see [lammops_has_id\(\)](#) for a list of valid categories.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *
- **category** – category of IDs

Returnsnumber of IDs in category

```
int lammops_id_name(void*, const char*, int, char*, int)
```

Look up the name of an ID by index in the list of IDs of a given category.

Added in version 9Oct2020.

This function copies the name of the *category* ID with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to `void *`.
- **category** – category of IDs
- **idx** – index of the ID in the list of *category* styles ($0 \leq \text{idx} < \text{count}$)
- **buffer** – string buffer to copy the name of the style to
- **buf_size** – size of the provided string buffer

Returns

1 if successful, otherwise 0

1.1.9 Utility functions

To simplify some tasks, the library interface contains these utility functions. They do not directly call the LAMMPS library.

- `lammops_encode_image_flags()`
- `lammops_decode_image_flags()`
- `lammops_set_fix_external_callback()`
- `lammops_fix_external_get_force()`
- `lammops_fix_external_set_energy_global()`
- `lammops_fix_external_set_energy_peratom()`
- `lammops_fix_external_set_virial_global()`
- `lammops_fix_external_set_virial_peratom()`
- `lammops_fix_external_set_vector_length()`
- `lammops_fix_external_set_vector()`
- `lammops_flush_buffers()`
- `lammops_free()`
- `lammops_is_running()`
- `lammops_force_timeout()`

- `lammps_has_error()`
- `lammps_get_last_error_message()`
- `lammps_python_api_version()`

The `lammps_free()` function is a clean-up function to free memory that the library had allocated previously via other function calls. Look for notes in the descriptions of the individual commands where such memory buffers were allocated that require the use of `lammps_free()`.

int **lammps_encode_image_flags**(int ix, int iy, int iz)

Encode three integer image flags into a single imageint.

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```
int64_t lammps_encode_image_flags(int ix, int iy, int iz);
```

This function performs the bit-shift, addition, and bit-wise OR operations necessary to combine the values of three integers representing the image flags in x-, y-, and z-direction. Unless LAMMPS is compiled with `-DLAMMPS_BIGBIG`, those integers are limited 10-bit signed integers [-512, 511]. Otherwise the return type changes from `int` to `int64_t` and the valid range for the individual image flags becomes [-1048576, 1048575], i.e. that of a 21-bit signed integer. There is no check on whether the arguments conform to these requirements.

Parameters

- **ix** – image flag value in x
- **iy** – image flag value in y
- **iz** – image flag value in z

Returns

encoded image flag integer

void **lammps_decode_image_flags**(int image, int *flags)

Decode a single image flag integer into three regular integers

The prototype for this function when compiling with `-DLAMMPS_BIGBIG` is:

```
void lammps_decode_image_flags(int64_t image, int *flags);
```

This function does the reverse operation of `lammps_encode_image_flags()` and takes an image flag integer does the bit-shift and bit-masking operations to decode it and stores the resulting three regular integers into the buffer pointed to by `flags`.

Parameters

- **image** – encoded image flag integer
 - **flags** – pointer to storage where the decoded image flags are stored.
-

void **lammmps_set_fix_external_callback**(void *handle, const char *id, FixExternalFnPtr funcptr, void *ptr)

Set up the callback function for a fix external instance with the given ID.

Fix *external* allows programs that are running LAMMPS through its library interface to modify certain LAMMPS properties on specific timesteps, similar to the way other fixes do.

This function sets the callback function for use with the “pf/callback” mode. The function has to have C language bindings with the prototype:

```
void func(void *ptr, bigint timestep, int nlocal, tagint *ids, double **x, double_  
→ **fexternal);
```

The argument *ptr* to this function will be stored in fix external and the passed as the first argument calling the callback function *func()*. This would usually be a pointer to the active LAMMPS instance, i.e. the same pointer as the *handle* argument. This would be needed to call functions that set the global or per-atom energy or virial contributions from within the callback function.

The callback mechanism is one of the two modes of how forces and can be applied to a simulation with the help of fix external. The alternative is the array mode where you call `lammmps_fix_external_get_force()`.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Changed in version 28Jul2021.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *.
- **id** – fix ID of fix external instance
- **funcptr** – pointer to callback function
- **ptr** – pointer to object in calling code, passed to callback function as first argument

double ****lammmps_fix_external_get_force**(void *handle, const char *id)

Get pointer to the force array storage in a fix external instance with the given ID.

Added in version 28Jul2021.

Fix *external* allows programs that are running LAMMPS through its library interface to add or modify certain LAMMPS properties on specific timesteps, similar to the way other fixes do.

This function provides access to the per-atom force storage in a fix external instance with the given fix-ID to be added to the individual atoms when using the “pf/array” mode. The *fexternal* array can be accessed like other “native” per-atom arrays accessible via the `lammmps_extract_atom()` function. Please note that the array stores holds the forces for *local* atoms for each MPI ranks, in the order determined by the neighbor list build. Because the underlying data structures can change as well as the order of atom as they migrate between MPI processes because of the domain decomposition parallelization, this function should be always called immediately before the forces are going to be set to get an up-to-date pointer. You can use, for example, `lammmps_extract_setting()` to obtain the number of local atoms *nlocal* and then assume the dimensions of the returned force array as `double force[nlocal][3]`.

This is an alternative to the callback mechanism in fix external set up by `lammmps_set_fix_external_callback()`. The main difference is that this mechanism can be used

when forces are pre-computed and the control alternates between LAMMPS and the external code, while the callback mechanism can call the external code to compute the force when the fix is triggered and needs them.

Please see the documentation for [fix external](#) for more information about how to use the fix and how to couple it with an external code.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to `void *`.
- **id** – fix ID of fix external instance

Returns

a pointer to the per-atom force array allocated by the fix

`void lammops_fix_external_set_energy_global(void *handle, const char *id, double eng)`

Set the global energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to [lammops_set_fix_external_callback\(\)](#) and [lammops_fix_external_get_force\(\)](#) to also set the contribution to the global energy from the external code. The value of the *eng* argument will be stored in the fix and applied on the current and all following timesteps until changed by another call to this function. The energy is in energy units as determined by the current *units* settings and is the **total** energy of the contribution. Thus when running in parallel all MPI processes have to call this function with the **same** value and this will be returned as scalar property of the fix external instance when accessed in LAMMPS input commands or from variables.

Please see the documentation for [fix external](#) for more information about how to use the fix and how to couple it with an external code.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to `void *`.
 - **id** – fix ID of fix external instance
 - **eng** – total energy to be added to the global energy
-

`void lammops_fix_external_set_energy_peratom(void *handle, const char *id, double *eng)`

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to [lammops_set_fix_external_callback\(\)](#) to set the per-atom energy contribution due to the fix from the external code as part of the callback function. For this to work, the handle to the LAMMPS object must be passed as the *ptr* argument when registering the callback function.

Please see the documentation for [fix external](#) for more information about how to use the fix and how to couple it with an external code.

Note

This function is fully independent from `lammps_fix_external_set_energy_global()` and will **NOT** add any contributions to the global energy tally and **NOT** check whether the sum of the contributions added here are consistent with the global added energy.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to `void *`.
- **id** – fix ID of fix external instance
- **eng** – pointer to array of length `nlocal` with the energy to be added to the per-atom energy

void `lammps_fix_external_set_virial_global`(void *handle, const char *id, double *virial)

Set the global virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to `lammps_set_fix_external_callback()` and `lammps_fix_external_get_force()` to set the contribution to the global virial from the external code.

The 6 values of the *virial* array will be stored in the fix and applied on the current and all following timesteps until changed by another call to this function. The components of the virial need to be stored in the order: *xx*, *yy*, *zz*, *xy*, *xz*, *yz*. In LAMMPS the virial is stored internally as *stress*volume* in units of *pressure*volume* as determined by the current *units* settings and is the **total** contribution. Thus when running in parallel all MPI processes have to call this function with the **same** value and this will then be added by fix external.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to `void *`.
- **id** – fix ID of fix external instance
- **virial** – the 6 global stress tensor components to be added to the global virial

void `lammps_fix_external_set_virial_peratom`(void *handle, const char *id, double **virial)

Set the per-atom virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to `lammps_set_fix_external_callback()` to set the per-atom virial contribution due to the fix from the external code as part of the callback function. For this to work, the handle to the LAMMPS object must be passed as the *ptr* argument when registering the callback function.

The order and units of the per-atom stress tensor elements are the same as for the global virial. The code in fix external assumes the dimensions of the per-atom virial array is `double virial[nlocal][6]`.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Note

This function is fully independent from `lammops_fix_external_set_virial_global()` and will **NOT** add any contributions to the global virial tally and **NOT** check whether the sum of the contributions added here are consistent with the global added virial.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *
- **id** – fix ID of fix external instance
- **virial** – a list of nlocal entries with the 6 per-atom stress tensor components to be added to the per-atom virial

void **lammops_fix_external_set_vector_length**(void *handle, const char *id, int len)

Set the vector length for a global vector stored with fix external for analysis

Added in version 28Jul2021.

This is a companion function to `lammops_set_fix_external_callback()` and `lammops_fix_external_get_force()` to set the length of a global vector of properties that will be stored with the fix via `lammops_fix_external_set_vector()`.

This function needs to be called **before** a call to `lammops_fix_external_set_vector()` and **before** a run or minimize command. When running in parallel it must be called from **all** MPI processes and with the same length parameter.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void *
- **id** – fix ID of fix external instance
- **len** – length of the global vector to be stored with the fix

void **lammops_fix_external_set_vector**(void *handle, const char *id, int idx, double val)

Store a global vector value for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to `lammops_set_fix_external_callback()` and `lammops_fix_external_get_force()` to set the values of a global vector of properties that will be stored with the fix. And can be accessed from within LAMMPS input commands (e.g., fix ave/time or variables) when used in a vector context.

This function needs to be called **after** a call to `lammops_fix_external_set_vector_length()` and the **before** a run or minimize command. When running in parallel it must be called from **all** MPI processes and with the **same** index and value parameters. The value is assumed to be extensive.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Note

The index in the *idx* parameter is 1-based, i.e. the first element is set with *idx* = 1 and the last element of the vector with *idx* = N, where N is the value of the *len* parameter of the call to *lammops_fix_external_set_vector_length()*.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to `void *`.
- **id** – fix ID of fix external instance
- **idx** – 1-based index of in global vector
- **val** – value to be stored in global vector

`void lammops_flush_buffers(void *ptr)`

Flush output buffers

This function can be used to flush buffered output to be written to screen and logfile pointers to simplify capturing output from LAMMPS library calls.

Parameters

handle – pointer to a previously created LAMMPS instance cast to `void *`.

`void lammops_free(void *ptr)`

Free memory buffer allocated by LAMMPS.

Some of the LAMMPS C library interface functions return data as pointer to a buffer that has been allocated by LAMMPS or the library interface. This function can be used to delete those in order to avoid memory leaks.

Parameters

ptr – pointer to data allocated by LAMMPS

`int lammops_is_running(void *handle)`

Check if LAMMPS is currently inside a run or minimization

This function can be used from signal handlers or multi-threaded applications to determine if the LAMMPS instance is currently active.

Parameters

handle – pointer to a previously created LAMMPS instance cast to `void *`.

Returns

0 if idle or >0 if active

void **lammops_force_timeout**(void *handle)

Force a timeout to stop an ongoing run cleanly.

This function can be used from signal handlers or multi-threaded applications to cleanly terminate an ongoing run.

Parameters

handle – pointer to a previously created LAMMPS instance cast to void *

int **lammops_has_error**(void *handle)

Check if there is a (new) error message available

This function can be used to query if an error inside of LAMMPS has thrown a *C++ exception*.

Note

The *handle* pointer may be NULL for this function, as would be the case when a call to create a LAMMPS instance has failed. Then this function will not check the error status inside the LAMMPS instance, but instead would check the global error buffer of the library interface.

Parameters

handle – pointer to a previously created LAMMPS instance cast to void * or NULL

Returns

0 on no error, 1 on error.

int **lammops_get_last_error_message**(void *handle, char *buffer, int buf_size)

Copy the last error message into the provided buffer

This function can be used to retrieve the error message that was set in the event of an error inside of LAMMPS which resulted in a *C++ exception*. A suitable buffer for a C-style string has to be provided and its length. If the internally stored error message is longer, it will be truncated accordingly. If the buffer is a NULL pointer, then nothing will be copied. The return value of the function corresponds to the kind of error: a “1” indicates an error that occurred on all MPI ranks and is often recoverable, while a “2” indicates an abort that would happen only in a single MPI rank and thus may not be recoverable, as other MPI ranks may be waiting on the failing MPI ranks to send messages.

Note

The *handle* pointer may be NULL for this function, as would be the case when a call to create a LAMMPS instance has failed. Then this function will not check the error buffer inside the LAMMPS instance, but instead would check the global error buffer of the library interface.

The *buffer* pointer may be NULL. This will clear any error status without copying the error message.

Parameters

- **handle** – pointer to a previously created LAMMPS instance cast to void * or NULL.
- **buffer** – string buffer to copy the error message to, may be NULL
- **buf_size** – size of the provided string buffer

Returns

1 when all ranks had the error, 2 on a single rank error.

int `lammops_python_api_version()`

Return API version of embedded Python interpreter

Added in version 3Nov2022.

This function is used by the ML-IAP python code (`mliappy`) to verify the API version of the embedded python interpreter of the PYTHON package. It returns -1 if the PYTHON package is not enabled.

Returns

PYTHON_API_VERSION constant of the python interpreter or -1

1.1.10 Extending the C API

The functionality of the LAMMPS library interface has historically been motivated by the needs of its users. Functions have been added or expanded as they were needed and used. Contributions to the interface are always welcome. However with a refactoring of the library interface and its documentation that started in Spring 2020, there are now a few requirements for including new changes or extensions.

- New functions should be orthogonal to existing ones and not implement functionality that can already be achieved with the existing APIs.
- All changes and additions should be documented with [Doxygen](#) style comments and references to those functions added to the corresponding files in the `doc/src` folder.
- If possible, new unit tests to test those new features should be added.
- New features should also be implemented and documented not just for the C interface, but also the Python and Fortran interfaces.
- All additions should work and be compatible with `-DLAMMPS_BIGBIG`, `-DLAMMPS_SMALLBIG`, `-DLAMMPS_SMALLSMALL` as well as when compiling with and without MPI support.
- The `library.h` file should be kept compatible to C code at a level similar to C89. Its interfaces may not reference any custom data types (e.g. `bigint`, `tagint`, and so on) that are only known inside of LAMMPS; instead `int` and `int64_t` should be used.
- only use C style comments, not C++ style

Please note that these are not **strict** requirements, but the LAMMPS developers very much appreciate, if they are followed and can assist with implementing what is missing. It helps maintaining the code base and keeping it consistent.

1.2 LAMMPS Python APIs

The LAMMPS Python module enables calling the LAMMPS C library API from Python by dynamically loading functions in the LAMMPS shared library through the [Python ctypes module](#). Because of the dynamic loading, it is **required** that LAMMPS is compiled in “*shared*” mode. The Python interface is object-oriented, but otherwise tries to be very similar to the C library API. Three different Python classes to run LAMMPS are available and they build on each other. More information on this is in the [Use Python with LAMMPS](#) section of the manual. Use of the LAMMPS Python module is described in [The lammps Python module](#).

1.3 LAMMPS Fortran API

The LAMMPS Fortran module is a wrapper around calling functions from the LAMMPS C library API. This is done using the ISO_C_BINDING feature in Fortran 2003. The interface is object-oriented but otherwise tries to be very similar to the C library API and the basic Python module.

1.3.1 The LIBLAMMPS Fortran Module

The [LIBLAMMPS](#) module provides an interface to call LAMMPS from Fortran. It is based on the LAMMPS C library interface and requires a fully Fortran 2003-compatible compiler to be compiled. It is designed to be self-contained and not require any support functions written in C, C++, or Fortran other than those in the C library interface and the LAMMPS Fortran module itself.

While C libraries have a defined binary interface (ABI) and can thus be used from multiple compiler versions from different vendors as long as they are compatible with the hosting operating system, the same is not true for Fortran programs. Thus, the LAMMPS Fortran module needs to be compiled alongside the code using it from the source code in `fortran/lammps.f90` and with the same compiler used to build the rest of the Fortran code that interfaces to LAMMPS. When linking, you also need to [link to the LAMMPS library](#). A typical command line for a simple program using the Fortran interface would be:

```
mpifort -o testlib.x lammps.f90 testlib.f90 -L. -llammps
```

Please note that the MPI compiler wrapper is only required when the calling the library *from* an MPI-parallelized program. Otherwise, using the plain Fortran compiler (gfortran, ifort, flang, etc.) will suffice, since there are no direct references to MPI library features, definitions and subroutine calls; MPI communicators are referred to by their integer index representation as required by the Fortran MPI interface. It may be necessary to link to additional libraries, depending on how LAMMPS was configured and whether the LAMMPS library *was compiled as a static or dynamic library*.

If the LAMMPS library itself has been compiled with MPI support, the resulting executable will be able to run LAMMPS in parallel with `mpirun`, `mpiexec`, or equivalent. This may be either on the “world” communicator or a sub-communicator created by the calling Fortran code. If, on the other hand, the LAMMPS library has been compiled **without** MPI support, each LAMMPS instance will run independently using just one processor.

Please also note that the order of the source files matters: the `lammps.f90` file needs to be compiled first, since it provides the [LIBLAMMPS](#) module that would need to be imported by the calling Fortran code in order to use the Fortran interface. A working example can be found together with equivalent examples in C and C++ in the `examples/COUPLE/simple` folder of the LAMMPS distribution.

Fortran compiler compatibility

A fully Fortran 2003 compatible Fortran compiler is required. This means that currently only GNU Fortran 9 and later are compatible and thus the default compilers of Red Hat or CentOS 7 and Ubuntu 18.04 LTS and not compatible. Either newer compilers need to be installed or the Linux updated.

1.3.2 Creating or deleting a LAMMPS object

With the Fortran interface, the creation of a *LAMMPS* instance is included in the constructor for creating the *lammps()* derived type. To import the definition of that type and its type-bound procedures, you need to add a `USE LIBLAMMPS` statement. Internally, it will call either *lammps_open_fortran()* or *lammps_open_no_mpi()* from the C library API to create the class instance. All arguments are optional and *lammps_mpi_init()* will be called automatically if it is needed. Similarly, a possible call to *lammps_mpi_finalize()* is integrated into the *close()* function and triggered with the optional logical argument set to `.TRUE.`. Here is a simple example:

```
PROGRAM testlib
  USE LIBLAMMPS                ! include the LAMMPS library interface
  IMPLICIT NONE
  TYPE(lammps) :: lmp          ! derived type to hold LAMMPS instance
  CHARACTER(LEN=12), PARAMETER :: args(3) = &
    [ CHARACTER(LEN=12) :: 'liblammps', '-log', 'none' ]

  ! create a LAMMPS instance (and initialize MPI)
  lmp = lammps(args)
  ! get and print numerical version code
  PRINT*, 'LAMMPS Version: ', lmp%version()
  ! delete LAMMPS instance (and shutdown MPI)
  CALL lmp%close(.TRUE.)
END PROGRAM testlib
```

It is also possible to pass command line flags from Fortran to C/C++ and thus make the resulting executable behave similarly to the standalone executable (it will ignore the *-in/-i* flag, though). This allows using the command line to configure accelerator and suffix settings, configure screen and logfile output, or to set index style variables from the command line and more. Here is a correspondingly adapted version of the previous example:

```
PROGRAM testlib2
  USE LIBLAMMPS                ! include the LAMMPS library interface
  IMPLICIT NONE
  TYPE(lammps) :: lmp          ! derived type to hold LAMMPS instance
  CHARACTER(LEN=128), ALLOCATABLE :: command_args(:)
  INTEGER :: i, argc

  ! copy command line flags to `command_args`
  argc = COMMAND_ARGUMENT_COUNT()
  ALLOCATE(command_args(0:argc))
  DO i=0, argc
    CALL GET_COMMAND_ARGUMENT(i, command_args(i))
  END DO
```

(continues on next page)

(continued from previous page)

```

! create a LAMMPS instance (and initialize MPI)
lmp = lammps(command_args)
! get and print numerical version code
PRINT*, 'Program name: ', command_args(0)
PRINT*, 'LAMMPS Version: ', lmp%version()
! delete LAMMPS instance (and shuts down MPI)
CALL lmp%close(.TRUE.)
DEALLOCATE(command_args)
END PROGRAM testlib2

```

1.3.3 Executing LAMMPS commands

Once a LAMMPS instance is created, it is possible to “drive” the LAMMPS simulation by telling LAMMPS to read commands from a file or to pass individual or multiple commands from strings or lists of strings. This is done similarly to how it is implemented in the *C library interface*. Before handing off the calls to the C library interface, the corresponding Fortran versions of the calls (*file()*, *command()*, *commands_list()*, and *commands_string()*) have to make copies of the strings passed as arguments so that they can be modified to be compatible with the requirements of strings in C without affecting the original strings. Those copies are automatically deleted after the functions return. Below is a small demonstration of the uses of the different functions.

```

PROGRAM testcmd
  USE LIBLAMMPS
  TYPE(lammps) :: lmp
  CHARACTER(LEN=512) :: cmds
  CHARACTER(LEN=40), ALLOCATABLE :: cmdlist(:)
  CHARACTER(LEN=10) :: trimmed
  INTEGER :: i

  lmp = lammps()
  CALL lmp%file('in.melt')
  CALL lmp%command('variable zpos index 1.0')
  ! define 10 groups of 10 atoms each
  ALLOCATE(cmdlist(10))
  DO i=1, 10
    WRITE(trimmed,'(I10)') 10*i
    WRITE(cmdlist(i),'(A,I1,A,I10,A,A)')      &
      'group g', i-1, ' id ', 10*(i-1)+1, ':', ADJUSTL(trimmed)
  END DO
  CALL lmp%commands_list(cmdlist)
  ! run multiple commands from multi-line string
  cmds = 'clear' // NEW_LINE('A') // &
        'region box block 0 2 0 2 0 2' // NEW_LINE('A') // &
        'create_box 1 box' // NEW_LINE('A') // &
        'create_atoms 1 single 1.0 1.0 ${zpos}'
  CALL lmp%commands_string(cmds)
  CALL lmp%close(.TRUE.)
END PROGRAM testcmd

```

1.3.4 Accessing system properties

The C library interface allows the *extraction of different kinds of information* about the active simulation instance and also—in some cases—to apply modifications to it, and the Fortran interface provides access to the same data using Fortran-style, C-interoperable data types. In some cases, the Fortran library interface makes pointers to internal LAMMPS data structures accessible; when accessing them through the library interfaces, special care is needed to avoid data corruption and crashes. Please see the documentation of the individual type-bound procedures for details.

Below is an example demonstrating some of the possible uses.

```
PROGRAM testprop
  USE LIBLAMMPS
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_double, c_int64_t, c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  TYPE(lammps) :: lmp
  INTEGER(KIND=c_int64_t), POINTER :: natoms, ntimestep, bval
  REAL(KIND=c_double), POINTER :: dt, dval
  INTEGER(KIND=c_int), POINTER :: nfield, typ, ival
  INTEGER(KIND=c_int) :: i
  CHARACTER(LEN=11) :: key
  REAL(KIND=c_double) :: pe, ke

  lmp = lammps()
  CALL lmp%file('in.sysinit')
  natoms = lmp%extract_global('natoms')
  WRITE(OUTPUT_UNIT,'(A,I0,A)') 'Running a simulation with ', natoms, ' atoms'
  WRITE(OUTPUT_UNIT,'(I0,A,I0,A,I0,A)') lmp%extract_setting('nlocal'), &
    ' local and ', lmp%extract_setting('nghost'), ' ghost atoms. ', &
    lmp%extract_setting('ntypes'), ' atom types'

  CALL lmp%command('run 2 post no')

  ntimestep = lmp%last_thermo('step', 0)
  nfield = lmp%last_thermo('num', 0)
  WRITE(OUTPUT_UNIT,'(A,I0,A,I0)') 'Last thermo output on step: ', ntimestep, &
    ', number of fields: ', nfield
  DO i=1, nfield
    key = lmp%last_thermo('keyword',i)
    typ = lmp%last_thermo('type',i)
    IF (typ == lmp%dtype%i32) THEN
      ival = lmp%last_thermo('data',i)
      WRITE(OUTPUT_UNIT,*) key, ': ', ival
    ELSE IF (typ == lmp%dtype%i64) THEN
      bval = lmp%last_thermo('data',i)
      WRITE(OUTPUT_UNIT,*) key, ': ', bval
    ELSE IF (typ == lmp%dtype%r64) THEN
      dval = lmp%last_thermo('data',i)
      WRITE(OUTPUT_UNIT,*) key, ': ', dval
    END IF
  END DO

  dt = lmp%extract_global('dt')
  ntimestep = lmp%extract_global('ntimestep')
  WRITE(OUTPUT_UNIT,'(A,I0,A,F4.1,A)') 'At step: ', ntimestep, &
```

(continues on next page)

(continued from previous page)

```

      ' Changing timestep from', dt, ' to 0.5'
      dt = 0.5_c_double
      CALL lmp%command('run 2 post no')

      WRITE(OUTPUT_UNIT,'(A,I0)') 'At step: ', ntimestep
      pe = lmp%get_thermo('pe')
      ke = lmp%get_thermo('ke')
      WRITE(OUTPUT_UNIT,*) 'PE = ', pe
      WRITE(OUTPUT_UNIT,*) 'KE = ', ke

      CALL lmp%close(.TRUE.)
END PROGRAM testprop

```

1.3.5 The LIBLAMMPS module API

Below are the detailed descriptions of definitions and interfaces of the contents of the [LIBLAMMPS](#) Fortran interface to LAMMPS.

type lammops

Derived type that is the general class of the Fortran interface. It holds a reference to the [LAMMPS](#) class instance to which any of the included calls are forwarded.

Type fields

- % **handle** [*c_ptr*] :: reference to the LAMMPS class
- % **style** [*type(lammops_style)*] :: derived type to access lammops style constants
- % **type** [*type(lammops_type)*] :: derived type to access lammops type constants
- % **dtype** [*type(lammops_dtype)*] :: derived type to access lammops data type constants
- % **close** [*subroutine*] :: [close\(\)](#)
- % **error** [*subroutine*] :: [error\(\)](#)
- % **file** [*subroutine*] :: [file\(\)](#)
- % **command** [*subroutine*] :: [command\(\)](#)
- % **commands_list** [*subroutine*] :: [commands_list\(\)](#)
- % **commands_string** [*subroutine*] :: [commands_string\(\)](#)
- % **get_natoms** [*function*] :: [get_natoms\(\)](#)
- % **get_thermo** [*function*] :: [get_thermo\(\)](#)
- % **last_thermo** [*function*] :: [last_thermo\(\)](#)
- % **extract_box** [*subroutine*] :: [extract_box\(\)](#)
- % **reset_box** [*subroutine*] :: [reset_box\(\)](#)
- % **memory_usage** [*subroutine*] :: [memory_usage\(\)](#)
- % **get_mpi_comm** [*function*] :: [get_mpi_comm\(\)](#)
- % **extract_setting** [*function*] :: [extract_setting\(\)](#)

- % **extract_global** [*function*] :: [extract_global\(\)](#)
- % **map_atom** [*function*] :: [map_atom\(\)](#)
- % **extract_atom** [*function*] :: [extract_atom\(\)](#)
- % **extract_compute** [*function*] :: [extract_compute\(\)](#)
- % **extract_fix** [*function*] :: [extract_fix\(\)](#)
- % **extract_variable** [*function*] :: [extract_variable\(\)](#)
- % **set_variable** [*subroutine*] :: [set_variable\(\)](#)
- % **set_string_variable** [*subroutine*] :: [set_set_string_variable\(\)](#)
- % **set_internal_variable** [*subroutine*] :: [set_internal_variable\(\)](#)
- % **gather_atoms** [*subroutine*] :: [gather_atoms\(\)](#)
- % **gather_atoms_concat** [*subroutine*] :: [gather_atoms_concat\(\)](#)
- % **gather_atoms_subset** [*subroutine*] :: [gather_atoms_subset\(\)](#)
- % **scatter_atoms** [*subroutine*] :: [scatter_atoms\(\)](#)
- % **scatter_atoms_subset** [*subroutine*] :: [scatter_atoms_subset\(\)](#)
- % **gather_bonds** [*subroutine*] :: [gather_bonds\(\)](#)
- % **gather_angles** [*subroutine*] :: [gather_angles\(\)](#)
- % **gather_dihedrals** [*subroutine*] :: [gather_dihedrals\(\)](#)
- % **gather_impropers** [*subroutine*] :: [gather_impropers\(\)](#)
- % **gather** [*subroutine*] :: [gather\(\)](#)
- % **gather_concat** [*subroutine*] :: [gather_concat\(\)](#)
- % **gather_subset** [*subroutine*] :: [gather_subset\(\)](#)
- % **scatter** [*subroutine*] :: [scatter\(\)](#)
- % **scatter_subset** [*subroutine*] :: [scatter_subset\(\)](#)
- % **create_atoms** [*subroutine*] :: [create_atoms\(\)](#)
- % **find_pair_neighlist** [*function*] :: [find_pair_neighlist\(\)](#)
- % **find_fix_neighlist** [*function*] :: [find_fix_neighlist\(\)](#)
- % **find_compute_neighlist** [*function*] :: [find_compute_neighlist\(\)](#)
- % **neighlist_num_elements** [*function*] :: [neighlist_num_elements\(\)](#)
- % **neighlist_element_neighbors** [*subroutine*] :: [neighlist_element_neighbors\(\)](#)
- % **version** [*function*] :: [version\(\)](#)
- % **get_os_info** [*subroutine*] :: [get_os_info\(\)](#)
- % **config_has_mpi_support** [*function*] :: [config_has_mpi_support\(\)](#)
- % **config_has_gzip_support** [*function*] :: [config_has_gzip_support\(\)](#)
- % **config_has_png_support** [*function*] :: [config_has_png_support\(\)](#)
- % **config_has_jpeg_support** [*function*] :: [config_has_jpeg_support\(\)](#)
- % **config_has_ffmpeg_support** [*function*] :: [config_has_ffmpeg_support\(\)](#)

- % **config_has_exceptions** *[function]* :: *config_has_exceptions()*
 - % **config_has_package** *[function]* :: *config_has_package()*
 - % **config_package_count** *[function]* :: *config_package_count()*
 - % **config_package_name** *[function]* :: *config_package_name()*
 - % **installed_packages** *[subroutine]* :: *installed_packages()*
 - % **config_accelerator** *[function]* :: *config_accelerator()*
 - % **has_gpu_device** *[function]* :: *has_gpu_device()*
 - % **get_gpu_device_info** *[subroutine]* :: *get_gpu_device_info()*
 - % **has_style** *[function]* :: *has_style()*

 - % **force_timeout** *[subroutine]* :: *force_timeout()*
 - % **has_error** *[function]* :: *has_error()*
 - % **get_last_error_message** *[subroutine]* :: *get_last_error_message()*
-

function lammps([args][,comm])

This is the constructor for the Fortran class and will forward the arguments to a call to either [lammps_open_fortran\(\)](#) or [lammps_open_no_mpi\(\)](#). If the LAMMPS library has been compiled with MPI support, it will also initialize MPI, if it has not already been initialized before.

The *args* argument with the list of command line parameters is optional and so is the *comm* argument with the MPI communicator. If *comm* is not provided, MPI_COMM_WORLD is assumed. For more details please see the documentation of [lammps_open\(\)](#).

Options

- **args** [*character(len=*)*,*dimension(:)*,*optional*] :: arguments as list of strings
- **comm** [*integer*,*optional*] :: MPI communicator

Call to

[lammps_open_fortran\(\)](#) [lammps_open_no_mpi\(\)](#)

Return

lammps :: an instance of the [lammps](#) derived type

Note

The MPI_F08 module, which defines Fortran 2008 bindings for MPI, is not directly supported by this interface due to the complexities of supporting both the MPI_F08 and MPI modules at the same time. However, you should be able to use the MPI_VAL member of the MPI_comm derived type to access the integer value of the communicator, such as in

```
PROGRAM testmpi
  USE LIBLAMMPS
  USE MPI_F08
  TYPE(lammps) :: lmp
  lmp = lammps(comm=MPI_COMM_SELF%MPI_VAL)
END PROGRAM testmpi
```

type lammps_style

This derived type is there to provide a convenient interface for the style constants used with [extract_compute\(\)](#), [extract_fix\(\)](#), and [extract_variable\(\)](#). Assuming your LAMMPS instance is called *lmp*, these constants will be *lmp%style%global*, *lmp%style%atom*, and *lmp%style%local*. These values are identical to the values described in [_LMP_STYLE_CONST](#) for the C library interface.

Type fields

- **% global** [*integer(c_int)*] :: used to request global data
- **% atom** [*integer(c_int)*] :: used to request per-atom data
- **% local** [*integer(c_int)*] :: used to request local data

type lammps_type

This derived type is there to provide a convenient interface for the type constants used with [extract_compute\(\)](#), [extract_fix\(\)](#), and [extract_variable\(\)](#). Assuming your LAMMPS instance is called *lmp*, these constants will be *lmp%type%scalar*, *lmp%type%vector*, and *lmp%type%array*. These values are identical to the values described in [_LMP_TYPE_CONST](#) for the C library interface.

Type fields

- **% scalar** [*integer(c_int)*] :: used to request scalars

- **% vector** [*integer(c_int)*] :: used to request vectors
- **% array** [*integer(c_int)*] :: used to request arrays (matrices)

Procedures Bound to the `lammps` Derived Type

subroutine `close`(*[finalize]*)

This method will close down the LAMMPS instance through calling `lammps_close()`. If the *finalize* argument is present and has a value of `.TRUE.`, then this subroutine also calls `lammps_kokkos_finalize()` and `lammps_mpi_finalize()`.

Options

finalize [*logical, optional*] :: shut down the MPI environment of the LAMMPS library if `.TRUE.`.

Call to

`lammps_close()` `lammps_mpi_finalize()` `lammps_kokkos_finalize()`

subroutine `error`(*error_type, error_text*)

This method is a wrapper around the `lammps_error()` function and will dispatch an error through the LAMMPS Error class.

Added in version 3Nov2022.

Parameters

- **error_type** [*integer(c_int)*] :: constant to select which Error class function to call
- **error_text** [*character(len=*)*] :: error message

Call to

`lammps_error()`

subroutine `file`(*filename*)

This method will call `lammps_file()` to have LAMMPS read and process commands from a file.

Parameters

filename [*character(len=*)*] :: name of file with LAMMPS commands

Call to

`lammps_file()`

subroutine `command`(*cmd*)

This method will call `lammps_command()` to have LAMMPS execute a single command.

Parameters

cmd [*character(len=*)*] :: single LAMMPS command

Call to

`lammps_command()`

subroutine commands_list(*cmds*)

This method will call `lammps_commands_list()` to have LAMMPS execute a list of input lines.

Parameters

cmd [*character(len=*)*,*dimension(:)*] :: list of LAMMPS input lines

Call to

`lammps_commands_list()`

subroutine commands_string(*str*)

This method will call `lammps_commands_string()` to have LAMMPS execute a block of commands from a string.

Parameters

str [*character(len=*)*] :: LAMMPS input in string

Call to

`lammps_commands_string()`

function get_natoms()

This function will call `lammps_get_natoms()` and return the number of atoms in the system.

Call to

`lammps_get_natoms()`

Return

natoms [*real(c_double)*] :: number of atoms

Note

If you would prefer to get the number of atoms in its native format (i.e., as a 32- or 64-bit integer, depending on how LAMMPS was compiled), this can be extracted with `extract_global()`.

function get_thermo(*name*)

This function will call `lammps_get_thermo()` and return the value of the corresponding thermodynamic keyword.

Added in version 3Nov2022.

Parameters

name [*character(len=*)*] :: string with the name of the thermo keyword

Call to

`lammps_get_thermo()`

Return

value [*real(c_double)*] :: value of the requested thermo property or `0.0_c_double`

function `last_thermo(what, index)`

This function will call `lammops_last_thermo()` and returns either a string or a pointer to a cached copy of LAMMPS last thermodynamic output, depending on the data requested through *what*. Note that *index* uses 1-based indexing to access thermo output columns.

Added in version 15Jun2023.

Note that this function actually does not return a value, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data (with the exception of string data, which are copied and returned as ordinary Fortran strings). Pointers must be of the correct data type to point to said data (typically `INTEGER(c_int)`, `INTEGER(c_int64_t)`, or `REAL(c_double)`). The pointer being associated with LAMMPS data is type-checked at run-time via an overloaded assignment operator. The pointers returned by this function point to temporary, read-only data that may be overwritten at any time, so their target values need to be copied to local storage if they are supposed to persist.

For example,

```
PROGRAM thermo
  USE LIBLAMMPS
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_double, c_int64_t, c_int
  TYPE(lammps) :: lmp
  INTEGER(KIND=c_int64_t), POINTER :: n timestep, bval
  REAL(KIND=c_double), POINTER :: dval
  INTEGER(KIND=c_int), POINTER :: nfield, typ, ival
  INTEGER(KIND=c_int) :: i
  CHARACTER(LEN=11) :: key

  lmp = lammps()
  CALL lmp%file('in.sysinit')

  n timestep = lmp%last_thermo('step', 0)
  nfield = lmp%last_thermo('num', 0)
  PRINT*, 'Last thermo output on step: ', n timestep, ' Number of fields: ', nfield
  DO i=1, nfield
    key = lmp%last_thermo('keyword',i)
    typ = lmp%last_thermo('type',i)
    IF (typ == lmp%dtype%i32) THEN
      ival = lmp%last_thermo('data',i)
      PRINT*, key, ': ', ival
    ELSE IF (typ == lmp%dtype%i64) THEN
      bval = lmp%last_thermo('data',i)
      PRINT*, key, ': ', bval
    ELSE IF (typ == lmp%dtype%r64) THEN
      dval = lmp%last_thermo('data',i)
      PRINT*, key, ': ', dval
    END IF
  END DO
  CALL lmp%close(.TRUE.)
END PROGRAM thermo
```

would extract the last timestep where thermo output was done and the number of columns it printed. Then it loops over the columns to print out column header keywords and the corresponding data.

Note

If `last_thermo()` returns a string, the string must have a length greater than or equal to the length of the string (not including the terminal NULL character) that LAMMPS returns. If the variable's length is too short, the string will be truncated. As usual in Fortran, strings are padded with spaces at the end. If you use an allocatable string, the string **must be allocated** prior to calling this function.

Parameters

- **what** [*character(len=*)*] :: string with the name of the thermo keyword
- **index** [*integer(c_int)*] :: 1-based column index

Call to

`lammps_last_thermo()`

Return

pointer [*polymorphic*] :: pointer to LAMMPS data. The left-hand side of the assignment should be either a string (if expecting string data) or a C-compatible pointer (e.g., `INTEGER(c_int)`, `POINTER :: nlocal`) to the extracted property.

Warning

Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures, crashes, or bogus simulations. In general, it is much better to use a LAMMPS input command that sets or changes these parameters. Using an input command will take care of all side effects and necessary updates of settings derived from such settings.

subroutine extract_box([*boxlo*][, *boxhi*][, *xy*][, *yz*][, *xz*][, *pflags*][, *boxflag*])

This subroutine will call `lammps_extract_box()`. All parameters are optional, though obviously at least one should be present. The parameters *pflags* and *boxflag* are stored in LAMMPS as integers, but should be declared as LOGICAL variables when calling from Fortran.

Added in version 3Nov2022.

Options

- **boxlo** [*real(c_double),dimension(3),optional*] :: vector in which to store lower-bounds of simulation box
- **boxhi** [*real(c_double),dimension(3),optional*] :: vector in which to store upper-bounds of simulation box
- **xy** [*real(c_double),optional*] :: variable in which to store xy tilt factor
- **yz** [*real(c_double),optional*] :: variable in which to store yz tilt factor
- **xz** [*real(c_double),optional*] :: variable in which to store xz tilt factor
- **pflags** [*logical,dimension(3),optional*] :: vector in which to store periodicity flags (.TRUE. means periodic in that dimension)
- **boxflag** [*logical,optional*] :: variable in which to store boolean denoting whether the box will change during a simulation (.TRUE. means box will change)

Call to

`lammps_extract_box()`

Note

Note that a frequent use case of this function is to extract only one or more of the options rather than all seven. For example, assuming “`lmp`” represents a properly-initialized LAMMPS instance, the following code will extract the periodic box settings into the variable “`periodic`”:

```
! code to start up
LOGICAL :: periodic(3)
! code to initialize LAMMPS / run things / etc.
CALL lmp%extract_box(pflags = periodic)
```

subroutine reset_box(*boxlo*, *boxhi*, *xy*, *yz*, *xz*)

This subroutine will call `lammps_reset_box()`. All parameters are required.

Added in version 3Nov2022.

Parameters

- **boxlo** [*real(c_double),dimension(3)*] :: vector of three doubles containing the lower box boundary
- **boxhi** [*real(c_double),dimension(3)*] :: vector of three doubles containing the upper box boundary
- **xy** [*real(c_double)*] :: x-y tilt factor
- **yz** [*real(c_double)*] :: y-z tilt factor
- **xz** [*real(c_double)*] :: x-z tilt factor

Call to

`lammps_reset_box()`

subroutine memory_usage(*meminfo*)

This subroutine will call `lammps_memory_usage()` and store the result in the three-element array *meminfo*.

Added in version 3Nov2022.

Parameters

meminfo [*real(c_double),dimension(3)*] :: vector of three doubles in which to store memory usage data

Call to

`lammps_memory_usage()`

function get_mpi_comm()

This function returns a Fortran representation of the LAMMPS “world” communicator.

Added in version 3Nov2022.

Call to

`lammps_get_mpi_comm()`

Return

comm [*integer*] :: Fortran integer equivalent to the MPI communicator LAMMPS is using

Note

The C library interface currently returns type `int` instead of type `MPI_Fint`, which is the C type corresponding to Fortran `INTEGER` types of the default kind. On most compilers, these are the same anyway, but this interface exchanges values this way to avoid warning messages.

Note

The `MPI_F08` module, which defines Fortran 2008 bindings for MPI, is not directly supported by this function. However, you should be able to convert between the two using the `MPI_VAL` member of the communicator. For example,

```
USE MPI_F08
USE LIBLAMMPS
TYPE(lammps) :: lmp
TYPE(MPI_Comm) :: comm
! ... [commands to set up LAMMPS/etc.]
comm%MPI_VAL = lmp%get_mpi_comm()
```

should assign an `MPI_F08` communicator properly.

function `extract_setting(keyword)`

Query LAMMPS about global settings. See the documentation for the `lammps_extract_setting()` function from the C library.

Added in version 3Nov2022.

Parameters

keyword [*character(len=*)*] :: string containing the name of the thermo keyword

Call to

`lammps_extract_setting()`

Return

setting [*integer(c_int)*] :: value of the queried setting or `-1` if unknown

function `extract_global(name)`

This function calls `lammps_extract_global()` and returns either a string or a pointer to internal global LAMMPS data, depending on the data requested through *name*.

Added in version 3Nov2022.

Note that this function actually does not return a value, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data (with the exception of string data, which are copied and returned as ordinary Fortran strings). Pointers must be of the correct data type to point to said data (typically `INTEGER(c_int)`, `INTEGER(c_int64_t)`, or `REAL(c_double)`) and have compatible kind and rank. The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time via an overloaded assignment operator. The pointers returned by this function are generally persistent; therefore it is not necessary to call the function again unless a *clear command* has been issued, which wipes out and recreates the contents of the `LAMMPS` class.

For example,

```

PROGRAM demo
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int64_t, c_int, c_double
  USE LIBLAMMPS
  TYPE(lammps) :: lmp
  INTEGER(c_int), POINTER :: nlocal => NULL()
  INTEGER(c_int64_t), POINTER :: ntimestep => NULL()
  REAL(c_double), POINTER :: dt => NULL()
  CHARACTER(LEN=10) :: units
  lmp = lammps()
  ! other commands
  nlocal = lmp%extract_global('nlocal')
  ntimestep = lmp%extract_global('ntimestep')
  dt = lmp%extract_global('dt')
  units = lmp%extract_global('units')
  ! more commands
  lmp.close(.TRUE.)
END PROGRAM demo

```

would extract the number of atoms on this processor, the current time step, the size of the current time step, and the units being used into the variables *nlocal*, *ntimestep*, *dt*, and *units*, respectively.

Note

If *extract_global()* returns a string, the string must have a length greater than or equal to the length of the string (not including the terminal NULL character) that LAMMPS returns. If the variable's length is too short, the string will be truncated. As usual in Fortran, strings are padded with spaces at the end. If you use an allocatable string, the string **must be allocated** prior to calling this function, but you can automatically reallocate it to the correct length after the function returns, viz.,

```

PROGRAM test
  USE LIBLAMMPS
  TYPE(lammps) :: lmp
  CHARACTER(LEN=:), ALLOCATABLE :: str
  lmp = lammps()
  CALL lmp%command('units metal')
  ALLOCATE(CHARACTER(LEN=80) :: str)
  str = lmp%extract_global('units')
  str = TRIM(str) ! re-allocates to length len_trim(str) here
  PRINT*, LEN(str), LEN_TRIM(str)
END PROGRAM test

```

will print the number 5 (the length of the word “metal”) twice.

Parameters

name [*character(len=*)*] :: string with the name of the property to extract

Call to

lammps_extract_global()

Return

pointer [*polymorphic*] :: pointer to LAMMPS data. The left-hand side of the assignment should be either a string (if expecting string data) or a C-compatible pointer (e.g., *INTEGER(c_int)*, *POINTER :: nlocal*) to the extracted property. If expecting vector data, the pointer should have dimension “:”.

Warning

Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures, crashes, or bogus simulations. In general, it is much better to use a LAMMPS input command that sets or changes these parameters. Using an input command will take care of all side effects and necessary updates of settings derived from such settings.

function `extract_atom(name)`

This function calls `lammps_extract_atom()` and returns a pointer to LAMMPS data tied to the `Atom` class, depending on the data requested through `name`.

Added in version 3Nov2022.

Note that this function actually does not return a pointer, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data. Pointers must be of the correct type, kind, and rank (e.g., `INTEGER(c_int)`, `DIMENSION(:)` for “type”, “mask”, or “id”; `INTEGER(c_int64_t)`, `DIMENSION(:)` for “id” if LAMMPS was compiled with the `-DLAMMPS_BIGBIG` flag; `REAL(c_double)`, `DIMENSION(:, :)` for “x”, “v”, or “f”; and so forth). The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time.

Parameters

name [*character(len=*)*] :: string with the name of the property to extract

Call to

`lammps_extract_atom()`

Return

pointer [*polymorphic*] :: pointer to LAMMPS data. The left-hand side of the assignment should be a C-interoperable pointer of appropriate kind and rank (e.g., `INTEGER(c_int)`, `POINTER :: mask(:)`) to the extracted property. If expecting vector data, the pointer should have dimension “:”; if expecting matrix data, the pointer should have dimension “:,:”.

Warning

Pointers returned by this function are generally not persistent, as per-atom data may be redistributed, reallocated, and reordered at every re-neighboring operation. It is advisable to re-bind pointers using `extract_atom()` between runs.

Array index order

Two-dimensional arrays returned from `extract_atom()` will be **transposed** from equivalent arrays in C, and they will be indexed from 1 instead of 0. For example, in C,

```
void *lmp;
double **x;
/* more code to setup, etc. */
x = lammps_extract_atom(lmp, "x");
printf("%f\n", x[5][1]);
```

will print the y-coordinate of the sixth atom on this processor. Conversely,

```

TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:, :), POINTER :: x => NULL()
! more code to setup, etc.
x = lmp%extract_atom("x")
PRINT '(f0.6)', x(2,6)

```

will print the y-coordinate of the sixth atom on this processor (note the transposition of the two indices). This is not a choice, but rather a consequence of the different conventions adopted by the Fortran and C standards decades ago: in C, the block of data

```
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16
```

interpreted as a 4×4 matrix would be

$$\begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \\ 13 & 14 & 15 & 16 \end{bmatrix},$$

that is, in row-major order. In Fortran, the same block of data is interpreted in column-major order, namely,

$$\begin{bmatrix} 1 & 5 & 9 & 13 \\ 2 & 6 & 10 & 14 \\ 3 & 7 & 11 & 15 \\ 4 & 8 & 12 & 16 \end{bmatrix}.$$

This difference in interpretation of the same block of data by the two languages means, in effect, that matrices from C or C++ will be transposed when interpreted in Fortran.

Note

If you would like the indices to start at 0 instead of 1 (which follows typical notation in C and C++, but not Fortran), you can create another pointer and associate it thus:

```

REAL(c_double), DIMENSION(:, :), POINTER :: x, x0
x = lmp%extract_atom("x")
x0(0:,0:) => x

```

The above would cause the dimensions of x to be (1:3, 1:nmax) and those of $x0$ to be (0:2, 0:nmax-1).

function `extract_compute(id, style, type)`

This function calls `lammps_extract_compute()` and returns a pointer to LAMMPS data tied to the `Compute` class, specifically data provided by the compute identified by `id`. Computes may provide global, per-atom, or local data, and those data may be a scalar, a vector, or an array. Since computes may provide multiple kinds of data, the user is required to specify which set of data is to be returned through the `style` and `type` variables.

Added in version 3Nov2022.

Note that this function actually does not return a value, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data. Pointers must be of the correct data type to point to said data (i.e., `REAL(c_double)`) and have compatible rank. The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time via an overloaded assignment operator.

For example,

```

TYPE(lammops) :: lmp
REAL(c_double), DIMENSION(:), POINTER :: COM
! code to setup, create atoms, etc.
CALL lmp%command('compute COM all com')
COM = lmp%extract_compute('COM', lmp%style%global, lmp%style%type)

```

will bind the variable *COM* to the center of mass of the atoms created in your simulation. The vector in this case has length 3; the length (or, in the case of array data, the number of rows and columns) is determined for you based on data from the Compute class.

Array index order

Two-dimensional arrays returned from `extract_compute()` will be **transposed** from equivalent arrays in C, and they will be indexed from 1 instead of 0. See the note at `extract_atom()` for further details.

The following combinations are possible (assuming `lmp` is the name of your LAMMPS instance):

Style	Type	Type to assign to	Returned data
<code>lmp%style%global</code>	<code>lmp%type%scalar</code>	<code>REAL(c_double), POINTER</code>	Global scalar
<code>lmp%style%global</code>	<code>lmp%type%vector</code>	<code>REAL(c_double), DIMENSION(:), POINTER</code>	Global vector
<code>lmp%style%global</code>	<code>lmp%type%array</code>	<code>REAL(c_double), DIMENSION(:,:), POINTER</code>	Global array
<code>lmp%style%atom</code>	<code>lmp%type%vector</code>	<code>REAL(c_double), DIMENSION(:), POINTER</code>	Per-atom vector
<code>lmp%style%atom</code>	<code>lmp%type%array</code>	<code>REAL(c_double), DIMENSION(:,:), POINTER</code>	Per-atom array
<code>lmp%style%local</code>	<code>lmp%type%vector</code>	<code>REAL(c_double), DIMENSION(:), POINTER</code>	Local vector
<code>lmp%style%local</code>	<code>lmp%type%array</code>	<code>REAL(c_double), DIMENSION(:,:), POINTER</code>	Local array

Parameters

- **id** [*character(len=*)*] :: compute ID from which to extract data
- **style** [*integer(c_int)*] :: value indicating the style of data to extract (global, per-atom, or local)
- **type** [*integer(c_int)*] :: value indicating the type of data to extract (scalar, vector, or array)

Call to

`lammops_extract_compute()`

Return

pointer [*polymorphic*] :: pointer to LAMMPS data. The left-hand side of the assignment should be a C-compatible pointer (e.g., `REAL(c_double), POINTER :: x`) to the extracted property. If expecting vector data, the pointer should have dimension “:”; if expecting array (matrix) data, the pointer should have dimension “:,:”.

Note

If the compute's data are not already computed for the current step, the compute will be invoked. LAMMPS cannot easily check at that time if it is valid to invoke a compute, so it may fail with an error. The caller has to check to avoid such an error.

Warning

The pointers returned by this function are generally not persistent, since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation. It is advisable to re-invoke this function before the data are accessed or make a copy if the data are to be used after other LAMMPS commands have been issued. Do **not** modify the data returned by this function.

function `extract_fix(id, style, type[, nrow][, ncol])`

This function calls `lammps_extract_fix()` and returns a pointer to LAMMPS data tied to the `Fix` class, specifically data provided by the fix identified by `id`. Fixes may provide global, per-atom, or local data, and those data may be a scalar, a vector, or an array. Since many fixes provide multiple kinds of data, the user is required to specify which set of data is to be returned through the `style` and `type` variables.

Added in version 3Nov2022.

Global data are calculated at the time they are requested and are only available element-by-element. As such, the user is expected to provide the `nrow` variable to specify which element of a global vector or the `nrow` and `ncol` variables to specify which element of a global array the user wishes LAMMPS to return. The `ncol` variable is optional for global scalar or vector data, and both `nrow` and `ncol` are optional when a global scalar is requested, as well as when per-atom or local data are requested. The following combinations are possible (assuming `lmp` is the name of your LAMMPS instance):

Style	Type	nrow	ncol	Type to assign to	Returned data
<code>lmp%style%gl</code>	<code>lmp%type%sc</code>	Ig-nored	Ig-nored	<code>REAL(c_double)</code>	Global scalar
<code>lmp%style%gl</code>	<code>lmp%type%vec</code>	Re-quired	Ig-nored	<code>REAL(c_double)</code>	Element of global vector
<code>lmp%style%gl</code>	<code>lmp%type%arr</code>	Re-quired	Re-quired	<code>REAL(c_double)</code>	Element of global array
<code>lmp%style%at</code>	<code>lmp%type%sc</code>				(not allowed)
<code>lmp%style%at</code>	<code>lmp%type%vec</code>	Ig-nored	Ig-nored	<code>REAL(c_double)</code> , <code>DIMENSION(:)</code> , <code>POINTER</code>	Per-atom vector
<code>lmp%style%at</code>	<code>lmp%type%arr</code>	Ig-nored	Ig-nored	<code>REAL(c_double)</code> , <code>DIMENSION(:, :)</code> , <code>POINTER</code>	Per-atom array
<code>lmp%style%lo</code>	<code>lmp%type%sc</code>				(not allowed)
<code>lmp%style%lo</code>	<code>lmp%type%vec</code>	Ig-nored	Ig-nored	<code>REAL(c_double)</code> , <code>DIMENSION(:)</code> , <code>POINTER</code>	Per-atom vector
<code>lmp%style%lo</code>	<code>lmp%type%arr</code>	Ig-nored	Ig-nored	<code>REAL(c_double)</code> , <code>DIMENSION(:, :)</code> , <code>POINTER</code>	Per-atom array

In the case of global data, this function returns a value of type `REAL(c_double)`. For per-atom or local data, this function does not return a value but instead associates the pointer on the left side of the assignment to point to internal LAMMPS data. Pointers must be of the correct type and kind to point to said data (i.e., `REAL(c_double)`)

and have compatible rank. The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time via an overloaded assignment operator.

For example,

```
TYPE(lammps) :: lmp
REAL(c_double) :: dr, dx, dy, dz
! more code to set up, etc.
lmp%command('fix george all recenter 2 2 2')
! more code
dr = lmp%extract_fix("george", lmp%style%global, lmp%style%scalar)
dx = lmp%extract_fix("george", lmp%style%global, lmp%style%vector, 1)
dy = lmp%extract_fix("george", lmp%style%global, lmp%style%vector, 2)
dz = lmp%extract_fix("george", lmp%style%global, lmp%style%vector, 3)
```

will extract the global scalar calculated by *fix recenter* into the variable *dr* and the three elements of the global vector calculated by *fix recenter* into the variables *dx*, *dy*, and *dz*, respectively.

If asked for per-atom or local data, *extract_fix()* returns a pointer to actual LAMMPS data. The pointer returned will have the appropriate size to match the internal data, and will be type/kind/rank-checked at the time of the assignment. For example,

```
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:), POINTER :: r
! more code to set up, etc.
lmp%command('fix state all store/state 0 x y z')
! more code
r = lmp%extract_fix('state', lmp%style%atom, lmp%type%array)
```

will bind the pointer *r* to internal LAMMPS data representing the per-atom array computed by *fix store/state* when three inputs are specified. Similarly,

```
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:), POINTER :: x
! more code to set up, etc.
lmp%command('fix state all store/state 0 x')
! more code
x = lmp%extract_fix('state', lmp%style%atom, lmp%type%vector)
```

will associate the pointer *x* with internal LAMMPS data corresponding to the per-atom vector computed by *fix store/state* when only one input is specified. Similar examples with *lmp%style%atom* replaced by *lmp%style%local* will extract local data from fixes that define local vectors and/or arrays.

Warning

The pointers returned by this function for per-atom or local data are generally not persistent, since the computed data may be redistributed, reallocated, and reordered at every invocation of the fix. It is thus advisable to re-invoke this function before the data are accessed or to make a copy if the data are to be used after other LAMMPS commands have been issued.

Note

LAMMPS cannot easily check if it is valid to access the data, so it may fail with an error. The caller has to

avoid such an error.

Parameters

- **id** [*character(len=*)*] :: string with the name of the fix from which to extract data
- **style** [*integer(c_int)*] :: value indicating the style of data to extract (global, per-atom, or local)
- **type** [*integer(c_int)*] :: value indicating the type of data to extract (scalar, vector, or array)
- **nrow** [*integer(c_int)*] :: row index (used only for global vectors and arrays)
- **ncol** [*integer(c_int)*] :: column index (only used for global arrays)

Call to

`lammps_extract_fix()`

Return

data [*polymorphic*] :: LAMMPS data (for global data) or a pointer to LAMMPS data (for per-atom or local data). The left-hand side of the assignment should be of type `REAL(c_double)` and have appropriate rank (i.e., `DIMENSION(:)` if expecting per-atom or local vector data and `DIMENSION(:, :)` if expecting per-atom or local array data). If expecting local or per-atom data, it should have the `POINTER` attribute, but if expecting global data, it should be an ordinary (non-`POINTER`) variable.

Array index order

Two-dimensional global, per-atom, or local array data from `extract_fix()` will be **transposed** from equivalent arrays in C (or in the ordinary LAMMPS interface accessed through thermodynamic output), and they will be indexed from 1, not 0. This is true even for global data, which are returned as scalars—this is done primarily so the interface is consistent, as there is no choice but to transpose the indices for per-atom or local array data. See the similar note under `extract_atom()` for further details.

function `extract_variable(name[, group])`

This function calls `lammps_extract_variable()` and returns a scalar, vector, or string containing the value of the variable identified by *name*. When the variable is an *equal*-style variable (or one compatible with that style such as *internal*), the variable is evaluated and the corresponding value returned. When the variable is an *atom*-style variable, the variable is evaluated and a vector of values is returned. With all other variables, a string is returned. The *group* argument is only used for *atom* style variables and is ignored otherwise. If *group* is absent for *atom*-style variables, the group is assumed to be “all”.

Added in version 3Nov2022.

This function returns the values of the variables, not pointers to them. Vectors pointing to *atom*-style variables should be of type `REAL(c_double)`, be of rank 1 (i.e., `DIMENSION(:)`), and have the `ALLOCATABLE` attribute.

Note

Unlike the C library interface, the Fortran interface does not require you to deallocate memory when you are through; this is done for you, behind the scenes.

For example,

```
TYPE(lammps) :: lmp
REAL(c_double) :: area
! more code to set up, etc.
lmp%command('variable A equal lx*ly')
! more code
area = lmp%extract_variable("A")
```

will extract the x - y cross-sectional area of the simulation into the variable *area*.

Parameters

name [*character(len=*)*] :: variable name to evaluate

Options

group [*character(len=*)*,*optional*] :: group for which to extract per-atom data (if absent, use "all")

Call to

lammps_extract_variable()

Return

data [*polymorphic*] :: scalar of type REAL(c_double) (for *equal*-style variables and others that are *equal*-compatible), vector of type REAL(c_double), DIMENSION(:), ALLOCATABLE for *atom*- or *vector*-style variables, or CHARACTER(LEN=*) for *string*-style and compatible variables. Strings whose length is too short to hold the result will be truncated. Allocatable strings must be allocated before this function is called; see note at [extract_global\(\)](#) regarding allocatable strings. Allocatable arrays (for *atom*- and *vector*-style data) will be reallocated on assignment.

Note

LAMMPS cannot easily check if it is valid to access the data referenced by the variables (e.g., computes, fixes, or thermodynamic info), so it may fail with an error. The caller has to make certain that the data are extracted only when it is safe to evaluate the variable and thus an error and crash are avoided.

subroutine set_variable(name, str)

Set the value of a string-style variable.

Deprecated since version 7Feb2024.

This function assigns a new value from the string *str* to the string-style variable *name*. If *name* does not exist or is not a string-style variable, an error is generated.

Warning

This subroutine is deprecated and [set_string_variable\(\)](#) should be used instead.

Parameters

- **name** [*character(len=*)*] :: name of the variable
- **str** [*character(len=*)*] :: new value to assign to the variable

Call to

lammps_set_variable()

subroutine set_string_variable(*name*, *str*)

Set the value of a string-style variable.

Added in version 7Feb2024.

This function assigns a new value from the string *str* to the string-style variable *name*. If *name* does not exist or is not a string-style variable, an error is generated.

Parameters

- **name** [*character(len=*)*] :: name of the variable
- **str** [*character(len=*)*] :: new value to assign to the variable

Call to

`lammops_set_string_variable()`

subroutine set_internal_variable(*name*, *val*)

Set the value of an internal-style variable.

Added in version 7Feb2024.

This function assigns a new value from the floating-point number *val* to the internal-style variable *name*. If *name* does not exist or is not an internal-style variable, an error is generated.

Parameters

- **name** [*character(len=*)*] :: name of the variable
- **val** [*read(c_double)*] :: new value to assign to the variable

Call to

`lammops_set_internal_variable()`

subroutine gather_atoms(*name*, *count*, *data*)

This function calls `lammops_gather_atoms()` to gather the named atom-based entity for all atoms on all processors and return it in the vector *data*. The vector *data* will be ordered by atom ID, which requires consecutive atom IDs (1 to *natoms*).

Added in version 3Nov2022.

If you need a similar array but have non-consecutive atom IDs, see `gather_atoms_concat()`; for a similar array but for a subset of atoms, see `gather_atoms_subset()`.

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,2), *x*(2,2), *x*(3,2), *x*(1,3), ...]); *data* must be ALLOCATABLE and will be allocated to length (*count* × *natoms*), as queried by `get_natoms()`.

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., *x* or *mask*)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x/y/z* components.

- **data** [*polymorphic,dimension(:),allocatable*] :: array into which to store the data. Array *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type INTEGER(c_int) if expecting integer data and REAL(c_double) if expecting floating-point data.

Call to

`lammers_gather_atoms()`

Note

If you want data from this function to be accessible as a two-dimensional array, you can declare a rank-2 pointer and reassign it, like so:

```
USE, INTRINSIC :: ISO_C_BINDING
USE LIBLAMMPS
TYPE(lammers) :: lmp
REAL(c_double), DIMENSION(:), ALLOCATABLE, TARGET :: xdata
REAL(c_double), DIMENSION(:, :), POINTER :: x
! other code to set up, etc.
CALL lmp%gather_atoms('x',3,xdata)
x(1:3,1:size(xdata)/3) => xdata
```

You can then access the y-component of atom 3 with `x(2,3)`. See the note about array index order at [extract_atom\(\)](#).

subroutine `gather_atoms_concat(name, count, data)`

This function calls `lammers_gather_atoms_concat()` to gather the named atom-based entity for all atoms on all processors and return it in the vector *data*.

Added in version 3Nov2022.

The vector *data* will not be ordered by atom ID, and there is no restriction on the IDs being consecutive. If you need the IDs, you can do another `gather_atoms_concat()` with *name* set to `id`.

If you need a similar array but have consecutive atom IDs, see `gather_atoms()`; for a similar array but for a subset of atoms, see `gather_atoms_subset()`.

This function is not compatible with `-DLAMMPS_BIGBIG`.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., *x* or *mask*)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x/y/z* components.
- **data** [*polymorphic,dimension(:),allocatable*] :: array into which to store the data. Array *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type INTEGER(c_int) if expecting integer data and REAL(c_double) if expecting floating-point data.

Call to

`lammers_gather_atoms_concat()`

subroutine gather_atoms_subset(*name, count, ids, data*)

This function calls `lammps_gather_atoms_subset()` to gather the named atom-based entity for the atoms in the array *ids* from all processors and return it in the vector *data*.

Added in version 3Nov2022.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional allocatable array. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use `gather_atoms()` or `gather_atoms_concat()`.

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is [100, 57, 210], then *data* might look like [x(1,100), x(2,100), x(3,100), x(1,57), x(2,57), x(3,57), x(1,210), ...]; *ids* must be provided by the user, and *data* must be of rank 1 (i.e., DIMENSION(:)) and have the ALLOCATABLE attribute.

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., *x* or *mask*)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x/y/z* components.
- **ids** [*integer(c_int),dimension(:)*] :: atom IDs corresponding to the atoms to be gathered
- **data** [*polymorphic,dimension(:),allocatable*] :: array into which to store the data. Array *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type INTEGER(*c_int*) if expecting integer data and REAL(*c_double*) if expecting floating-point data.

Call to

`lammps_gather_atoms_subset()`

subroutine scatter_atoms(*name, data*)

This function calls `lammps_scatter_atoms()` to scatter the named atom-based entities in *data* to all processors.

Added in version 3Nov2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processors. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use `scatter_atoms_subset()` to scatter data for some (or all) atoms, in any order.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = [x(1,1), x(2,1), x(3,1), x(1,2), x(2,2), x(3,2), x(1,3), ...]); *data* must be of length *natoms* or 3**natoms*.

Parameters

- **name** [*character(len=*)*] :: quantity to be scattered (e.g., *x* or *charge*)
- **data** [*polymorphic,dimension(:)*] :: per-atom values packed in a one-dimensional array containing the data to be scattered. This array must have length *natoms* (e.g., for *type* or *charge*) or length *natoms* × 3 (e.g., for *x* or *f*). The array *data* must be rank 1 (i.e., DIMENSION(:)) and be of type INTEGER(*c_int*) (e.g., for *mask* or *type*) or of type REAL(*c_double*) (e.g., for *x* or *charge* or *f*).

Call to`lammops_scatter_atoms()`

subroutine scatter_atoms_subset(*name, ids, data*)

This function calls `lammops_scatter_atoms_subset()` to scatter the named atom-based entities in *data* to all processors.

Added in version 3Nov2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processors. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array, *ids*. Use `scatter_atoms()` to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of 1 or 3 values, depending on which quantity is being scattered, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array $[x(1,1), x(2,1), x(3,1), x(1,100), x(2,100), x(3,100), x(1,57), x(2,57), x(3,57)]$, then *ids* would be $[1, 100, 57]$ and *name* would be *x*.

Parameters

- **name** [*character(len=*)*] :: quantity to be scattered (e.g., *x* or *charge*)
- **ids** [*integer(c_int), dimension(:)*] :: atom IDs corresponding to the atoms being scattered
- **data** [*polymorphic, dimension(:)*] :: per-atom values packed into a one-dimensional array containing the data to be scattered. This array must have either the same length as *ids* (for *mask*, *type*, etc.) or three times its length (for *x*, *f*, etc.); the array must be rank 1 and be of type `INTEGER(c_int)` (e.g., for *mask* or *type*) or of type `REAL(c_double)` (e.g., for *charge*, *x*, or *f*).

Call to`lammops_scatter_atoms_subset()`

subroutine gather_bonds(*data*)

Gather type and constituent atom information for all bonds.

Added in version 3Nov2022.

This function copies the list of all bonds into an allocatable array. The array will be filled with (bond type, bond atom 1, bond atom 2) for each bond. The array is allocated to the right length (i.e., three times the number of bonds). The array *data* must be of the same type as the LAMMPS `tagint` type, which is equivalent to either `INTEGER(c_int)` or `INTEGER(c_int64_t)`, depending on whether `-DLAMMPS_BIGBIG` was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM bonds
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  USE LIBLAMMPS
  IMPLICIT NONE
  INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: bonds
  INTEGER(c_int), DIMENSION(:,:), POINTER :: bonds_array
  TYPE(lammps) :: lmp
  INTEGER :: i
```

(continues on next page)

(continued from previous page)

```

! other commands to initialize LAMMPS, create bonds, etc.
CALL lmp%gather_bonds(bonds)
bonds_array(1:3, 1:SIZE(bonds)/3) => bonds
DO i = 1, SIZE(bonds)/3
  WRITE(OUTPUT_UNIT, '(A,1X,I4,A,I4,1X,I4)') 'bond', bonds_array(1,i), &
    '; type = ', bonds_array(2,i), bonds_array(3,i)
END DO
END PROGRAM bonds

```

Parameters

data [*integer(kind=*)*,*allocatable*] :: array into which to copy the result. *The KIND parameter is either `c_int` or, if LAMMPS was compiled with `-DLAMMPS_BIGBIG`, kind `c_int64_t`.

Call to

`lammps_gather_bonds()`

subroutine gather_angles(data)

Gather type and constituent atom information for all angles.

Added in version 8Feb2023.

This function copies the list of all angles into an allocatable array. The array will be filled with (angle type, angle atom 1, angle atom 2, angle atom 3) for each angle. The array is allocated to the right length (i.e., four times the number of angles). The array *data* must be of the same type as the LAMMPS `tagint` type, which is equivalent to either `INTEGER(c_int)` or `INTEGER(c_int64_t)`, depending on whether `-DLAMMPS_BIGBIG` was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```

PROGRAM angles
USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
USE LIBLAMMPS
IMPLICIT NONE
INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: angles
INTEGER(c_int), DIMENSION(:,:), POINTER :: angles_array
TYPE(lammps) :: lmp
INTEGER :: i
! other commands to initialize LAMMPS, create angles, etc.
CALL lmp%gather_angles(angles)
angles_array(1:4, 1:SIZE(angles)/4) => angles
DO i = 1, SIZE(angles)/4
  WRITE(OUTPUT_UNIT, '(A,1X,I4,A,I4,1X,I4,1X,I4)') 'angle', angles_array(1,i), &
    '; type = ', angles_array(2,i), angles_array(3,i), angles_array(4,i)
END DO
END PROGRAM angles

```

Parameters

data [*integer(kind=*)*,*allocatable*] :: array into which to copy the result. *The KIND parameter is either `c_int` or, if LAMMPS was compiled with `-DLAMMPS_BIGBIG`, kind `c_int64_t`.

Call to

`lammps_gather_angles()`

subroutine gather(*self, name, count, data*)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, in order by atom ID.

Added in version 22Dec2022.

This subroutine gathers data from all processes and stores them in a one-dimensional allocatable array. The array *data* will be ordered by atom ID, which requires consecutive IDs (1 to *natoms*). If you need a similar array but for non-consecutive atom IDs, see [lammgs_gather_concat\(\)](#); for a similar array but for a subset of atoms, see [lammgs_gather_subset\(\)](#).

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x*, then *data* is [x(1,1), x(2,1), x(3,1), x(1,2), x(2,2), x(3,2), x(1,3), ...]); *data* must be ALLOCATABLE and will be allocated to length (*count* × *natoms*), as queried by [get_natoms\(\)](#).

This function will return an error if fix or compute data are requested and the fix or compute ID given does not have per-atom data. See the note about re-interpreting the vector as a matrix at [gather_atoms\(\)](#).

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., “x” or “mask” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **count** [*integer(c_int)*] :: number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (x,y,z) components.
- **data** [*real(c_double),dimension(:),allocatable*] :: array into which to store the data. Array must have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data.

Call to

[lammgs_gather\(\)](#)

subroutine gather_dihedrals(*data*)

Gather type and constituent atom information for all dihedrals.

Added in version 8Feb2023.

This function copies the list of all dihedrals into an allocatable array. The array will be filled with (dihedral type, dihedral atom 1, dihedral atom 2, dihedral atom 3, dihedral atom 4) for each dihedral. The array is allocated to the right length (i.e., five times the number of dihedrals). The array *data* must be of the same type as the LAMMPS tagint type, which is equivalent to either INTEGER(c_int) or INTEGER(c_int64_t), depending on whether -DLAMMPS_BIGBIG was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM dihedrals
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  USE LIBLAMMPS
  IMPLICIT NONE
```

(continues on next page)

(continued from previous page)

```

INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: dihedrals
INTEGER(c_int), DIMENSION(:,:), POINTER :: dihedrals_array
TYPE(lammps) :: lmp
INTEGER :: i
! other commands to initialize LAMMPS, create dihedrals, etc.
CALL lmp%gather_dihedrals(dihedrals)
dihedrals_array(1:5, 1:SIZE(dihedrals)/5) => dihedrals
DO i = 1, SIZE(dihedrals)/5
  WRITE(OUTPUT_UNIT, '(A,1X,I4,A,I4,1X,I4,1X,I4,1X,I4)') 'dihedral', dihedrals_
→array(1,i), &
  '; type = ', dihedrals_array(2,i), dihedrals_array(3,i), dihedrals_array(4,i),
→ dihedrals_array(5,i)
END DO
END PROGRAM dihedrals

```

Parameters

data [*integer(kind=*)*,*allocatable*] :: array into which to copy the result. *The KIND parameter is either *c_int* or, if LAMMPS was compiled with `-DLAMMPS_BIGBIG`, *c_int64_t*.

Call to

`lammps_gather_dihedrals()`

subroutine gather_impropers(data)

Gather type and constituent atom information for all impropers.

Added in version 8Feb2023.

This function copies the list of all impropers into an allocatable array. The array will be filled with (improper type, improper atom 1, improper atom 2, improper atom 3, improper atom 4) for each improper. The array is allocated to the right length (i.e., five times the number of impropers). The array *data* must be of the same type as the LAMMPS *tagint* type, which is equivalent to either `INTEGER(c_int)` or `INTEGER(c_int64_t)`, depending on whether `-DLAMMPS_BIGBIG` was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```

PROGRAM impropers
USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
USE LIBLAMMPS
IMPLICIT NONE
INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: impropers
INTEGER(c_int), DIMENSION(:,:), POINTER :: impropers_array
TYPE(lammps) :: lmp
INTEGER :: i
! other commands to initialize LAMMPS, create impropers, etc.
CALL lmp%gather_impropers(impropers)
impropers_array(1:5, 1:SIZE(impropers)/5) => impropers
DO i = 1, SIZE(impropers)/5
  WRITE(OUTPUT_UNIT, '(A,1X,I4,A,I4,1X,I4,1X,I4,1X,I4)') 'improper', impropers_
→array(1,i), &
  '; type = ', impropers_array(2,i), impropers_array(3,i), impropers_array(4,i),
→

```

(continues on next page)

(continued from previous page)

```
→ impropers_array(5,i)
  END DO
END PROGRAM impropers
```

Parameters

data [*integer(kind=*)*,*allocatable*] :: array into which to copy the result. *The KIND parameter is either `c_int` or, if LAMMPS was compiled with `-DLAMMPS_BIGBIG`, kind `c_int64_t`.

Call to

`lammps_gather_improbers()`

subroutine `gather_concat`(*self*, *name*, *count*, *data*)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, unordered.

Added in version 22Dec2022.

This subroutine gathers data for all atoms and stores them in a one-dimensional allocatable array. The data will be a concatenation of chunks from each processor's owned atoms, in whatever order the atoms are in on each processor. This process has no requirement that the atom IDs be consecutive. If you need the ID of each atom, you can do another call to either `gather_atoms_concat()` or `gather_concat()` with *name* set to `id`. If you have consecutive IDs and want the data to be in order, use `gather()`; for a similar array but for a subset of atoms, use `gather_subset()`.

The *data* array will be in groups of *count* values, with *natoms* groups total, but not in order by atom ID (e.g., if *name* is *x* and *count* is 3, then *data* might be something like `[x(1,11), x(2,11), x(3,11), x(1,3), x(2,3), x(3,3), x(1,5), ...]`); *data* must be `ALLOCATABLE` and will be allocated to length $(count \times natoms)$, as queried by `get_natoms()`.

This function is not compatible with `-DLAMMPS_BIGBIG`.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., “x” or “mask” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x/y/z* components.
- **data** [*polymorphic,dimension(:),allocatable*] :: array into which to store the data. Array *must* have the `ALLOCATABLE` attribute and be of rank 1 (i.e., `DIMENSION(:)`). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type `INTEGER(c_int)` if expecting integer data and `REAL(c_double)` if expecting floating-point data.

Call to

`lammps_gather_concat()`

subroutine gather_subset(*name, count, ids, data*)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes for a subset of atoms.

Added in version 22Dec2022.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional allocatable array. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use [gather\(\)](#) or [gather_concat\(\)](#).

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is [100, 57, 210], then *data* might look like [*x*(1,100), *x*(2,100), *x*(3,100), *x*(1,57), *x*(2,57), *x*(3,57), *x*(1,210), ...]); *ids* must be provided by the user, and *data* must have the `ALLOCATABLE` attribute and be of rank 1 (i.e., `DIMENSION(:)`). If *data* is already allocated, it will be reallocated to fit the length of the incoming data.

This function is not compatible with `-DLAMMPS_BIGBIG`.

Parameters

- **name** [*character(len=*)*] :: quantity to be scattered
- **ids** [*integer(c_int),dimension(:)*] :: atom IDs corresponding to the atoms being scattered (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **count** [*integer(c_int)*] :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x/y/z* components.
- **data** [*polymorphic,dimension(:),allocatable*] :: per-atom values packed into a one-dimensional array containing the data to be scattered. This array must have the `ALLOCATABLE` attribute and will be allocated either to the same length as *ids* (for *mask*, *type*, etc.) or to three times its length (for *x*, *f*, etc.); the array must be rank 1 and be of type `INTEGER(c_int)` (e.g., for *mask* or *type*) or of type `REAL(c_double)` (e.g., for *charge*, *x*, or *f*).

Call to

[lammps_gather_subset\(\)](#)

subroutine scatter(*name, data*)

This function calls [lammps_scatter\(\)](#) to scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entity in *data* to all processes.

Added in version 22Dec2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processes. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use [scatter_subset\(\)](#) to scatter data for some (or all) atoms, unordered.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,2), *x*(2,2), *x*(3,2), *x*(1,3), ...]); *data* must be of length (*count* × *natoms*).

This function is not compatible with `-DLAMMPS_BIGBIG`.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., “x” or “f” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)

- **data** [*polymorphic,dimension(:)*] :: per-atom values packed in a one-dimensional array; *data* should be of type `INTEGER(c_int)` or `REAL(c_double)`, depending on the type of data being scattered, and be of rank 1 (i.e., `DIMENSION(:)`).

Call to

`lammops_scatter()`

subroutine `scatter_subset(name, ids, data)`

This function calls `lammops_scatter_subset()` to scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities in *data* from a subset of atoms to all processes.

Added in version 22Dec2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processes. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array. Use `scatter()` to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of *count* values, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array [x(1,1), x(2,1), x(3,1), x(1,100), x(2,100), x(3,100), x(1,57), x(2,57), x(3,57)], then *count* = 3 and *ids* = [1, 100, 57].

This function is not compatible with `-DLAMMPS_BIGBIG`.

Parameters

- **name** [*character(len=*)*] :: desired quantity (e.g., “x” or “mask” for atom properties, “f_id” for per-atom fix data, “c_id” for per-atom compute data, “d_name” or “i_name” for fix property/atom vectors with *count* = 1, “d2_name” or “i2_name” for fix property/atom vectors with *count* > 1)
- **ids** [*integer(c_int)*] :: list of atom IDs to scatter data for
- **data** [*polymorphic,dimension(:)*] :: per-atom values packed in a one-dimensional array of length *size(ids) * count*.

Call to

`lammops_scatter_subset()`

subroutine `create_atoms([id,] type, x, [v,] [image,] [bexpand])`

This method calls `lammops_create_atoms()` to create additional atoms from a given list of coordinates and a list of atom types. Additionally, the atom IDs, velocities, and image flags may be provided.

Added in version 3Nov2022.

Parameters

- **type** [*integer(c_int),dimension(N)*] :: vector of *N* atom types (required/see note below)
- **x** [*real(c_double),dimension(3N)*] :: vector of *3N* x/y/z positions of the new atoms, arranged as [x₁, y₁, z₁, x₂, y₂, ...] (required/see note below)

Options

- **id** [*integer(kind=*),dimension(N),optional*] :: vector of *N* atom IDs; if absent, LAMMPS will generate them for you. *The `KIND` parameter should be `c_int` unless LAMMPS was compiled with `-DLAMMPS_BIGBIG`, in which case it should be `c_int64_t`.
- **v** [*real(c_double),dimension(3N),optional*] :: vector of *3N* x/y/z velocities of the new atoms, arranged as [v_{1,x}, v_{1,y}, v_{1,z}, v_{2,x}, ...]; if absent, they will be set to zero

- **image** [*integer(kind=*)*,*dimension(N)*,*optional*] :: vector of N image flags; if absent, they are set to zero. *The KIND parameter should be `c_int` unless LAMMPS was compiled with `-DLAMMPS_BIGBIG`, in which case it should be `c_int64_t`. See note below.
- **bexpand** [*logical*,*optional*] :: if `.TRUE.`, atoms outside of shrink-wrap boundaries will be created, not dropped, and the box dimensions will be extended. Default is `.FALSE.`

Call to

```
lammps_create_atoms()
```

Note

The *type* and *x* arguments are required, but they are declared OPTIONAL in the module because making them mandatory would require *id* to be present as well. To have LAMMPS generate the ids for you, use a call something like

```
lmp%create_atoms(type=new_types, x=new_xs)
```

Note

When LAMMPS has been compiled with `-DLAMMPS_BIGBIG`, it is not possible to include the *image* parameter but omit the *id* parameter. Either *id* must be present, or both *id* and *image* must be absent. This is required because having all arguments be optional in both generic functions creates an ambiguous interface. This limitation does not exist if LAMMPS was not compiled with `-DLAMMPS_BIGBIG`.

function find_pair_neighlist(*style*[, *exact*][, *nsub*][, *reqid*])

Find index of a neighbor list requested by a pair style.

Added in version 3Nov2022.

This function determines which of the available neighbor lists for pair styles matches the given conditions. It first matches the style name. If *exact* is `.TRUE.`, the name must match exactly; if `.FALSE.`, a regular expression or sub-string match is done. If the pair style is *hybrid* or *hybrid/overlay*, the style is matched against the sub-styles instead. If the same pair style is used multiple times as a sub-style, the *nsub* argument must be > 0 ; this argument represents the *n*th instance of the sub-style (same as for the *pair_coeff* command, for example). In that case, *nsub* = 0 will not produce a match, and the function will return -1 .

The final condition to be checked is the request ID (*reqid*). This will usually be zero, but some pair styles request multiple neighbor lists and set the request ID to a value greater than zero.

Parameters

style [*character(len=*)*] :: String used to search for pair style instance.

Options

- **exact** [*logical*,*optional*] :: Flag to control whether style should match exactly or only a regular expression/sub-string match is applied. Default: `.TRUE.`
- **nsub** [*integer(c_int)*,*optional*] :: Match *nsub*th hybrid sub-style instance of the same style. Default: 0.
- **reqid** [*integer(c_int)*,*optional*] :: Request ID to identify the neighbor list in case there are multiple requests from the same pair style instance. Default: 0.

Call to

```
lammps_find_pair_neighlist()
```

Return

index [*integer(c_int)*] :: Neighbor list index if found, otherwise -1 .

function find_fix_neighlist(*id* [, *reqid*])

Find index of a neighbor list requested by a fix.

Added in version 3Nov2022.

The neighbor list request from a fix is identified by the fix ID and the request ID. The request ID is typically zero, but will be > 0 for fixes with multiple neighbor list requests.

Parameters

id [*character(len=*)*] :: Identifier of fix instance

Options

reqid [*integer(c_int), optional*] :: request ID to identify the neighbor list in cases in which there are multiple requests from the same fix. Default: 0.

Call to

lammops_find_fix_neighlist()

Return

index [*integer(c_int)*] :: neighbor list index if found, otherwise -1

function find_compute_neighlist(*id* [, *reqid*])

Find index of a neighbor list requested by a compute.

Added in version 3Nov2022.

The neighbor list request from a compute is identified by the compute ID and the request ID. The request ID is typically zero, but will be > 0 in case a compute has multiple neighbor list requests.

Parameters

id [*character(len=*)*] :: Identifier of compute instance.

Options

reqid [*integer(c_int), optional*] :: request ID to identify the neighbor list in cases in which there are multiple requests from the same compute. Default: 0.

Call to

lammops_find_compute_neighlist()

Return

index [*integer(c_int)*] :: neighbor list index if found, otherwise -1 .

function neighlist_num_elements(*idx*)

Return the number of entries in the neighbor list with the given index.

Added in version 3Nov2022.

Parameters

idx [*integer(c_int)*] :: neighbor list index

Call to

lammops_neighlist_num_elements() *lammops_neighlist_num_elements()*

Return

inum [*integer(c_int)*] :: number of entries in neighbor list, or -1 if *idx* is not a valid index.

subroutine neighlist_element_neighbors(*idx, element, iatom, neighbors*)

Return atom local index, number of neighbors, and array of neighbor local atom indices of a neighbor list entry.

Added in version 3Nov2022.

Parameters

- **idx** [*integer(c_int)*] :: index of this neighbor list in the list of all neighbor lists
- **element** [*integer(c_int)*] :: index of this neighbor list entry
- **iatom** [*integer(c_int)*] :: local atom index (i.e., in the range [1,nlocal+nghost]; -1 if invalid or element value
- **neighbors** [*integer(c_int),dimension(:),pointer*] :: pointer to an array of neighboring atom local indices

Call to

lammps_neighlist_element_neighbors()

function version()

This method returns the numeric LAMMPS version like *lammps_version()* does.

Call to

lammps_version()

Return

version [*integer*] :: LAMMPS version

subroutine get_os_info(*buffer*)

This function can be used to retrieve detailed information about the hosting operating system and compiler/runtime environment.

Added in version 3Nov2022.

A suitable buffer has to be provided. The assembled text will be truncated so as not to overflow this buffer. The string is typically a few hundred bytes long.

Parameters

buffer [*character(len=*)*] :: string that will house the information.

Call to

lammps_get_os_info()

function config_has_mpi_support()

This function is used to query whether LAMMPS was compiled with a real MPI library or in serial.

Added in version 3Nov2022.

Call to

lammps_config_has_mpi_support()

Return

has_mpi [*logical*] :: .FALSE. when compiled with STUBS, .TRUE. if compiled with MPI.

function config_has_gzip_support()

Check if the LAMMPS library supports reading or writing compressed files via a pipe to gzip or similar compression programs.

Added in version 3Nov2022.

Several LAMMPS commands (e.g., *read_data command*, *write_data command*, *dump styles atom, custom, and xyz*) support reading and writing compressed files via creating a pipe to the *gzip* program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether *gzip* or any other supported compression programs themselves are installed and usable.

Call to

lammops_config_has_gzip_support()

Return

has_gzip [*logical*]

function config_has_png_support()

Check if the LAMMPS library supports writing PNG format images.

Added in version 3Nov2022.

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the *PNG image file format* is available in the current LAMMPS library.

Call to

lammops_config_has_png_support()

Return

has_png [*logical*]

function config_has_jpeg_support()

Check if the LAMMPS library supports writing JPEG format images.

Added in version 3Nov2022.

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the *JPEG image file format* is available in the current LAMMPS library.

Call to

lammops_config_has_jpeg_support()

Return

has_jpeg [*logical*]

function config_has_ffmpeg_support()

Check if the LAMMPS library supports creating movie files via a pipe to ffmpeg.

Added in version 3Nov2022.

The LAMMPS *dump style movie* supports generating movies from images on-the-fly via creating a pipe to the *ffmpeg* program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether the *ffmpeg* itself is installed and usable.

Call to

lammps_config_has_ffmpeg_support()

Return

has_ffmpeg [logical]

function config_has_exceptions()

Check whether LAMMPS errors will throw C++ exceptions.

Added in version 3Nov2022.

When using the library interface, the library interface functions will “catch” exceptions, and then the error status can be checked by calling *has_error()*. The most recent error message can be retrieved via *get_last_error_message()*. This allows to restart a calculation or delete and recreate the LAMMPS instance when a C++ exception occurs. One application of using exceptions this way is the *LAMMPS-GUI*.

Call to

lammps_config_has_exceptions()

Return

has_exceptions [logical]

function config_has_package(name)

Check whether a specific package has been included in LAMMPS

Added in version 3Nov2022.

This function checks whether the LAMMPS library in use includes the specific *LAMMPS package* provided as argument.

Call to

lammps_config_has_package()

Return

has_package [logical]

function config_package_count()

Count the number of installed packages in the LAMMPS library.

Added in version 3Nov2022.

This function counts how many *LAMMPS packages* are included in the LAMMPS library in use. It directly calls the C library function *lammps_config_package_count()*.

Call to

lammps_config_package_count()

Return

npackages [*integer(c_int)*] :: number of packages installed

subroutine config_package_name(*idx*, *buffer*)

Get the name of a package in the list of installed packages in the LAMMPS library.

Added in version 3Nov2022.

This subroutine copies the name of the package with the index *idx* into the provided string *buffer*. If the name of the package exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, *buffer* is set to an empty string.

Parameters

- **idx** [*integer(c_int)*] :: index of the package in the list of included packages ($0 \leq idx <$ package count)
- **buffer** [*character(len=*)*] :: string to hold the name of the package

Call to

[*lammps_config_package_name\(\)*](#)

subroutine installed_packages(*package* [, *length*])

Obtain a list of the names of enabled packages in the LAMMPS shared library and store it in *package*.

Added in version 3Nov2022.

This function is analogous to the [*installed_packages*](#) function in the Python API. The optional argument *length* sets the length of each string in the vector *package* (default: 31).

Parameters

package [*character(len=:),dimension(:),allocatable*] :: list of packages; *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)) with allocatable length.

Options

length [*integer,optional*] :: length of each string in the list. Default: 31.

Call to

[*lammps_config_package_count\(\)*](#) [*lammps_config_package_name\(\)*](#)

function config_accelerator(*package*, *category*, *setting*)

This function calls [*lammps_config_accelerator\(\)*](#) to check the availability of compile time settings of included *accelerator packages* in LAMMPS.

Added in version 3Nov2022.

Supported packages names are “GPU”, “KOKKOS”, “INTEL”, and “OPENMP”. Supported categories are “api” with possible settings “cuda”, “hip”, “phi”, “pthreads”, “opencl”, “openmp”, and “serial”; and “precision” with possible settings “double”, “mixed”, and “single”.

Parameters

- **package** [*character(len=*)*] :: string with the name of the accelerator package
- **category** [*character(len=*)*] :: string with the name of the setting
- **setting** [*character(len=*)*] :: string with the name of the specific setting

Call to

`lammps_config_accelerator()`

Return

available [*logical*] :: .TRUE. if the combination of package, category, and setting is available, otherwise .FALSE..

function has_gpu_device()

Checks for the presence of a viable GPU package device.

Added in version 3Nov2022.

This function calls `lammps_has_gpu_device()`, which checks at runtime whether an accelerator device is present that can be used with the *GPU package*.

More detailed information about the available device or devices can be obtained by calling the `get_gpu_device_info()` subroutine.

Call to

`lammps_has_gpu_device()`

Return

available [*logical*] :: .TRUE. if a viable device is available, .FALSE. if not.

subroutine get_gpu_device_info(buffer)

Get GPU package device information.

Added in version 3Nov2022.

Calls `lammps_get_gpu_device_info()` to retrieve detailed information about any accelerator devices that are viable for use with the *GPU package*. It will fill *buffer* with a string that is equivalent to the output of the `nvc_get_device` or `ocl_get_device` or `hip_get_device` tools that are compiled alongside LAMMPS if the GPU package is enabled.

A suitable-length Fortran string has to be provided. The assembled text will be truncated so as not to overflow this buffer. This string can be several kilobytes long if multiple devices are present.

Parameters

buffer [*character(len=*)*] :: string into which to copy the information.

Call to

`lammps_get_gpu_device_info()`

function has_style(category, name)

Check whether a specific style has been included in LAMMPS.

Added in version 3Nov2022.

This function calls `lammps_has_style()` to check whether the LAMMPS library in use includes the specific style *name* associated with a specific *category* provided as arguments. Please see `lammps_has_style()` for a list of valid categories.

Parameters

- **category** [*character(len=*)*] :: category of the style
- **name** [*character(len=*)*] :: name of the style

Call to

`lammps_has_style()`

Return

`has_style [logical] :: .TRUE. if included, .FALSE. if not.`

function style_count(category)

Count the number of styles of *category* in the LAMMPS library.

Added in version 3Nov2022.

This function counts how many styles in the provided *category* are included in the LAMMPS library currently in use. Please see `lammps_has_style()` for a list of valid categories.

Parameters

category [*character(len=*)*] :: category of styles to count

Call to

`lammps_style_count()`

Return

count [*integer(c_int)*] :: number of styles in *category*

subroutine style_name(category, idx, buffer)

Look up the name of a style by index in the list of styles of a given category in the LAMMPS library.

Added in version 3Nov2022.

This function calls `lammps_style_name()` and copies the name of the *category* style with index *idx* into the provided string *buffer*. The length of *buffer* must be long enough to contain the name of the style; if it is too short, the name will be truncated accordingly. If *idx* is out of range, *buffer* will be the empty string and a warning will be issued.

Parameters

- **category** [*character(len=*)*] :: category of styles
- **idx** [*integer(c_int)*] :: index of the style in the list of *category* styles ($1 \leq \text{idx} \leq \text{style count}$)
- **buffer** [*character(len=*)*] :: string buffer to copy the name of the style into

Call to

`lammps_style_name()`

function has_id(category, name)

This function checks if the current LAMMPS instance a *category* ID of the given *name* exists. Valid categories are: *compute*, *dump*, *fix*, *group*, *molecule*, *region*, and *variable*.

Added in version 3Nov2022.

Parameters

- **category** [*character(len=*)*] :: category of the ID
- **name** [*character(len=*)*] :: name of the ID

Call to

`lammps_has_id()`

Return

has_id [*logical*] :: .TRUE. if *category* style *name* exists, .FALSE. if not.

function id_count(category)

This function counts how many IDs in the provided *category* are defined in the current LAMMPS instance. Please see [has_id\(\)](#) for a list of valid categories.

Added in version 3Nov2022.

Parameters

category [*character(len=*)*] :: category of the ID

Call to

[lammps_id_count\(\)](#)

Return

count [*integer(c_int)*] :: number of IDs in *category*

subroutine id_name(category, idx, buffer)

Look up the name of an ID by index in the list of IDs of a given category.

Added in version 3Nov2022.

This function copies the name of the *category* ID with the index *idx* into the provided string *buffer*. The length of the buffer must be long enough to hold the string; if the name of the style exceeds the length of the buffer, it will be truncated accordingly. If *buffer* is ALLOCATABLE, it must be allocated *before* the function is called. If *idx* is out of range, *buffer* is set to an empty string and a warning is issued.

Parameters

- **category** [*character(len=*)*] :: category of IDs
- **idx** [*integer(c_int)*] :: index of the ID in the list of *category* styles ($0 \leq idx < count$)
- **buffer** [*character(len=*)*] :: string into which to copy the name of the style

Call to

[lammps_id_name\(\)](#)

function plugin_count()

This function counts the number of loaded plugins.

Added in version 3Nov2022.

Call to

[lammps_plugin_count\(\)](#)

Return

n [*integer(c_int)*] :: number of loaded plugins

subroutine plugin_name(*idx*, *stylebuf*, *namebuf*)

Look up the style and name of a plugin by its index in the list of plugins.

Added in version 3Nov2022.

This function copies the name of the *style* plugin with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, both strings are set to the empty string and a warning is printed.

Parameters

- **idx** [*integer(c_int)*] :: index of the plugin in the list all or *style* plugins
- **stylebuf** [*character(len=*)*] :: string into which to copy the style of the plugin
- **namebuf** [*character(len=*)*] :: string into which to copy the style of the plugin

Call to

```
lammps_plugin_name()
```

function encode_image_flags(*ix*, *iy*, *iz*)

Encodes three integer image flags into a single `imageint`.

Added in version 3Nov2022.

This function performs the bit-shift, addition, and bit-wise OR operations necessary to combine the values of three integers representing the image flags in the *x*-, *y*-, and *z*-directions. Unless LAMMPS is compiled with `-DLAMMPS_BIGBIG`, those integers are limited to 10-bit signed integers $[-512, 512)$. If `-DLAMMPS_BIGBIG` was used when compiling, then the return value is of kind `c_int64_t` instead of kind `c_int`, and the valid range for the individual image flags becomes $[-1048576, 1048575)$ (i.e., the range of a 21-bit signed integer). There is no check on whether the arguments conform to these requirements; values out of range will simply be wrapped back into the interval.

Parameters

- **ix** [*integer(c_int)*] :: image flag in *x*-direction
- **iy** [*integer(c_int)*] :: image flag in *y*-direction
- **iz** [*integer(c_int)*] :: image flag in *z*-direction

Return

imageint [*integer(kind=*)*] :: encoded image flag. *The `KIND` parameter is `c_int` unless LAMMPS was built with `-DLAMMPS_BIGBIG`, in which case it is `c_int64_t`.

Note

The fact that the programmer does not know the `KIND` parameter of the return value until compile time means that it is impossible to define an interface that works for both sizes of `imageint`. One side effect of this is that you must assign the return value of this function to a variable; it cannot be used as the argument to another function or as part of an array constructor. For example,

```
my_images = [lmp%encode_image_flags(0,0,0), lmp%encode_image_flags(1,0,0)]
```

will *not* work; instead, do something like

```
my_images(1) = lmp%encode_image_flags(0,0,0)
my_images(2) = lmp%encode_image_flags(1,0,0)
```

subroutine decode_image_flags(*image, flags*)

This function does the reverse operation of [encode_image_flags\(\)](#): it takes the image flag and performs the bit-shift and bit-masking operations to decode it and stores the resulting three integers into the array *flags*.

Added in version 3Nov2022.

Parameters

- **image** [*integer(kind=*)*] :: encoded image flag. *The KIND parameter is either `c_int` or, if LAMMPS was compiled with `-DLAMMPS_BIGBIG`, `c_int64_t`. Kind compatibility is checked at run-time.
- **flags** [*integer(c_int),dimension(3)*] :: three-element vector where the decoded image flags will be stored.

subroutine set_fix_external_callback(*id, callback, caller*)

Set the callback function for a [fix external](#) instance with the given ID.

Added in version 22Dec2022.

Fix [external](#) allows programs that are running LAMMPS through its library interface to modify certain LAMMPS properties on specific time steps, similar to the way other fixes do.

This subroutine sets the callback function for use with the “pf/callback” mode. The function should have Fortran language bindings with the following interface, which depends on how LAMMPS was compiled:

```

ABSTRACT INTERFACE
  SUBROUTINE external_callback(caller, timestep, ids, x, fexternal)
    USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int, c_double, c_int64_t
    CLASS(*), INTENT(INOUT) :: caller
    INTEGER(c_bigint), INTENT(IN) :: timestep
    INTEGER(c_tagint), DIMENSION(:), INTENT(IN) :: ids
    REAL(c_double), DIMENSION(:, :), INTENT(IN) :: x
    REAL(c_double), DIMENSION(:, :), INTENT(OUT) :: fexternal
  END SUBROUTINE external_callback
END INTERFACE

```

where `c_bigint` is `c_int` if `-DLAMMPS_SMALLSMALL` was used and `c_int64_t` otherwise; and `c_tagint` is `c_int64_t` if `-DLAMMPS_BIGBIG` was used and `c_int` otherwise.

The argument *caller* to [set_fix_external_callback\(\)](#) is unlimited polymorphic (i.e., it can be any Fortran object you want to pass to the calling function) and will be available as the first argument to the callback function. It can be your LAMMPS instance, which you might need if the callback function needs access to the library interface. The argument must be a scalar; to pass non-scalar data, wrap those data in a derived type and pass an instance of the derived type to *caller*.

The array *ids* is an array of length *nlocal* (as accessed from the `Atom` class or through [extract_global\(\)](#)). The arrays *x* and *fexternal* are $3 \times nlocal$ arrays; these are transposed from what they would look like in C (see note about array index order at [extract_atom\(\)](#)).

The callback mechanism is one of two ways that forces can be applied to a simulation with the help of [fix external](#). The alternative is *array* mode, where one calls [fix_external_get_force\(\)](#).

Please see the documentation for [fix external](#) for more information about how to use the fix and couple it with external programs.

Parameters

- **id** [*character(len=*)*] :: ID of *fix external* instance
- **callback** [*external*] :: subroutine *fix external* should call
- **caller** [*class(*),optional*] :: object you wish to pass to the callback procedure (must be a scalar; see note)

Call to

lammops_set_fix_external_callback()

Note

The interface for your callback function must match types precisely with the abstract interface block given above. **The compiler probably will not be able to check this for you.** In particular, the first argument (“caller”) must be of type CLASS(*) or you will probably get a segmentation fault or at least a misinterpretation of whatever is in memory there. You can resolve the object using the SELECT TYPE construct. An example callback function (assuming LAMMPS was compiled with -DLAMMPS_SMALLBIG) that applies something akin to Hooke’s Law (with each atom having a different *k* value) is shown below.

```

MODULE stuff
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int, c_double, c_int64_t
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : error_unit
  IMPLICIT NONE

  TYPE shield
    REAL(c_double), DIMENSION(:,:), ALLOCATABLE :: k
    ! assume k gets allocated to dimension(3,nlocal) at some point
    ! and assigned values
  END TYPE shield

  SUBROUTINE my_callback(caller, timestep, ids, x, fexternal)
    CLASS(*), INTENT(INOUT) :: caller
    INTEGER(c_int), INTENT(IN) :: timestep
    INTEGER(c_int64_t), INTENT(IN) :: ids
    REAL(c_double), INTENT(IN) :: x(:,:)
    REAL(c_double), INTENT(OUT) :: fexternal(:,:)

    SELECT TYPE (caller)
      TYPE IS (shield)
        fexternal = - caller%k * x
      CLASS DEFAULT
        WRITE(error_unit,*) 'UH OH...'
    END SELECT
  END SUBROUTINE my_callback
END MODULE stuff

! then, when assigning the callback function, do this:
PROGRAM example
  USE LIBLAMMPS
  USE stuff
  TYPE(lammps) :: lmp
  TYPE(shield) :: my_shield
  lmp = lammps()
  CALL lmp%command('fix ext all external pf/callback 1 1')
  CALL lmp%set_fix_external_callback('ext', my_callback, my_shield)
END PROGRAM example

```

function fix_external_get_force(id)

Get pointer to the force array storage in a fix external instance with the given ID.

Added in version 22Dec2022.

Fix *external* allows programs that are running LAMMPS through its library interfaces to add or modify certain LAMMPS properties on specific time steps, similar to the way other fixes do.

This function provides access to the per-atom force storage in a fix external instance with the given fix-ID to be added to the individual atoms when using the “pf/array” mode. The *fexternal* array can be accessed like other “native” per-atom arrays accessible via the *extract_atom()* function. Please note that the array stores the forces for *local* atoms for each MPI rank, in the order determined by the neighbor list build. Because the underlying data structures can change as well as the order of atom as they migrate between MPI processes because of the domain decomposition parallelization, this function should be always called immediately before the forces are going to be set to get an up-to-date pointer. You can use, for example, *extract_setting()* to obtain the number of local atoms *nlocal* and then assume the dimensions of the returned force array as `REAL(c_double) :: force(3,nlocal)`.

This function is an alternative to the callback mechanism in fix external set up by *set_fix_external_callback()*. The main difference is that this mechanism can be used when forces are to be pre-computed and the control alternates between LAMMPS and the external driver, while the callback mechanism can call an external subroutine to compute the force when the fix is triggered and needs them.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

`id [character(len=*)]` :: ID of *fix external* instance

Call to

`lammmps_fix_external_get_force()`

Return

`fexternal [real(c_double),dimension(3,nlocal)]` :: pointer to the per-atom force array allocated by the fix

subroutine fix_external_set_energy_global(id, eng)

Set the global energy contribution for a *fix external* instance with the given ID.

Added in version 22Dec2022.

This is a companion function to *set_fix_external_callback()* and *fix_external_get_force()* that also sets the contribution to the global energy from the external program. The value of the *eng* argument will be stored in the fix and applied on the current and all following time steps until changed by another call to this function. The energy is in energy units as determined by the current *units* settings and is the **total** energy of the contribution. Thus, when running in parallel, all MPI processes have to call this function with the **same** value, and this will be returned as a scalar property of the fix external instance when accessed in LAMMPS input commands or from variables.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

- `id [character(len=*)]` :: fix ID of fix external instance

- **eng** [*real(c_double)*] :: total energy to be added to the global energy

Call to

```
lammops_fix_external_set_energy_global()
```

subroutine **fix_external_set_virial_global**(*id*, *virial*)

Set the global virial contribution for a fix external instance with the given ID.

Added in version 22Dec2022.

This is a companion function to [set_fix_external_callback\(\)](#) and [fix_external_get_force\(\)](#) to set the contribution to the global virial from an external program.

The six values of the *virial* array will be stored in the fix and applied on the current and all following time steps until changed by another call to this function. The components of the virial need to be stored in the following order: *xx*, *yy*, *zz*, *xy*, *xz*, *yz*. In LAMMPS, the virial is stored internally as *stress*volume* in units of *pressure*volume* as determined by the current *units* settings and is the **total** contribution. Thus, when running in parallel, all MPI processes have to call this function with the **same** value, and this will then be added by fix external.

Please see the documentation for [fix external](#) for more information about how to use the fix and how to couple it with an external code.

Parameters

- **id** [*character(len=*)*] :: fix ID of fix external instance
- **virial** [*real(c_double),dimension(6)*] :: the six global stress tensor components to be added to the global virial

Call to

```
lammops_fix_external_set_virial_global()
```

subroutine **fix_external_set_energy_peratom**(*id*, *eng*)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 22Dec2022.

This is a companion function to [set_fix_external_callback\(\)](#) to set the per-atom energy contribution due to the fix from the external program as part of the callback function. For this to work, the LAMMPS object must be passed as part of the *caller* argument when registering the callback function, or the callback function must otherwise have access to the LAMMPS object, such as through a module-based pointer.

Note

This function is fully independent from [fix_external_set_energy_global\(\)](#) and will **NOT** add any contributions to the global energy tally and will **NOT** check whether the sum of the contributions added here are consistent with the global added energy.

Please see the documentation for [fix external](#) for more information about how to use the fix and how to couple it with an external code.

Parameters

- **id** [*character(len=*)*] :: fix ID of the fix external instance
- **eng** [*real(c_double),dimension(:)*] :: array of length *nlocal* containing the energy to add to the per-atom energy

Call to

`lammps_fix_external_set_energy_peratom()`

subroutine `set_fix_external_set_virial_peratom`(*id*, *virial*)

This is a companion function to `set_fix_external_callback()` to set the per-atom virial contribution due to the fix from the external program as part of the callback function. For this to work, the LAMMPS object must be passed as the *caller* argument when registering the callback function.

Added in version 22Dec2022.

Note

This function is fully independent from `fix_external_set_virial_global()` and will **NOT** add any contributions to the global virial tally and **NOT** check whether the sum of the contributions added here are consistent with the global added virial.

The order and units of the per-atom stress tensor elements are the same as for the global virial. The type and dimensions of the per-atom virial array must be `REAL(c_double)`, `DIMENSION(6,nlocal)`.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

- **id** [*character(len=*)*] :: fix ID of fix external instance
- **virial** [*real(c_double),dimension(:,:)*] :: an array of $6 \times nlocal$ components to be added to the per-atom virial

Call to

`lammps_set_virial_peratom()`

subroutine `fix_external_set_vector_length`(*id*, *length*)

Set the vector length for a global vector stored with fix external for analysis.

Added in version 22Dec2022.

This is a companion function to `set_fix_external_callback()` and `fix_external_get_force()` to set the length of a global vector of properties that will be stored with the fix via `fix_external_set_vector()`.

This function needs to be called **before** a call to `fix_external_set_vector()` and **before** a run or minimize command. When running in parallel, it must be called from **all** MPI processes with the same length argument.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

- **id** [*character(len=*)*] :: fix ID of fix external instance
- **length** [*integer(c_int)*] :: length of the global vector to be stored with the fix

Call to

`lammps_fix_external_set_vector_length()`

subroutine `fix_external_set_vector(id, idx, val)`

Store a global vector value for a fix external instance with the given ID.

Added in version 22Dec2022.

This is a companion function to `set_fix_external_callback()` and `fix_external_get_force()` to set the values of a global vector of properties that will be stored with the fix and can be accessed from within LAMMPS input commands (e.g., fix ave/time or variables) when used in a vector context.

This function needs to be called **after** a call to `fix_external_set_vector_length()` and **before** a run or minimize command. When running in parallel, it must be called from **all** MPI processes with the **same** `idx` and `val` parameters. The variable `val` is assumed to be extensive.

Note

The index in the `idx` parameter is 1-based (i.e., the first element is set with `idx = 1`, and the last element of the vector with `idx = N`, where `N` is the value of the `length` parameter of the call to `fix_external_set_vector_length()`).

Please see the documentation for `fix external` for more information about how to use the fix and how to couple it with an external code.

Parameters

- **id** [*character(len=*)*] :: ID of fix external instance
- **idx** [*integer(c_int)*] :: 1-based index in global vector
- **val** [*integer(c_int)*] :: value to be stored in global vector at index `idx`

Call to

`lammops_fix_external_set_vector()`

subroutine `flush_buffers()`

This function calls `lammops_flush_buffers()`, which flushes buffered output to be written to screen and logfile. This can simplify capturing output from LAMMPS library calls.

Added in version 3Nov2022.

Call to

`lammops_flush_buffers()`

function `is_running()`

Check if LAMMPS is currently inside a run or minimization.

Added in version 3Nov2022.

This function can be used from signal handlers or multi-threaded applications to determine if the LAMMPS instance is currently active.

Call to

`lammops_is_running()`

Return

`is_running [logical]` :: `.FALSE.` if idle or `.TRUE.` if active

subroutine force_timeout()

Force a timeout to stop an ongoing run cleanly.

Added in version 3Nov2022.

This function can be used from signal handlers or multi-threaded applications to terminate an ongoing run cleanly.

Call to

`lammops_force_timeout()`

function has_error()

Check if there is a (new) error message available.

Added in version 3Nov2022.

This function can be used to query if an error inside of LAMMPS has thrown a *C++ exception*.

Call to

`lammops_has_error()`

Return

`has_error [logical] :: .TRUE.` if there is an error.

subroutine get_last_error_message(buffer[, status])

Copy the last error message into the provided buffer.

Added in version 3Nov2022.

This function can be used to retrieve the error message that was set in the event of an error inside of LAMMPS that resulted in a *C++ exception*. A suitable buffer for a string has to be provided. If the internally-stored error message is longer than the string, it will be truncated accordingly. The optional argument *status* indicates the kind of error: a “1” indicates an error that occurred on all MPI ranks and is often recoverable, while a “2” indicates an abort that would happen only in a single MPI rank and thus may not be recoverable, as other MPI ranks may be waiting on the failing MPI rank(s) to send messages.

Parameters

`buffer [character(len=*)]` :: string buffer to copy the error message into

Options

`status [integer(c_int),optional]` :: 1 when all ranks had the error, 2 on a single-rank error.

Call to

`lammops_get_last_error_message()`

1.4 LAMMPS C++ API

It is also possible to invoke the LAMMPS C++ API directly in your code. It lacks some of the convenience of the C library API, but it allows more direct access to simulation data and thus more low-level manipulations. The following links provide some examples and references to the C++ API.

1.4.1 Using the C++ API directly

Using the C++ classes of the LAMMPS library is lacking some of the convenience of the C library API, but it allows a more direct access to simulation data and thus more low-level manipulations and tighter integration of LAMMPS into another code. While for the complete C library API is provided in the `library.h` header file, for using the C++ API it is required to include the individual header files defining the individual classes in use. Typically the name of the class and the name of the header follow some simple rule. Examples are given below.

1.4.2 Creating or deleting a LAMMPS object

When using the LAMMPS library interfaces, the core task is to create an instance of the `LAMMPS_NS::LAMMPS` class. In C++ this can be done directly through the `new` operator. All further operations are then initiated through calling member functions of some of the components of the LAMMPS class or accessing their data members. The destruction of the LAMMPS instance is correspondingly initiated by using the `delete` operator. Here is a simple example:

```
#include "lammps.h"

#include <mpi.h>
#include <iostream>

int main(int argc, char **argv)
{
    LAMMPS_NS::LAMMPS *lmp;
    // custom argument vector for LAMMPS library
    const char *lmpargv[] {"liblammps", "-log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    // explicitly initialize MPI
    MPI_Init(&argc, &argv);

    // create LAMMPS instance
    lmp = new LAMMPS_NS::LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
    // output numerical version string
    std::cout << "LAMMPS version ID: " << lmp->num_ver << std::endl;
    // delete LAMMPS instance
    delete lmp;

    // stop MPI environment
    MPI_Finalize();
    return 0;
}
```

This minimal example only requires to include the `lammps.h` header file since it only accesses a non-pointer member of the LAMMPS class.

1.4.3 Executing LAMMPS commands

Once a LAMMPS instance is created by your C++ code, you need to set up a simulation and that is most conveniently done by “driving” it through issuing commands like you would do when running a LAMMPS simulation from an input script. Processing of input in LAMMPS is handled by the `Input` class an instance of which is a member of the `LAMMPS` class. You have two options: reading commands from a file, or executing a single command from a string. See below for a small example:

```
#include "lammps.h"
#include "input.h"
#include <mpi.h>

using namespace LAMMPS_NS;

int main(int argc, char **argv)
{
    const char *lmpargv[] {"liblammps", "-log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    MPI_Init(&argc, &argv);
    LAMMPS *lmp = new LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
    lmp->input->file("in.melt");
    lmp->input->one("run 100 post no");
    delete lmp;
    return 0;
}
```

USE PYTHON WITH LAMMPS

These pages describe various ways that LAMMPS and Python can be used together.

2.1 Overview

The LAMMPS distribution includes a `python` directory with the Python code needed to run LAMMPS from Python. The `python/lammps` package contains *the “lammps” Python module* that wraps the LAMMPS C-library interface. This module makes it possible to do the following either from a Python script, or interactively from a Python prompt:

- create one or more instances of LAMMPS
- invoke LAMMPS commands or read them from an input script
- run LAMMPS incrementally
- extract LAMMPS results
- and modify internal LAMMPS data structures.

From a Python script you can do this in serial or in parallel. Running Python interactively in parallel does not generally work, unless you have a version of Python that extends Python to enable multiple instances of Python to read what you type.

To do all of this, you must build LAMMPS in *“shared” mode* and make certain that your Python interpreter can find the `lammps` Python package and the LAMMPS shared library file.

The Python wrapper for LAMMPS uses the `ctypes` package in Python, which auto-generates the interface code needed between Python and a set of C-style library functions. `Ctypes` has been part of the standard Python distribution since version 2.5. You can check which version of Python you have by simply typing “python” at a shell prompt. Below is an example output for Python version 3.8.5.

```
$ python
Python 3.8.5 (default, Aug 12 2020, 00:00:00)
[GCC 10.2.1 20200723 (Red Hat 10.2.1-1)] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>>
```

Warning

The options described in this section of the manual for using Python with LAMMPS currently support either Python 2 or 3. Specifically version 2.7 or later and 3.6 or later. Since the Python community no longer maintains Python 2 (see [this notice](#)), we recommend use of Python 3 with LAMMPS. While Python 2 code should continue to work,

that is not something we can guarantee long-term. If you notice Python code in the LAMMPS distribution that is not compatible with Python 3, please contact the LAMMPS developers or submit [and issue on GitHub](#)

LAMMPS can work together with Python in three ways. First, Python can wrap LAMMPS through the its *library interface*, so that a Python script can create one or more instances of LAMMPS and launch one or more simulations. In Python terms, this is referred to as “extending” Python with a LAMMPS module.

Fig. 1: Launching LAMMPS via Python

Second, the lower-level Python interface in the *lammmps Python class* can be used indirectly through the provided *PyLammps* and *IPyLammps* wrapper classes, also written in Python. These wrappers try to simplify the usage of LAMMPS in Python by providing a more object-based interface to common LAMMPS functionality. They also reduce the amount of code necessary to parameterize LAMMPS scripts through Python and make variables and computes directly accessible.

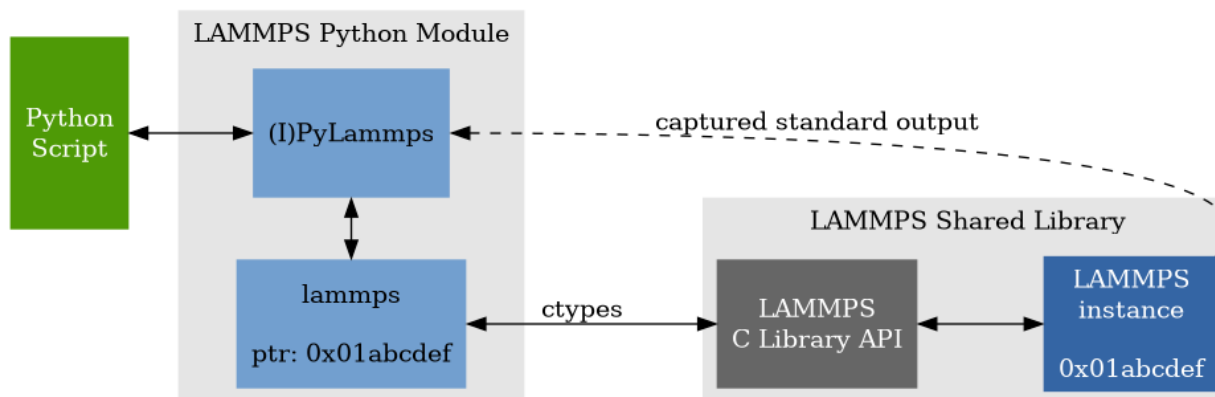

Fig. 2: Using the PyLammps / IPyLammps wrappers

Third, LAMMPS can use the Python interpreter, so that a LAMMPS input script or styles can invoke Python code directly, and pass information back-and-forth between the input script and Python functions you write. This Python code can also call back to LAMMPS to query or change its attributes through the LAMMPS Python module mentioned above. In Python terms, this is called “embedding” Python into LAMMPS. When used in this mode, Python can perform script operations that the simple LAMMPS input script syntax can not.

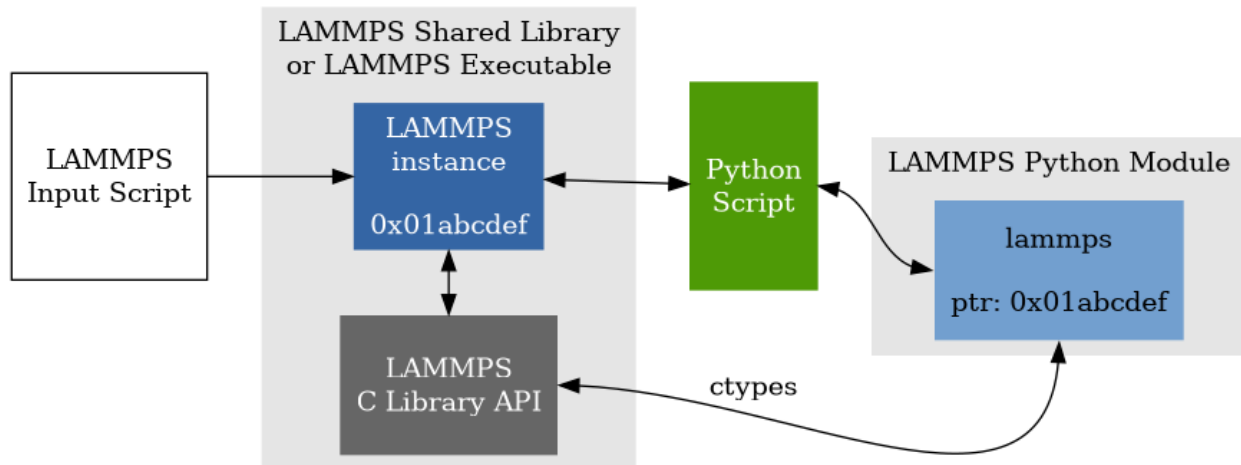

Fig. 3: Calling Python code from LAMMPS

2.2 Installation

The LAMMPS Python module enables calling the *LAMMPS C library API* from Python by dynamically loading functions in the LAMMPS shared library through the Python `ctypes` module. Because of the dynamic loading, it is required that LAMMPS is compiled in “*shared*” mode.

Two components are necessary for Python to be able to invoke LAMMPS code:

- The LAMMPS Python Package (`lammmps`) from the `python` folder
- The LAMMPS Shared Library (`liblammmps.so`, `liblammmps.dylib` or `liblammmps.dll`) from the folder where you compiled LAMMPS.

2.2.1 Installing the LAMMPS Python Module and Shared Library

Making LAMMPS usable within Python and vice versa requires putting the LAMMPS Python package (`lammmps`) into a location where the Python interpreter can find it and installing the LAMMPS shared library into a folder that the dynamic loader searches or inside of the installed `lammmps` package folder. There are multiple ways to achieve this.

1. Install both components into a Python `site-packages` folder, either system-wide or in the corresponding user-specific folder. This way no additional environment variables need to be set, but the shared library is otherwise not accessible.
2. Do an installation into a virtual environment.
3. Leave the files where they are in the source/development tree and adjust some environment variables.

Python package

Compile LAMMPS with either *CMake* or the *traditional make* procedure in *shared mode*. After compilation has finished, type (in the compilation folder):

```
make install-python
```

This will try to build a so-called (binary) wheel file, a compressed binary python package and then install it with the python package manager ‘`pip`’. Installation will be attempted into a system-wide `site-packages`

folder and if that fails into the corresponding folder in the user's home directory. For a system-wide installation you usually would have to gain superuser privilege first, e.g. though `sudo`

File	Location	Notes
LAMMPS Python package	<ul style="list-style-type: none"> • <code>\$HOME/.local/lib/pythonX.Y/site-packages/lammps</code> 	X.Y depends on the installed Python version
LAMMPS shared library	<ul style="list-style-type: none"> • <code>\$HOME/.local/lib/pythonX.Y/site-packages/lammps</code> 	X.Y depends on the installed Python version

For a system-wide installation those folders would then become.

File	Location	Notes
LAMMPS Python package	<ul style="list-style-type: none"> • <code>/usr/lib/pythonX.Y/site-packages/lammps</code> 	X.Y depends on the installed Python version
LAMMPS shared library	<ul style="list-style-type: none"> • <code>/usr/lib/pythonX.Y/site-packages/lammps</code> 	X.Y depends on the installed Python version

No environment variables need to be set for those, as those folders are searched by default by Python or the LAMMPS Python package.

Changed in version 24Mar2022.

Note

If there is an existing installation of the LAMMPS python module, `make install-python` will try to update it. However, that will fail if the older version of the module was installed by LAMMPS versions until 17Feb2022. Those were using the `distutils` package, which does not create a “manifest” that allows a clean uninstall. The `make install-python` command will always produce a `lammps-<version>-<python>-<abi>-<os>-<arch>.whl` file (the ‘wheel’). And this file can be later installed directly with `python -m pip install <wheel file>.whl` without having to type `make install-python` again and repeating the build step, too.

For the traditional `make` process you can override the python version to version `x.y` when calling `make` with `PYTHON=pythonX.Y`. For a CMake based compilation this choice has to be made during the CMake configuration step.

If the default settings of `make install-python` are not what you want, you can invoke `install.py` from the python directory manually as

```
python install.py -p <python package> -l <shared library> -v <version.h file> [-
→n]
```

- The `-p` flag points to the `lammps` Python package folder to be installed,

- the `-l` flag points to the LAMMPS shared library file to be installed,
- the `-v` flag points to the LAMMPS version header file to extract the version date,
- and the optional `-n` instructs the script to only build a wheel file but not attempt to install it.

Virtual environment

A virtual environment is a minimal Python installation inside of a folder. It allows isolating and customizing a Python environment that is mostly independent from a user or system installation. For the core Python environment, it uses symbolic links to the system installation and thus it can be set up quickly and will not take up much disk space. This gives you the flexibility to install (newer/different) versions of Python packages that would potentially conflict with already installed system packages. It also does not require any superuser privileges. See [PEP 405: Python Virtual Environments](#) for more information.

To create a virtual environment in the folder `$HOME/myenv`, use the `venv` module as follows.

```
# create virtual environment in folder $HOME/myenv
python3 -m venv $HOME/myenv
```

For Python versions prior 3.3 you can use `virtualenv` command instead of “`python3 -m venv`”. This step has to be done only once.

To activate the virtual environment type:

```
source $HOME/myenv/bin/activate
```

This has to be done every time you log in or open a new terminal window and after you turn off the virtual environment with the `deactivate` command.

When using CMake to build LAMMPS, you need to set `CMAKE_INSTALL_PREFIX` to the value of the `$VIRTUAL_ENV` environment variable during the configuration step. For the traditional make procedure, no additional steps are needed. After compiling LAMMPS you can do a “Python package only” installation with `make install-python` and the LAMMPS Python package and the shared library file are installed into the following locations:

File	Location	Notes
LAMMPS Python Module	<ul style="list-style-type: none"> • <code>\$VIRTUAL_ENV/lib/pythonX.Y/site-packages/lammps</code> 	X.Y depends on the installed Python version
LAMMPS shared library	<ul style="list-style-type: none"> • <code>\$VIRTUAL_ENV/lib/pythonX.Y/site-packages/lammps</code> 	X.Y depends on the installed Python version

In place usage

You can also *compile LAMMPS* as usual in “*shared*” mode leave the shared library and Python package inside the source/compilation folders. Instead of copying the files where they can be found, you need to set the environment variables `PYTHONPATH` (for the Python package) and `LD_LIBRARY_PATH` (or `DYLD_LIBRARY_PATH` on macOS

For Bourne shells (bash, ksh and similar) the commands are:

```
export PYTHONPATH=${PYTHONPATH}:${HOME}/lammeps/python
export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:${HOME}/lammeps/src
```

For the C-shells like csh or tcsh the commands are:

```
setenv PYTHONPATH ${PYTHONPATH}:${HOME}/lammeps/python
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:${HOME}/lammeps/src
```

On macOS you may also need to set DYLD_LIBRARY_PATH accordingly. You can make those changes permanent by editing your \$HOME/.bashrc or \$HOME/.login files, respectively.

Note

The PYTHONPATH needs to point to the parent folder that contains the lammeps package!

To verify if LAMMPS can be successfully started from Python, start the Python interpreter, load the lammeps Python module and create a LAMMPS instance. This should not generate an error message and produce output similar to the following:

```
$ python
Python 3.8.5 (default, Sep  5 2020, 10:50:12)
[GCC 10.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> import lammeps
>>> lmp = lammeps.lammeps()
LAMMPS (18 Sep 2020)
using 1 OpenMP thread(s) per MPI task
>>>
```

Note

Unless you opted for “In place use”, you will have to rerun the installation any time you recompile LAMMPS to ensure the latest Python package and shared library are installed and used.

Note

If you want Python to be able to load different versions of the LAMMPS shared library with different settings, you will need to manually copy the files under different names (e.g. liblammeps_mpi.so or liblammeps_gpu.so) into the appropriate folder as indicated above. You can then select the desired library through the *name* argument of the LAMMPS object constructor (see *Creating or deleting a LAMMPS object*).

2.2.2 Extending Python to run in parallel

If you wish to run LAMMPS in parallel from Python, you need to extend your Python with an interface to MPI. This also allows you to make MPI calls directly from Python in your script, if you desire.

We have tested this with [MPI for Python](#) (aka mpi4py) and you will find installation instruction for it below.

Installation of mpi4py (version 3.0.3 as of Sep 2020) can be done as follows:

- Via pip into a local user folder with:

```
pip install --user mpi4py
```

- Via dnf into a system folder for RedHat/Fedora systems:

```
# for use with OpenMPI
sudo dnf install python3-mpi4py-openmpi
# for use with MPICH
sudo dnf install python3-mpi4py-openmpi
```

- Via pip into a virtual environment (see above):

```
$ source $HOME/myenv/activate
(myenv)$ pip install mpi4py
```

- Via pip into a system folder (not recommended):

```
sudo pip install mpi4py
```

For more detailed installation instructions and additional options, please see the [mpi4py installation](#) page.

To use mpi4py and LAMMPS in parallel from Python, you **must** make certain that **both** are using the **same** implementation and version of MPI library. If you only have one MPI library installed on your system this is not an issue, but it can be if you have multiple MPI installations (e.g. on an HPC cluster to be selected through environment modules). Your LAMMPS build is explicit about which MPI it is using, since it is either detected during CMake configuration or in the traditional make build system you specify the details in your low-level `src/MAKE/Makefile.foo` file. The installation process of mpi4py uses the `mpicc` command to find information about the MPI it uses to build against. And it tries to load “libmpi.so” from the `LD_LIBRARY_PATH`. This may or may not find the MPI library that LAMMPS is using. If you have problems running both mpi4py and LAMMPS together, this is an issue you may need to address, e.g. by loading the module for different MPI installation so that mpi4py finds the right one.

If you have successfully installed mpi4py, you should be able to run Python and type

```
from mpi4py import MPI
```

without error. You should also be able to run Python in parallel on a simple test script

```
mpirun -np 4 python3 test.py
```

where `test.py` contains the lines

```
from mpi4py import MPI
comm = MPI.COMM_WORLD
print("Proc %d out of %d procs" % (comm.Get_rank(), comm.Get_size()))
```

and see one line of output for each processor you run on. Please note that the order of the lines is not deterministic

```
$ mpirun -np 4 python3 test.py
Proc 0 out of 4 procs
Proc 1 out of 4 procs
Proc 2 out of 4 procs
Proc 3 out of 4 procs
```

2.3 Run LAMMPS from Python

After compiling the LAMMPS shared library and making it ready to use, you can now write and run Python scripts that import the LAMMPS Python module and launch LAMMPS simulations through Python scripts. The following pages take you through the various steps necessary, what functionality is available and give some examples how to use it.

2.3.1 Running LAMMPS and Python in serial

To run a LAMMPS in serial, type these lines into Python interactively from the `bench` directory:

```
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
```

Or put the same lines in the file `test.py` and run it as

```
python3 test.py
```

Either way, you should see the results of running the `in.lj` benchmark on a single processor appear on the screen, the same as if you had typed something like:

```
lmp_serial -in in.lj
```

2.3.2 Running LAMMPS and Python in parallel with MPI

To run LAMMPS in parallel, assuming you have installed the `mpi4py` package as discussed [Extending Python to run in parallel](#), create a `test.py` file containing these lines:

```
from mpi4py import MPI
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
me = MPI.COMM_WORLD.Get_rank()
nprocs = MPI.COMM_WORLD.Get_size()
print("Proc %d out of %d procs has" % (me,nprocs),lmp)
MPI.Finalize()
```

You can run the script in parallel as:

```
mpirun -np 4 python3 test.py
```

and you should see the same output as if you had typed

```
mpirun -np 4 lmp_mpi -in in.lj
```

Note that without the mpi4py specific lines from `test.py`

```
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
```

running the script with `mpirun` on P processors would lead to P independent simulations to run parallel, each with a single processor. Therefore, if you use the mpi4py lines and you see multiple LAMMPS single processor outputs, mpi4py is not working correctly.

Also note that once you import the mpi4py module, mpi4py initializes MPI for you, and you can use MPI calls directly in your Python script, as described in the mpi4py documentation. The last line of your Python script should be `MPI.finalize()`, to ensure MPI is shut down correctly.

2.3.3 Running Python scripts

Note that any Python script (not just for LAMMPS) can be invoked in one of several ways:

```
python script.py
python -i script.py
./script.py
```

The last command requires that the first line of the script be something like this:

```
#!/usr/bin/python
```

or

```
#!/usr/bin/env python
```

where the path in the first case needs to point to where you have Python installed (the second option is workaround for when this may change), and that you have made the script file executable:

```
chmod +x script.py
```

Without the `-i` flag, Python will exit when the script finishes. With the `-i` flag, you will be left in the Python interpreter when the script finishes, so you can type subsequent commands. As mentioned above, you can only run Python interactively when running Python on a single processor, not in parallel.

2.3.4 Creating or deleting a LAMMPS object

With the Python interface the creation of a *LAMMPS* instance is included in the constructors for the *lammps*, *PyLammps*, and *IPyLammps* classes. Internally it will call either *lammps_open()* or *lammps_open_no_mpi()* from the C library API to create the class instance.

All arguments are optional. The *name* argument allows loading a LAMMPS shared library that is named `liblammps_machine.so` instead of the default name of `liblammps.so`. In most cases the latter will be installed or used. The *ptr* argument is for use of the *lammps* module from inside a LAMMPS instance, e.g. with the *python* command, where a pointer to the already existing *LAMMPS* class instance can be passed to the Python class and used

instead of creating a new instance. The *comm* argument may be used in combination with the `mpi4py` module to pass an MPI communicator to LAMMPS and thus it is possible to run the Python module like the library interface on a subset of the MPI ranks after splitting the communicator.

Here are simple examples using all three Python interfaces:

lammmps API

```
from lammmps import lammmps

# NOTE: argv[0] is set by the lammmps class constructor
args = ["-log", "none"]

# create LAMMPS instance
lmp = lammmps(cmdargs=args)

# get and print numerical version code
print("LAMMPS Version: ", lmp.version())

# explicitly close and delete LAMMPS instance (optional)
lmp.close()
```

PyLammps API

The `PyLammps` class is a wrapper around the `lammmps` class and all of its lower level functions. By default, it will create a new instance of `lammmps` passing along all arguments to the constructor of `lammmps`.

```
from lammmps import PyLammps

# NOTE: argv[0] is set by the lammmps class constructor
args = ["-log", "none"]

# create LAMMPS instance
L = PyLammps(cmdargs=args)

# get and print numerical version code
print("LAMMPS Version: ", L.version())

# explicitly close and delete LAMMPS instance (optional)
L.close()
```

`PyLammps` objects can also be created on top of an existing `lammmps` object:

```
from lammmps import lammmps, PyLammps
...
# create LAMMPS instance
lmp = lammmps(cmdargs=args)

# create PyLammps instance using previously created LAMMPS instance
L = PyLammps(ptr=lmp)
```

This is useful if you have to create the `lammmps` instance in a specific way, but want to take advantage

of the *PyLammps* interface.

IPyLammps API

The *IPyLammps* class is an extension of the *PyLammps* class. It has the same construction behavior. By default, it will create a new instance of *lammps* passing along all arguments to the constructor of *lammps*.

```
from lammps import IPyLammps

# NOTE: argv[0] is set by the lammps class constructor
args = ["-log", "none"]

# create LAMMPS instance
L = IPyLammps(cmdargs=args)

# get and print numerical version code
print("LAMMPS Version: ", L.version())

# explicitly close and delete LAMMPS instance (optional)
L.close()
```

You can also initialize *IPyLammps* on top of an existing *lammps* or *PyLammps* object:

```
from lammps import lammps, IPyLammps
...
# create LAMMPS instance
lmp = lammps(cmdargs=args)

# create PyLammps instance using previously created LAMMPS instance
L = PyLammps(ptr=lmp)
```

This is useful if you have to create the *lammps* instance in a specific way, but want to take advantage of the *IPyLammps* interface.

In all of the above cases, same as with the *C library API*, this will use the `MPI_COMM_WORLD` communicator for the MPI library that LAMMPS was compiled with.

The `lmp.close()` call is optional since the LAMMPS class instance will also be deleted automatically during the *lammps* class destructor. Instead of `lmp.close()` it is also possible to call `lmp.finalize()`; this will destruct the LAMMPS instance, but also finalized and release the MPI and/or Kokkos environment if enabled and active.

Note that you can create multiple LAMMPS objects in your Python script, and coordinate and run multiple simulations, e.g.

```
from lammps import lammps
lmp1 = lammps()
lmp2 = lammps()
lmp1.file("in.file1")
lmp2.file("in.file2")
```

2.3.5 Executing commands

Once an instance of the *lammps*, *PyLammps*, or *IPyLammps* class is created, there are multiple ways to “feed” it commands. In a way that is not very different from running a LAMMPS input script, except that Python has many more facilities for structured programming than the LAMMPS input script syntax. Furthermore it is possible to “compute” what the next LAMMPS command should be.

lammps API

Same as in the equivalent *C library functions*, commands can be read from a file, a single string, a list of strings and a block of commands in a single multi-line string. They are processed under the same boundary conditions as the C library counterparts. The example below demonstrates the use of `lammps.file()`, `lammps.command()`, `lammps.commands_list()`, and `lammps.commands_string()`:

```
from lammps import lammps
lmp = lammps()

# read commands from file 'in.melt'
lmp.file('in.melt')

# issue a single command
lmp.command('variable zpos index 1.0')

# create 10 groups with 10 atoms each
cmds = ["group g{} id {}:{}".format(i, 10*i+1, 10*(i+1)) for i in range(10)]
lmp.commands_list(cmds)

# run commands from a multi-line string
block = """
clear
region box block 0 2 0 2 0 2
create_box 1 box
create_atoms 1 single 1.0 1.0 ${zpos}
"""
lmp.commands_string(block)
```

PyLammps/IPyLammps API

Unlike the *lammps* API, the *PyLammps*/*IPyLammps* APIs allow running LAMMPS commands by calling equivalent member functions of *PyLammps* and *IPyLammps* instances.

For instance, the following LAMMPS command

```
region box block 0 10 0 5 -0.5 0.5
```

can be executed using with the *lammps* API with the following Python code if `lmp` is an instance of *lammps*:

```
from lammps import lammps

lmp = lammps()
lmp.command("region box block 0 10 0 5 -0.5 0.5")
```

With the PyLammps interface, any LAMMPS command can be split up into arbitrary parts. These parts are then passed to a member function with the name of the *command*. For the *region* command that means the `region()` method can be called. The arguments of the command can be passed as one string, or individually.

```
from lammps import PyLammps

L = PyLammps()

# pass command parameters as one string
L.region("box block 0 10 0 5 -0.5 0.5")

# OR pass them individually
L.region("box block", 0, 10, 0, 5, -0.5, 0.5)
```

In the latter example, all parameters except the first are Python floating-point literals. The member function takes the entire parameter list and transparently merges it to a single command string.

The benefit of this approach is avoiding redundant command calls and easier parameterization. In the lammps API parameterization needed to be done manually by creating formatted command strings.

```
lmp.command("region box block %f %f %f %f %f %f" % (xlo, xhi, ylo, yhi, zlo,
→ zhi))
```

In contrast, methods of PyLammps accept parameters directly and will convert them automatically to a final command string.

```
L.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```

Using these facilities, the example shown for the lammps API can be rewritten as follows:

```
from lammps import PyLammps
L = PyLammps()

# read commands from file 'in.melt'
L.file('in.melt')

# issue a single command
L.variable('zpos', 'index', 1.0)

# create 10 groups with 10 atoms each
for i in range(10):
    L.group(f"g{i}", "id", f"{10*i+1}:{10*(i+1)}")

L.clear()
L.region("box block", 0, 2, 0, 2, 0, 2)
L.create_box(1, "box")
L.create_atoms(1, "single", 1.0, 1.0, "${zpos}")
```

2.3.6 System properties

Similar to what is described in *System properties*, the instances of *lammmps*, *PyLammmps*, or *IPyLammmps* can be used to extract different kinds of information about the active LAMMPS instance and also to modify some of it. The main difference between the interfaces is how the information is exposed.

While the *lammmps* is just a thin layer that wraps C API calls, *PyLammmps* and *IPyLammmps* expose information as objects and properties.

In some cases the data returned is a direct reference to the original data inside LAMMPS cast to *ctypes* pointers. Where possible, the wrappers will determine the *ctypes* data type and cast pointers accordingly. If *numpy* is installed arrays can also be extracted as *numpy* arrays, which will access the C arrays directly and have the correct dimensions to protect against invalid accesses.

Warning

When accessing per-atom data, please note that this data is the per-processor local data and indexed accordingly. These arrays can change sizes and order at every neighbor list rebuild and atom sort event as atoms are migrating between subdomains.

lammmps API

```
from lammmps import lammmps

lmp = lammmps()
lmp.file("in.sysinit")

natoms = lmp.get_natoms()
print(f"running simulation with {natoms} atoms")

lmp.command("run 1000 post no");

for i in range(10):
    lmp.command("run 100 pre no post no")
    pe = lmp.get_thermo("pe")
    ke = lmp.get_thermo("ke")
    print(f"PE = {pe}\nKE = {ke}")

lmp.close()
```

Methods:

- *version()*: return the numerical version id, e.g. LAMMPS 2 Sep 2015 -> 20150902
- *get_thermo()*: return current value of a thermo keyword
- *last_thermo()*: return a dictionary of the last thermodynamic output
- *get_natoms()*: total # of atoms as int
- *reset_box()*: reset the simulation box size
- *extract_setting()*: return a global setting
- *extract_global()*: extract a global quantity
- *extract_box()*: extract box info
- *create_atoms()*: create N atoms with IDs, types, x, v, and image flags

Properties:

- *last_thermo_step*: the last timestep thermodynamic output was computed

PyLammps/IPyLammps API

In addition to the functions provided by *lammps*, *PyLammps* objects have several properties which allow you to query the system state:

L.system

Is a dictionary describing the system such as the bounding box or number of atoms

L.system.xlo, L.system.xhi

bounding box limits along x-axis

L.system.ylo, L.system.yhi

bounding box limits along y-axis

L.system.zlo, L.system.zhi

bounding box limits along z-axis

L.communication

configuration of communication subsystem, such as the number of threads or processors

L.communication.nthreads

number of threads used by each LAMMPS process

L.communication.nprocs

number of MPI processes used by LAMMPS

L.fixes

List of fixes in the current system

L.computes

List of active computes in the current system

L.dumps

List of active dumps in the current system

L.groups

List of groups present in the current system

Retrieving the value of an arbitrary LAMMPS expressions

LAMMPS expressions can be immediately evaluated by using the `eval` method. The passed string parameter can be any expression containing global *thermo command* values, variables, compute or fix data (see *Output from LAMMPS (thermo, dumps, computes, fixes, variables)*):

```
result = L.eval("ke") # kinetic energy
result = L.eval("pe") # potential energy

result = L.eval("v_t/2.0")
```

Example

```
from lammps import PyLammps

L = PyLammps()
L.file("in.sysinit")

print(f"running simulation with {L.system.natoms} atoms")

L.run(1000, "post no");

for i in range(10):
    L.run(100, "pre no post no")
    pe = L.eval("pe")
    ke = L.eval("ke")
    print(f"PE = {pe}\nKE = {ke}")
```

2.3.7 Per-atom properties

Similar to what is described in *Per-atom properties*, the instances of *lammps*, *PyLammps*, or *IPyLammps* can be used to extract atom quantities and modify some of them. The main difference between the interfaces is how the information is exposed.

While the *lammps* is just a thin layer that wraps C API calls, *PyLammps* and *IPyLammps* expose information as objects and properties.

In some cases the data returned is a direct reference to the original data inside LAMMPS cast to `ctypes` pointers. Where possible, the wrappers will determine the `ctypes` data type and cast pointers accordingly. If `numpy` is installed arrays can also be extracted as numpy arrays, which will access the C arrays directly and have the correct dimensions to protect against invalid accesses.

Warning

When accessing per-atom data, please note that this data is the per-processor local data and indexed accordingly. These arrays can change sizes and order at every neighbor list rebuild and atom sort event as atoms are migrating between subdomains.

lammps API

```
from lammps import lammps

lmp = lammps()
lmp.file("in.sysinit")

nlocal = lmp.extract_global("nlocal")
x = lmp.extract_atom("x")

for i in range(nlocal):
    print("(x,y,z) = (" , x[i][0], x[i][1], x[i][2], ")")

lmp.close()
```

Methods:

- `extract_atom()`: extract a per-atom quantity

Numpy Methods:

- `numpy.extract_atom()`: extract a per-atom quantity as numpy array

PyLammps/IPyLammps API

All atoms in the current simulation can be accessed by using the `PyLammps.atoms` property. Each element of this list is a `Atom` or `Atom2D` object. The attributes of these objects provide access to their data (id, type, position, velocity, force, etc.):

```
# access first atom
L.atoms[0].id
L.atoms[0].type

# access second atom
L.atoms[1].position
L.atoms[1].velocity
L.atoms[1].force
```

Some attributes can be changed:

```
# set position in 2D simulation
L.atoms[0].position = (1.0, 0.0)

# set position in 3D simulation
L.atoms[0].position = (1.0, 0.0, 1.0)
```

2.3.8 Compute, fixes, variables

This section documents accessing or modifying data from objects like computes, fixes, or variables in LAMMPS using the `lammps` module.

lammps API

For `lammps.extract_compute()` and `lammps.extract_fix()`, the global, per-atom, or local data calculated by the compute or fix can be accessed. What is returned depends on whether the compute or fix calculates a scalar or vector or array. For a scalar, a single double value is returned. If the compute or fix calculates a vector or array, a pointer to the internal LAMMPS data is returned, which you can use via normal Python subscripting.

The one exception is that for a fix that calculates a global vector or array, a single double value from the vector or array is returned, indexed by I (vector) or I and J (array). I,J are zero-based indices. See the [Howto output](#) page for a discussion of global, per-atom, and local data, and of scalar, vector, and array data types. See the doc pages for individual [computes](#) and [fixes](#) for a description of what they calculate and store.

For `lammps.extract_variable()`, an *equal-style or atom-style variable* is evaluated and its result returned.

For equal-style variables a single `c_double` value is returned and the group argument is ignored. For atom-style variables, a vector of `c_double` is returned, one value per atom, which you can use via normal Python subscripting. The values will be zero for atoms not in the specified group.

`lammps.numpy.extract_compute()`, `lammps.numpy.extract_fix()`, and `lammps.numpy.extract_variable()` are equivalent NumPy implementations that return NumPy arrays instead of ctypes pointers.

The `lammmps.set_variable()` method sets an existing string-style variable to a new string value, so that subsequent LAMMPS commands can access the variable.

Methods:

- `lammmps.extract_compute()`: extract value(s) from a compute
- `lammmps.extract_fix()`: extract value(s) from a fix
- `lammmps.extract_variable()`: extract value(s) from a variable
- `lammmps.set_variable()`: set existing named string-style variable to value

NumPy Methods:

- `lammmps.numpy.extract_compute()`: extract value(s) from a compute, return arrays as numpy arrays
- `lammmps.numpy.extract_fix()`: extract value(s) from a fix, return arrays as numpy arrays
- `lammmps.numpy.extract_variable()`: extract value(s) from a variable, return arrays as numpy arrays

PyLammps/IPyLammps API

PyLammps and IPyLammps classes currently do not add any additional ways of retrieving information out of computes and fixes. This information can still be accessed by using the lammps API:

```
L.lmp.extract_compute(...)
L.lmp.extract_fix(...)
# OR
L.lmp.numpy.extract_compute(...)
L.lmp.numpy.extract_fix(...)
```

LAMMPS variables can be both defined and accessed via the `PyLammps` interface.

To define a variable you can use the `variable` command:

```
L.variable("a index 2")
```

A dictionary of all variables is returned by the `PyLammps.variables` property:

you can access an individual variable by retrieving a variable object from the `L.variables` dictionary by name

```
a = L.variables['a']
```

The variable value can then be easily read and written by accessing the `value` property of this object.

```
print(a.value)
a.value = 4
```

2.3.9 Scatter/gather operations

```

data = lmp.gather_atoms(name,type,count) # return per-atom property of all atoms,
↳gathered into data, ordered by atom ID
                                # name = "x", "charge", "type", etc
data = lmp.gather_atoms_concat(name,type,count) # ditto, but concatenated atom values,
↳from each proc (unordered)
data = lmp.gather_atoms_subset(name,type,count,ndata,ids) # ditto, but for subset of,
↳Ndata atoms with IDs

lmp.scatter_atoms(name,type,count,data) # scatter per-atom property to all atoms from,
↳data, ordered by atom ID
                                # name = "x", "charge", "type", etc
                                # count = # of per-atom values, 1 or 3, etc

lmp.scatter_atoms_subset(name,type,count,ndata,ids,data) # ditto, but for subset of,
↳Ndata atoms with IDs

```

The gather methods collect peratom info of the requested type (atom coords, atom types, forces, etc) from all processors, and returns the same vector of values to each calling processor. The scatter functions do the inverse. They distribute a vector of peratom values, passed by all calling processors, to individual atoms, which may be owned by different processors.

Note that the data returned by the gather methods, e.g. `gather_atoms("x")`, is different from the data structure returned by `extract_atom("x")` in four ways. (1) `Gather_atoms()` returns a vector which you index as `x[i]`; `extract_atom()` returns an array which you index as `x[i][j]`. (2) `Gather_atoms()` orders the atoms by atom ID while `extract_atom()` does not. (3) `Gather_atoms()` returns a list of all atoms in the simulation; `extract_atoms()` returns just the atoms local to each processor. (4) Finally, the `gather_atoms()` data structure is a copy of the atom coords stored internally in LAMMPS, whereas `extract_atom()` returns an array that effectively points directly to the internal data. This means you can change values inside LAMMPS from Python by assigning a new values to the `extract_atom()` array. To do this with the `gather_atoms()` vector, you need to change values in the vector, then invoke the `scatter_atoms()` method.

For the scatter methods, the array of coordinates passed to must be a ctypes vector of ints or doubles, allocated and initialized something like this:

```

from ctypes import c_double
natoms = lmp.get_natoms()
n3 = 3*natoms
x = (n3*c_double)()
x[0] = x coord of atom with ID 1
x[1] = y coord of atom with ID 1
x[2] = z coord of atom with ID 1
x[3] = x coord of atom with ID 2
...
x[n3-1] = z coord of atom with ID natoms
lmp.scatter_atoms("x", 1, 3, x)

```

The coordinates can also be provided as arguments to the initializer of x:

```

from ctypes import c_double
natoms = 2
n3 = 3*natoms
# init in constructor
x = (n3*c_double)(0.0, 0.0, 0.0, 1.0, 1.0, 1.0)

```

(continues on next page)

(continued from previous page)

```

lmp.scatter_atoms("x", 1, 3, x)
# or using a list
coords = [1.0, 2.0, 3.0, -3.0, -2.0, -1.0]
x = (c_double*len(coords))(*coords)

```

Alternatively, you can just change values in the vector returned by the gather methods, since they are also ctypes vectors.

2.3.10 Neighbor list access

Access to neighbor lists is handled through a couple of wrapper classes that allows to treat it like either a python list or a NumPy array. The access procedure is similar to that of the C-library interface: use one of the “find” functions to look up the index of the neighbor list in the global table of neighbor lists and then get access to the neighbor list data. The code sample below demonstrates reading the neighbor list data using the NumPy access method.

```

from lammps import lammps
import numpy as np

lmp = lammps()
lmp.commands_string("""
region box block -2 2 -2 2 -2 2
lattice fcc 1.0
create_box 1 box
create_atoms 1 box
mass 1 1.0
pair_style lj/cut 2.5
pair_coeff 1 1 1.0 1.0
run 0 post no""")

# look up the neighbor list
nidx = lmp.find_pair_neighlist('lj/cut')
nl = lmp.numpy.get_neighlist(nidx)
tags = lmp.extract_atom('id')
print("half neighbor list with {} entries".format(nl.size))
# print neighbor list contents
for i in range(0,nl.size):
    idx, nlist = nl.get(i)
    print("\natom {} with ID {} has {} neighbors:".format(idx,tags[idx],nlist.size))
    if nlist.size > 0:
        for n in np.nditer(nlist):
            print("  atom {} with ID {}".format(n,tags[n]))

```

Another example for extracting a full neighbor list without evaluating a potential is shown below.

```

from lammps import lammps
import numpy as np

lmp = lammps()
lmp.commands_string("""
newton off
region box block -2 2 -2 2 -2 2
lattice fcc 1.0
create_box 1 box

```

(continues on next page)

(continued from previous page)

```

create_atoms 1 box
mass 1 1.0
pair_style zero 1.0 full
pair_coeff * *
run 0 post no""")

# look up the neighbor list
nlist = lmp.find_pair_neighlist('zero')
nl = lmp.numpy.get_neighlist(nlist)
tags = lmp.extract_atom('id')
print("full neighbor list with {} entries".format(nl.size))
# print neighbor list contents
for i in range(0,nl.size):
    idx, nlist = nl.get(i)
    print("\natom {} with ID {} has {} neighbors:".format(idx,tags[idx],nlist.size))
    if nlist.size > 0:
        for n in np.nditer(nlist):
            pass
            print(" atom {} with ID {}".format(n,tags[n]))

```

Methods:

- `lammops.get_neighlist()`: Get neighbor list for given index
- `lammops.get_neighlist_size()`: Get number of elements in neighbor list
- `lammops.get_neighlist_element_neighbors()`: Get element in neighbor list and its neighbors
- `lammops.find_pair_neighlist()`: Find neighbor list of pair style
- `lammops.find_fix_neighlist()`: Find neighbor list of pair style
- `lammops.find_compute_neighlist()`: Find neighbor list of pair style

NumPy Methods:

- `lammops.numpy.get_neighlist()`: Get neighbor list for given index, which uses NumPy arrays for its element neighbor arrays
- `lammops.numpy.get_neighlist_element_neighbors()`: Get element in neighbor list and its neighbors (as numpy array)

2.3.11 Configuration information

The following methods can be used to query the LAMMPS library about compile time settings and included packages and styles.

Listing 1: Example for using configuration settings functions

```

from lammops import lammops

lmp = lammops()

try:
    lmp.file("in.missing")
except Exception as e:

```

(continues on next page)

(continued from previous page)

```
print("LAMMPS failed with error:", e)

# write compressed dump file depending on available of options

if lmp.has_style("dump", "atom/zstd"):
    lmp.command("dump d1 all atom/zstd 100 dump.zst")
elif lmp.has_style("dump", "atom/gz"):
    lmp.command("dump d1 all atom/gz 100 dump.gz")
elif lmp.has_gzip_support():
    lmp.command("dump d1 all atom 100 dump.gz")
else:
    lmp.command("dump d1 all atom 100 dump")
```

Methods:

- `lammops.has_mpi_support`
- `lammops.has_exceptions`
- `lammops.has_gzip_support`
- `lammops.has_png_support`
- `lammops.has_jpeg_support`
- `lammops.has_ffmpeg_support`
- `lammops.installed_packages`
- `lammops.get_accelerator_config`
- `lammops.has_style()`
- `lammops.available_styles()`

2.4 The `lammops` Python module

The LAMMPS Python interface is implemented as a module called `lammops` which is defined in the `lammops` package in the `python` folder of the LAMMPS source code distribution. After compilation of LAMMPS, the module can be installed into a Python system folder or a user folder with `make install-python`. Components of the module can then loaded into a Python session with the `import` command.

There are multiple Python interface classes in the `lammops` module:

- the `lammops` class. This is a wrapper around the C-library interface and its member functions try to replicate the *C-library API* closely. This is the most feature-complete Python API.
- the `PyLammops` class. This is a more high-level and more Python style class implemented on top of the `lammops` class.
- the `IPyLammops` class is derived from `PyLammops` and adds embedded graphics features to conveniently include LAMMPS into Jupyter notebooks.

Version check

The `lammops` module stores the version number of the LAMMPS version it is installed from. When initializing the `lammops` class, this version is checked to be the same as the result from `lammops.version()`, the version of the LAMMPS shared library that the module interfaces to. If they are not the same an `AttributeError` exception is raised since a mismatch of versions (e.g. due to incorrect use of the `LD_LIBRARY_PATH` or `PYTHONPATH` environment variables) can lead to crashes or data corruption and otherwise incorrect behavior.

LAMMPS module global members:

`lammops.__version__`

Numerical representation of the LAMMPS version this module was taken from. Has the same format as the result of `lammops.version()`.

2.4.1 The `lammops` class API

The `lammops` class is the core of the LAMMPS Python interfaces. It is a wrapper around the *LAMMPS C library API* using the `Python ctypes module` and a shared library compiled from the LAMMPS source code. The individual methods in this class try to closely follow the corresponding C functions. The handle argument that needs to be passed to the C functions is stored internally in the class and automatically added when calling the C library functions. Below is a detailed documentation of the API.

class `lammops.lammops(name="", cmdargs=None, ptr=None, comm=None)`

Create an instance of the LAMMPS Python class.

This is a Python wrapper class that exposes the LAMMPS C-library interface to Python. It either requires that LAMMPS has been compiled as shared library which is then dynamically loaded via the `ctypes` Python module or that this module is called from a Python function that is called from a Python interpreter embedded into a LAMMPS executable, for example through the `python invoke` command. When the class is instantiated it calls the `lammops_open()` function of the LAMMPS C-library interface, which in turn will create an instance of the *LAMMPS C++ class*. The handle to this C++ class is stored internally and automatically passed to the calls to the C library interface.

Parameters

- **name** (*string*) – “machine” name of the shared LAMMPS library (“mpi” loads `liblammops_mpi.so`, “” loads `liblammops.so`)
- **cmdargs** (*list*) – list of command line arguments to be passed to the `lammops_open()` function. The executable name is automatically added.
- **ptr** (*pointer*) – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
- **comm** (*MPI_Comm*) – MPI communicator (as provided by `mpi4py`). None means use `MPI_COMM_WORLD` implicitly.

property `numpy`

Return object to access numpy versions of API

It provides alternative implementations of API functions that return numpy arrays instead of `ctypes` pointers. If numpy is not installed, accessing this property will lead to an `ImportError`.

Returns

instance of numpy wrapper object

Return type*numpy_wrapper***close()**

Explicitly delete a LAMMPS instance through the C-library interface.

This is a wrapper around the *lammps_close()* function of the C-library interface.

finalize()

Shut down the MPI communication and Kokkos environment (if active) through the library interface by calling *lammps_mpi_finalize()* and *lammps_kokkos_finalize()*.

You cannot create or use any LAMMPS instances after this function is called unless LAMMPS was compiled without MPI and without Kokkos support.

error(*error_type*, *error_text*)

Forward error to the LAMMPS Error class.

Added in version 3Nov2022.

This is a wrapper around the *lammps_error()* function of the C-library interface.

Parameters

- **error_type** (*int*)
- **error_text** (*string*)

version()

Return a numerical representation of the LAMMPS version in use.

This is a wrapper around the *lammps_version()* function of the C-library interface.

Returns

version number

Return type

int

get_os_info()

Return a string with information about the OS and compiler runtime

This is a wrapper around the *lammps_get_os_info()* function of the C-library interface.

Returns

OS info string

Return type

string

get_mpi_comm()

Get the MPI communicator in use by the current LAMMPS instance

This is a wrapper around the *lammps_get_mpi_comm()* function of the C-library interface. It will return *None* if either the LAMMPS library was compiled without MPI support or the mpi4py Python module is not available.

Returns

MPI communicator

Return type

MPI_Comm

file(*path*)

Read LAMMPS commands from a file.

This is a wrapper around the `lammps_file()` function of the C-library interface. It will open the file with the name/path *file* and process the LAMMPS commands line by line until the end. The function will return when the end of the file is reached.

Parameters

path (*string*) – Name of the file/path with LAMMPS commands

command(*cmd*)

Process a single LAMMPS input command from a string.

This is a wrapper around the `lammps_command()` function of the C-library interface.

Parameters

cmd (*string*) – a single lammps command

commands_list(*cmdlist*)

Process multiple LAMMPS input commands from a list of strings.

This is a wrapper around the `lammps_commands_list()` function of the C-library interface.

Parameters

cmdlist (*list of strings*) – a single lammps command

commands_string(*multicmd*)

Process a block of LAMMPS input commands from a string.

This is a wrapper around the `lammps_commands_string()` function of the C-library interface.

Parameters

multicmd (*string*) – text block of lammps commands

get_natoms()

Get the total number of atoms in the LAMMPS instance.

Will be precise up to 53-bit signed integer due to the underlying `lammps_get_natoms()` function returning a double.

Returns

number of atoms

Return type

int

extract_box()

Extract simulation box parameters

This is a wrapper around the `lammps_extract_box()` function of the C-library interface. Unlike in the C function, the result is returned as a list.

Returns

list of the extracted data: boxlo, boxhi, xy, yz, xz, periodicity, box_change

Return type

[3*double, 3*double, double, double, 3*int, int]

reset_box(*boxlo*, *boxhi*, *xy*, *yz*, *xz*)

Reset simulation box parameters

This is a wrapper around the `lammps_reset_box()` function of the C-library interface.

Parameters

- **boxlo** (*list of 3 floating point numbers*) – new lower box boundaries
- **boxhi** (*list of 3 floating point numbers*) – new upper box boundaries
- **xy** (*float*) – xy tilt factor
- **yz** (*float*) – yz tilt factor
- **xz** (*float*) – xz tilt factor

get_thermo(*name*)

Get current value of a thermo keyword

This is a wrapper around the [`lammops_get_thermo\(\)`](#) function of the C-library interface.

Parameters

name (*string*) – name of thermo keyword

Returns

value of thermo keyword

Return type

double or None

property last_thermo_step

Get the last timestep where thermodynamic data was computed

Returns

the timestep or a negative number if there has not been any thermo output yet

Return type

int

last_thermo()

Get a dictionary of the last thermodynamic output

This is a wrapper around the [`lammops_last_thermo\(\)`](#) function of the C-library interface. It collects the cached thermo data from the last timestep into a dictionary. The return value is None, if there has not been any thermo output yet.

Returns

a dictionary containing the last computed thermo output values

Return type

dict or None

extract_setting(*name*)

Query LAMMPS about global settings that can be expressed as an integer.

This is a wrapper around the [`lammops_extract_setting\(\)`](#) function of the C-library interface. Its documentation includes a list of the supported keywords.

Parameters

name (*string*) – name of the setting

Returns

value of the setting

Return type

int

extract_global_datatype(*name*)

Retrieve global property datatype from LAMMPS

This is a wrapper around the `lammps_extract_global_datatype()` function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns `None` if the keyword is not recognized. Otherwise it will return a positive integer value that corresponds to one of the *data type* constants defined in the `lammps` module.

Parameters

name (*string*) – name of the property

Returns

data type of global property, see *Data Types*

Return type

int

extract_global(*name*, *dtype=None*)

Query LAMMPS about global settings of different types.

This is a wrapper around the `lammps_extract_global()` function of the C-library interface. Since there are no pointers in Python, this method will - unlike the C function - return the value or a list of values. The `lammps_extract_global()` documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library. You can also force a specific data type. For that purpose the `lammps` module contains *data type* constants. This function returns `None` if either the keyword is not recognized, or an invalid data type constant is used.

Parameters

- **name** (*string*) – name of the property
- **dtype** (*int*, *optional*) – data type of the returned data (see *Data Types*)

Returns

value of the property or list of values or `None`

Return type

int, float, list, or `NoneType`

extract_pair_dimension(*name*)

Retrieve pair style property dimensionality from LAMMPS

Added in version TBD.

This is a wrapper around the `lammps_extract_pair_dimension()` function of the C-library interface. The list of supported keywords depends on the pair style. This function returns `None` if the keyword is not recognized.

Parameters

name (*string*) – name of the property

Returns

dimensionality of the extractable data (typically 0, 1, or 2)

Return type

int

extract_pair(*name*)

Extract pair style data from LAMMPS.

Added in version TBD.

This is a wrapper around the `lammops_extract_pair()` function of the C-library interface. Since there are no pointers in Python, this method will - unlike the C function - return the value or a list of values. Since Python needs to know the dimensionality to be able to interpret the result, this function will detect the dimensionality by asking the library. This function returns `None` if the keyword is not recognized.

Parameters

name (*string*) – name of the property

Returns

value of the property or list of values or `None`

Return type

float, list of float, list of list of floats, or `NoneType`

map_atom(*id*)

Map a global atom ID (aka tag) to the local atom index

This is a wrapper around the `lammops_map_atom()` function of the C-library interface.

Parameters

id (*int*) – atom ID

Returns

local index

Return type

`int`

extract_atom_datatype(*name*)

Retrieve per-atom property datatype from LAMMPS

This is a wrapper around the `lammops_extract_atom_datatype()` function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns `None` if the keyword is not recognized. Otherwise it will return an integer value that corresponds to one of the *data type* constants defined in the `lammops` module.

Parameters

name (*string*) – name of the property

Returns

data type of per-atom property (see *Data Types*)

Return type

`int`

extract_atom(*name*, *dtype=None*)

Retrieve per-atom properties from LAMMPS

This is a wrapper around the `lammops_extract_atom()` function of the C-library interface. Its documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library. You can also force a specific data type by setting `dtype` to one of the *data type* constants defined in the `lammops` module. This function returns `None` if either the keyword is not recognized, or an invalid data type constant is used.

Note

While the returned arrays of per-atom data are dimensioned for the range `[0:nmax]` - as is the underlying storage - the data is usually only valid for the range of `[0:nlocal]`, unless the property of interest is

also updated for ghost atoms. In some cases, this depends on a LAMMPS setting, see for example *comm_modify vel yes*.

Parameters

- **name** (*string*) – name of the property
- **dtype** (*int*, *optional*) – data type of the returned data (see [Data Types](#))

Returns

requested data or None

Return type

ctypes.POINTER(ctypes.c_int32), ctypes.POINTER(ctypes.POINTER(ctypes.c_int32)),
ctypes.POINTER(ctypes.c_int64), ctypes.POINTER(ctypes.POINTER(ctypes.c_int64)),
ctypes.POINTER(ctypes.c_double), ctypes.POINTER(ctypes.POINTER(ctypes.c_double)),
or NoneType

extract_compute(*cid*, *cstyle*, *ctype*)

Retrieve data from a LAMMPS compute

This is a wrapper around the `lammops_extract_compute()` function of the C-library interface. This function returns None if either the compute id is not recognized, or an invalid combination of *cstyle* and *ctype* constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, otherwise a pointer.

Parameters

- **cid** (*string*) – compute ID
- **cstyle** (*int*) – style of the data retrieve (global, atom, or local), see [Style Constants](#)
- **ctype** (*int*) – type or size of the returned data (scalar, vector, or array), see [Type Constants](#)

Returns

requested data as scalar, pointer to 1d or 2d double array, or None

Return type

c_double, ctypes.POINTER(c_double), ctypes.POINTER(ctypes.POINTER(c_double)), or
NoneType

extract_fix(*fid*, *fstyle*, *ftype*, *nrow=0*, *ncol=0*)

Retrieve data from a LAMMPS fix

This is a wrapper around the `lammops_extract_fix()` function of the C-library interface. This function returns None if either the fix id is not recognized, or an invalid combination of *fstyle* and *ftype* constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, also when accessing global vectors or arrays, otherwise a pointer.

Note

When requesting global data, the fix data can only be accessed one item at a time without access to the whole vector or array. Thus this function will always return a scalar. To access vector or array elements the “nrow” and “ncol” arguments need to be set accordingly (they default to 0).

Parameters

- **fid** (*string*) – fix ID
- **fstyle** (*int*) – style of the data retrieve (global, atom, or local), see [Style Constants](#)
- **ftype** (*int*) – type or size of the returned data (scalar, vector, or array), see [Type Constants](#)
- **nrow** (*int*) – index of global vector element or row index of global array element
- **ncol** (*int*) – column index of global array element

Returns

requested data or None

Return type

c_double, ctypes.POINTER(c_double), ctypes.POINTER(ctypes.POINTER(c_double)), or NoneType

extract_variable(*name, group=None, vartype=None*)

Evaluate a LAMMPS variable and return its data

This function is a wrapper around the function [lammps_extract_variable\(\)](#) of the C library interface, evaluates variable name and returns a copy of the computed data. The memory temporarily allocated by the C-interface is deleted after the data is copied to a Python variable or list. The variable must be either an equal-style (or equivalent) variable or an atom-style variable. The variable type can be provided as the *vartype* parameter, which may be one of several constants: LMP_VAR_EQUAL, LMP_VAR_ATOM, LMP_VAR_VECTOR, or LMP_VAR_STRING. If omitted or None, LAMMPS will determine its value for you based on a call to [lammps_extract_variable_datatype\(\)](#) from the C library interface. The *group* parameter is only used for atom-style variables and defaults to the group “all”.

Parameters

- **name** (*string*) – name of the variable to execute
- **group** (*string, only for atom-style variables*) – name of group for atom-style variable
- **vartype** (*int*) – type of variable, see [Variable Type Constants](#)

Returns

the requested data

Return type

c_double, (c_double), or NoneType

flush_buffers()

Flush output buffers

This is a wrapper around the [lammps_flush_buffers\(\)](#) function of the C-library interface.

set_variable(*name, value*)

Set a new value for a LAMMPS string style variable

Deprecated since version 7Feb2024.

This is a wrapper around the [lammps_set_variable\(\)](#) function of the C-library interface.

Parameters

- **name** (*string*) – name of the variable
- **value** (*any. will be converted to a string*) – new variable value

Returns

either 0 on success or -1 on failure

Return type

int

set_string_variable(name, value)

Set a new value for a LAMMPS string style variable

Added in version 7Feb2024.

This is a wrapper around the `lammps_set_string_variable()` function of the C-library interface.

Parameters

- **name** (*string*) – name of the variable
- **value** (*any. will be converted to a string*) – new variable value

Returns

either 0 on success or -1 on failure

Return type

int

set_internal_variable(name, value)

Set a new value for a LAMMPS internal style variable

Added in version 7Feb2024.

This is a wrapper around the `lammps_set_internal_variable()` function of the C-library interface.

Parameters

- **name** (*string*) – name of the variable
- **value** (*float or compatible. will be converted to float*) – new variable value

Returns

either 0 on success or -1 on failure

Return type

int

gather_bonds()

Retrieve global list of bonds

Added in version 28Jul2021.

This is a wrapper around the `lammps_gather_bonds()` function of the C-library interface.

This function returns a tuple with the number of bonds and a flat list of ctypes integer values with the bond type, bond atom1, bond atom2 for each bond.

Returns

a tuple with the number of bonds and a list of c_int or c_long

Return type

(int, 3*nbonds*c_tagint)

gather_angles()

Retrieve global list of angles

Added in version 8Feb2023.

This is a wrapper around the `lammps_gather_angles()` function of the C-library interface.

This function returns a tuple with the number of angles and a flat list of ctypes integer values with the angle type, angle atom1, angle atom2, angle atom3 for each angle.

Returns

a tuple with the number of angles and a list of c_int or c_long

Return type

(int, 4*nangles*c_tagint)

gather_dihedrals()

Retrieve global list of dihedrals

Added in version 8Feb2023.

This is a wrapper around the [`lammops_gather_dihedrals\(\)`](#) function of the C-library interface.

This function returns a tuple with the number of dihedrals and a flat list of ctypes integer values with the dihedral type, dihedral atom1, dihedral atom2, dihedral atom3, dihedral atom4 for each dihedral.

Returns

a tuple with the number of dihedrals and a list of c_int or c_long

Return type

(int, 5*ndihedrals*c_tagint)

gather_impropers()

Retrieve global list of impropers

Added in version 8Feb2023.

This is a wrapper around the [`lammops_gather_impropers\(\)`](#) function of the C-library interface.

This function returns a tuple with the number of impropers and a flat list of ctypes integer values with the improper type, improper atom1, improper atom2, improper atom3, improper atom4 for each improper.

Returns

a tuple with the number of impropers and a list of c_int or c_long

Return type

(int, 5*nimpropers*c_tagint)

encode_image_flags(ix, iy, iz)

convert 3 integers with image flags for x-, y-, and z-direction into a single integer like it is used internally in LAMMPS

This method is a wrapper around the [`lammops_encode_image_flags\(\)`](#) function of library interface.

Parameters

- **ix** (int) – x-direction image flag
- **iy** (int) – y-direction image flag
- **iz** (int) – z-direction image flag

Returns

encoded image flags

Return type

lammops.c_imageint

decode_image_flags(image)

Convert encoded image flag integer into list of three regular integers.

This method is a wrapper around the [`lammops_decode_image_flags\(\)`](#) function of library interface.

Parameters

image (*lammps.c_imageint*) – encoded image flags

Returns

list of three image flags in x-, y-, and z- direction

Return type

list of 3 int

create_atoms(*n, id, type, x, v=None, image=None, shrinkexceed=False*)

Create N atoms from list of coordinates and properties

This function is a wrapper around the `lammps_create_atoms()` function of the C-library interface, and the behavior is similar except that the *v*, *image*, and *shrinkexceed* arguments are optional and default to *None*, *None*, and *False*, respectively. With *None* being equivalent to a NULL pointer in C.

The lists of coordinates, types, atom IDs, velocities, image flags can be provided in any format that may be converted into the required internal data types. Also the list may contain more than *N* entries, but not fewer. In the latter case, the function will return without attempting to create atoms. You may use the `encode_image_flags` method to properly combine three integers with image flags into a single integer.

Parameters

- **n** (*int*) – number of atoms for which data is provided
- **id** (*list of lammps.tagint*) – list of atom IDs with at least n elements or None
- **type** (*list of int*) – list of atom types
- **x** (*list of float*) – list of coordinates for x-, y-, and z (flat list of 3n entries)
- **v** (*list of float*) – list of velocities for x-, y-, and z (flat list of 3n entries) or None (optional)
- **image** (*list of lammps.imageint*) – list of encoded image flags (optional)
- **shrinkexceed** (*bool*) – whether to expand shrink-wrap boundaries if atoms are outside the box (optional)

Returns

number of atoms created. 0 if insufficient or invalid data

Return type

int

property has_mpi_support

Report whether the LAMMPS shared library was compiled with a real MPI library or in serial.

This is a wrapper around the `lammps_config_has_mpi_support()` function of the library interface.

Returns

False when compiled with MPI STUBS, otherwise True

Return type

bool

property is_running

Report whether being called from a function during a run or a minimization

Added in version 9Oct2020.

Various LAMMPS commands must not be called during an ongoing run or minimization. This property allows to check for that. This is a wrapper around the `lammps_is_running()` function of the library interface.

Returns

True when called during a run otherwise false

Return type

bool

force_timeout()

Trigger an immediate timeout, i.e. a “soft stop” of a run.

Added in version 9Oct2020.

This function allows to cleanly stop an ongoing run or minimization at the next loop iteration. This is a wrapper around the [*lammps_force_timeout\(\)*](#) function of the library interface.

property has_exceptions

Report whether the LAMMPS shared library was compiled with C++ exceptions handling enabled

This is a wrapper around the [*lammps_config_has_exceptions\(\)*](#) function of the library interface.

Returns

state of C++ exception support

Return type

bool

property has_gzip_support

Report whether the LAMMPS shared library was compiled with support for reading and writing compressed files through gzip.

This is a wrapper around the [*lammps_config_has_gzip_support\(\)*](#) function of the library interface.

Returns

state of gzip support

Return type

bool

property has_png_support

Report whether the LAMMPS shared library was compiled with support for writing images in PNG format.

This is a wrapper around the [*lammps_config_has_png_support\(\)*](#) function of the library interface.

Returns

state of PNG support

Return type

bool

property has_jpeg_support

Report whether the LAMMPS shared library was compiled with support for writing images in JPEG format.

This is a wrapper around the [*lammps_config_has_jpeg_support\(\)*](#) function of the library interface.

Returns

state of JPEG support

Return type

bool

property has_ffmpeg_support

State of support for writing movies with ffmpeg in the LAMMPS shared library

This is a wrapper around the [*lammps_config_has_ffmpeg_support\(\)*](#) function of the library interface.

Returns

state of ffmpeg support

Return type

bool

has_package(*name*)

Report if the named package has been enabled in the LAMMPS shared library.

Added in version 3Nov2022.

This is a wrapper around the `lammps_config_has_package()` function of the library interface.

Parameters

name (*string*) – name of the package

Returns

state of package availability

Return type

bool

property accelerator_config

Return table with available accelerator configuration settings.

This is a wrapper around the `lammps_config_accelerator()` function of the library interface which loops over all known packages and categories and returns enabled features as a nested dictionary with all enabled settings as list of strings.

Returns

nested dictionary with all known enabled settings as list of strings

Return type

dictionary

property has_gpu_device

Availability of GPU package compatible device

This is a wrapper around the `lammps_has_gpu_device()` function of the C library interface.

Returns

True if a GPU package compatible device is present, otherwise False

Return type

bool

get_gpu_device_info()

Return a string with detailed information about any devices that are usable by the GPU package.

This is a wrapper around the `lammps_get_gpu_device_info()` function of the C-library interface.

Returns

GPU device info string

Return type

string

property installed_packages

List of the names of enabled packages in the LAMMPS shared library

This is a wrapper around the functions `lammps_config_package_count()` and `:cpp:func`lammps_config_package_name`` of the library interface.

:return

has_style(*category*, *name*)

Returns whether a given style name is available in a given category

This is a wrapper around the function `lammops_has_style()` of the library interface.

Parameters

- **category** (*string*) – name of category
- **name** (*string*) – name of the style

Returns

true if style is available in given category

Return type

bool

available_styles(*category*)

Returns a list of styles available for a given category

This is a wrapper around the functions `lammops_style_count()` and `lammops_style_name()` of the library interface.

Parameters

category (*string*) – name of category

Returns

list of style names in given category

Return type

list

has_id(*category*, *name*)

Returns whether a given ID name is available in a given category

Added in version 9Oct2020.

This is a wrapper around the function `lammops_has_id()` of the library interface.

Parameters

- **category** (*string*) – name of category
- **name** (*string*) – name of the ID

Returns

true if ID is available in given category

Return type

bool

available_ids(*category*)

Returns a list of IDs available for a given category

Added in version 9Oct2020.

This is a wrapper around the functions `lammops_id_count()` and `lammops_id_name()` of the library interface.

Parameters

category (*string*) – name of category

Returns

list of id names in given category

Return type

list

available_plugins(*category*)

Returns a list of plugins available for a given category

Added in version 10Mar2021.

This is a wrapper around the functions `lammmps_plugin_count()` and `lammmps_plugin_name()` of the library interface.

Returns

list of style/name pairs of loaded plugins

Return type

list

set_fix_external_callback(*fix_id*, *callback*, *caller=None*)

Set the callback function for a fix external instance with a given fix ID.

Optionally also set a reference to the calling object.

This is a wrapper around the `lammmps_set_fix_external_callback()` function of the C-library interface. However this is set up to call a Python function with the following arguments.

- object is the value of the “caller” argument
- ntimestep is the current timestep
- nlocal is the number of local atoms on the current MPI process
- tag is a 1d NumPy array of integers representing the atom IDs of the local atoms
- x is a 2d NumPy array of doubles of the coordinates of the local atoms
- f is a 2d NumPy array of doubles of the forces on the local atoms that will be added

Changed in version 28Jul2021.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **callback** – Python function that will be called from fix external
- **caller** – reference to some object passed to the callback function

Type

string

Type

function

Type

object, optional

fix_external_get_force(*fix_id*)

Get access to the array with per-atom forces of a fix external instance with a given fix ID.

Added in version 28Jul2021.

This is a wrapper around the `lammmps_fix_external_get_force()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance

Type

string

Returns

requested data

Return type

ctypes.POINTER(ctypes.POINTER(ctypes.double))

fix_external_set_energy_global(*fix_id*, *eng*)

Set the global energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_energy_global()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eng** – potential energy value to be added by fix external

Type

string

Type

float

fix_external_set_virial_global(*fix_id*, *virial*)

Set the global virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_virial_global()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eng** – list of 6 floating point numbers with the virial to be added by fix external

Type

string

Type

float

fix_external_set_energy_peratom(*fix_id*, *eatom*)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_energy_peratom()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eatom** – list of potential energy values for local atoms to be added by fix external

Type

string

Type

float

fix_external_set_virial_peratom(*fix_id*, *vatom*)

Set the per-atom virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_virial_peratom()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **vatom** – list of natoms lists with 6 floating point numbers to be added by fix external

Type

string

Type

float

fix_external_set_vector_length(*fix_id*, *length*)

Set the vector length for a global vector stored with fix external for analysis

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_vector_length()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **length** – length of the global vector

Type

string

Type

int

fix_external_set_vector(*fix_id*, *idx*, *val*)

Store a global vector value for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the `lammops_fix_external_set_vector()` function of the C-library interface.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **idx** – 1-based index of the value in the global vector
- **val** – value to be stored in the global vector

Type

string

Type

int

Type

float

get_neighlist(*idx*)

Returns an instance of *NeighList* which wraps access to the neighbor list with the given index

See `lammps.numpy.get_neighlist()` if you want to use NumPy arrays instead of `c_int` pointers.

Parameters

idx (*int*) – index of neighbor list

Returns

an instance of *NeighList* wrapping access to neighbor list data

Return type

NeighList

get_neighlist_size(*idx*)

Return the number of elements in neighbor list with the given index

Parameters

idx (*int*) – neighbor list index

Returns

number of elements in neighbor list with index *idx*

Return type

int

get_neighlist_element_neighbors(*idx*, *element*)

Return data of neighbor list entry

Parameters

- **element** (*int*) – neighbor list index
- **element** – neighbor list element index

Returns

tuple with atom local index, number of neighbors and array of neighbor local atom indices

Return type

(*int*, *int*, *POINTER(c_int)*)

find_pair_neighlist(*style*, *exact=True*, *nsub=0*, *reqid=0*)

Find neighbor list index of pair style neighbor list

Search for a neighbor list requested by a pair style instance that matches “style”. If *exact* is *True*, the pair style name must match exactly. If *exact* is *False*, the pair style name is matched against “style” as regular expression or sub-string. If the pair style is a hybrid pair style, the style is instead matched against the hybrid sub-styles. If the same pair style is used as sub-style multiple types, you must set *nsub* to a value *n* > 0 which indicates the *n*th instance of that sub-style to be used (same as for the `pair_coeff` command). The default value of 0 will fail to match in that case.

Once the pair style instance has been identified, it may have requested multiple neighbor lists. Those are uniquely identified by a request ID > 0 as set by the pair style. Otherwise the request ID is 0.

Parameters

- **style** (*string*) – name of pair style that should be searched for
- **exact** (*bool*, *optional*) – controls whether style should match exactly or only must be contained in pair style name, defaults to *True*
- **nsub** (*int*, *optional*) – match *nsub*-th hybrid sub-style, defaults to 0

- **reqid**(*int*, *optional*) – list request id, > 0 in case there are more than one, defaults to 0

Returns

neighbor list index if found, otherwise -1

Return type

int

find_fix_neighlist(*fixid*, *reqid=0*)

Find neighbor list index of fix neighbor list

The fix instance requesting the neighbor list is uniquely identified by the fix ID. In case the fix has requested multiple neighbor lists, those are uniquely identified by a request ID > 0 as set by the fix. Otherwise the request ID is 0 (the default).

Parameters

- **fixid**(*string*) – name of fix
- **reqid**(*int*, *optional*) – id of neighbor list request, in case there are more than one request, defaults to 0

Returns

neighbor list index if found, otherwise -1

Return type

int

find_compute_neighlist(*computeid*, *reqid=0*)

Find neighbor list index of compute neighbor list

The compute instance requesting the neighbor list is uniquely identified by the compute ID. In case the compute has requested multiple neighbor lists, those are uniquely identified by a request ID > 0 as set by the compute. Otherwise the request ID is 0 (the default).

Parameters

- **computeid**(*string*) – name of compute
- **reqid**(*int*, *optional*) – index of neighbor list request, in case there are more than one request, defaults to 0

Returns

neighbor list index if found, otherwise -1

Return type

int

class `lammops.numpy_wrapper.numpy_wrapper`(*lmp*)

lammops API NumPy Wrapper

This is a wrapper class that provides additional methods on top of an existing `lammops` instance. The methods transform raw ctypes pointers into NumPy arrays, which give direct access to the original data while protecting against out-of-bounds accesses.

There is no need to explicitly instantiate this class. Each instance of `lammops` has a `numpy` property that returns an instance.

Parameters

`lmp`(`lammops`) – instance of the `lammops` class

extract_atom(*name*, *dtype=None*, *nelem=None*, *dim=None*)

Retrieve per-atom properties from LAMMPS as NumPy arrays

This is a wrapper around the `lammmps.extract_atom()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Note

The returned arrays of per-atom data are by default dimensioned for the range [0:nlocal] since that data is *always* valid. The underlying storage for the data, however, is typically allocated for the range of [0:nmax]. Whether there is valid data in the range [nlocal:nlocal+nghost] depends on whether the property of interest is also updated for ghost atoms. This is not often the case. In some cases, it depends on a LAMMPS setting, see for example [comm_modify vel yes](#). By using the optional *nelem* parameter the size of the returned NumPy can be overridden. There is no check whether the number of elements chosen is valid.

Parameters

- **name** (*string*) – name of the property
- **dtype** (*int*, *optional*) – type of the returned data (see [Data Types](#))
- **nelem** (*int*, *optional*) – number of elements in array
- **dim** (*int*, *optional*) – dimension of each element

Returns

requested data as NumPy array with direct access to C data or None

Return type

numpy.array or NoneType

extract_compute(*cid*, *cstyle*, *ctype*)

Retrieve data from a LAMMPS compute

This is a wrapper around the `lammmps.extract_compute()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Parameters

- **cid** (*string*) – compute ID
- **cstyle** (*int*) – style of the data retrieve (global, atom, or local), see [Style Constants](#)
- **ctype** (*int*) – type of the returned data (scalar, vector, or array), see [Type Constants](#)

Returns

requested data either as float, as NumPy array with direct access to C data, or None

Return type

float, numpy.array, or NoneType

extract_fix(*fid*, *fstyle*, *ftype*, *nrow=0*, *ncol=0*)

Retrieve data from a LAMMPS fix

This is a wrapper around the `lammmps.extract_fix()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Note

When requesting global data, the fix data can only be accessed one item at a time without access to the whole vector or array. Thus this function will always return a scalar. To access vector or array elements the “nrow” and “ncol” arguments need to be set accordingly (they default to 0).

Parameters

- **fid** (*string*) – fix ID
- **fstyle** (*int*) – style of the data retrieve (global, atom, or local), see [Style Constants](#)
- **ftype** (*int*) – type or size of the returned data (scalar, vector, or array), see [Type Constants](#)
- **nrow** (*int*) – index of global vector element or row index of global array element
- **ncol** (*int*) – column index of global array element

Returns

requested data

Return type

integer or double value, pointer to 1d or 2d double array or None

extract_variable(*name*, *group=None*, *vartype=0*)

Evaluate a LAMMPS variable and return its data

This function is a wrapper around the function `lammops.extract_variable()` method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Parameters

- **name** (*string*) – name of the variable to execute
- **group** (*string*) – name of group for atom-style variable (ignored for equal-style variables)
- **vartype** (*int*) – type of variable, see [Variable Type Constants](#)

Returns

the requested data or None

Return type

c_double, numpy.array, or NoneType

gather_bonds()

Retrieve global list of bonds as NumPy array

Added in version 28Jul2021.

This is a wrapper around `lammops.gather_bonds()` It behaves the same as the original method, but returns a NumPy array instead of a ctypes list.

Returns

the requested data as a 2d-integer numpy array

Return type

numpy.array(nbonds,3)

gather_angles()

Retrieve global list of angles as NumPy array

Added in version 8Feb2023.

This is a wrapper around `lammops.gather_angles()` It behaves the same as the original method, but returns a NumPy array instead of a ctypes list.

Returns

the requested data as a 2d-integer numpy array

Return type

`numpy.array(nangles,4)`

gather_dihedrals()

Retrieve global list of dihedrals as NumPy array

Added in version 8Feb2023.

This is a wrapper around `lammops.gather_dihedrals()` It behaves the same as the original method, but returns a NumPy array instead of a ctypes list.

Returns

the requested data as a 2d-integer numpy array

Return type

`numpy.array(ndihedrals,5)`

gather_impropers()

Retrieve global list of impropers as NumPy array

Added in version 8Feb2023.

This is a wrapper around `lammops.gather_impropers()` It behaves the same as the original method, but returns a NumPy array instead of a ctypes list.

Returns

the requested data as a 2d-integer numpy array

Return type

`numpy.array(nimpropers,5)`

fix_external_get_force(fix_id)

Get access to the array with per-atom forces of a fix external instance with a given fix ID.

Changed in version 28Jul2021.

This function is a wrapper around the `lammops.fix_external_get_force()` method. It behaves the same as the original method, but returns a NumPy array instead of a ctypes pointer.

Parameters

fix_id – Fix-ID of a fix external instance

Type

string

Returns

requested data

Return type

`numpy.array`

fix_external_set_energy_peratom(fix_id, eatom)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This function is an alternative to `lammops.fix_external_set_energy_peratom()` method. It behaves the same as the original method, but accepts a NumPy array instead of a list as argument.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eatom** – per-atom potential energy

Type

string

Type

numpy.array

fix_external_set_virial_peratom(*fix_id*, *vatom*)

Set the per-atom virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This function is an alternative to `lammops.fix_external_set_virial_peratom()` method. It behaves the same as the original method, but accepts a NumPy array instead of a list as argument.

Parameters

- **fix_id** – Fix-ID of a fix external instance
- **eatom** – per-atom potential energy

Type

string

Type

numpy.array

get_neighlist(*idx*)

Returns an instance of `NumPyNeighList` which wraps access to the neighbor list with the given index

Parameters**idx** (*int*) – index of neighbor list**Returns**

an instance of `NumPyNeighList` wrapping access to neighbor list data

Return type`NumPyNeighList`**get_neighlist_element_neighbors**(*idx*, *element*)

Return data of neighbor list entry

This function is a wrapper around the function `lammops.get_neighlist_element_neighbors()` method. It behaves the same as the original method, but returns a NumPy array containing the neighbors instead of a ctypes pointer.

Parameters

- **element** (*int*) – neighbor list index
- **element** – neighbor list element index

Returns

tuple with atom local index and numpy array of neighbor local atom indices

Return type

(int, numpy.array)

2.4.2 The PyLammps class API

The *PyLammps* class is a wrapper that creates a simpler, more “Pythonic” interface to common LAMMPS functionality. LAMMPS data structures are exposed through objects and properties. This makes Python scripts shorter and more concise. See the *PyLammps Tutorial* for an introduction on how to use this interface.

class `lammps.PyLammps`(*name*="", *cmdargs*=None, *ptr*=None, *comm*=None, *verbose*=False)

This is a Python wrapper class around the lower-level *lammps* class, exposing a more Python-like, object-oriented interface for prototyping system inside of IPython and Jupyter notebooks.

It either creates its own instance of *lammps* or can be initialized with an existing instance. The arguments are the same of the lower-level interface. The original interface can still be accessed via `PyLammps.lmp`.

Parameters

- **name** (*string*) – “machine” name of the shared LAMMPS library (“mpi” loads `liblammps_mpi.so`, “” loads `liblammps.so`)
- **cmdargs** (*list*) – list of command line arguments to be passed to the *lammps_open()* function. The executable name is automatically added.
- **ptr** (*pointer*) – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
- **comm** (*MPI_Comm*) – MPI communicator (as provided by `mpi4py`). None means use `MPI_COMM_WORLD` implicitly.
- **verbose** (*bool*) – print all LAMMPS output to stdout

Variables

- **lmp** (*lammps*) – instance of original LAMMPS Python interface
- **runs** – list of completed runs, each storing the thermo output

`close()`

Explicitly delete a LAMMPS instance

This is a wrapper around the *lammps.close()* of the Python interface.

`version()`

Return a numerical representation of the LAMMPS version in use.

This is a wrapper around the *lammps.version()* function of the Python interface.

Returns

version number

Return type

int

`file(file)`

Read LAMMPS commands from a file.

This is a wrapper around the *lammps.file()* function of the Python interface.

Parameters

path (*string*) – Name of the file/path with LAMMPS commands

property `enable_cmd_history`

Getter

Return whether command history is saved

Setter

Set if command history should be saved

Type

bool

write_script(filepath)

Write LAMMPS script file containing all commands executed up until now

Parameters

filepath (*string*) – path to script file that should be written

clear_cmd_history()

Clear LAMMPS command history up to this point

append_cmd_history(cmd)

Commands will be added to the command history but not executed.

Add *commands* only to the command history, but do not execute them, so that you can conveniently create Lammps input files, using `PyLammps.write_script()`.

command(cmd)

Execute LAMMPS command

If `PyLammps.enable_cmd_history` is set to `True`, commands executed will be recorded. The entire command history can be written to a file using `PyLammps.write_script()`. To clear the command history, use `PyLammps.clear_cmd_history()`.

Parameters

cmd – command string that should be executed

Type

cmd: string

run(*args, **kwargs)

Execute LAMMPS run command with given arguments

Thermo data of the run is recorded and saved as new entry in `PyLammps.runs`. The latest run can be retrieved by `PyLammps.last_run`.

Note, for recording of all thermo steps during a run, the PYTHON package needs to be enabled in LAMMPS. Otherwise, it will only capture the final timestep.

property last_run

Return data produced of last completed run command

Getter

Returns an object containing information about the last run command

Type

dict

property atoms

All atoms of this LAMMPS instance

Getter

Returns a list of atoms currently in the system

Type

AtomList

property system

The system state of this LAMMPS instance

Getter

Returns an object with properties storing the current system state

Type

namedtuple

property communication

The communication state of this LAMMPS instance

Getter

Returns an object with properties storing the current communication state

Type

namedtuple

property computes

The list of active computes of this LAMMPS instance

Getter

Returns a list of computes that are currently active in this LAMMPS instance

Type

list

property dumps

The list of active dumps of this LAMMPS instance

Getter

Returns a list of dumps that are currently active in this LAMMPS instance

Type

list

property fixes

The list of active fixes of this LAMMPS instance

Getter

Returns a list of fixes that are currently active in this LAMMPS instance

Type

list

property groups

The list of active atom groups of this LAMMPS instance

Getter

Returns a list of atom groups that are currently active in this LAMMPS instance

Type

list

property variables

Returns a dictionary of all variables defined in the current LAMMPS instance

Getter

Returns a dictionary of all variables that are defined in this LAMMPS instance

Type

dict

eval(*expr*)

Evaluate expression

Parameters

expr (*string*) – the expression string that should be evaluated inside of LAMMPS

Returns

the value of the evaluated expression

Return type

float if numeric, string otherwise

lmp_print(*s*)

needed for Python2 compatibility, since print is a reserved keyword

class `lammmps.AtomList`(*pylammmps_instance*)

A dynamic list of atoms that returns either an [Atom](#) or [Atom2D](#) instance for each atom. Instances are only allocated when accessed.

Variables

- **natoms** – total number of atoms
- **dimensions** – number of dimensions in system

class `lammmps.Atom`(*pylammmps_instance*, *index*)

A wrapper class then represents a single atom inside of LAMMPS

It provides access to properties of the atom and allows you to change some of them.

property `id`

Return the atom ID

Type

int

property `type`

Return the atom type

Type

int

property `mol`

Return the atom molecule index

Type

int

property `mass`

Return the atom mass as a per-atom property. This returns either the per-type mass or the per-atom mass (AKA ‘rmass’) depending on what is available with preference for the per-atom mass.

Changed in version 17Apr2024: Support both per-type and per-atom masses. With per-type return “mass[type[i]]” else return “rmass[i]”. Per-atom mass is preferred if available.

Type

float

property `radius`

Return the particle radius

Type

float

property position**Getter**

Return position of atom

Setter

Set position of atom

Type

numpy.array (float, float, float)

property velocity**Getter**

Return velocity of atom

Setter

Set velocity of atom

Type

numpy.array (float, float, float)

property force

Return the total force acting on the atom

Type

numpy.array (float, float, float)

property omega

Return the rotational velocity of the particle

Type

numpy.array (float, float, float)

property torque

Return the total torque acting on the particle

Type

numpy.array (float, float, float)

property angular_momentum

Return the angular momentum of the particle

Type

numpy.array (float, float, float)

property charge

Return the atom charge

Type

float

class lammps.Atom2D(*pylammps_instance*, *index*)

A wrapper class then represents a single 2D atom inside of LAMMPS

Inherits all properties from the [Atom](#) class, but returns 2D versions of position, velocity, and force.

It provides access to properties of the atom and allows you to change some of them.

property position

Access to coordinates of an atom

Getter

Return position of atom

Setter

Set position of atom

Type

numpy.array (float, float)

property velocity

Access to velocity of an atom :getter: Return velocity of atom :setter: Set velocity of atom :type: numpy.array (float, float)

property force

Access to force of an atom :getter: Return force of atom :setter: Set force of atom :type: numpy.array (float, float)

2.4.3 The IPyLammps class API

The *IPyLammps* class is an extension of *PyLammps*, adding additional functions to quickly display visualizations such as images and videos inside of IPython. See the *PyLammps Tutorial* for examples.

class lammps.*IPyLammps*(name="", cmdargs=None, ptr=None, comm=None)

IPython wrapper for LAMMPS which adds embedded graphics capabilities to PyLammps interface

It either creates its own instance of *lammps* or can be initialized with an existing instance. The arguments are the same of the lower-level interface. The original interface can still be accessed via *PyLammps.lmp*.

Parameters

- **name** (*string*) – “machine” name of the shared LAMMPS library (“mpi” loads liblammps_mpi.so, “” loads liblammps.so)
- **cmdargs** (*list*) – list of command line arguments to be passed to the *lammps_open()* function. The executable name is automatically added.
- **ptr** (*pointer*) – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
- **comm** (*MPI_Comm*) – MPI communicator (as provided by *mpi4py*). None means use *MPI_COMM_WORLD* implicitly.

image(filename='snapshot.png', group='all', color='type', diameter='type', size=None, view=None, center=None, up=None, zoom=1.0, background_color='white')

Generate image using write_dump command and display it

See *dump image* for more information.

Parameters

- **filename** (*string*) – Name of the image file that should be generated. The extension determines whether it is PNG or JPEG
- **group** (*string*) – the group of atoms write_image should use
- **color** (*string*) – name of property used to determine color
- **diameter** (*string*) – name of property used to determine atom diameter
- **size** (*tuple (width, height)*) – dimensions of image

- **view**(*tuple (theta, phi)*) – view parameters
- **center**(*tuple (flag, center_x, center_y, center_z)*) – center parameters
- **up**(*tuple (up_x, up_y, up_z)*) – vector pointing to up direction
- **zoom**(*float*) – zoom factor
- **background_color**(*string*) – background color of scene

Returns

Image instance used to display image in notebook

Return type

`IPython.core.display.Image`

video(*filename*)

Load video from file

Can be used to visualize videos from *dump movie*.

Parameters

filename(*string*) – Path to video file

Returns

HTML Video Tag used by notebook to embed a video

Return type

`IPython.display.HTML`

2.4.4 Additional components of the `lammmps` module

The `lammmps` module additionally contains several constants and the `NeighList` class:

Data Types

`LAMMPS_INT`, `LAMMPS_INT_2D`, `LAMMPS_DOUBLE`, `LAMMPS_DOUBLE_2D`, `LAMMPS_INT64`,
`LAMMPS_INT64_2D`, `LAMMPS_STRING`

Constants in the `lammmps` module to indicate how to cast data when the C library function returns a void pointer. Used in `lammmps.extract_global()` and `lammmps.extract_atom()`. See `_LMP_DATATYPE_CONST` for the equivalent constants in the C library interface.

Style Constants

`LMP_STYLE_GLOBAL`, `LMP_STYLE_ATOM`, `LMP_STYLE_LOCAL`

Constants in the `lammmps` module to select what style of data to request from computes or fixes. See `_LMP_STYLE_CONST` for the equivalent constants in the C library interface. Used in `lammmps.extract_compute()`, `lammmps.extract_fix()`, and their NumPy variants `lammmps.numpy.extract_compute()` and `lammmps.numpy.extract_fix()`.

Type Constants

LMP_TYPE_SCALAR, LMP_TYPE_VECTOR, LMP_TYPE_ARRAY, LMP_SIZE_VECTOR, LMP_SIZE_ROWS, LMP_SIZE_COLS

Constants in the *lammps* module to select what type of data to request from computes or fixes. See *_LMP_TYPE_CONST* for the equivalent constants in the C library interface. Used in *lammps.extract_compute()*, *lammps.extract_fix()*, and their NumPy variants *lammps.numpy.extract_compute()* and *lammps.numpy.extract_fix()*.

Variable Type Constants

LMP_VAR_EQUAL, LMP_VAR_ATOM

Constants in the *lammps* module to select what type of variable to query when calling *lammps.extract_variable()*. See also: *variable command*.

Classes representing internal objects

class *lammps.NeighList*(*lmp, idx*)

This is a wrapper class that exposes the contents of a neighbor list.

It can be used like a regular Python list. Each element is a tuple of:

- the atom local index
- its number of neighbors
- and a pointer to an *c_int* array containing local atom indices of its neighbors

Internally it uses the lower-level LAMMPS C-library interface.

Parameters

- **lmp** (*lammps*) – reference to instance of *lammps*
- **idx** (*int*) – neighbor list index

property size

Returns

number of elements in neighbor list

get(*element*)

Access a specific neighbor list entry. “element” must be a number from 0 to the size-1 of the list

Returns

tuple with atom local index, number of neighbors and ctypes pointer to neighbor’s local atom indices

Return type

(int, int, ctypes.POINTER(c_int))

find(*iatom*)

Find the neighbor list for a specific (local) atom *iatom*. If there is no list for *iatom*, (-1, None) is returned.

Returns

tuple with number of neighbors and ctypes pointer to neighbor’s local atom indices

Return type

(int, ctypes.POINTER(c_int))

class `lammops.numpy_wrapper.NumPyNeighList(lmp, idx)`

This is a wrapper class that exposes the contents of a neighbor list.

It can be used like a regular Python list. Each element is a tuple of:

- the atom local index
- a NumPy array containing the local atom indices of its neighbors

Internally it uses the lower-level LAMMPS C-library interface.

Parameters

- **`lmp`** (`lammops`) – reference to instance of `lammops`
- **`idx`** (`int`) – neighbor list index

`get(element)`

Access a specific neighbor list entry. “element” must be a number from 0 to the size-1 of the list

Returns

tuple with atom local index, numpy array of neighbor local atom indices

Return type

(int, numpy.array)

`find(iatom)`

Find the neighbor list for a specific (local) atom *iatom*. If there is no list for *iatom*, None is returned.

Returns

numpy array of neighbor local atom indices

Return type

numpy.array or None

2.5 Extending the Python interface

As noted previously, most of the `lammops` Python class methods correspond one-to-one with the functions in the LAMMPS library interface in `src/library.cpp` and `library.h`. This means you can extend the Python wrapper by following these steps:

- Add a new interface function to `src/library.cpp` and `src/library.h`.
- Rebuild LAMMPS as a shared library.
- Add a wrapper method to `python/lammops/core.py` for this interface function.
- Define the corresponding `argtypes` list and `restype` in the `lammops.__init__()` function.
- Re-install the shared library and the python module, if needed
- You should now be able to invoke the new interface function from a Python script.

2.6 Calling Python from LAMMPS

LAMMPS has several commands which can be used to invoke Python code directly from an input script:

- *python*
- *variable python*
- *fix python/invoke*
- *pair_style python*

The *python* command which can be used to define and execute a Python function that you write the code for. The Python function can also be assigned to a LAMMPS python-style variable via the *variable* command. Each time the variable is evaluated, either in the LAMMPS input script itself, or by another LAMMPS command that uses the variable, this will trigger the Python function to be invoked.

The Python code for the function can be included directly in the input script or in an auxiliary file. The function can have arguments which are mapped to LAMMPS variables (also defined in the input script) and it can return a value to a LAMMPS variable. This is thus a mechanism for your input script to pass information to a piece of Python code, ask Python to execute the code, and return information to your input script.

Note that a Python function can be arbitrarily complex. It can import other Python modules, instantiate Python classes, call other Python functions, etc. The Python code that you provide can contain more code than the single function. It can contain other functions or Python classes, as well as global variables or other mechanisms for storing state between calls from LAMMPS to the function.

The Python function you provide can consist of “pure” Python code that only performs operations provided by standard Python. However, the Python function can also “call back” to LAMMPS through its Python-wrapped library interface, in the manner described in the *Python run* doc page. This means it can issue LAMMPS input script commands or query and set internal LAMMPS state. As an example, this can be useful in an input script to create a more complex loop with branching logic, than can be created using the simple looping and branching logic enabled by the *next* and *if* commands.

See the *python* page and the *variable* doc page for its python-style variables for more info, including examples of Python code you can write for both pure Python operations and callbacks to LAMMPS.

2.7 Output Readers

The Python package contains the *lammops.formats* module, which provides classes to post-process some of the output files generated by LAMMPS.

class *lammops.formats.LogFile*(*filename*)

Reads LAMMPS log files and extracts the thermo information

It supports the line, multi, and yaml thermo output styles.

Parameters

filename (*str*) – path to log file

Variables

- **runs** – List of LAMMPS runs in log file. Each run is a dictionary with thermo fields as keys, storing the values over time
- **errors** – List of error lines in log file

```
class lammps.formats.AvgChunkFile(filename)
```

Reads files generated by fix ave/chunk

Parameters

filename (*str*) – path to ave/chunk file

Variables

- **timesteps** – List of timesteps stored in file
- **total_count** – total count over time
- **chunks** – List of chunks. Each chunk is a dictionary containing its ID, the coordinates, and the averaged quantities

2.8 Example Python scripts

The `python/examples` directory has Python scripts which show how Python can run LAMMPS, grab data, change it, and put it back into LAMMPS.

These are the Python scripts included as demos in the `python/examples` directory of the LAMMPS distribution, to illustrate the kinds of things that are possible when Python wraps LAMMPS. If you create your own scripts, send them to us and we can include them in the LAMMPS distribution.

<code>trivial.py</code>	read/run a LAMMPS input script through Python
<code>demo.py</code>	invoke various LAMMPS library interface routines
<code>simple.py</code>	run in parallel, similar to <code>examples/COUPLE/simple/simple.cpp</code>
<code>split.py</code>	same as <code>simple.py</code> but running in parallel on a subset of procs
<code>gui.py</code>	GUI go/stop/temperature-slider to control LAMMPS
<code>plot.py</code>	real-time temperature plot with GnuPlot via <code>Pizza.py</code>
<code>viz_TOOL.py</code>	real-time viz via some viz package
<code>vizplotgui_TOOL.py</code>	combination of <code>viz_TOOL.py</code> and <code>plot.py</code> and <code>gui.py</code>

For the `viz_TOOL.py` and `vizplotgui_TOOL.py` commands, replace `TOOL` with `gl` or `atomeye` or `pymol` or `vmd`, depending on what visualization package you have installed.

Note that for GL, you need to be able to run the `Pizza.py` GL tool, which is included in the `pizza` subdirectory. See the `Pizza.py` doc pages for more info:

- <https://lammps.github.io/pizza>

Note that for AtomEye, you need version 3, and there is a line in the scripts that specifies the path and name of the executable. See the AtomEye web pages for more details:

- <http://li.mit.edu/Archive/Graphics/A/>
- <http://li.mit.edu/Archive/Graphics/A3/A3.html>

The latter link is to AtomEye 3 which has the scripting capability needed by these Python scripts.

Note that for PyMol, you need to have built and installed the open-source version of PyMol in your Python, so that you can import it from a Python script. See the PyMol web pages for more details:

- <https://www.pymol.org>
- <https://github.com/schrodinger/pymol-open-source>

The latter link is to the open-source version.

Note that for VMD, you need a fairly current version (1.8.7 works for me) and there are some lines in the `pizza/vmd.py` script for 4 PIZZA variables that have to match the VMD installation on your system.

See the `python/README` file for instructions on how to run them and the source code for individual scripts for comments about what they do.

Here are screenshots of the `vizplotgui_tool.py` script in action for different visualization package options:

2.9 Handling LAMMPS errors

LAMMPS and the LAMMPS library are compiled with *C++ exception support* to provide a better error handling experience. LAMMPS errors trigger throwing a C++ exception. These exceptions allow capturing errors on the C++ side and rethrowing them on the Python side. This way LAMMPS errors can be handled through the Python exception handling mechanism.

```
from lammps import lammps, MPIAbortException

lmp = lammps()

try:
    # LAMMPS will normally terminate itself and the running process if an error
    # occurs. This would kill the Python interpreter. The library wrapper will
    # detect that an error has occurred and throw a Python exception

    lmp.command('unknown')
except MPIAbortException as ae:
    # Single MPI process got killed. This would normally be handled by an MPI abort
    pass
except Exception as e:
    # All (MPI) processes have reached this error
    pass
```

Warning

Capturing a LAMMPS exception in Python can still mean that the current LAMMPS process is in an illegal state and must be terminated. It is advised to save your data and terminate the Python instance as quickly as possible when running in parallel with MPI.

2.10 Troubleshooting

2.10.1 Testing if Python can launch LAMMPS

To test if LAMMPS is callable from Python, launch Python interactively and type:

```
>>> from lammps import lammps
>>> lmp = lammps()
```

If you get no errors, you're ready to use LAMMPS from Python. If the second command fails, the most common error to see is

```
OSError: Could not load LAMMPS dynamic library
```

which means Python was unable to load the LAMMPS shared library. This typically occurs if the system can't find the LAMMPS shared library or one of the auxiliary shared libraries it depends on, or if something about the library is incompatible with your Python. The error message should give you an indication of what went wrong.

If your shared library uses a suffix, such as `liblammps_mpi.so`, change the constructor call as follows (see [Creating or deleting a LAMMPS object](#) for more details):

```
>>> lmp = lammps(name='mpi')
```

You can also test the load directly in Python as follows, without first importing from the `lammps` module:

```
>>> from ctypes import CDLL
>>> CDLL("liblammps.so")
```

If an error occurs, carefully go through the steps in [Installing the LAMMPS Python Module and Shared Library](#) and on the [Build_basics](#) page about building a shared library.

If you are not familiar with [Python](#), it is a powerful scripting and programming language which can do almost everything that compiled languages like C, C++, or Fortran can do in fewer lines of code. It also comes with a large collection of add-on modules for many purposes (either bundled or easily installed from Python code repositories). The major drawback is slower execution speed of the script code compared to compiled programming languages. But when the script code is interfaced to optimized compiled code, performance can be on par with a standalone executable, for as long as the scripting is restricted to high-level operations. Thus Python is also convenient to use as a “glue” language to “drive” a program through its library interface, or to hook multiple pieces of software together, such as a simulation code and a visualization tool, or to run a coupled multi-scale or multi-physics model.

See the [Coupling LAMMPS to other codes](#) page for more ideas about coupling LAMMPS to other codes. See the [LAMMPS Library Interfaces](#) page for a description of the LAMMPS library interfaces. That interface is exposed to Python either when calling LAMMPS from Python or when calling Python from a LAMMPS input script and then calling back to LAMMPS from Python code. The C-library interface is designed to be easy to add functionality to, thus the Python interface to LAMMPS is easy to extend as well.

If you create interesting Python scripts that run LAMMPS or interesting Python functions that can be called from a LAMMPS input script, that you think would be generally useful, please post them as a pull request to our [GitHub site](#), and they can be added to the LAMMPS distribution or web page.

MODIFYING & EXTENDING LAMMPS

LAMMPS has a modular design, so that it is easy to modify or extend with new functionality. In fact, about 95% of its source code is optional. The following pages give basic instructions on adding new features to LAMMPS. More in-depth explanations and documentation of individual functions and classes are given in [Information for Developers](#).

If you add a new feature to LAMMPS and think it will be of general interest to other users, we encourage you to submit it for inclusion in LAMMPS. This process is explained in the following three pages:

- [how to prepare and submit your code](#)
- [requirements for submissions](#)
- [style guidelines](#)

A summary description of various types of styles in LAMMPS follows. A discussion of implementing specific styles from scratch is given in [writing new styles](#).

3.1 Overview

The best way to add a new feature to LAMMPS is to find a similar feature and look at the corresponding source and header files to figure out what it does. You will need some knowledge of C++ to understand the high-level structure of LAMMPS and its class organization. Functions (class methods) that do actual computations are mostly written in C-style code and operate on simple C-style data structures (vectors and arrays). A high-level overview of the programming style choices in LAMMPS is [given elsewhere](#).

Most of the new features described on the [Modify](#) doc page require you to write a new C++ derived class (except for exceptions described below, where you can make small edits to existing files). Creating a new class requires 2 files, a source code file (*.cpp) and a header file (*.h). The derived class must provide certain methods to work as a new option. Depending on how different your new feature is compared to existing features, you can either derive from the base class itself, or from a derived class that already exists. Enabling LAMMPS to invoke the new class is as simple as putting the two source files in the src directory and re-building LAMMPS.

The advantage of C++ and its object-orientation is that all the code and variables needed to define the new feature are in the 2 files you write. Thus, it should not make the rest of LAMMPS more complex or cause bugs through unwanted side effects.

Here is a concrete example. Suppose you write 2 files `pair_foo.cpp` and `pair_foo.h` that define a new class `PairFoo` which computes pairwise potentials described in the classic 1997 [paper](#) by Foo, *et al.* If you wish to invoke those potentials in a LAMMPS input script with a command like:

```
pair_style foo 0.1 3.5
```

then your `pair_foo.h` file should be structured as follows:

```
#ifdef PAIR_CLASS
// clang-format off
PairStyle(foo,PairFoo);
#else
// clang-format on
...
(class definition for PairFoo)
...
#endif
```

where “foo” is the style keyword in the pair_style command, and PairFoo is the class name defined in your pair_foo.cpp and pair_foo.h files.

When you re-build LAMMPS, your new pairwise potential becomes part of the executable and can be invoked with a pair_style command like the example above. Arguments like 0.1 and 3.5 can be defined and processed by your new class.

As illustrated by this example, many features referred to in the LAMMPS documentation are called a “style” of a particular command.

The [Modify page](#) lists all the common styles in LAMMPS, and discusses the header file for the base class that these styles derive from. Public variables in that file can be used and set by the derived classes, and may also be used by the base class. Sometimes they are also accessed by the rest of LAMMPS. Pure functions, which means functions declared as virtual in the base class header file and which are also set to 0, are functions you **must** implement in your new derived class to give it the functionality LAMMPS expects. Virtual functions that are not set to 0 are functions you may override or not. Those are usually defined with an empty function body.

Additionally, new output options can be added directly to the thermo.cpp, dump_custom.cpp, and variable.cpp files. These are also listed on the [Modify page](#).

Here are additional guidelines for modifying LAMMPS and adding new functionality:

- Think about whether what you want to do would be better as a pre- or post-processing step. Many computations are more easily and more quickly done that way.
- Do not try to do anything within the timestepping of a run that is not parallel. For example, do not accumulate a bunch of data on a single processor and analyze it. That would run the risk of seriously degrading the parallel efficiency.
- If your new feature reads arguments or writes output, make sure you follow the unit conventions discussed by the [units](#) command.

(Foo) Foo, Morefoo, and Maxfoo, J of Classic Potentials, 75, 345 (1997).

3.2 Submitting new features for inclusion in LAMMPS

We encourage LAMMPS users to submit new features they wrote for LAMMPS to be included in the LAMMPS distribution and thus become easily accessible to all LAMMPS users. The LAMMPS source code is managed with git and public development is hosted on [GitHub](#). You can monitor the repository to be notified of releases, follow the ongoing development, and comment on topics of interest to you.

This section contains general information regarding the preparation and submission of new features to LAMMPS. If you are new to development in LAMMPS, we recommend you read one of the tutorials on developing a new [pair style](#) or [fix style](#) which provide a friendly introduction to what LAMMPS development entails and common vocabulary used on this section.

3.2.1 Communication with the LAMMPS developers

For any larger modifications or programming project, you are encouraged to contact the LAMMPS developers ahead of time to discuss implementation strategies. That will make it easier to integrate your contribution and typically results in less work for everyone involved. You are also encouraged to search through the list of [open issues on GitHub](#) and submit a new issue for a planned feature, to avoid duplicating work (and possibly being scooped).

For informal communication with the LAMMPS developers, you may ask to join the [LAMMPS developers on Slack](#). This slack work space is by invitation only. For access, please send an e-mail to slack@lammmps.org explaining what part of LAMMPS you are working on. Only discussions related to LAMMPS development are tolerated in that work space, so this is **NOT** for people looking for help with compiling, installing, or using LAMMPS. Please post a message to the [LAMMPS forum](#) for those purposes.

3.2.2 Time and effort required

How quickly your contribution will be integrated can vary widely. It depends largely on how much effort is required by the LAMMPS developers to integrate and test it, if any and what kind of changes to the core code are required, how quickly you can address them, and how much interest the contribution is to the larger LAMMPS community. This process can be streamlined by following the [requirements](#) and [style guidelines](#). A small, modular, well written contribution may be integrated within hours, but a complex change that requires a re-design of a core functionality in LAMMPS can take months before inclusion (though this is rare).

3.2.3 Submission procedure

All changes to LAMMPS (including those from LAMMPS developers) are integrated via pull requests on GitHub and cannot be merged without passing the automated testing and an approving review by a LAMMPS core developer. Before submitting your contribution, you should therefore first ensure that your added or modified code compiles and works correctly with the latest development version of LAMMPS and contains all bug fixes from it.

Once you have prepared everything, see the [LAMMPS GitHub Tutorial](#) page for instructions on how to submit your changes or new files through a GitHub pull request. If you are unable or unwilling to submit via GitHub yourself, you may also send patch files or full files to the [LAMMPS developers](#) and ask them to submit a pull request on GitHub on your behalf. If this is the case, create a gzipped tar file of all new or changed files or a corresponding patch file using ‘diff -u’ or ‘diff -c’ format and compress it with gzip. Please only use gzip compression, as this works well and is available on all platforms. This mode of submission may delay the integration as it depends more on the LAMMPS developers.

3.2.4 External contributions

If you prefer to do so, you can also develop and support your add-on feature **without** having it included in the LAMMPS distribution, for example as a download from a website of your own. See the [External LAMMPS packages and tools](#) page of the LAMMPS website for examples of groups that do this. We are happy to advertise your package and website from that page. Simply email the [developers](#) with info about your package, and we will post it there. We recommend naming external packages USER-<name> so they can be easily distinguished from packages in the LAMMPS distribution which do not have the USER- prefix.

3.2.5 Location of files: individual files and packages

We rarely accept new styles in the core src folder. Thus, please review the list of *available Packages* to see if your contribution should be added to one of them. It should fit into the general purpose of that package. If it does not fit well, it may be added to one of the EXTRA- packages or the MISC package.

However, if your project includes many related features that are not covered by one of the existing packages or is dependent on a library (bundled or external), it is best to create a new package with its own directory (with a name like FOO). In addition to your new files, the directory should contain a README text file containing your name and contact information and a brief description of what your new package does.

3.2.6 Changes to core LAMMPS files

If designed correctly, most additions do not require any changes to the core code of LAMMPS; they are simply add-on files that are compiled with the rest of LAMMPS. To make those styles work, you may need some trivial changes to the core code. An example of a trivial change is making a parent-class method “virtual” when you derive a new child class from it. If your features involve more substantive changes to the core LAMMPS files, it is particularly encouraged that you communicate with the LAMMPS developers early in development.

3.3 Requirements for contributions to LAMMPS

The following is a summary of the current requirements and recommendations for including contributed source code or documentation into the LAMMPS software distribution.

3.3.1 Motivation

The LAMMPS developers are committed to provide a software package that is versatile, reliable, high-quality, efficient, portable, and easy to maintain and modify. Achieving all of these goals is challenging since a large part of LAMMPS consists of contributed code from many different authors who may not be professionally trained programmers or familiar with the idiosyncrasies of maintaining a large software package. In addition, changes that interfere with the parallel efficiency of the core code must be avoided. As LAMMPS continues to grow and more features and functionality are added, it is necessary to follow established guidelines when accepting new contributions while also working at the same time to improve the existing code.

The following requirements and recommendations are provided as a guide. They indicate which individual requirements are strict, and which represent a preference and thus are negotiable or optional. Please feel free to contact the LAMMPS core developers in case you need additional explanations or clarifications, or you need assistance in implementing the (strict) requirements for your contributions. Requirements include:

- *Licensing requirements* (strict)
- *Integration testing* (strict)
- *Documentation* (strict)
- *Programming language standards* (strict)
- *Build system* (strict)
- *Command or style names* (strict)
- *Programming style requirements* (varied)
- *Examples* (preferred)
- *Error or warning messages and explanations* (preferred)

- *Citation reminder* (optional)
- *Testing* (optional)

3.3.2 Licensing requirements (strict)

Contributing authors agree when submitting a pull request that their contributions can be distributed under the LAMMPS license conditions. This is the GNU public license in version 2 (not 3 or later) for the publicly distributed versions, e.g. on the LAMMPS homepage or on GitHub. We also have a version of LAMMPS under LGPL 2.1 terms which is available on request; this will usually be the latest available or a previous stable version with a few LGPL 2.1 incompatible files removed. More details are found on the [LAMMPS open-source license page](#).

Your new source files should have the LAMMPS copyright and GPL notice, followed by your name and email address at the top, like other user-contributed LAMMPS source files.

Contributions may be under a different license as long as that license does not conflict with the aforementioned terms. Contributions that use code with a conflicting license can be split into two parts:

1. the core parts (i.e. parts that must be in the *src* tree) that are licensed under compatible terms and bundled with the LAMMPS sources
2. an external library that must be downloaded and compiled (either separately or as part of the LAMMPS compilation)

Please note, that this split licensing mode may complicate including the contribution in binary packages.

3.3.3 Integration testing (strict)

Where possible we use available continuous integration tools to search for common programming mistakes, portability limitations, incompatible formatting, and undesired side effects. Contributed code must pass the automated tests on GitHub before it can be merged with the LAMMPS distribution. These tests compile LAMMPS in a variety of environments and settings and run the bundled unit tests. At the discretion of the LAMMPS developer managing the pull request, additional tests may be activated that test for “side effects” on running a collection of input decks and create consistent results. The translation of the documentation to HTML and PDF is also tested.

This means that contributed source code **must** compile with the most current version of LAMMPS with `-DLAMMPS_BIGBIG` in addition to the default setting of `-DLAMMPS_SMALLBIG`. The code needs to work correctly in both cases, and also in serial and parallel using MPI.

Some “disruptive” changes may break tests and require updates to the testing tools or scripts or tests themselves. This is rare. If in doubt, contact the LAMMPS developer that is assigned to the pull request.

3.3.4 Documentation (strict)

Contributions that add new styles or commands or augment existing ones must include the corresponding new or modified documentation in [ReStructuredText format](#) (.rst files in the `doc/src/` folder). The documentation should be written in American English and the .rst file must only use ASCII characters, so it can be cleanly translated to PDF files (via [sphinx](#) and PDFLaTeX). Special characters may be included via embedded math expression typeset in a LaTeX subset.

When adding new commands, they need to be integrated into the sphinx documentation system, and the corresponding command tables and lists updated. When translating the documentation into html files there should be no warnings. When adding a new package, some lists describing packages must also be updated as well as a package specific description added. Likewise, if necessary, some package specific build instructions should be included.

As appropriate, the text files with the documentation can include inline mathematical expressions or figures (see `doc/JPG` for examples). Additional PDF files with further details may also be included; see `doc/PDF` for examples. The page should also include literature citations as appropriate; see the bottom of `doc/fix_nh.rst` for examples and the earlier part of the same file for how to format the cite itself. Citation labels must be unique across **all** `.rst` files. The “Restrictions” section of the page should indicate if your command is only available if LAMMPS is built with the appropriate package. See other command doc files for examples of how to do this.

Please run at least “make html” and “make spelling” from within the `doc/src` directory, and carefully inspect and proofread the resulting HTML format doc page before submitting your code. Upon submission of a pull request, checks for error free completion of the HTML and PDF build will be performed and also a spell check, a check for correct anchors and labels, and a check for completeness of references to all styles in their corresponding tables and lists is run. In case the spell check reports false positives, they can be added to the file `doc/utils/sphinx-config/false_positives.txt`

Contributions that add or modify the library interface or “public” APIs from the C++ code or the Fortran module must include suitable doxygen comments in the source and corresponding changes to the documentation sources for the “Programmer Guide” guide section of the LAMMPS manual.

If your feature requires some more complex steps and explanations to be used correctly or some external or bundled tools or scripts, we recommend that you also contribute a *Howto document* providing some more background information and some tutorial material. This can also be used to provide more in-depth explanations of models that require use of multiple commands.

As a rule-of-thumb, the more clear and self-explanatory you make your documentation, README files and examples, and the easier you make it for people to get started, the more likely it is that users will try out your new feature.

Programming language standards (strict)

The core of LAMMPS is written in C++11 in a style that can be mostly described as “C with classes”. Advanced C++ features like operator overloading or excessive use of templates are avoided with the intent to keep the code readable to programmers that have limited C++ programming experience. C++ constructs are acceptable when they help improve the readability and reliability of the code, e.g. when using the `std::string` class instead of manipulating pointers and calling the string functions of the C library. In addition, a collection of convenient *utility functions and classes* for recurring tasks and a collection of *platform neutral functions* for improved portability are provided. Contributions with code requiring more recent C++ standards are only accepted as packages with the post C++11 standard code confined to the package so that it is optional.

Included Fortran code has to be compatible with the Fortran 2003 standard. Since not all platforms supported by LAMMPS provide good support for compiling Fortran files, it should be considered to rewrite these parts as C++ code, if possible and thus allow for a wider adoption of the contribution. As of January 2023, all previously included Fortran code for the LAMMPS executable has been replaced by equivalent C++ code.

Python code must be compatible with Python 3.5 and later. Large parts of LAMMPS (including the *PYTHON package*) are also compatible with Python 2.7. Compatibility with Python 2.7 is desirable, but compatibility with Python 3.5 is **required**.

Compatibility with older programming language standards is very important to maintain portability and availability of LAMMPS on many platforms. This applies especially to HPC cluster environments, which tend to be running older software stacks and where LAMMPS users may be required to use those older tools for access to advanced hardware features or not have the option to install newer compilers or libraries.

3.3.5 Build system (strict)

LAMMPS currently supports two build systems: one that is based on *traditional Makefiles* and one that is based on *CMake*. Therefore, your contribution must be compatible with and support both build systems.

For a single pair of header and implementation files that are an independent feature, it is usually only required to add them to `src/.gitignore`.

For traditional make, if your contributed files or package depend on other LAMMPS style files or packages also being installed (e.g. because your file is a derived class from the other LAMMPS class), then an `Install.sh` file is also needed to check for those dependencies and modifications to `src/Depend.sh` to trigger the checks. See other README and `Install.sh` files in other directories as examples.

Similarly, for CMake support, changes may need to be made to `cmake/CMakeLists.txt`, some of the files in `cmake/presets`, and possibly a file with specific instructions needs to be added to `cmake/Modules/Packages/`. Please check out how this is handled for existing packages and ask the LAMMPS developers if you need assistance.

3.3.6 Command or style names, file names, and keywords (strict)

All user-visible command or style names should be all lower case and should only use letters, numbers, or forward slashes. They should be descriptive and initialisms should be avoided unless they are well established (e.g. `lj` for Lennard-Jones). For a compute style “some/name” the source files must be called `compute_some_name.h` and `compute_some_name.cpp`. The “include guard” in the header file would then be `LMP_COMPUTE_SOME_NAME_H` and the class name `ComputeSomeName`.

3.3.7 Programming style requirements (varied)

To maintain source code consistency across contributions from many people, there are various programming style requirements for contributions to LAMMPS. Some of these requirements are strict and must be followed, while others are only preferred and thus may be skipped. An in-depth discussion of the style guidelines is provided in the *programming style doc page*.

3.3.8 Examples (preferred)

For many new features, it is preferred that example scripts (simple, small, fast to complete on 1 CPU) are included that demonstrate the use of new or extended functionality. These are typically include under the `examples` or `examples/PACKAGES` directory and are further described on the *examples page*. Guidelines for input scripts include:

- commands that generate output should be commented out (except when the output is the sole purpose or the feature, e.g. for a new compute)
- commands like *log*, *echo*, *package*, *processors*, *suffix* may **not** be used in the input file (exception: “processors * 1” or similar is acceptable when used to avoid unwanted domain decomposition of empty volumes)
- outside of the log files, no generated output should be included
- custom thermo_style settings may not include output measuring CPU or other time as it complicates comparisons between different runs
- input files should be named `in.name`, data files should be named `data.name` and log files should be named `log.version.name.<compiler>.<ncpu>`
- the total file size of all the inputs and outputs should be small
- where possible, potential files from the “potentials” folder or data file from other folders should be re-used through symbolic links

3.3.9 Error or warning messages and explanations (preferred)

Changed in version 4May2022.

Starting with LAMMPS version 4 May 2022, the LAMMPS developers have agreed on a new policy for error and warning messages.

Previously, all error and warning strings were supposed to be listed in the class header files with an explanation. Those would then be regularly “harvested” and transferred to alphabetically sorted lists in the manual. To avoid excessively long lists and to reduce effort, this came with a requirement to have rather generic error messages (e.g. “Illegal ... command”). To identify the specific cause, the name of the source file and the line number of the error location would be printed, so that one could look up the cause by reading the source code.

The new policy encourages more specific error messages that ideally indicate the cause directly, and requiring no further lookup. This is aided by the `{fmt}` library enabling Error class methods that take a variable number of arguments and an error text that will be treated like a `{fmt}` syntax format string. Error messages should still preferably be kept to a single line or two lines at most.

For more complex explanations or errors that have multiple possible reasons, a paragraph should be added to the *Error_details* page with an error code reference (e.g. `... _err0001:`) then the utility function `utils::errorurl()` can be used to generate a URL that will directly lead to that paragraph. An error for missing arguments can be easily generated using the `utils::missing_cmd_args()` convenience function. An example for this approach would be the `src/read_data.cpp` and `src/atom.cpp` files that implement the *read_data* and *atom_modify* commands and that may create “*Unknown identifier in data file*” errors that may have multiple possible reasons which complicates debugging, and thus require some additional explanation.

The transformation of existing LAMMPS code to this new scheme is ongoing. Given the size of the LAMMPS code base, it will take a significant amount of time to complete. For new code, however, following the new approach is strongly preferred. The expectation is that the new scheme will make understanding errors easier for LAMMPS users, developers, and maintainers.

3.3.10 Citation reminder (optional)

If there is a paper of yours describing your feature (either the algorithm/science behind the feature itself, or its initial usage, or its implementation in LAMMPS), you can add the citation to the *.cpp source file. See `src/DIFFRACTION/compute_saed.cpp` for an example. A BibTeX format citation is stored in a string variable at the top of the file, and a single line of code registering this variable is added to the constructor of the class. When your feature is used, then LAMMPS (by default) will print the brief info and the DOI in the first line to the screen and the full citation to the log file.

If there is additional functionality (which may have been added later) described in a different publication, additional citation descriptions may be added so long as they are only registered when the corresponding keyword activating this functionality is used.

With these options, it is possible to have LAMMPS output a specific citation reminder whenever a user invokes your feature from their input script. Please note that you should *only* use this for the *most* relevant paper for a feature and a publication that you or your group authored. E.g. adding a citation in the source code for a paper by Nose and Hoover if you write a fix that implements their integrator is not the intended usage. That kind of citation should just be included in the documentation page you provide describing your contribution. If you are not sure what the best option would be, please contact the LAMMPS developers for advice.

3.3.11 Testing (optional)

If your contribution contains new utility functions or a supporting class (i.e. anything that does not depend on a LAMMPS object), new unit tests should be added to a suitable folder in the `unittest` tree. When adding a new LAMMPS style computing forces or selected fixes, a `.yaml` file with a test configuration and reference data should be added for the styles where a suitable tester program already exists (e.g. pair styles, bond styles, etc.). Please see [this section in the manual](#) for more information on how to enable, run, and expand testing.

3.4 LAMMPS programming style

The aim of the LAMMPS developers is to use a consistent programming style and naming conventions across the entire code base, as this helps with maintenance, debugging, and understanding the code, both for developers and users. This page provides a list of standard style choices used in LAMMPS. Some of these standards are required, while others are just preferred. Following these conventions will make it much easier to integrate your contribution. If you are uncertain, please ask.

The files `pair_lj_cut.h`, `pair_lj_cut.cpp`, `utils.h`, and `utils.cpp` may serve as representative examples.

3.4.1 Include files (varied)

- Header files that define a new LAMMPS style (i.e. that have a `SomeStyle(some/name, SomeName);` macro in them) should only use the include file for the base class and otherwise use forward declarations and pointers; when interfacing to a library use the PIMPL (pointer to implementation) approach where you have a pointer to a struct that contains all library specific data (and thus requires the library header) but use a forward declaration and define the struct only in the implementation file. This is a **strict** requirement since this is where type clashes between packages and hard-to-find bugs have regularly manifested in the past.
- Header files, especially those defining a “style”, should only use the absolute minimum number of include files and **must not** contain any `using` statements. Typically, that would only be the header for the base class. Instead, any include statements should be put in the corresponding implementation files and forward declarations be used. For implementation files, the “include what you use” principle should be employed. However, there is the notable exception that when the `pointers.h` header is included (or the header of one of the classes derived from it), certain headers will *always* be included and thus do not need to be explicitly specified. These are: `mpi.h`, `cstddef`, `cstdio`, `cstdlib`, `string`, `utils.h`, `vector`, `fmt/format.h`, `climits`, `cinttypes`. This also means any such file can assume that `FILE`, `NULL`, and `INT_MAX` are defined.
- Class members variables should not be initialized in the header file, but instead should be initialized either in the initializer list of the constructor or explicitly assigned in the body of the constructor. If the member variable is relevant to the functionality of a class (for example when it stores a value from a command line argument), the member variable declaration is followed by a brief comment explaining its purpose and what its values can be. Class members that are pointers should always be initialized to `nullptr` in the initializer list of the constructor. This reduces clutter in the header and avoids accessing uninitialized pointers, which leads to hard to debug issues, class members are often implicitly initialized to `NULL` on the first use (but *not* after a [clear command](#)). Please see the files `reset_atoms_mol.h` and `reset_atoms_mol.cpp` as an example.
- System headers or headers from installed libraries are included with angular brackets (example: `#include <vector>`), while local include files use double quotes (example: `#include "atom.h"`)
- When including system header files from the C library use the C++-style names (`<cstdlib>` or `<cstring>`) instead of the C-style names (`<stdlib.h>` or `<string.h>`)
- The order of `#include` statements in a file `some_name.cpp` that implements a class `SomeName` defined in a header file `some_name.h` should be as follows:
 - `#include "some_name.h"` followed by an empty line

- LAMMPS include files e.g. `#include "comm.h"` or `#include "modify.h"` in alphabetical order followed by an empty line
- System header files from the C++ or C standard library followed by an empty line
- `using namespace LAMMPS_NS` or other namespace imports.

3.4.2 Whitespace (preferred)

Source files should not contain TAB characters unless required by the syntax (e.g. in makefiles) and no trailing whitespace. Text files should have Unix-style line endings (LF-only). Git will automatically convert those in both directions when running on Windows; use `dos2unix` on Linux machines to convert files to Unix-style line endings. The last line of text files include a line ending.

You can check for these issues with the python scripts in the *“tools/coding_standard”* folder. When run normally with a source file or a source folder as argument, they will list all non-conforming lines. By adding the `-f` flag to the command line, they will modify the flagged files to try to remove the detected issues.

3.4.3 Constants (strongly preferred)

Global or per-file constants should be declared as *static constexpr* variables rather than via the pre-processor with *#define*. The name of constants should be all uppercase. This has multiple advantages:

- constants are easily identified as such by their all upper case name
- rather than a pure text substitution during pre-processing, *constexpr variables* have a type associated with them and are processed later in the parsing process where the syntax checks and type specific processing (e.g. via overloads) can be applied to them.
- compilers can emit a warning if the constant is not used and thus can be removed (we regularly check for and remove dead code like this)
- there are no unexpected substitutions and thus confusing syntax errors when compiling leading to, for instance, conflicts so that LAMMPS cannot be compiled with certain combinations of packages (this *has* happened multiple times in the past).

Pre-processor defines should be limited to macros (but consider C++ templates) and conditional compilation. If a pre-processor define must be used, it should be defined at the top of the `.cpp` file after the include statements and at all cost it should be avoided to put them into header files.

Some sets of commonly used constants are provided in the `MathConst` and `EwaldConst` namespaces and implemented in the files `math_const.h` and `ewald_const.h`, respectively.

There are always exceptions, special cases, and legacy code in LAMMPS, so please contact the LAMMPS developers if you are not sure.

3.4.4 Placement of braces (strongly preferred)

For new files added to the “src” tree, a `clang-format` configuration file is provided under the name `.clang-format`. This file is compatible with clang-format version 8 and later. With that file present, files can be reformatted according to the configuration with a command like: `clang-format -i new-file.cpp`. Ideally, this is done while writing the code or before a pull request is submitted. Blocks of code where the reformatting from clang-format yields hard-to-read or otherwise undesirable output may be protected with placing a pair `// clang-format off` and `// clang-format on` comments around that block.

3.4.5 Miscellaneous standards (varied)

- I/O is done via the C-style stdio library and **not** iostreams.
- Do not use so-called “alternative tokens” like `and`, `or`, `not` and similar, but rather use the corresponding operators `&&`, `||`, and `!`. The alternative tokens are not available by default on all compilers.
- Output to the screen and the logfile should use the corresponding FILE pointers and only be done on MPI rank 0. Use the `utils::logmesg()` convenience function where possible.
- Usage of C++11 *virtual*, *override*, *final* keywords: Please follow the [C++ Core Guideline C.128](#). That means, you should only use *virtual* to declare a new virtual function, *override* to indicate you are overriding an existing virtual function, and *final* to prevent any further overriding.
- Trivial destructors: Do not write destructors when they are empty and *default*.

```
// don't write destructors for A or B like this

class A : protected Pointers {
public:
    A();
    ~A() override {}
};

class B : protected Pointers {
public:
    B();
    ~B() override = default;
};

// instead, let the compiler create the implicit default destructor by not writing
// it

class A : protected Pointers {
public:
    A();
};

class B : protected Pointers {
public:
    B();
};
```

- Please use clang-format only to reformat files that you have contributed. For header files containing a `SomeStyle(keyword, ClassName)` macros it is required to have this macro embedded with a pair of `// clang-format off`, `// clang-format on` comments and the line must be terminated with a semicolon (;). Example:

```
#ifdef COMMAND_CLASS
// clang-format off
CommandStyle(run,Run);
// clang-format on
#else

#ifdef LMP_RUN_H
[...]
```

You may also use `// clang-format on/off` throughout your files to protect individual sections from being reformatted.

- All files should have 0644 permissions, i.e. writable by the user only and readable by all and no executable permissions. Executable permissions (0755) should only be for shell scripts or python or similar scripts for interpreted script languages.

3.5 Atom styles

Classes that define an *atom style* are derived from the AtomVec class and managed by the Atom class. The atom style determines what attributes are associated with an atom and communicated when it is a ghost atom or migrates to a new processor. A new atom style can be created if one of the existing atom styles does not define all the attributes you need to store and communicate with atoms.

The file `atom_vec_atomic.cpp` is the simplest example of an atom style. Examining the code for others will make these instructions more clear.

Note that the *atom style hybrid* command can be used to define atoms or particles which have the union of properties of individual styles. Also the *fix property/atom* command can be used to add a single property (e.g. charge or a molecule ID) to a style that does not have it. It can also be used to add custom properties to an atom, with options to communicate them with ghost atoms or read them from a data file. Other LAMMPS commands can access these custom properties, as can new pair, fix, compute styles that are written to work with these properties. For example, the *set* command can be used to set the values of custom per-atom properties from an input script. All of these methods are less work than writing and testing(!) code for a new atom style.

If you follow these directions your new style will automatically work in tandem with others via the *atom_style hybrid* command.

The first step is to define a set of string lists in the constructor of the new derived class. Each list will have zero or more comma-separated strings that correspond to the variable names used in the `atom.h` header file for per-atom properties. Note that some represent per-atom vectors (q, molecule) while other are per-atom arrays (x,v). For all but the last two lists you do not need to specify any of (id,type,x,v,f). Those are included automatically as needed in the other lists.

<code>fields_grow</code>	full list of properties which is allocated and stored
<code>fields_copy</code>	list of properties to copy atoms are rearranged on-processor
<code>fields_comm</code>	list of properties communicated to ghost atoms every step
<code>fields_comm_vel</code>	additional properties communicated if <i>comm_modify vel</i> is used
<code>fields_reverse</code>	list of properties summed from ghost atoms every step
<code>fields_border</code>	list of properties communicated with ghost atoms every reneighboring step
<code>fields_border_vel</code>	additional properties communicated if <i>comm_modify vel</i> is used
<code>fields_exchange</code>	list of properties communicated when an atom migrates to another processor
<code>fields_restart</code>	list of properties written/read to/from a restart file
<code>fields_create</code>	list of properties defined when an atom is created by <i>create_atoms</i>
<code>fields_data_atom</code>	list of properties (in order) in the Atoms section of a data file, as read by <i>read_data</i>
<code>fields_data_vel</code>	list of properties (in order) in the Velocities section of a data file, as read by <i>read_data</i>

In these lists you can list variable names which LAMMPS already defines (in some other atom style), or you can create new variable names. You should not re-use a LAMMPS variable in your atom style that is used for something with a different meaning in another atom style. If the meaning is related, but interpreted differently by your atom style, then using the same variable name means a user must not use your style and the other style together in a *atom_style hybrid* command. Because there will only be one value of the variable and different parts of LAMMPS will then likely use it differently. LAMMPS has no way of checking for this.

If you are defining new variable names then make them descriptive and unique to your new atom style. For example choosing “e” for energy is a bad choice; it is too generic. A better choice would be “e_foo”, where “foo” is specific to your style.

If any of the variable names in your new atom style do not exist in LAMMPS, you need to add them to the `src/atom.h` and `atom.cpp` files.

Search for the word “customize” or “customization” in these 2 files to see where to add your variable. Adding a flag to the 2nd customization section in `atom.h` is only necessary if your code (e.g. a pair style) needs to check that a per-atom property is defined. These flags should also be set in the constructor of the atom style child class.

In `atom.cpp`, aside from the constructor and destructor, there are 3 methods that a new variable name or flag needs to be added to.

In `Atom::peratom_create()` when using the `Atom::add_peratom()` method, a `cols` argument of 0 is for per-atom vectors, a `length > 1` is for per-atom arrays. Note the use of the extra per-thread flag and the `add_peratom_vary()` method when last dimension of the array is variable-length.

Adding the variable name to `Atom::extract()` enables the per-atom data to be accessed through the *LAMMPS library interface* by a calling code, including from *Python*.

The constructor of the new atom style will also typically set a few flags which are defined at the top of `atom_vec.h`. If these are unclear, see how other atom styles use them.

The `grow_pointers()` method is also required to make a copy of peratom data pointers, as explained in the code.

There are a number of other optional methods which your atom style can implement. These are only needed if you need to do something out-of-the-ordinary which the default operation of the `AtomVec` parent class does not take care of. The best way to figure out why they are sometimes useful is to look at how other atom styles use them.

- `process_args` = use if the atom style has arguments
- `init` = called before each run
- `force_clear` = called before force computations each timestep

A few atom styles define “bonus” data associated with some or all of their particles, such as *atom_style ellipsoid* or *tri*. These methods work with that data:

- `copy_bonus`
- `clear_bonus`
- `pack_comm_bonus`
- `unpack_comm_bonus`
- `pack_border_bonus`
- `unpack_border_bonus`
- `pack_exchange_bonus`
- `unpack_exchange_bonus`
- `size_restart_bonus`
- `pack_restart_bonus`
- `unpack_restart_bonus`
- `data_atom_bonus`
- `memory_usage_bonus`

The *atom_style body* command can define a particle geometry with an arbitrary number of values. This method reads it from a data file:

- `data_body`

These methods are called before or after operations handled by the parent `AtomVec` class. They allow an atom style to do customized operations on the per-atom values. For example *atom_style sphere* reads a diameter and density of each particle from a data file. But these need to be converted internally to a radius and mass. That operation is done in the `data_atom_post()` method.

- `pack_restart_pre`
- `pack_restart_post`
- `unpack_restart_init`
- `create_atom_post`
- `data_atom_post`
- `pack_data_pre`
- `pack_data_post`

These methods enable the *compute property/atom* command to access per-atom variables it does not already define as arguments, so that they can be written to a dump file or used by other LAMMPS commands.

- `property_atom`
- `pack_property_atom`

3.6 Pair styles

Classes that compute pairwise non-bonded interactions are derived from the `Pair` class. In LAMMPS, pairwise force calculations include many-body potentials such as EAM, Tersoff, or ReaxFF where particles interact without an explicit bond topology but include interactions beyond pairwise non-bonded contributions. New styles can be created to add support for additional pair potentials to LAMMPS. When the modifications are small, sometimes it is more effective to derive from an existing pair style class. This latter approach is also used by *Accelerator packages* where the accelerated style names differ from their base classes by an appended suffix.

The file `src/pair_lj_cut.cpp` is an example of a `Pair` class with a very simple potential function. It includes several optional methods to enable its use with *run_style respa* and *compute group/group*. *Writing new pair styles* contains a detailed discussion of writing new pair styles from scratch, and how simple and more complex pair styles can be implemented with examples from existing pair styles.

Here is a brief list of some the class methods in the `Pair` class that *must* be or *may* be overridden in a derived class for a new pair style.

Required	“pure” methods that <i>must</i> be overridden in a derived class
<code>compute</code>	workhorse routine that computes pairwise interactions
<code>settings</code>	processes the arguments to the <code>pair_style</code> command
<code>coeff</code>	set coefficients for one i,j type pair, called from <code>pair_coeff</code>

Optional	methods that have a default or dummy implementation
init_one	perform initialization for one i,j type pair
init_style	style initialization: request neighbor list(s), error checks
init_list	Neighbor class callback function to pass neighbor list to pair style
single	force/r and energy of a single pairwise interaction between 2 atoms
compute_inner/middle/outer	versions of compute used by rRESPA
memory_usage	return estimated amount of memory used by the pair style
modify_params	process arguments to pair_modify command
extract	provide access to internal scalar or per-type data like cutoffs
extract_peratom	provide access to internal per-atom data
setup	initialization at the beginning of a run
finish	called at the end of a run, e.g. to print
write & read_restart	write/read i,j pair coeffs to restart files
write & read_restart_settings	write/read global settings to restart files
write_data	write Pair Coeffs section to data file
write_data_all	write PairIJ Coeffs section to data file
pack & unpack_forward_comm	copy data to and from buffer if style uses forward communication
pack & unpack_reverse_comm	copy data to and from buffer if style uses reverse communication
reinit	reset all type-based parameters, called by fix adapt for example
reset_dt	called when the time step is changed by timestep or fix reset/dt

Here is a list of flags or settings that should be set in the constructor of the derived pair class when they differ from the default setting.

Name of flag	Description	default
single_enable	1 if single() method is implemented, 0 if missing	1
respa_enable	1 if pair style has compute_inner/middle/outer()	0
restartinfo	1 if pair style writes its settings to a restart	1
one_coeff	1 if only a pair_coeff * * command is allowed	0
manybody_flag	1 if pair style is a manybody potential	0
unit_convert_flag	value != 0 indicates support for unit conversion	0
no_virial_fdotr_compute	1 if pair style does not call virial_fdotr_compute()	0
writedata	1 if write_data() and write_data_all() are implemented	0
comm_forward	size of buffer (in doubles) for forward communication	0
comm_reverse	size of buffer (in doubles) for reverse communication	0
ghostneigh	1 if cutghost is set and style uses neighbors of ghosts	0
finitecutflag	1 if cutoff depends on diameter of atoms	0
reinitflag	1 if style has reinit() and is compatible with fix adapt	0
ewaldflag	1 if compatible with kspace_style ewald	0
pppmflag	1 if compatible with kspace_style ppm	0
msmflag	1 if compatible with kspace_style msm	0
dispersionflag	1 if compatible with ewald/disp or ppm/disp	0
tip4pflag	1 if compatible with kspace_style ppm/tip4p	0
dipoleflag	1 if compatible with dipole kspace_style	0
spinflag	1 if compatible with spin kspace_style	0

3.7 Bond, angle, dihedral, improper styles

Classes that compute molecular interactions are derived from the Bond, Angle, Dihedral, and Improper classes. New styles can be created to add new potentials to LAMMPS.

Bond_harmonic.cpp is the simplest example of a bond style. Ditto for the harmonic forms of the angle, dihedral, and improper style commands.

Here is a brief description of common methods you define in your new derived class. See bond.h, angle.h, dihedral.h, and improper.h for details and specific additional methods.

Required	“pure” methods that <i>must</i> be overridden in a derived class
compute	compute the molecular interactions for all listed items
coeff	set coefficients for one type
equilibrium_distance	length of bond, used by SHAKE (bond styles only)
equilibrium_angle	opening of angle, used by SHAKE (angle styles only)
write & read_restart	writes/reads coeffs to restart files
single	force/r (bond styles only) and energy of a single bond or angle

Optional	methods that have a default or dummy implementation
init	check if all coefficients are set, calls init_style()
init_style	check if style specific conditions are met
settings	apply global settings for all types
write & read_restart_settings	writes/reads global style settings to restart files
write_data	write corresponding Coeffs section(s) in data file
memory_usage	tally memory allocated by the style
extract	provide access to internal data (bond or angle styles only)
reinit	reset all type-based parameters, called by fix adapt (bonds only)
pack & unpack_forward_comm	copy data to and from buffer in forward communication (bonds only)
pack & unpack_reverse_comm	copy data to and from buffer in reverse communication (bonds only)

Here is a list of flags or settings that should be set in the constructor of the derived class when they differ from the default setting.

Name of flag	Description	default
writedata	1 if write_data() is implemented	1
single_extra	number of extra single values calculated (bond styles only)	0
partial_flag	1 if bond type can be set to 0 and deleted (bond styles only)	0
reinitflag	1 if style has reinit() and is compatible with fix adapt	1
comm_forward	size of buffer (in doubles) for forward communication (bond styles only)	0
comm_reverse	size of buffer (in doubles) for reverse communication (bond styles only)	0
comm_reverse_off	size of buffer for reverse communication with newton off (bond styles only)	0

3.8 Compute styles

Classes that compute scalar and vector quantities like temperature and the pressure tensor, as well as classes that compute per-atom quantities like kinetic energy and the centro-symmetry parameter are derived from the Compute class. New styles can be created to add new calculations to LAMMPS.

Compute_temp.cpp is a simple example of computing a scalar temperature. Compute_ke_atom.cpp is a simple example of computing per-atom kinetic energy.

Here is a brief description of methods you define in your new derived class. See compute.h for details.

init	perform one time setup (required)
init_list	neighbor list setup, if needed (optional)
compute_scalar	compute a scalar quantity (optional)
compute_vector	compute a vector of quantities (optional)
compute_peratom	compute one or more quantities per atom (optional)
compute_local	compute one or more quantities per processor (optional)
pack_comm	pack a buffer with items to communicate (optional)
unpack_comm	unpack the buffer (optional)
pack_reverse	pack a buffer with items to reverse communicate (optional)
unpack_reverse	unpack the buffer (optional)
remove_bias	remove velocity bias from one atom (optional)
remove_bias_all	remove velocity bias from all atoms in group (optional)
restore_bias	restore velocity bias for one atom after remove_bias (optional)
restore_bias_all	same as before, but for all atoms in group (optional)
pair_tally_callback	callback function for <i>tally</i> -style computes (optional).
memory_usage	tally memory usage (optional)

Tally-style computes are a special case, as their computation is done in two stages: the callback function is registered with the pair style and then called from the Pair::ev_tally() function, which is called for each pair after force and energy has been computed for this pair. Then the tallied values are retrieved with the standard compute_scalar or compute_vector or compute_peratom methods. The *compute styles in the TALLY package* provide *examples* for utilizing this mechanism.

3.9 Fix styles

In LAMMPS, a “fix” is any operation that is computed during timestepping that alters some property of the system. Essentially everything that happens during a simulation besides force computation, neighbor list construction, and output, is a “fix”. This includes time integration (update of coordinates and velocities), force constraints or boundary conditions (SHAKE or walls), and diagnostics (compute a diffusion coefficient). New styles can be created to add new options to LAMMPS.

Fix_setforce.cpp is a simple example of setting forces on atoms to prescribed values. There are dozens of fix options already in LAMMPS; choose one as a template that is similar to what you want to implement.

Here is a brief description of methods you can define in your new derived class. See fix.h for details.

setmask	determines when the fix is called during the timestep (required)
init	initialization before a run (optional)
init_list	store pointer to neighbor list; called by neighbor list code (optional)
setup_pre_exchange	called before atom exchange in setup (optional)

continues on next page

Table 1 – continued from previous page

setup_pre_force	called before force computation in setup (optional)
setup	called immediately before the first timestep and after forces are computed (optional)
min_setup_pre_force	like setup_pre_force, but for minimizations instead of MD runs (optional)
min_setup	like setup, but for minimizations instead of MD runs (optional)
initial_integrate	called at very beginning of each timestep (optional)
pre_exchange	called before atom exchange on re-neighboring steps (optional)
pre_neighbor	called before neighbor list build (optional)
pre_force	called before pair & molecular forces are computed (optional)
post_force	called after pair & molecular forces are computed and communicated (optional)
final_integrate	called at end of each timestep (optional)
end_of_step	called at very end of timestep (optional)
write_restart	dumps fix info to restart file (optional)
restart	uses info from restart file to re-initialize the fix (optional)
grow_arrays	allocate memory for atom-based arrays used by fix (optional)
copy_arrays	copy atom info when an atom migrates to a new processor (optional)
pack_exchange	store atom's data in a buffer (optional)
unpack_exchange	retrieve atom's data from a buffer (optional)
pack_restart	store atom's data for writing to restart file (optional)
unpack_restart	retrieve atom's data from a restart file buffer (optional)
size_restart	size of atom's data (optional)
maxsize_restart	max size of atom's data (optional)
setup_pre_force_respa	same as setup_pre_force, but for rRESPA (optional)
initial_integrate_respa	same as initial_integrate, but for rRESPA (optional)
post_integrate_respa	called after the first half integration step is done in rRESPA (optional)
pre_force_respa	same as pre_force, but for rRESPA (optional)
post_force_respa	same as post_force, but for rRESPA (optional)
final_integrate_respa	same as final_integrate, but for rRESPA (optional)
min_pre_force	called after pair & molecular forces are computed in minimizer (optional)
min_post_force	called after pair & molecular forces are computed and communicated in minimizer (optional)
min_store	store extra data for linesearch based minimization on a LIFO stack (optional)
min_pushstore	push the minimization LIFO stack one element down (optional)
min_popstore	pop the minimization LIFO stack one element up (optional)
min_clearstore	clear minimization LIFO stack (optional)
min_step	reset or move forward on line search minimization (optional)
min_dof	report number of degrees of freedom <i>added</i> by this fix in minimization (optional)
max_alpha	report maximum allowed step size during linesearch minimization (optional)
pack_comm	pack a buffer to communicate a per-atom quantity (optional)
unpack_comm	unpack a buffer to communicate a per-atom quantity (optional)
pack_reverse_comm	pack a buffer to reverse communicate a per-atom quantity (optional)
unpack_reverse_comm	unpack a buffer to reverse communicate a per-atom quantity (optional)
dof	report number of degrees of freedom <i>removed</i> by this fix during MD (optional)
compute_scalar	return a global scalar property that the fix computes (optional)
compute_vector	return a component of a vector property that the fix computes (optional)
compute_array	return a component of an array property that the fix computes (optional)
deform	called when the box size is changed (optional)
reset_target	called when a change of the target temperature is requested during a run (optional)
reset_dt	is called when a change of the time step is requested during a run (optional)
modify_param	called when a fix_modify request is executed (optional)
memory_usage	report memory used by fix (optional)
thermo	compute quantities for thermodynamic output (optional)

Typically, only a small fraction of these methods are defined for a particular fix. Setmask is mandatory, as it deter-

mines when the fix will be invoked during the timestep. Fixes that perform time integration (*nve*, *nvt*, *npt*) implement `initial_integrate()` and `final_integrate()` to perform velocity Verlet updates. Fixes that constrain forces implement `post_force()`.

Fixes that perform diagnostics typically implement `end_of_step()`. For an `end_of_step` fix, one of your fix arguments must be the variable “`nevery`” which is used to determine when to call the fix and you must set this variable in the constructor of your fix. By convention, this is the first argument the fix defines (after the ID, group-ID, style).

If the fix needs to store information for each atom that persists from timestep to timestep, it can manage that memory and migrate the info with the atoms as they move from processors to processor by implementing the `grow_arrays`, `copy_arrays`, `pack_exchange`, and `unpack_exchange` methods. Similarly, the `pack_restart` and `unpack_restart` methods can be implemented to store information about the fix in restart files. If you wish an integrator or force constraint fix to work with rRESPA (see the [run_style](#) command), the `initial_integrate`, `post_force_integrate`, and `final_integrate_respa` methods can be implemented. The thermo method enables a fix to contribute values to thermodynamic output, as printed quantities and/or to be summed to the potential energy of the system.

3.10 Input script command style

New commands can be added to LAMMPS input scripts by adding new classes that are derived from the `Command` class and thus must have a “`command`” method. For example, the `create_atoms`, `read_data`, `velocity`, and `run` commands are all implemented in this fashion. When such a command is encountered in the LAMMPS input script, LAMMPS simply creates a class instance with the corresponding name, invokes the “`command`” method of the class, and passes it the arguments from the input script. The command method can perform whatever operations it wishes on LAMMPS data structures.

The single method your new class must define is as follows:

command	operations performed by the new command
---------	---

Of course, the new class can define other methods and variables as needed.

3.11 Dump styles

Classes that dump per-atom info to files are derived from the `Dump` class. To dump new quantities or in a new format, a new derived dump class can be added, but it is typically simpler to modify the `DumpCustom` class contained in the `dump_custom.cpp` file.

`Dump_atom.cpp` is a simple example of a derived dump class.

Here is a brief description of methods you define in your new derived class. See `dump.h` for details.

<code>write_header</code>	write the header section of a snapshot of atoms
<code>count</code>	count the number of lines a processor will output
<code>pack</code>	pack a proc’s output data into a buffer
<code>write_data</code>	write a proc’s data to a file

See the [dump](#) command and its *custom* style for a list of keywords for atom information that can already be dumped by `DumpCustom`. It includes options to dump per-atom info from `Compute` classes, so adding a new derived `Compute` class is one way to calculate new quantities to dump.

Note that new keywords for atom properties are not typically added to the [dump custom](#) command. Instead they are added to the [compute property/atom](#) command.

3.12 Kspace styles

Classes that compute long-range Coulombic interactions via K-space representations (Ewald, PPPM) are derived from the KSpace class. New styles can be created to add new K-space options to LAMMPS.

Ewald.cpp is an example of computing K-space interactions.

Here is a brief description of methods you define in your new derived class. See kspace.h for details.

init	initialize the calculation before a run
setup	computation before the first timestep of a run
compute	every-timestep computation
memory_usage	tally of memory usage

3.13 Minimization styles

Classes that perform energy minimization derived from the Min class. New styles can be created to add new minimization algorithms to LAMMPS.

Min_cg.cpp is an example of conjugate gradient minimization.

Here is a brief description of methods you define in your new derived class. See min.h for details.

init	initialize the minimization before a run
run	perform the minimization
memory_usage	tally of memory usage

3.14 Region styles

Classes that define geometric regions are derived from the Region class. Regions are used elsewhere in LAMMPS to group atoms, delete atoms to create a void, insert atoms in a specified region, etc. New styles can be created to add new region shapes to LAMMPS.

Region_sphere.cpp is an example of a spherical region.

Here is a brief description of methods you define in your new derived class. See region.h for details.

inside	determine whether a point is in the region
surface_interior	determine if a point is within a cutoff distance inside of surface
surface_exterior	determine if a point is within a cutoff distance outside of surface
shape_update	change region shape if set by time-dependent variable

3.15 Body styles

Classes that define body particles are derived from the Body class. Body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc.

See the [Howto body](#) page for an overview of using body particles and the various body styles LAMMPS supports. New styles can be created to add new kinds of body particles to LAMMPS.

Body_nparticle.cpp is an example of a body particle that is treated as a rigid body containing N sub-particles.

Here is a brief description of methods you define in your new derived class. See body.h for details.

data_body	process a line from the Bodies section of a data file
noutrow	number of sub-particles output is generated for
noutcol	number of values per-sub-particle output is generated for
output	output values for the Mth sub-particle
pack_comm_body	body attributes to communicate every timestep
unpack_comm_body	unpacking of those attributes
pack_border_body	body attributes to communicate when reneighboring is done
unpack_border_body	unpacking of those attributes

3.16 Granular Sub-Model styles

In granular models, particles are spheres with a finite radius and rotational degrees of freedom as further described in the [Howto granular page](#). Interactions between pair of particles or particles and walls may therefore depend on many different modes of motion as described in [pair granular](#) and [fix wall/gran](#). In both cases, the exchange of forces, torques, and heat flow between two types of bodies is defined using a GranularModel class. The GranularModel class organizes the details of an interaction using a series of granular sub-models each of which describe a particular interaction mode (e.g. normal forces or rolling friction). From a parent GranSubMod class, several types of sub-model classes are derived:

- GranSubModNormal: normal force sub-model
- GranSubModDamping: normal damping sub-model
- GranSubModTangential: tangential forces and sliding friction sub-model
- GranSubModRolling: rolling friction sub-model
- GranSubModTwisting: twisting friction sub-model
- GranSubModHeat: heat conduction sub-model

For each type of sub-model, more classes are further derived, each describing a specific implementation. For instance, from the GranSubModNormal class the GranSubModNormalHooke, GranSubModNormalHertz, and GranSubModNormalJKR classes are derived which calculate Hookean, Hertzian, or JKR normal forces, respectively. This modular structure simplifies the addition of new granular contact models as one only needs to create a new GranSubMod class without having to modify the more complex PairGranular, FixGranWall, and GranularModel classes. Most GranSubMod methods are also already defined by the parent classes so new contact models typically only require edits to a few relevant methods (e.g. methods that define coefficients and calculate forces).

Each GranSubMod class has a pointer to both the LAMMPS class and the GranularModel class which owns it, `lmp` and `gm`, respectively. The GranularModel class includes several public variables that describe the geometry/dynamics of the contact such as

xi and xj	Positions of the two contacting bodies
vi and vj	Velocities of the two contacting bodies
omegai and omegaj	Angular velocities of the two contacting bodies
dx and nx	The displacement and normalized displacement vectors
r, rsq, and rin	The distance, distance squared, and inverse distance
radsum	The sum of particle radii
vr, vn, and vt	The relative velocity vector and its normal and tangential components
wr	The relative rotational velocity

These quantities, among others, are calculated in the `GranularModel->check_contact()` and `GranularModel->calculate_forces()` methods which can be referred to for more details.

To create a new `GranSubMod` class, it is recommended that one first looks at similar `GranSubMod` classes. All `GranSubMod` classes share several general methods which may need to be defined

<code>GranSubMod->mix</code>	Optional method to define how coefficients are mixed for different atom types. By default, coefficients are mixed using a geometric mean.
<code>GranSubMod->coe</code>	Parses coefficients to define local variables. Run once at model construction.
<code>GranSubMod->ini</code>	Optional method to define local variables after other <code>GranSubMod</code> types were created. For instance, this method may be used by a tangential model that derives parameters from the normal model.

There are also several type-specific methods

<code>GranSubModNormal->t</code>	Optional method to test when particles are in contact. By default, this is when particles overlap.
<code>GranSubModNormal->p</code>	Optional method to return the distance at which particles stop interacting. By default, this is when particles no longer overlap.
<code>GranSubModNormal->c</code>	Optional method to return the radius of the contact. By default, this returns the radius of the geometric cross section.
<code>GranSubModNormal->s</code>	Optional method that defines the critical force to break the contact used by some tangential, rolling, and twisting sub-models. By default, this is the current total normal force including damping.
<code>GranSubModNormal->c</code>	Required method that returns the normal contact force
<code>GranSubModDamping-></code>	Required method that returns the normal damping force
<code>GranSubModTangential-></code>	Required method that calculates tangential forces/torques
<code>GranSubModTwisting-></code>	Required method that calculates twisting friction forces/torques
<code>GranSubModRolling-></code>	Required method that calculates rolling friction forces/torques
<code>GranSubModHeat->cal</code>	Required method that returns the rate of heat flow

As an example, say one wanted to create a new normal force option that consisted of a Hookean force with a piecewise stiffness. This could be done by adding a new set of files `gran_sub_mod_custom.h`:

```
#ifndef GranSubMod_CLASS
// clang-format off
GranSubModStyle(hooke/piecewise,GranSubModNormalHookePiecewise,NORMAL);
// clang-format on
#else

#endif GRAN_SUB_MOD_CUSTOM_H
```

(continues on next page)

(continued from previous page)

```

#define GRAN_SUB_MOD_CUSTOM_H_

#include "gran_sub_mod.h"
#include "gran_sub_mod_normal.h"

namespace LAMMPS_NS {
namespace Granular_NS {
  class GranSubModNormalHookePiecewise : public GranSubModNormal {
  public:
    GranSubModNormalHookePiecewise(class GranularModel *, class LAMMPS *);
    void coeffs_to_local() override;
    double calculate_forces() override;
  protected:
    double k1, k2, delta_switch;
  };
} // namespace Granular_NS
} // namespace LAMMPS_NS

#endif /*GRAN_SUB_MOD_CUSTOM_H_ */
#endif /*GRAN_SUB_MOD_CLASS_H_ */

```

and gran_sub_mod_custom.cpp

```

#include "gran_sub_mod_custom.h"
#include "gran_sub_mod_normal.h"
#include "granular_model.h"

using namespace LAMMPS_NS;
using namespace Granular_NS;

GranSubModNormalHookePiecewise::GranSubModNormalHookePiecewise(GranularModel *gm, LAMMPS_
→ *lmp) :
  GranSubModNormal(gm, lmp)
{
  num_coeffs = 4;
}

/* ----- */

void GranSubModNormalHookePiecewise::coeffs_to_local()
{
  k1 = coeffs[0];
  k2 = coeffs[1];
  damp = coeffs[2];
  delta_switch = coeffs[3];
}

/* ----- */

double GranSubModNormalHookePiecewise::calculate_forces()
{

```

(continues on next page)

(continued from previous page)

```

double Fne;
if (gm->delta >= delta_switch) {
    Fne = k1 * delta_switch + k2 * (gm->delta - delta_switch);
} else {
    Fne = k1 * gm->delta;
}
return Fne;
}

```

3.17 Thermodynamic output options

The `Thermo` class computes and prints thermodynamic information to the screen and log file; see the files `thermo.cpp` and `thermo.h`.

There are four styles defined in `thermo.cpp`: “one”, “multi”, “yaml”, and “custom”. The “custom” style allows the user to explicitly list keywords for individual quantities to print when thermodynamic output is generated. The others have a fixed list of keywords. See the [thermo_style](#) command for a list of available quantities. The formatting of the “custom” style defaults to the “one” style, but can be adapted using [thermo_modify line](#).

The thermo styles (one, multi, etc) are defined by lists of keywords with associated formats for integer and floating point numbers and identified by an enumerator constant. Adding a new style thus mostly requires defining a new list of keywords and the associated formats and then inserting the required output processing where the enumerators are identified. Search for the word “CUSTOMIZATION” with references to “thermo style” in the `thermo.cpp` file to see the locations where code will need to be added. The member function `Thermo::header()` prints output at the very beginning of a thermodynamic output block and can be used to print column headers or other front matter. The member function `Thermo::footer()` prints output at the end of a thermodynamic output block. The formatting of the output is done by assembling a “line” (which may span multiple lines if the style inserts newline characters “\n” as in the “multi” style).

New thermodynamic keywords can also be added to `thermo.cpp` to compute new quantities for output. Search for the word “CUSTOMIZATION” with references to “keyword” in `thermo.cpp` to see the several locations where code will need to be added. Effectively, you need to define a member function that computes the property, add an if statement in `Thermo::parse_fields()` where the corresponding header string for the keyword and the function pointer is registered by calling the `Thermo::addfield()` method, and add an if statement in `Thermo::evaluate_keyword()` which is called from the `Variable` class when a thermo keyword is encountered.

Note

The third argument to `Thermo::addfield()` is a flag indicating whether the function for the keyword computes a floating point (FLOAT), regular integer (INT), or big integer (BIGINT) value. This information is used for formatting the thermodynamic output. Inside the function the result must then be stored either in the `dvalue`, `ivalue` or `bivalue` member variable, respectively.

Since the [thermo_style custom](#) command allows to use output of quantities calculated by [fixes](#), [computes](#), and [variables](#), it may often be simpler to compute what you wish via one of those constructs, rather than by adding a new keyword to the `thermo_style` command.

3.18 Variable options

The `Variable` class computes and stores *variable* information in LAMMPS; see the file `variable.cpp`. The value associated with a variable can be periodically printed to the screen via the *print*, *fix print*, or *thermo_style custom* commands. Variables of style “equal” can compute complex equations that involve the following types of arguments:

```
thermo keywords = ke, vol, atoms, ...
other variables = v_a, v_myvar, ...
math functions = div(x,y), mult(x,y), add(x,y), ...
group functions = mass(group), xcm(group,x), ...
atom values = x[123], y[3], vx[34], ...
compute values = c_mytemp[0], c_thermo_press[3], ...
```

Adding keywords for the *thermo_style custom* command (which can then be accessed by variables) is discussed in the *Modify thermo* documentation.

Adding a new math function of one or two arguments can be done by editing one section of the `Variable::evaluate()` method. Search for the word “customize” to find the appropriate location.

Adding a new group function can be done by editing one section of the `Variable::evaluate()` method. Search for the word “customize” to find the appropriate location. You may need to add a new method to the `Group` class as well (see the `group.cpp` file).

Accessing a new atom-based vector can be done by editing one section of the `Variable::evaluate()` method. Search for the word “customize” to find the appropriate location.

Adding new *compute styles* (whose calculated values can then be accessed by variables) is discussed in the *Modify compute* documentation.

INFORMATION FOR DEVELOPERS

This section describes the internal structure and basic algorithms of the LAMMPS code. This is a work in progress and additional information will be added incrementally depending on availability of time and requests from the LAMMPS user community.

4.1 Source files

The source files of the LAMMPS code are found in two directories of the distribution: `src` and `lib`. Most of the code is written in C++ but there are small a number of files in several other languages like C, Fortran, Shell script, or Python.

The core of the code is located in the `src` folder and its subdirectories. A sizable number of these files are in the `src` directory itself, but there are plenty of *packages*, which can be included or excluded when LAMMPS is built. See the *Include packages in build* section of the manual for more information about that part of the build process. LAMMPS currently supports building with *conventional makefiles* and through *CMake*. Those procedures differ in how packages are enabled or disabled for inclusion into a LAMMPS binary, so they cannot be mixed. The source files for each package are in all-uppercase subdirectories of the `src` folder, for example `src/MOLECULE` or `src/EXTRA-MOLECULE`. The `src/STUBS` subdirectory is not a package but contains a dummy MPI library, that is used when building a serial version of the code. The `src/MAKE` directory and its subdirectories contain makefiles with settings and flags for a variety of configuration and machines for the build process with traditional makefiles.

The `lib` directory contains the source code for several supporting libraries or files with configuration settings to use globally installed libraries, that are required by some optional packages. They may include python scripts that can transparently download additional source code on request. Each subdirectory, like `lib/poems` or `lib/gpu`, contains the source files, some of which are in different languages such as Fortran or CUDA. These libraries included in the LAMMPS build, if the corresponding package is installed.

LAMMPS C++ source files almost always come in pairs, such as `src/run.cpp` (implementation file) and `src/run.h` (header file). Each pair of files defines a C++ class, for example the `LAMMPS_NS::Run` class, which contains the code invoked by the *run* command in a LAMMPS input script. As this example illustrates, source file and class names often have a one-to-one correspondence with a command used in a LAMMPS input script. Some source files and classes do not have a corresponding input script command, for example `src/force.cpp` and the `LAMMPS_NS::Force` class. They are discussed in the next section.

The names of all source files are in lower case and may use the underscore character ‘`_`’ to separate words. Apart from bundled, externally maintained libraries, which may have different conventions, all C and C++ header files have a `.h` extension, all C++ files have a `.cpp` extension, and C files a `.c` extension. A few C++ classes and utility functions are implemented with only a `.h` file. Examples are the Pointers and Commands classes or the MathVec functions.

4.2 Class topology

Though LAMMPS has a lot of source files and classes, its class topology is not very deep, which can be seen from the *LAMMPS class topology* figure. In that figure, each name refers to a class and has a pair of associated source files in the `src` folder, for example the class `LAMMPS_NS::Memory` corresponds to the files `memory.cpp` and `memory.h`, or the class `LAMMPS_NS::AtomVec` corresponds to the files `atom_vec.cpp` and `atom_vec.h`. Full lines in the figure represent compositing: that is, the class at the base of the arrow holds a pointer to an instance of the class at the tip. Dashed lines instead represent inheritance: the class at the tip of the arrow is derived from the class at the base. Classes with a red boundary are not instantiated directly, but they represent the base classes for “styles”. Those “styles” make up the bulk of the LAMMPS code and only a few representative examples are included in the figure, so it remains readable.

The `LAMMPS_NS::LAMMPS` class is the topmost class and represents what is generally referred to as an “instance of LAMMPS”. It is a composite holding pointers to instances of other core classes providing the core functionality of the MD engine in LAMMPS and through them abstractions of the required operations. The constructor of the LAMMPS class will instantiate those instances, process the command line flags, initialize MPI (if not already done) and set up file pointers for input and output. The destructor will shut everything down and free all associated memory. Thus code for the standalone LAMMPS executable in `main.cpp` simply initializes MPI, instantiates a single instance of LAMMPS while passing it the command line flags and input script. It deletes the LAMMPS instance after the method reading the input returns and shuts down the MPI environment before it exits the executable.

The `LAMMPS_NS::Pointers` class is not shown in the *LAMMPS class topology* figure for clarity. It holds references to many of the members of the `LAMMPS_NS::LAMMPS`, so that all classes derived from `LAMMPS_NS::Pointers` have direct access to those references. From the class topology all classes with blue boundary are referenced in the Pointers class and all classes in the second and third columns, that are not listed as derived classes, are instead derived from `LAMMPS_NS::Pointers`. To initialize the pointer references in Pointers, a pointer to the LAMMPS class instance needs to be passed to the constructor. All constructors for classes derived from it, must do so and thus pass that pointer to the constructor for `LAMMPS_NS::Pointers`. The default constructor for `LAMMPS_NS::Pointers` is disabled to enforce this.

Since all storage is supposed to be encapsulated (there are a few exceptions), the LAMMPS class can also be instantiated multiple times by a calling code. Outside the aforementioned exceptions, those LAMMPS instances can be used alternately. As of the time of this writing (early 2023) LAMMPS is not yet sufficiently thread-safe for concurrent execution. When running in parallel with MPI, care has to be taken, that suitable copies of communicators are used to not create conflicts between different instances.

The LAMMPS class currently holds instances of 19 classes representing the core functionality. There are a handful of virtual parent classes in LAMMPS that define what LAMMPS calls *styles*. These are shaded red in the *LAMMPS class topology* figure. Each of these are parents of a number of child classes that implement the interface defined by the parent class. There are two main categories of these styles: some may only have one instance active at a time (e.g. atom, pair, bond, angle, dihedral, improper, kspace, comm) and there is a dedicated pointer variable for each of them in the corresponding composite class. Setups that require a mix of different such styles have to use a *hybrid* class instance that acts as a proxy, and manages and forwards calls to the corresponding sub-style class instances for the designated subset of atoms or data. The composite class may also have lists of class instances, e.g. `Modify` handles lists of compute and fix styles, while `Output` handles a list of dump class instances.

The exception to this scheme are the `command` style classes. These implement specific commands that can be invoked before, after, or in between runs. For these an instance of the class is created, its `command()` method called and then, after completion, the class instance deleted. Examples for this are the `create_box`, `create_atoms`, `minimize`, `run`, `set`, or `velocity` command styles.

For all those styles, certain naming conventions are employed: for the `fix nve` command the class is called `FixNVE` and the source files are `fix_nve.h` and `fix_nve.cpp`. Similarly, for `fix ave/time` we have `FixAveTime` and `fix_ave_time.h` and `fix_ave_time.cpp`. Style names are lower case and without spaces or special characters. A suffix or words are appended with a forward slash ‘/’ which denotes a variant of the corresponding class without the suffix. To connect the style name and the class name, LAMMPS uses macros like: `AtomStyle()`, `PairStyle()`,

Fig. 1: LAMMPS class topology

This figure shows relations of base classes of the LAMMPS simulation package. Full lines indicate that a class holds an instance of the class it is pointing to; dashed lines point to derived classes that are given as examples of what classes may be instantiated during a LAMMPS run based on the input commands and accessed through the API define by their respective base classes. At the core is the `LAMMPS` class, which holds pointers to class instances with specific purposes. Those may hold instances of other classes, sometimes directly, or only temporarily, sometimes as derived classes or derived classes of derived classes, which may also hold instances of other classes.

BondStyle(), RegionStyle(), and so on in the corresponding header file. During configuration or compilation, files with the pattern `style_<name>.h` are created that consist of a list of include statements including all headers of all styles of a given type that are currently enabled (or “installed”).

More details on individual classes in the *LAMMPS class topology* are as follows:

- The Memory class handles allocation of all large vectors and arrays.
- The Error class prints all (terminal) error and warning messages.
- The Universe class sets up one or more partitions of processors so that one or multiple simulations can be run, on the processors allocated for a run, e.g. by the `mpirun` command.
- The Input class reads and processes input (strings and files), stores variables, and invokes *commands*.
- Command style classes are derived from the Command class. They provide input script commands that perform one-time operations before/after/between simulations or which invoke a simulation. They are usually instantiated from within the Input class, its `command` method invoked, and then immediately destructed.
- The Finish class is instantiated to print statistics to the screen after a simulation is performed, by commands like `run` and `minimize`.
- The Special class walks the bond topology of a molecular system to find first, second, third neighbors of each atom. It is invoked by several commands, like *read_data*, *read_restart*, or *replicate*.
- The Atom class stores per-atom properties associated with atom styles. More precisely, they are allocated and managed by a class derived from the AtomVec class, and the Atom class simply stores pointers to them. The classes derived from AtomVec represent the different atom styles, and they are instantiated through the *atom_style* command.
- The Update class holds instances of an integrator and a minimizer class. The Integrate class is a parent style for the Verlet and r-RESPA time integrators, as defined by the *run_style* command. The Min class is a parent style for various energy minimizers.
- The Neighbor class builds and stores neighbor lists. The NeighList class stores a single list (for all atoms). A NeighRequest class instance is created by pair, fix, or compute styles when they need a particular kind of neighbor list and use the NeighRequest properties to select the neighbor list settings for the given request. There can be multiple instances of the NeighRequest class. The Neighbor class will try to optimize how the requests are processed. Depending on the NeighRequest properties, neighbor lists are constructed from scratch, aliased, or constructed by post-processing an existing list into sub-lists.
- The Comm class performs inter-processor communication, typically of ghost atom information. This usually involves MPI message exchanges with 6 neighboring processors in the 3d logical grid of processors mapped to the simulation box. There are two *communication styles*, enabling different ways to perform the domain decomposition.
- The Irregular class is used, when atoms may migrate to arbitrary processors.
- The Domain class stores the simulation box geometry, as well as geometric Regions and any user definition of a Lattice. The latter are defined by the *region* and *lattice* commands in an input script.
- The Force class computes various forces between atoms. The Pair parent class is for non-bonded or pairwise forces, which in LAMMPS also includes many-body forces such as the Tersoff 3-body potential if those are computed by walking pairwise neighbor lists. The Bond, Angle, Dihedral, Improper parent classes are styles for bonded interactions within a static molecular topology. The KSpace parent class is for computing long-range Coulombic interactions. One of its child classes, PPPM, uses the FFT3D and Remap classes to redistribute and communicate grid-based information across the parallel processors.
- The Modify class stores lists of class instances derived from the *Fix* and *Compute* base classes.
- The Group class manipulates groups that atoms are assigned to via the *group* command. It also has functions to compute various attributes of groups of atoms.

- The Output class is used to generate 3 kinds of output from a LAMMPS simulation: thermodynamic information printed to the screen and log file, dump file snapshots, and restart files. These correspond to the *Thermo*, *Dump*, and *WriteRestart* classes respectively. The Dump class is a base class, with several derived classes implementing various dump style variants.
- The Timer class logs timing information, output at the end of a run.

4.3 Code design

This section explains some code design choices in LAMMPS with the goal of helping developers write new code similar to the existing code. Please see the section on *Requirements for contributed code* for more specific recommendations and guidelines. While that section is organized more in the form of a checklist for code contributors, the focus here is on overall code design strategy, choices made between possible alternatives, and discussing some relevant C++ programming language constructs.

Historically, the basic design philosophy of the LAMMPS C++ code was a “C with classes” style. The motivation was to make it easy to modify LAMMPS for people without significant training in C++ programming. Data structures and code constructs were used that resemble the previous implementation(s) in Fortran. A contributing factor to this choice was that at the time, C++ compilers were often not mature and some advanced features contained bugs or did not function as the standard required. There were also disagreements between compiler vendors as to how to interpret the C++ standard documents.

However, C++ compilers and the C++ programming language have advanced significantly. In 2020, the LAMMPS developers decided to require the C++11 standard as the minimum C++ language standard for LAMMPS. Since then, we have begun to replace C-style constructs with equivalent C++ functionality. This was taken either from the C++ standard library or implemented as custom classes or functions. The goal is to improve readability of the code and to increase code reuse through abstraction of commonly used functionality.

Note

Please note that as of spring 2023 there is still a sizable chunk of legacy code in LAMMPS that has not yet been refactored to reflect these style conventions in full. LAMMPS has a large code base and many contributors. There is also a hierarchy of precedence in which the code is adapted. Highest priority has been the code in the `src` folder, followed by code in packages in order of their popularity and complexity (simpler code gets adapted sooner), followed by code in the `lib` folder. Source code that is downloaded from external packages or libraries during compilation is not subject to the conventions discussed here.

4.3.1 Object-oriented code

LAMMPS is designed to be an object-oriented code. Each simulation is represented by an instance of the LAMMPS class. When running in parallel, each MPI process creates such an instance. This can be seen in the `main.cpp` file where the core steps of running a LAMMPS simulation are the following 3 lines of code:

```
LAMMPS *lammps = new LAMMPS(argc, argv, lammps_comm);
lammps->input->file();
delete lammps;
```

The first line creates a LAMMPS class instance and passes the command line arguments and the global communicator to its constructor. The second line triggers the LAMMPS instance to process the input (either from standard input or a provided input file) until the simulation ends. The third line deletes the LAMMPS instance. The remainder of the `main.cpp` file has code for error handling, MPI configuration, and other special features.

The basic LAMMPS class hierarchy which is created by the LAMMPS class constructor is shown in [LAMMPS class topology](#). When input commands are processed, additional class instances are created, or deleted, or replaced. Likewise, specific member functions of specific classes are called to trigger actions such creating atoms, computing forces, computing properties, time-propagating the system, or writing output.

Compositing and Inheritance

LAMMPS makes extensive use of the object-oriented programming (OOP) principles of *compositing* and *inheritance*. Classes like the LAMMPS class are a **composite** containing pointers to instances of other classes like `Atom`, `Comm`, `Force`, `Neighbor`, `Modify`, and so on. Each of these classes implements certain functionality by storing and manipulating data related to the simulation and providing member functions that trigger certain actions. Some of those classes like `Force` are themselves composites, containing instances of classes describing different force interactions. Similarly, the `Modify` class contains a list of `Fix` and `Compute` classes. If the input commands that correspond to these classes include the word *style*, then LAMMPS stores only a single instance of that class. E.g. *atom_style*, *comm_style*, *pair_style*, *bond_style*. If the input command does **not** include the word *style*, then there may be many instances of that class defined, for example *region*, *fix*, *compute*, *dump*.

Inheritance enables creation of *derived* classes that can share common functionality in their base class while providing a consistent interface. The derived classes replace (dummy or pure) functions in the base class. The higher level classes can then call those methods of the instantiated classes without having to know which specific derived class variant was instantiated. In LAMMPS these derived classes are often referred to as “styles”, e.g. pair styles, fix styles, atom styles and so on.

This is the origin of the flexibility of LAMMPS. For example, pair styles implement a variety of different non-bonded interatomic potentials functions. All details for the implementation of a potential are stored and executed in a single class.

As mentioned above, there can be multiple instances of classes derived from the `Fix` or `Compute` base classes. They represent a different facet of LAMMPS’ flexibility, as they provide methods which can be called at different points within a timestep, as explained in *Developer_flow*. This allows the input script to tailor how a specific simulation is run, what diagnostic computations are performed, and how the output of those computations is further processed or output.

Additional code sharing is possible by creating derived classes from the derived classes (e.g., to implement an accelerated version of a pair style) where only a subset of the derived class methods are replaced with accelerated versions.

Polymorphism

Polymorphism and dynamic dispatch are another OOP feature that play an important role in how LAMMPS selects what code to execute. In a nutshell, this is a mechanism where the decision of which member function to call from a class is determined at runtime and not when the code is compiled. To enable it, the function has to be declared as `virtual` and all corresponding functions in derived classes should use the `override` property. Below is a brief example.

```
class Base {
public:
    virtual ~Base() = default;
    void call();
    void normal();
    virtual void poly();
};

void Base::call() {
    normal();
```

(continues on next page)

(continued from previous page)

```

    poly();
}

class Derived : public Base {
public:
    ~Derived() override = default;
    void normal();
    void poly() override;
};

// [...]

Base *base1 = new Base();
Base *base2 = new Derived();

base1->call();
base2->call();

```

The difference in behavior of the `normal()` and the `poly()` member functions is which of the two member functions is called when executing `base1->call()` versus `base2->call()`. Without polymorphism, a function within the base class can only call member functions within the same scope: that is, `Base::call()` will always call `Base::normal()`. But for the `base2->call()` case, the call of the virtual member function will be dispatched to `Derived::poly()` instead. This mechanism results in calling functions that are within the scope of the class that was used to *create* the instance, even if they are assigned to a pointer for their base class. This is the desired behavior, and this way LAMMPS can even use styles that are loaded at runtime from a shared object file with the *plugin command*.

A special case of virtual functions are so-called pure functions. These are virtual functions that are initialized to 0 in the class declaration (see example below).

```

class Base {
public:
    virtual void pure() = 0;
};

```

This has the effect that an instance of the base class cannot be created and that derived classes **must** implement these functions. Many of the functions listed with the various class styles in the section *Modifying & extending LAMMPS* are pure functions. The motivation for this is to define the interface or API of the functions, but defer their implementation to the derived classes.

However, there are downsides to this. For example, calls to virtual functions from within a constructor, will *not* be in the scope of the derived class, and thus it is good practice to either avoid calling them or to provide an explicit scope such as `Base::poly()` or `Derived::poly()`. Furthermore, any destructors in classes containing virtual functions should be declared virtual too, so they will be processed in the expected order before types are removed from dynamic dispatch.

Important Notes

In order to be able to detect incompatibilities at compile time and to avoid unexpected behavior, it is crucial that all member functions that are intended to replace a virtual or pure function use the `override` property keyword. For the same reason, the use of overloads or default arguments for virtual functions should be avoided, as they lead to confusion over which function is supposed to override which, and which arguments need to be declared.

Style Factories

In order to create class instances for different styles, LAMMPS often uses a programming pattern called *Factory*. Those are functions that create an instance of a specific derived class, say `PairLJCut` and return a pointer to the type of the common base class of that style, `Pair` in this case. To associate the factory function with the style keyword, a `std::map` class is used with function pointers indexed by their keyword (for example “lj/cut” for `PairLJCut` and “morse” for `PairMorse`). A couple of typedefs help keep the code readable, and a template function is used to implement the actual factory functions for the individual classes. Below is an example of such a factory function from the `Force` class as declared in `force.h` and implemented in `force.cpp`. The file `style_pair.h` is generated during compilation and includes all main header files (i.e. those starting with `pair_`) of pair styles and then the macro `PairStyle()` will associate the style name “lj/cut” with a factory function creating an instance of the `PairLJCut` class.

```
// from force.h
typedef Pair *(*PairCreator)(LAMMPS *);
typedef std::map<std::string, PairCreator> PairCreatorMap;
PairCreatorMap *pair_map;

// from force.cpp
template <typename S, typename T> static S *style_creator(LAMMPS *lmp)
{
    return new T(lmp);
}

// [...]

pair_map = new PairCreatorMap();

#define PAIR_CLASS
#define PairStyle(key, Class) (*pair_map)[#key] = &style_creator<Pair, Class>;
#include "style_pair.h"
#undef PairStyle
#undef PAIR_CLASS

// from pair_lj_cut.h

#ifdef PAIR_CLASS
PairStyle(lj/cut, PairLJCut);
#else
// [...]
```

Similar code constructs are present in other files like `modify.cpp` and `modify.h` or `neighbor.cpp` and `neighbor.h`. Those contain similar macros and include `style_*.h` files for creating class instances of styles they manage.

4.3.2 I/O and output formatting

C-style stdio versus C++ style iostreams

LAMMPS uses the “stdio” library of the standard C library for reading from and writing to files and console instead of C++ “iostreams”. This is mainly motivated by better performance, better control over formatting, and less effort to achieve specific formatting.

Since mixing “stdio” and “iostreams” can lead to unexpected behavior, use of the latter is strongly discouraged. Output to the screen should *not* use the predefined `stdout` FILE pointer, but rather the `screen` and `logfile` FILE pointers

managed by the LAMMPS class. Furthermore, output should generally only be done by MPI rank 0 (`comm->me == 0`). Output that is sent to both screen and logfile should use the `utils::logmesg()` convenience function.

We discourage the use of stringstream because the bundled `{fmt}` library and the customized tokenizer classes provide the same functionality in a cleaner way with better performance. This also helps maintain a consistent programming syntax with code from many different contributors.

Formatting with the `{fmt}` library

The LAMMPS source code includes a copy of the `{fmt}` library, which is preferred over formatting with the “`printf()`” family of functions. The primary reason is that it allows a typesafe default format for any type of supported data. This is particularly useful for formatting integers of a given size (32-bit or 64-bit) which may require different format strings depending on compile time settings or compilers/operating systems. Furthermore, `{fmt}` gives better performance, has more functionality, a familiar formatting syntax that has similarities to `format()` in Python, and provides a facility that can be used to integrate format strings and a variable number of arguments into custom functions in a much simpler way than the varargs mechanism of the C library. Finally, `{fmt}` has been included into the C++20 language standard, so changes to adopt it are future-proof.

Formatted strings are frequently created by calling the `fmt::format()` function, which will return a string as a `std::string` class instance. In contrast to the `%` placeholder in `printf()`, the `{fmt}` library uses `{}` to embed format descriptors. In the simplest case, no additional characters are needed, as `{fmt}` will choose the default format based on the data type of the argument. Otherwise, the `fmt::print()` function may be used instead of `printf()` or `fprintf()`. In addition, several LAMMPS output functions, that originally accepted a single string as argument have been overloaded to accept a format string with optional arguments as well (e.g., `Error::all()`, `Error::one()`, `utils::logmesg()`).

Summary of the `{fmt}` format syntax

The syntax of the format string is “`{[<argument id>]:<format spec>}`”, where either the argument id or the format spec (separated by a colon ‘:’) is optional. The argument id is usually a number starting from 0 that is the index to the arguments following the format string. By default, these are assigned in order (i.e. 0, 1, 2, 3, 4 etc.). The most common case for using argument id would be to use the same argument in multiple places in the format string without having to provide it as an argument multiple times. The argument id is rarely used in the LAMMPS source code.

More common is the use of a format specifier, which starts with a colon. This may optionally be followed by a fill character (default is ‘ ’). If provided, the fill character **must** be followed by an alignment character (‘<’, ‘^’, ‘>’ for left, centered, or right alignment (default)). The alignment character may be used without a fill character. The next important format parameter would be the minimum width, which may be followed by a dot ‘.’ and a precision for floating point numbers. The final character in the format string would be an indicator for the “presentation”, i.e. ‘d’ for decimal presentation of integers, ‘x’ for hexadecimal, ‘o’ for octal, ‘c’ for character etc. This mostly follows the “`printf()`” scheme, but without requiring an additional length parameter to distinguish between different integer widths. The `{fmt}` library will detect those and adapt the formatting accordingly. For floating point numbers there are correspondingly, ‘g’ for generic presentation, ‘e’ for exponential presentation, and ‘f’ for fixed point presentation.

The format string “`{:8}`” would thus represent *any* type argument and be replaced by at least 8 characters; “`{:<8}`” would do this as left aligned, “`{:^8}`” as centered, “`{:>8}`” as right aligned. If a specific presentation is selected, the argument type must be compatible or else the `{fmt}` formatting code will throw an exception. Some format string examples are given below:

```
auto mesg = fmt::format(" CPU time: {:4d}:{:02d}:{:02d}\n", cpuh, cpum, cpus);
mesg = fmt::format("{:<8s} | {:<10.5g} | {:<10.5g} | {:<10.5g} |{:6.1f} |{:6.2f}\n",
                  label, time_min, time, time_max, time_sq, tmp);
utils::logmesg(lmp, "{:>6} = max # of 1-2 neighbors\n", maxall);
```

(continues on next page)

(continued from previous page)

```
utils::logmesg(lmp, "Lattice spacing in x,y,z = {:.8} {:.8} {:.8}\n",
               xlattice, ylattice, zlattice);
```

which will create the following output lines:

```
CPU time:    0:02:16
Pair      | 2.0133      | 2.0133      | 2.0133      | 0.0 | 84.21
      4 = max # of 1-2 neighbors
Lattice spacing in x,y,z = 1.6795962 1.6795962 1.6795962
```

Finally, a special feature of the `{fmt}` library is that format parameters like the width or the precision may be also provided as arguments. In that case a nested format is used where a pair of curly braces (with an optional argument id) “{ }” are used instead of the value, for example “{: { }d}” will consume two integer arguments, the first will be the value shown and the second the minimum width.

For more details and examples, please consult the [{fmt} syntax documentation](#) website.

4.3.3 Memory management

Dynamical allocation of small data and objects can be done with the C++ commands “new” and “delete/delete[]”. Large data should use the member functions of the `Memory` class, most commonly, `Memory::create()`, `Memory::grow()`, and `Memory::destroy()`, which provide variants for vectors, 2d arrays, 3d arrays, etc. These can also be used for small data.

The use of `malloc()`, `calloc()`, `realloc()` and `free()` directly is strongly discouraged. To simplify adapting legacy code into the LAMMPS code base the member functions `Memory::smalloc()`, `Memory::srealloc()`, and `Memory::sfree()` are available, which perform additional error checks for safety.

Use of these custom memory allocation functions is motivated by the following considerations:

- Memory allocation failures on *any* MPI rank during a parallel run will trigger an immediate abort of the entire parallel calculation.
- A failing “new” will trigger an exception, which is also captured by LAMMPS and triggers a global abort.
- Allocation of multidimensional arrays will be done in a C compatible fashion, but such that the storage of the actual data is stored in one large contiguous block. Thus, when MPI communication is needed, the data can be communicated directly (similar to Fortran arrays).
- The “destroy()” and “sfree()” functions may safely be called on NULL pointers.
- The “destroy()” functions will nullify the pointer variables, thus making “use after free” errors easy to detect.
- It is possible to use a larger than default memory alignment (not on all operating systems, since the allocated storage pointers must be compatible with `free()` for technical reasons).

In the practical implementation of code this means, that any pointer variables, that are class members should be initialized to a `nullptr` value in their respective constructors. That way, it is safe to call `Memory::destroy()` or `delete[]` on them before *any* allocation outside the constructor. This helps prevent memory leaks.

4.4 Parallel algorithms

LAMMPS is designed to enable running simulations in parallel using the MPI parallel communication standard with distributed data via domain decomposition. The parallelization aims to be efficient, and resulting in good strong scaling (= good speedup for the same system) and good weak scaling (= the computational cost of enlarging the system is proportional to the system size). Additional parallelization using GPUs or OpenMP can also be applied within the subdomain assigned to an MPI process. For clarity, most of the following illustrations show the 2d simulation case. The underlying algorithms in those cases, however, apply to both 2d and 3d cases equally well.

Note

The text and most of the figures in this chapter were adapted for the manual from the section on parallel algorithms in the *new LAMMPS paper*.

4.4.1 Partitioning

The underlying spatial decomposition strategy used by LAMMPS for distributed-memory parallelism is set with the *comm_style* command and can be either “brick” (a regular grid) or “tiled”.

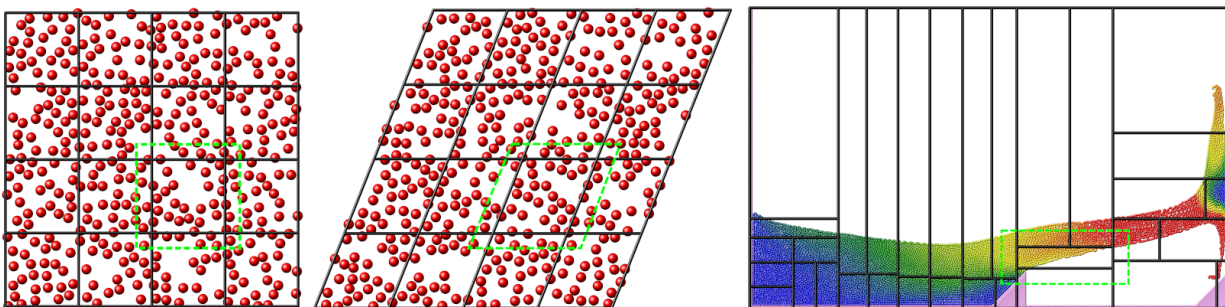

Fig. 2: Domain decomposition schemes

This figure shows the different kinds of domain decomposition used for MPI parallelization: “brick” on the left with an orthogonal (left) and a triclinic (middle) simulation domain, and a “tiled” decomposition (right). The black lines show the division into subdomains, and the contained atoms are “owned” by the corresponding MPI process. The green dashed lines indicate how subdomains are extended with “ghost” atoms up to the communication cutoff distance.

The LAMMPS simulation box is a 3d or 2d volume, which can be of orthogonal or triclinic shape, as illustrated in the *Domain decomposition schemes* figure for the 2d case. Orthogonal means the box edges are aligned with the x , y , z Cartesian axes, and the box faces are thus all rectangular. Triclinic allows for a more general parallelepiped shape in which edges are aligned with three arbitrary vectors and the box faces are parallelograms. In each dimension, box faces can be periodic, or non-periodic with fixed or shrink-wrapped boundaries. In the fixed case, atoms which move outside the face are deleted; shrink-wrapped means the position of the box face adjusts continuously to enclose all the atoms.

For distributed-memory MPI parallelism, the simulation box is spatially decomposed (partitioned) into non-overlapping subdomains which fill the box. The default partitioning, “brick”, is most suitable when atom density is roughly uniform, as shown in the left-side images of the *Domain decomposition schemes* figure. The subdomains comprise a regular grid, and all subdomains are identical in size and shape. Both the orthogonal and triclinic boxes can deform continuously during a simulation, e.g. to compress a solid or shear a liquid, in which case the processor subdomains likewise deform.

For models with non-uniform density, the number of particles per processor can be load-imbalanced with the default partitioning. This reduces parallel efficiency, as the overall simulation rate is limited by the slowest processor, i.e. the

one with the largest computational load. For such models, LAMMPS supports multiple strategies to reduce the load imbalance:

- The processor grid decomposition is by default based on the simulation cell volume and tries to optimize the volume to surface ratio for the subdomains. This can be changed with the *processors* command.
- The parallel planes defining the size of the subdomains can be shifted with the *balance* command. Which can be done in addition to choosing a more optimal processor grid.
- The recursive bisectioning algorithm in combination with the “tiled” communication style can produce a partitioning with equal numbers of particles in each subdomain.

The pictures above demonstrate different decompositions for a 2d system with 12 MPI ranks. The atom colors indicate the load imbalance of each subdomain, with green being optimal and red the least optimal.

Due to the vacuum in the system, the default decomposition is unbalanced, with several MPI ranks without atoms (left). By forcing a 1x12x1 processor grid, every MPI rank does computations now, but the number of atoms per subdomain is still uneven, and the thin slice shape increases the amount of communication between subdomains (center left). With a 2x6x1 processor grid and shifting the subdomain divisions, the load imbalance is further reduced and the amount of communication required between subdomains is less (center right). And using the recursive bisectioning leads to further improved decomposition (right).

4.4.2 Communication

Following the selected partitioning scheme, all per-atom data is distributed across the MPI processes, which allows LAMMPS to handle very large systems provided it uses a correspondingly large number of MPI processes. Since the per-atom data (atom IDs, positions, velocities, types, etc.) To be able to compute the short-range interactions, MPI processes need not only access to the data of atoms they “own” but also information about atoms from neighboring subdomains, in LAMMPS referred to as “ghost” atoms. These are copies of atoms storing required per-atom data for up to the communication cutoff distance. The green dashed-line boxes in the *Domain decomposition schemes* figure illustrate the extended ghost-atom subdomain for one processor.

This approach is also used to implement periodic boundary conditions: atoms that lie within the cutoff distance across a periodic boundary are also stored as ghost atoms and taken from the periodic replication of the subdomain, which may be the same subdomain, e.g. if running in serial. As a consequence of this, force computation in LAMMPS is not subject to minimum image conventions and thus cutoffs may be larger than half the simulation domain.

Efficient communication patterns are needed to update the “ghost” atom data, since that needs to be done at every MD time step or minimization step. The diagrams of the *ghost-atom-comm* figure illustrate how ghost atom communication is performed in two stages for a 2d simulation (three in 3d) for both a regular and irregular partitioning of the simulation box. For the regular case (left) atoms are exchanged first in the *x*-direction, then in *y*, with four neighbors in the grid of processor subdomains.

In the *x* stage, processor ranks 1 and 2 send owned atoms in their red-shaded regions to rank 0 (and vice versa). Then in the *y* stage, ranks 3 and 4 send atoms in their blue-shaded regions to rank 0, which includes ghost atoms they received in the *x* stage. Rank 0 thus acquires all its ghost atoms; atoms in the solid blue corner regions are communicated twice before rank 0 receives them.

Fig. 3: ghost atom communication

This figure shows the ghost atom communication patterns between subdomains for “brick” (left) and “tiled” communication styles for 2d simulations. The numbers indicate MPI process ranks. Here the subdomains are drawn spatially separated for clarity. The dashed-line box is the extended subdomain of processor 0 which includes its ghost atoms. The red- and blue-shaded boxes are the regions of communicated ghost atoms.

For the irregular case (right) the two stages are similar, but a processor can have more than one neighbor in each direction. In the x stage, MPI ranks 1,2,3 send owned atoms in their red-shaded regions to rank 0 (and vice versa). These include only atoms between the lower and upper y -boundary of rank 0’s subdomain. In the y stage, ranks 4,5,6 send atoms in their blue-shaded regions to rank 0. This may include ghost atoms they received in the x stage, but only if they are needed by rank 0 to fill its extended ghost atom regions in the $\pm y$ directions (blue rectangles). Thus, in this case, ranks 5 and 6 do not include ghost atoms they received from each other (in the x stage) in the atoms they send to rank 0. The key point is that while the pattern of communication is more complex in the irregular partitioning case, it can still proceed in two stages (three in 3d) via atom exchanges with only neighboring processors.

When attributes of owned atoms are sent to neighboring processors to become attributes of their ghost atoms, LAMMPS calls this a “forward” communication. On timesteps when atoms migrate to new owning processors and neighbor lists are rebuilt, each processor creates a list of its owned atoms which are ghost atoms in each of its neighbor processors. These lists are used to pack per-atom coordinates (for example) into message buffers in subsequent steps until the next reneighboring.

A “reverse” communication is when computed ghost atom attributes are sent back to the processor who owns the atom. This is used (for example) to sum partial forces on ghost atoms to the complete force on owned atoms. The order of the two stages described in the *ghost atom communication* figure is inverted, and the same lists of atoms are used to pack and unpack message buffers with per-atom forces. When a received buffer is unpacked, the ghost forces are summed to owned atom forces. As in forward communication, forces on atoms in the four blue corners of the diagrams are sent, received, and summed twice (once at each stage) before owning processors have the full force.

These two operations are used in many places within LAMMPS aside from exchange of coordinates and forces, for example by manybody potentials to share intermediate per-atom values, or by rigid-body integrators to enable each atom in a body to access body properties. Here are additional details about how these communication operations are performed in LAMMPS:

- When exchanging data with different processors, forward and reverse communication is done using `MPI_Send()` and `MPI_Irecv()` calls. If a processor is “exchanging” atoms with itself, only the pack and unpack operations are performed, e.g. to create ghost atoms across periodic boundaries when running on a single processor.

- For forward communication of owned atom coordinates, periodic box lengths are added and subtracted when the receiving processor is across a periodic boundary from the sender. There is then no need to apply a minimum image convention when calculating distances between atom pairs when building neighbor lists or computing forces.
- The cutoff distance for exchanging ghost atoms is typically equal to the neighbor cutoff. But it can also set to a larger value if needed, e.g. half the diameter of a rigid body composed of multiple atoms or over 3x the length of a stretched bond for dihedral interactions. It can also exceed the periodic box size. For the regular communication pattern (left), if the cutoff distance extends beyond a neighbor processor's subdomain, then multiple exchanges are performed in the same direction. Each exchange is with the same neighbor processor, but buffers are packed/unpacked using a different list of atoms. For forward communication, in the first exchange, a processor sends only owned atoms. In subsequent exchanges, it sends ghost atoms received in previous exchanges. For the irregular pattern (right) overlaps of a processor's extended ghost-atom subdomain with all other processors in each dimension are detected.

4.4.3 Neighbor lists

To compute forces efficiently, each processor creates a Verlet-style neighbor list which enumerates all pairs of atoms i, j (i = owned, j = owned or ghost) with separation less than the applicable neighbor list cutoff distance. In LAMMPS, the neighbor lists are stored in a multiple-page data structure; each page is a contiguous chunk of memory which stores vectors of neighbor atoms j for many i atoms. This allows pages to be incrementally allocated or deallocated in blocks as needed. Neighbor lists typically consume the most memory of any data structure in LAMMPS. The neighbor list is rebuilt (from scratch) once every few timesteps, then used repeatedly each step for force or other computations. The neighbor cutoff distance is $R_n = R_f + \Delta_s$, where R_f is the (largest) force cutoff defined by the interatomic potential for computing short-range pairwise or manybody forces and Δ_s is a “skin” distance that allows the list to be used for multiple steps assuming that atoms do not move very far between consecutive time steps. Typically, the code triggers reneighboring when any atom has moved half the skin distance since the last reneighboring; this and other options of the neighbor list rebuild can be adjusted with the `neigh_modify` command.

On steps when reneighboring is performed, atoms which have moved outside their owning processor's subdomain are first migrated to new processors via communication. Periodic boundary conditions are also (only) enforced on these steps to ensure each atom is re-assigned to the correct processor. After migration, the atoms owned by each processor are stored in a contiguous vector. Periodically, each processor spatially sorts owned atoms within its vector to reorder it for improved cache efficiency in force computations and neighbor list building. For that, atoms are spatially binned and then reordered so that atoms in the same bin are adjacent in the vector. Atom sorting can be disabled or its settings modified with the `atom_modify` command.

To build a local neighbor list in linear time, the simulation domain is overlaid (conceptually) with a regular 3d (or 2d) grid of neighbor bins, as shown in the *neighbor list stencils* figure for 2d models and a single MPI processor's subdomain. Each processor stores a set of neighbor bins which overlap its subdomain, extended by the neighbor cutoff distance R_n . As illustrated, the bins need not align with processor boundaries; an integer number in each dimension is fit to the size of the entire simulation box.

Most often, LAMMPS builds what is called a “half” neighbor list where each i, j neighbor pair is stored only once, with either atom i or j as the central atom. The build can be done efficiently by using a pre-computed “stencil” of bins around a central origin bin which contains the atom whose neighbors are being searched for. A stencil is simply a list of integer offsets in x, y, z of nearby bins surrounding the origin bin which are close enough to contain any neighbor atom j within a distance R_n from any atom i in the origin bin. Note that for a half neighbor list, the stencil can be asymmetric, since each atom only need store half its nearby neighbors.

These stencils are illustrated in the figure for a half list and a bin size of $\frac{1}{2}R_n$. There are 13 red+blue stencil bins in 2d (for the orthogonal case, 15 for triclinic). In 3d there would be 63, 13 in the plane of bins that contain the origin bin and 25 in each of the two planes above it in the z direction (75 for triclinic). The triclinic stencil has extra bins because the bins tile the bounding box of the entire triclinic domain, and thus are not periodic with respect to the simulation box itself. The stencil and logic for determining which i, j pairs to include in the neighbor list are altered slightly to account for this.

Fig. 4: neighbor list stencils

A 2d simulation subdomain (thick black line) and the corresponding ghost atom cutoff region (dashed blue line) for both orthogonal (left) and triclinic (right) domains. A regular grid of neighbor bins (thin lines) overlays the entire simulation domain and need not align with subdomain boundaries; only the portion overlapping the augmented subdomain is shown. In the triclinic case, it overlaps the bounding box of the tilted rectangle. The blue- and red-shaded bins represent a stencil of bins searched to find neighbors of a particular atom (black dot).

To build a neighbor list, a processor first loops over its “owned” plus “ghost” atoms and assigns each to a neighbor bin. This uses an integer vector to create a linked list of atom indices within each bin. It then performs a triply-nested loop over its owned atoms i , the stencil of bins surrounding atom i ’s bin, and the j atoms in each stencil bin (including ghost atoms). If the distance $r_{ij} < R_n$, then atom j is added to the vector of atom i ’s neighbors.

Here are additional details about neighbor list build options LAMMPS supports:

- The choice of bin size is an option; a size half of R_n has been found to be optimal for many typical cases. Smaller bins incur additional overhead to loop over; larger bins require more distance calculations. Note that for smaller bin sizes, the 2d stencil in the figure would be of a more semicircular shape (hemispherical in 3d), with bins near the corners of the square eliminated due to their distance from the origin bin.
- Depending on the interatomic potential(s) and other commands used in an input script, multiple neighbor lists and stencils with different attributes may be needed. This includes lists with different cutoff distances, e.g. for force computation versus occasional diagnostic computations such as a radial distribution function, or for the r-RESPA time integrator which can partition pairwise forces by distance into subsets computed at different time intervals. It includes “full” lists (as opposed to half lists) where each i,j pair appears twice, stored once with i and j , and which use a larger symmetric stencil. It also includes lists with partial enumeration of ghost atom neighbors. The full and ghost-atom lists are used by various manybody interatomic potentials. Lists may also use different criteria for inclusion of a pairwise interaction. Typically, this simply depends only on the distance between two atoms and the cutoff distance. But for finite-size coarse-grained particles with individual diameters (e.g. polydisperse granular particles), it can also depend on the diameters of the two particles.
- When using *pair style hybrid* multiple sub-lists of the master neighbor list for the full system need to be generated, one for each sub-style, which contains only the i,j pairs needed to compute interactions between subsets of atoms for the corresponding potential. This means, not all i or j atoms owned by a processor are included in a particular sub-list.
- Some models use different cutoff lengths for pairwise interactions between different kinds of particles, which are stored in a single neighbor list. One example is a solvated colloidal system with large colloidal particles where colloid/colloid, colloid/solvent, and solvent/solvent interaction cutoffs can be dramatically different. Another is a model of polydisperse finite-size granular particles; pairs of particles interact only when they are in contact with each other. Mixtures with particle size ratios as high as 10-100x may be used to model realistic systems. Efficient neighbor list building algorithms for these kinds of systems are available in LAMMPS. They include a method which uses different stencils for different cutoff lengths and trims the stencil to only include bins that straddle the cutoff sphere surface. More recently a method which uses both multiple stencils and multiple bin sizes was devel-

oped; it builds neighbor lists efficiently for systems with particles of any size ratio, though other considerations (timestep size, force computations) may limit the ability to model systems with huge polydispersity.

- For small and sparse systems and as a fallback method, LAMMPS also supports neighbor list construction without binning by using a full $O(N^2)$ loop over all i,j atom pairs in a subdomain when using the *neighbor nsq* command.
- Dependent on the “pair” setting of the *newton* command, the “half” neighbor lists may contain **all** pairs of atoms where atom j is a ghost atom (i.e. when the newton pair setting is *off*) For the newton pair *on* setting the atom j is only added to the list if its z coordinate is larger, or if equal the y coordinate is larger, and that is equal, too, the x coordinate is larger. For homogeneously dense systems, that will result in picking neighbors from a same size sector in always the same direction relative to the “owned” atom, and thus it should lead to similar length neighbor lists and reduce the chance of a load imbalance.

4.4.4 Long-range interactions

For charged systems, LAMMPS can compute long-range Coulombic interactions via the FFT-based particle-particle/particle-mesh (PPPM) method implemented in *k-space style ppm and its variants*. For that Coulombic interactions are partitioned into short- and long-range components. The short-ranged portion is computed in real space as a loop over pairs of charges within a cutoff distance, using neighbor lists. The long-range portion is computed in reciprocal space using a *k-space* style. For the PPPM implementation the simulation cell is overlaid with a regular FFT grid in 3d. It proceeds in several stages:

- a) each atom’s point charge is interpolated to nearby FFT grid points,
- b) a forward 3d FFT is performed,
- c) a convolution operation is performed in reciprocal space,
- d) one or more inverse 3d FFTs are performed, and
- e) electric field values from grid points near each atom are interpolated to compute its forces.

For any of the spatial-decomposition partitioning schemes each processor owns the brick-shaped portion of FFT grid points contained within its subdomain. The two interpolation operations use a stencil of grid points surrounding each atom. To accommodate the stencil size, each processor also stores a few layers of ghost grid points surrounding its brick. Forward and reverse communication of grid point values is performed similar to the corresponding *atom data communication*. In this case, electric field values on owned grid points are sent to neighboring processors to become ghost point values. Likewise charge values on ghost points are sent and summed to values on owned points.

For triclinic simulation boxes, the FFT grid planes are parallel to the box faces, but the mapping of charge and electric field values to/from grid points is done in reduced coordinates where the tilted box is conceptually a unit cube, so that the stencil and FFT operations are unchanged. However the FFT grid size required for a given accuracy is larger for triclinic domains than it is for orthogonal boxes.

Parallel 3d FFTs require substantial communication relative to their computational cost. A 3d FFT is implemented by a series of 1d FFTs along the x -, y -, and z -direction of the FFT grid. Thus, the FFT grid cannot be decomposed like atoms into 3 dimensions for parallel processing of the FFTs but only in 1 (as planes) or 2 (as pencils) dimensions and in between the steps the grid needs to be transposed to have the FFT grid portion “owned” by each MPI process complete in the direction of the 1d FFTs it has to perform. LAMMPS uses the pencil-decomposition algorithm as shown in the *Parallel FFT in PPPM* figure.

Initially (far left), each processor owns a brick of same-color grid cells (actually grid points) contained within its subdomain. A brick-to-pencil communication operation converts this layout to 1d pencils in the x -dimension (center left). Again, cells of the same color are owned by the same processor. Each processor can then compute a 1d FFT on each pencil of data it wholly owns using a call to the configured FFT library. A pencil-to-pencil communication then converts this layout to pencils in the y dimension (center right) which effectively transposes the x and y dimensions of the grid, followed by 1d FFTs in y . A final transpose of pencils from y to z (far right) followed by 1d FFTs in z completes the forward FFT. The data is left in a z -pencil layout for the convolution operation. One or more inverse FFTs then

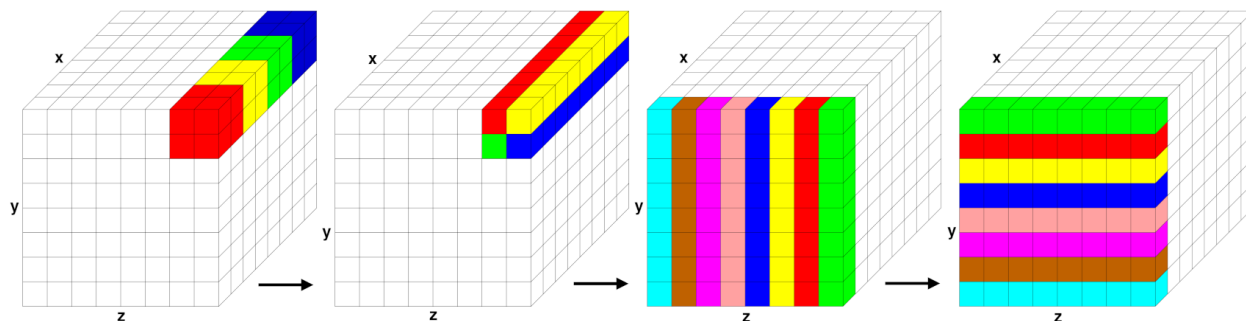

Fig. 5: Parallel FFT in PPPM

Stages of a parallel FFT for a simulation domain overlaid with an $8 \times 8 \times 8$ 3d FFT grid, partitioned across 64 processors. Within each of the 4 diagrams, grid cells of the same color are owned by a single processor; for simplicity, only cells owned by 4 or 8 of the 64 processors are colored. The two images on the left illustrate brick-to-pencil communication. The two images on the right illustrate pencil-to-pencil communication, which in this case transposes the y and z dimensions of the grid.

perform the sequence of 1d FFTs and communication steps in reverse order; the final layout of resulting grid values is the same as the initial brick layout.

Each communication operation within the FFT (brick-to-pencil or pencil-to-pencil or pencil-to-brick) converts one tiling of the 3d grid to another, where a tiling in this context means an assignment of a small brick-shaped subset of grid points to each processor, the union of which comprise the entire grid. The parallel `fftMPI` library written for LAMMPS allows arbitrary definitions of the tiling so that an irregular partitioning of the simulation domain can use it directly. Transforming data from one tiling to another is implemented in `fftMPI` using point-to-point communication, where each processor sends data to a few other processors, since each tile in the initial tiling overlaps with a handful of tiles in the final tiling.

The transformations could also be done using collective communication across all P processors with a single call to `MPI_Alltoall()`, but this is typically much slower. However, for the specialized brick and pencil tiling illustrated in *Parallel FFT in PPPM* figure, collective communication across the entire MPI communicator is not required. In the example, an 8^3 grid with 512 grid cells is partitioned across 64 processors; each processor owns a $2 \times 2 \times 2$ 3d brick of grid cells. The initial brick-to-pencil communication (upper left to upper right) only requires collective communication within subgroups of 4 processors, as illustrated by the 4 colors. More generally, a brick-to-pencil communication can be performed by partitioning P processors into $P^{\frac{1}{3}}$ subgroups of $P^{\frac{1}{3}}$ processors each. Each subgroup performs collective communication only within its subgroup. Similarly, pencil-to-pencil communication can be performed by partitioning P processors into $P^{\frac{1}{2}}$ subgroups of $P^{\frac{1}{2}}$ processors each. This is illustrated in the figure for the $y \Rightarrow z$ communication (center). An eight-processor subgroup owns the front yz plane of data and performs collective communication within the subgroup to transpose from a y -pencil to z -pencil layout.

LAMMPS invokes point-to-point communication by default, but also provides the option of partitioned collective communication when using a `kspace_modify collective yes` command to switch to that mode. In the latter case, the code detects the size of the disjoint subgroups and partitions the single P -size communicator into multiple smaller communicators, each of which invokes collective communication. Testing on a large IBM Blue Gene/Q machine at Argonne National Labs showed a significant improvement in FFT performance for large processor counts; partitioned collective communication was faster than point-to-point communication or global collective communication involving all P processors.

Here are some additional details about FFTs for long-range and related grid/particle operations that LAMMPS supports:

- The `fftMPI` library allows each grid dimension to be a multiple of small prime factors (2,3,5), and allows any number of processors to perform the FFT. The resulting brick and pencil decompositions are thus not always as well-aligned, but the size of subgroups of processors for the two modes of communication (brick/pencil and pencil/pencil) still scale as $O(P^{\frac{1}{3}})$ and $O(P^{\frac{1}{2}})$.

- For efficiency in performing 1d FFTs, the grid transpose operations illustrated in Figure [ref{fig:fft}](#) also involve reordering the 3d data so that a different dimension is contiguous in memory. This reordering can be done during the packing or unpacking of buffers for MPI communication.
- For large systems and particularly many MPI processes, the dominant cost for parallel FFTs is often the communication, not the computation of 1d FFTs, even though the latter scales as $N \log(N)$ in the number of grid points N per grid direction. This is due to the fact that only a 2d decomposition into pencils is possible while atom data (and their corresponding short-range force and energy computations) can be decomposed efficiently in 3d.

Reducing the number of MPI processes involved in the MPI communication will reduce this kind of overhead. By using a [hybrid MPI + OpenMP parallelization](#) it is still possible to use all processes for parallel computation. It will use OpenMP parallelization inside the MPI domains. While that may have a lower parallel efficiency for some part of the computation, that can be less than the communication overhead in the 3d FFTs.

As an alternative, it is also possible to start a [multi-partition](#) calculation and then use the [verlet/split integrator](#) to perform the PPPM computation on a dedicated, separate partition of MPI processes. This uses an integer “1: p ” mapping of p subdomains of the atom decomposition to one subdomain of the FFT grid decomposition and where pairwise non-bonded and bonded forces and energies are computed on the larger partition and the PPPM kspace computation concurrently on the smaller partition.

- LAMMPS also implements PPPM-based solvers for other long-range interactions, dipole and dispersion (Lennard-Jones), which can be used in conjunction with long-range Coulombics for point charges.
- LAMMPS implements a `GridComm` class which overlays the simulation domain with a regular grid, partitions it across processors in a manner consistent with processor subdomains, and provides methods for forward and reverse communication of owned and ghost grid point values. It is used for PPPM as an FFT grid (as outlined above) and also for the MSM algorithm, which uses a cascade of grid sizes from fine to coarse to compute long-range Coulombic forces. The `GridComm` class is also useful for models where continuum fields interact with particles. For example, the two-temperature model (TTM) defines heat transfer between atoms (particles) and electrons (continuum gas) where spatial variations in the electron temperature are computed by finite differences of a discretized heat equation on a regular grid. The [fix ttm/grid](#) command uses the `GridComm` class internally to perform its grid operations on a distributed grid instead of the original [fix ttm](#) which uses a replicated grid.

4.4.5 OpenMP Parallelism

The styles in the INTEL, KOKKOS, and OPENMP package offer to use OpenMP thread parallelism to predominantly distribute loops over local data and thus follow an orthogonal parallelization strategy to the decomposition into spatial domains used by the [MPI partitioning](#). For clarity, this section discusses only the implementation in the OPENMP package, as it is the simplest. The INTEL and KOKKOS package offer additional options and are more complex since they support more features and different hardware like co-processors or GPUs.

One of the key decisions when implementing the OPENMP package was to keep the changes to the source code small, so that it would be easier to maintain the code and keep it in sync with the non-threaded standard implementation. This is achieved by a) making the OPENMP version a derived class from the regular version (e.g. `PairLJCutOMP` from `PairLJCut`) and overriding only methods that are multi-threaded or need to be modified to support multi-threading (similar to what was done in the OPT package), b) keeping the structure in the modified code very similar so that side-by-side comparisons are still useful, and c) offloading additional functionality and multi-thread support functions into three separate classes `ThrOMP`, `ThrData`, and `FixOMP`. `ThrOMP` provides additional, multi-thread aware functionality not available in the corresponding base class (e.g. `Pair` for `PairLJCutOMP`) like multi-thread aware variants of the “tally” functions. Those functions are made available through multiple inheritance, so those new functions have to have unique names to avoid ambiguities; typically `_thr` is appended to the name of the function. `ThrData` is a class that manages per-thread data structures. It is used instead of extending the corresponding storage to per-thread arrays to avoid slowdowns due to “false sharing” when multiple threads update adjacent elements in an array and thus force the CPU cache lines to be reset and re-fetched. `FixOMP` finally manages the “multi-thread state” like settings and access to per-thread storage, it is activated by the [package omp](#) command.

Avoiding data races

A key problem when implementing thread parallelism in an MD code is to avoid data races when updating accumulated properties like forces, energies, and stresses. When interactions are computed, they always involve multiple atoms and thus there are race conditions when multiple threads want to update per-atom data of the same atoms. Five possible strategies have been considered to avoid this:

1. Restructure the code so that there is no overlapping access possible when computing in parallel, e.g. by breaking lists into multiple parts and synchronizing threads in between.
2. Have each thread be “responsible” for a specific group of atoms and compute these interactions multiple times, once on each thread that is responsible for a given atom, and then have each thread only update the properties of this atom.
3. Use mutexes around functions and regions of code where the data race could happen.
4. Use atomic operations when updating per-atom properties.
5. Use replicated per-thread data structures to accumulate data without conflicts and then use a reduction to combine those results into the data structures used by the regular style.

Option 5 was chosen for the OPENMP package because it would retain the performance for the case of a single thread and the code would be more maintainable. Option 1 would require extensive code changes, particularly to the neighbor list code; option 2 would have incurred a 2x or more performance penalty for the serial case; option 3 causes significant overhead and would enforce serialization of operations in inner loops and thus defeat the purpose of multi-threading; option 4 slows down the serial case although not quite as bad as option 2. The downside of option 5 is that the overhead of the reduction operations grows with the number of threads used, so there would be a crossover point where options 2 or 4 would result in faster executing. That is why option 2 for example is used in the GPU package because a GPU is a processor with a massive number of threads. However, since the MPI parallelization is generally more effective for typical MD systems, the expectation is that thread parallelism is only used for a smaller number of threads (2-8). At the time of its implementation, that number was equivalent to the number of CPU cores per CPU socket on high-end supercomputers.

Thus arrays like the force array are dimensioned to the number of atoms times the number of threads when enabling OpenMP support, and inside the compute functions a pointer to a different chunk is obtained by each thread. Similarly, accumulators like potential energy or virial are kept in per-thread instances of the `ThrData` class and then only reduced and stored in their global counterparts at the end of the force computation.

Loop scheduling

Multi-thread parallelization is applied by distributing (outer) loops statically across threads. Typically, this would be the loop over local atoms i when processing i,j pairs of atoms from a neighbor list. The design of the neighbor list code results in atoms having a similar number of neighbors for homogeneous systems and thus load imbalances across threads are not common and typically happen for systems where also the MPI parallelization would be unbalanced, which would typically have a more pronounced impact on the performance. This same loop scheduling scheme can also be applied to the reduction operations on per-atom data to try and reduce the overhead of the reduction operation.

Neighbor list parallelization

In addition to the parallelization of force computations, also the generation of the neighbor lists is parallelized. As explained previously, neighbor lists are built by looping over “owned” atoms and storing the neighbors in “pages”. In the OPENMP variants of the neighbor list code, each thread operates on a different chunk of “owned” atoms and allocates and fills its own set of pages with neighbor list data. This is achieved by each thread keeping its own instance of the *MyPage* page allocator class.

4.5 Accessing per-atom data

This page discusses how per-atom data is managed in LAMMPS, how it can be accessed, what communication patterns apply, and some of the utility functions that exist for a variety of purposes.

4.5.1 Owned and ghost atoms

As described on the *parallel partitioning algorithms* page, LAMMPS uses a domain decomposition of the simulation domain, either in a *brick* or *tiled* manner. Each MPI process *owns* exactly one subdomain and the atoms within it. To compute forces for tuples of atoms that are spread across sub-domain boundaries, also a “halo” of *ghost* atoms are maintained within a the communication cutoff distance of its subdomain.

The total number of atoms is stored in *Atom::natoms* (within any typical class this can be referred to as *atom->natoms*). The number of *owned* (or “local” atoms) are stored in *Atom::nlocal*; the number of *ghost* atoms is stored in *Atom::nghost*. The sum of *Atom::nlocal* over all MPI processes should be *Atom::natoms*. This is by default regularly checked by the Thermo class, and if the sum does not match, LAMMPS stops with a “lost atoms” error. For convenience also the property *Atom::nmax* is available, this is the maximum of *Atom::nlocal* + *Atom::nghost* across all MPI processes.

Per-atom properties are either managed by the atom style, or individual classes. or as custom arrays by the individual classes. If only access to *owned* atoms is needed, they are usually allocated to be of size *Atom::nlocal*, otherwise of size *Atom::nmax*. Please note that not all per-atom properties are available or updated on *ghost* atoms. For example, per-atom velocities are only updated with *comm_modify vel yes*.

4.5.2 Atom indexing

When referring to individual atoms, they may be indexed by their local *index*, their index in their *Atom::x* array. This is densely populated containing first all *owned* atoms (*index* < *Atom::nlocal*) and then all *ghost* atoms. The order of atoms in these arrays can change due to atoms migrating between subdomains, atoms being added or deleted, or atoms being sorted for better cache efficiency. Atoms are globally uniquely identified by their *atom ID*. There may be multiple atoms with the same atom ID present, but only one of them may be an *owned* atom.

To find the local *index* of an atom, when the *atom ID* is known, the *Atom::map()* function may be used. It will return the local atom index or -1. If the returned value is between 0 (inclusive) and *Atom::nlocal* (exclusive) it is an *owned* or “local” atom; for larger values the atom is present as a ghost atom; for a value of -1, the atom is not present on the current subdomain at all.

If multiple atoms with the same tag exist in the same subdomain, they can be found via the *Atom::sametag* array. It points to the next atom index with the same tag or -1 if there are no more atoms with the same tag. The list will be exhaustive when starting with an index of an *owned* atom, since the atom IDs are unique, so there can only be one such atom. Example code to count atoms with same atom ID in subdomain:

```

for (int i = 0; i < atom->nlocal; ++i) {
  int count = 0;
  while (sametag[i] >= 0) {
    i = sametag[i];
    ++count;
  }
  printf("Atom ID: %ld is present %d times\n", atom->tag[i], count);
}

```

4.5.3 Atom class versus AtomVec classes

The *Atom* class contains all kinds of flags and counters about atoms in the system and that includes pointers to **all** per-atom properties available for atoms. However, only a subset of these pointers are non-NULL and which those are depends on the atom style. For each atom style there is a corresponding *AtomVecXXX* class derived from the *AtomVec* base class, where the XXX indicates the atom style. This *AtomVecXXX* class will update the counters and per-atom pointers if atoms are added or removed to the system or migrate between subdomains.

4.6 Communication patterns

This page describes various inter-processor communication operations provided by LAMMPS, mostly in the core *Comm* class. These are operations for common tasks implemented using MPI library calls. They are used by other classes to perform communication of different kinds. These operations are useful to know about when writing new code for LAMMPS that needs to communicate data between processors.

4.6.1 Owned and ghost atoms

As described on the [parallel partitioning algorithms](#) page, LAMMPS spatially decomposes the simulation domain, either in a *brick* or *tiled* manner. Each processor (MPI task) owns atoms within its subdomain and additionally stores ghost atoms within a cutoff distance of its subdomain.

Forward and reverse communication

As described on the [parallel communication algorithms](#) page, the most common communication operations are first, *forward communication* which sends owned atom information from each processor to nearby processors to store with their ghost atoms. The need to do this communication arises when data from the owned atoms is updated (e.g. their positions) and this updated information needs to be **copied** to the corresponding ghost atoms.

And second, *reverse communication*, which sends ghost atom information from each processor to the owning processor to **accumulate** (sum) the values with the corresponding owned atoms. The need for this arises when data is computed and also stored with ghost atoms (e.g. forces when using a “half” neighbor list) and thus those terms need to be added to their corresponding atoms on the process where they are “owned” atoms. Please note, that with the [newton off](#) setting this does not happen and the neighbor lists are constructed so that these interactions are computed on both MPI processes containing one of the atoms and only the data pertaining to the local atom is stored.

The time-integration classes in LAMMPS invoke these operations each timestep via the *forward_comm()* and *reverse_comm()* methods in the *Comm* class. Which per-atom data is communicated depends on the currently used *atom style* and whether *comm_modify vel* setting is “no” (default) or “yes”.

Similarly, *Pair* style classes can invoke the *forward_comm(this)* and *reverse_comm(this)* methods in the *Comm* class to perform the same operations on per-atom data that is generated and stored within the pair style class. Note that this

function requires passing the `this` pointer as the first argument to enable the *Comm* class to call the “pack” and “unpack” functions discussed below. An example of the use of these functions are many-body pair styles like the embedded-atom method (EAM) which compute intermediate values in the first part of the `compute()` function that need to be stored by both owned and ghost atoms for the second part of the force computation. The *Comm* class methods perform the MPI communication for buffers of per-atom data. They “call back” to the *Pair* class, so it can *pack* or *unpack* the buffer with data the *Pair* class owns. There are 4 such methods that the *Pair* class must define, assuming it uses both forward and reverse communication:

- `pack_forward_comm()`
- `unpack_forward_comm()`
- `pack_reverse_comm()`
- `unpack_reverse_comm()`

The arguments to these methods include the buffer and a list of atoms to pack or unpack. The *Pair* class also must set the `comm_forward` and `comm_reverse` variables, which store the number of values stored in the communication buffers for each operation. This means, if desired, it can choose to store multiple per-atom values in the buffer, and they will be communicated together to minimize communication overhead. The communication buffers are defined vectors containing double values. To correctly store integers that may be 64-bit (bigint, tagint, imageint) in the buffer, you need to use the *ubuf union* construct.

The *Fix*, *Compute*, and *Dump* classes can also invoke the same kind of forward and reverse communication operations using the same *Comm* class methods. Likewise, the same pack/unpack methods and `comm_forward/comm_reverse` variables must be defined by the calling *Fix*, *Compute*, or *Dump* class.

For *Fix* classes, there is an optional second argument to the `forward_comm()` and `reverse_comm()` call which can be used when the fix performs multiple modes of communication, with different numbers of values per atom. The fix should set the `comm_forward` and `comm_reverse` variables to the maximum value, but can invoke the communication for a particular mode with a smaller value. For this to work, the `pack_forward_comm()`, etc methods typically use a class member variable to choose which values to pack/unpack into/from the buffer.

Finally, for reverse communications in *Fix* classes there is also the `reverse_comm_variable()` method that allows the communication to have a different amount of data per-atom. It invokes these corresponding callback methods:

- `pack_reverse_comm_size()`
- `unpack_reverse_comm_size()`

which have extra arguments to specify the amount of data stored in the buffer for each atom.

4.6.2 Higher level communication

There are also several higher-level communication operations provided in LAMMPS which work for either *brick* or *tiled* decompositions. They may be useful for a new class to invoke if it requires more sophisticated communication than the *forward* and *reverse* methods provide. The 3 communication operations described here are

- ring
- irregular
- rendezvous

You can invoke these *grep* command in the LAMMPS src directory, to see a list of classes that invoke the 3 operations.

- `grep "\->ring" *.cpp */*.cpp`
- `grep "irregular\->" *.cpp`
- `grep "\->rendezvous" *.cpp */*.cpp`

Ring operation

The *ring* operation is invoked via the *ring()* method in the *Comm* class.

Each processor first creates a buffer with a list of values, typically associated with a subset of the atoms it owns. Now think of the P processors as connected to each other in a *ring*. Each processor M sends data to the next $M+1$ processor. It receives data from the preceding $M-1$ processor. The ring is periodic so that the last processor sends to the first processor, and the first processor receives from the last processor.

Invoking the *ring()* method passes each processor's buffer in P steps around the ring. At each step a *callback* method, provided as an argument to *ring()*, in the caller is invoked. This allows each processor to examine the data buffer provided by every other processor. It may extract values needed by its atoms from the buffers, or it may alter placeholder values in the buffer. In the latter case, when the *ring* operation is complete, each processor can examine its original buffer to extract modified values.

Note that the *ring* operation is similar to an *MPI_Alltoall()* operation, where every processor effectively sends and receives data to every other processor. The difference is that the *ring* operation does it one step at a time, so the total volume of data does not need to be stored by every processor. However, the *ring* operation is also less efficient than *MPI_Alltoall()* because of the P stages required. So it is typically only suitable for small data buffers and occasional operations that are not time-critical.

Irregular operation

The *irregular* operation is provided by the *Irregular* class. What LAMMPS terms irregular communication is when each processor knows what data it needs to send to what processor, but does not know what processors are sending it data. An example is when load-balancing is performed and each processor needs to send some of its atoms to new processors.

The *Irregular* class provides 5 high-level methods useful in this context:

- *create_data()*
- *exchange_data()*
- *create_atom()*
- *exchange_atom()*
- *migrate_atoms()*

For the *create_data()* method, each processor specifies a list of N datums to send, each to a specified processor. Internally, the method creates efficient data structures for performing the communication. The *exchange_data()* method triggers the communication to be performed. Each processor provides the vector of N datums to send, and the size of each datum. All datums must be the same size.

The *create_atom()* and *exchange_atom()* methods are similar, except that the size of each datum can be different. Typically, this is used to communicate atoms, each with a variable amount of per-atom data, to other processors.

The *migrate_atoms()* method is a convenience wrapper on the *create_atom()* and *exchange_atom()* methods to simplify communication of all the per-atom data associated with an atom so that the atom can effectively migrate to a new owning processor. It is similar to the *exchange()* method in the *Comm* class invoked when atoms move to neighboring processors (in the regular or tiled decomposition) during timestepping, except that it allows atoms to have moved arbitrarily long distances and still be properly communicated to a new owning processor.

Rendezvous operation

Finally, the *rendezvous* operation is invoked via the *rendezvous()* method in the *Comm* class. Depending on how much communication is needed and how many processors a LAMMPS simulation is running on, it can be a much more efficient choice than the *ring()* method. It uses the *irregular* operation internally once or twice to do its communication. The rendezvous algorithm is described in detail in (*Plimpton*), including some LAMMPS use cases.

For the *rendezvous()* method, each processor specifies a list of N datums to send and which processor to send each of them to. Internally, this communication is performed as an irregular operation. The received datums are returned to the caller via invocation of *callback* function, provided as an argument to *rendezvous()*. The caller can then process the received datums and (optionally) assemble a new list of datums to communicate to a new list of specific processors. When the callback function exits, the *rendezvous()* method performs a second irregular communication on the new list of datums.

Examples in LAMMPS of use of the *rendezvous* operation are the *fix rigid/small* and *fix shake* commands (for one-time identification of the rigid body atom clusters) and the identification of special_bond 1-2, 1-3 and 1-4 neighbors within molecules. See the *special_bonds* command for context.

(**Plimpton**) Plimpton and Knight, JPDC, 147, 184-195 (2021).

4.7 How a timestep works

The first and most fundamental operation within LAMMPS to understand is how a timestep is structured. Timestepping is performed by calling methods of the *Integrate* class instance within the *Update* class. Since *Integrate* is a base class, it will point to an instance of a derived class corresponding to what is selected by the *run_style* input script command.

In this section, the timestep implemented by the *Verlet* class is described. A similar timestep protocol is implemented by the *Respa* class, for the r-RESPA hierarchical timestepping method.

The *Min* base class performs energy minimization, so does not perform a literal timestep. But it has logic similar to what is described here, to compute forces and invoke fixes at each iteration of a minimization. Differences between time integration and minimization are highlighted at the end of this section.

The *Verlet* class is encoded in the *src/verlet.cpp* and *verlet.h* files. It implements the velocity-Verlet timestepping algorithm. The workhorse method is *Verlet::run()*, but first we highlight several other methods in the class.

- The *init()* method is called at the beginning of each dynamics run. It simply sets some internal flags, based on user settings in other parts of the code.
- The *setup()* or *setup_minimal()* methods are also called before each run. The velocity-Verlet method requires current forces be calculated before the first timestep, so these routines compute forces due to all atomic interactions, using the same logic that appears in the timestepping described next. A few fixes are also invoked, using the mechanism described in the next section. Various counters are also initialized before the run begins. The *setup_minimal()* method is a variant that has a flag for performing less setup. This is used when runs are continued and information from the previous run is still valid. For example, if repeated short LAMMPS runs are being invoked, interleaved by other commands, via the *pre no* and *every* options of the run command, the *setup_minimal()* method is used.
- The *force_clear()* method initializes force and other arrays to zero before each timestep, so that forces (torques, etc) can be accumulated.

Now for the *Verlet::run()* method. Its basic structure in hi-level pseudocode is shown below. In the actual code in *src/verlet.cpp* some of these operations are conditionally invoked.

```

loop over N timesteps:
  if timeout condition: break
  ev_set()

  fix->initial_integrate()
  fix->post_integrate()

  nflag = neighbor->decide()
  if nflag:
    fix->pre_exchange()
    domain->pbc()
    domain->reset_box()
    comm->setup()
    neighbor->setup_bins()
    comm->exchange()
    comm->borders()
    fix->pre_neighbor()
    neighbor->build()
    fix->post_neighbor()
  else:
    comm->forward_comm()

  force_clear()
  fix->pre_force()

  pair->compute()
  bond->compute()
  angle->compute()
  dihedral->compute()
  improper->compute()
  kspace->compute()

  fix->pre_reverse()
  comm->reverse_comm()

  fix->post_force()
  fix->final_integrate()
  fix->end_of_step()

  if any output on this step:
    output->write()

# after loop
fix->post_run()

```

The `ev_set()` method (in the parent `Integrate` class), sets two flags (*eflag* and *vflag*) for energy and virial computation. Each flag encodes whether global and/or per-atom energy and virial should be calculated on this timestep, because some fix or variable or output will need it. These flags are passed to the various methods that compute particle interactions, so that they either compute and tally the corresponding data or can skip the extra calculations if the energy and virial are not needed. See the comments for the `Integrate::ev_set()` method, which document the flag values.

At various points of the timestep, fixes are invoked, e.g. `fix->initial_integrate()`. In the code, this is actually done via the `Modify` class, which stores all the `Fix` objects and lists of which should be invoked at what point in the timestep. Fixes are the LAMMPS mechanism for tailoring the operations of a timestep for a particular simula-

tion. As described elsewhere, each fix has one or more methods, each of which is invoked at a specific stage of the timestep, as show in the timestep pseudocode. All the active fixes defined in an input script, that are flagged to have an `initial_integrate()` method, are invoked at the beginning of each timestep. Examples are *fix nve* or *fix nvt* or *fix npt* which perform the start-of-timestep velocity-Verlet integration operations to update velocities by a half-step, and coordinates by a full step. The `post_integrate()` method is next for operations that need to happen immediately after those updates. Only a few fixes use this, e.g. to reflect particles off box boundaries in the *FixWallReflect* class.

The `decide()` method in the Neighbor class determines whether neighbor lists need to be rebuilt on the current timestep (conditions can be changed using the *neigh_modify every/delay/check* command. If not, coordinates of ghost atoms are acquired by each processor via the `forward_comm()` method of the Comm class. If neighbor lists need to be built, several operations within the inner if clause of the pseudocode are first invoked. The `pre_exchange()` method of any defined fixes is invoked first. Typically, this inserts or deletes particles from the system.

Periodic boundary conditions are then applied by the Domain class via its `pbcb()` method to remap particles that have moved outside the simulation box back into the box. Note that this is not done every timestep, but only when neighbor lists are rebuilt. This is so that each processor's subdomain will have consistent (nearby) atom coordinates for its owned and ghost atoms. It is also why dumped atom coordinates may be slightly outside the simulation box if not dumped on a step where the neighbor lists are rebuilt.

The box boundaries are then reset (if needed) via the `reset_box()` method of the Domain class, e.g. if box boundaries are shrink-wrapped to current particle coordinates. A change in the box size or shape requires internal information for communicating ghost atoms (Comm class) and neighbor list bins (Neighbor class) to be updated. The `setup()` method of the Comm class and `setup_bins()` method of the Neighbor class perform the update.

The code is now ready to migrate atoms that have left a processor's geometric subdomain to new processors. The `exchange()` method of the Comm class performs this operation. The `borders()` method of the Comm class then identifies ghost atoms surrounding each processor's subdomain and communicates ghost atom information to neighboring processors. It does this by looping over all the atoms owned by a processor to make lists of those to send to each neighbor processor. On subsequent timesteps, the lists are used by the `Comm::forward_comm()` method.

Fixes with a `pre_neighbor()` method are then called. These typically re-build some data structure stored by the fix that depends on the current atoms owned by each processor.

Now that each processor has a current list of its owned and ghost atoms, LAMMPS is ready to rebuild neighbor lists via the `build()` method of the Neighbor class. This is typically done by binning all owned and ghost atoms, and scanning a stencil of bins around each owned atom's bin to make a Verlet list of neighboring atoms within the force cutoff plus neighbor skin distance.

In the next portion of the timestep, all interaction forces between particles are computed, after zeroing the per-atom force vector via the `force_clear()` method. If the newton flag is set to *on* by the newton command, forces are added to both owned and ghost atoms, otherwise only to owned (aka local) atoms.

Pairwise forces are calculated first, which enables the global virial (if requested) to be calculated cheaply (at $O(N)$ cost instead of $O(N^2)$ at the end of the `Pair::compute()` method), by a dot product of atom coordinates and forces. By including owned and ghost atoms in the dot product, the effect of periodic boundary conditions is correctly accounted for. Molecular topology interactions (bonds, angles, dihedrals, impropers) are calculated next (if supported by the current atom style). The final contribution is from long-range Coulombic interactions, invoked by the KSpace class.

The `pre_reverse()` method in fixes is used for operations that have to be done *before* the upcoming reverse communication (e.g. to perform additional data transfers or reductions for data computed during the force computation and stored with ghost atoms).

If the newton flag is on, forces on ghost atoms are communicated and summed back to their corresponding owned atoms. The `reverse_comm()` method of the Comm class performs this operation, which is essentially the inverse operation of sending copies of owned atom coordinates to other processor's ghost atoms.

At this point in the timestep, the total force on each (local) atom is known. Additional force constraints (external forces, SHAKE, etc) are applied by Fixes that have a `post_force()` method. The second half of the velocity-Verlet

integration, `final_integrate()` is then performed (another half-step update of the velocities) via fixes like `nve`, `nvt`, `npt`.

At the end of the timestep, fixes that contain an `end_of_step()` method are invoked. These typically perform a diagnostic calculation, e.g. the `ave/time` and `ave/spatial` fixes. The final operation of the timestep is to perform any requested output, via the `write()` method of the `Output` class. There are 3 kinds of LAMMPS output: thermodynamic output to the screen and log file, snapshots of atom data to a dump file, and restart files. See the [thermo_style](#), [dump](#), and [restart](#) commands for more details.

The flow of control during energy minimization iterations is similar to that of a molecular dynamics timestep. Forces are computed, neighbor lists are built as needed, atoms migrate to new processors, and atom coordinates and forces are communicated to neighboring processors. The only difference is what `Fix` class operations are invoked when. Only a subset of LAMMPS fixes are useful during energy minimization, as explained in their individual doc pages. The relevant `Fix` class methods are `min_pre_exchange()`, `min_pre_force()`, and `min_post_force()`. Each fix is invoked at the appropriate place within the minimization iteration. For example, the `min_post_force()` method is analogous to the `post_force()` method for dynamics; it is used to alter or constrain forces on each atom, which affects the minimization procedure.

After all iterations are completed, there is a `cleanup` step which calls the `post_run()` method of fixes to perform operations only required at the end of a calculation (like freeing temporary storage or creating final outputs).

4.8 Writing new styles

The [Modifying & extending LAMMPS](#) section of the manual gives an overview of how LAMMPS can be extended by writing new classes that derive from existing parent classes in LAMMPS. Here, some specific coding details are provided for writing code for LAMMPS.

4.8.1 Writing new pair styles
